[2012 Chevrolet Volt / Opel Ampera Service Manual](#)

Volume 1

Foreword

This manual provides information on the diagnosis, service procedures, adjustments, and specifications for the 2012 Volt / Ampera.

The technicians who understand the material in this manual and in the appropriate Dealer Service Bulletins better serve the vehicle owners.

When this manual refers to a brand name, a part number, or a specific tool, you may use an equivalent product in place of the recommended item. All information, illustrations, and specifications in this manual are based on the latest product information available at the time of publication approval. General Motors reserves the right to make changes at any time without notice.

This applies to all text, illustrations, and tables.

Definition of Danger, Warning, Caution, and Note

The diagnosis and repair procedures in a GM Service Manual contain both general and specific Dangers, Warnings, Cautions, Notes or Important. GM is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for the proper operation of the vehicle, however, certain procedures may present a hazard to the technician if they are not followed in the recommended manner. Dangers, Warnings, Cautions and Notes or Important are elements designed to prevent these hazards, however, not all hazards can be foreseen. This information is placed at strategic locations within the service manual. This information is designed to prevent the following from occurring:

- Serious bodily injury or death to the technician
- Damage to the vehicle
- Unnecessary vehicle repairs
- Unnecessary component replacement
- Improper repair or replacement of vehicle components.
- Any warning or caution that appears in this service category is referenced from the individual service categories.

DANGER Defined

When encountering a DANGER, you will be asked to take a necessary action or not to take a prohibited action. If a DANGER is not heeded, the following consequences may occur:

- Serious bodily injury or death to the technician
- Serious bodily injury or death to other technicians in the workplace area

WARNING Defined

When encountering a WARNING, you will be asked to take a necessary action or not to take a prohibited action. If a WARNING is not heeded, the following consequences may occur:

- Serious bodily injury to the technician
- Serious bodily injury to other technicians in the workplace area
- Serious bodily injury to the driver and/or passenger(s) of the vehicle, if the vehicle has been improperly repaired

CAUTION Defined

CAUTIONS call special attention to a necessary action or to a prohibited action. If a CAUTION is not heeded, the following consequences may occur:

- Damage to the vehicle
- Unnecessary vehicle repairs
- Unnecessary component replacement
- Improper operation or performance of the system or component under repair
- Damage to any systems or components which are dependent upon the proper operation of the system or component under repair
- Improper operation or performance of any systems or components which are dependent upon the proper operation or performance of the system or component under repair
- Damage to fasteners, basic tools, or special tools
- The leakage of coolant, lubricant, or other vital fluids

NOTE or IMPORTANT Defined

NOTE and IMPORTANT statements emphasize a necessary characteristic of a diagnostic or repair procedure. NOTE or IMPORTANT statements are designed to do the following:

- Clarify a procedure
- Present additional information for accomplishing a procedure
- Give insight into the reason or reasons for performing a procedure in the manner recommended
- Present information that will help to accomplish a procedure in a more effective manner
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease

ABS Component Handling Warning

Warning: Certain components in the Antilock Brake System (ABS) are not intended to be serviced individually. Attempting to remove or disconnect certain system components may result in personal injury and/or improper system operation. Only those components with approved removal and installation procedures should be serviced.

Actions to Take When Working with Fuel Warning

Warning: Fuel Vapours can collect while servicing fuel system parts in enclosed areas such as a boot. To reduce the risk of fire and increased exposure to vapours:

- Use forced air ventilation such as a fan set outside of the boot.
- Plug or cap any fuel system openings in order to reduce fuel vapour formation.
- Clean up any spilled fuel immediately.
- Avoid sparks and any source of ignition.
- Use signs to alert others in the work area that fuel system work is in process.

Approved Equipment for Collision Repair Warning

Warning: To avoid personal injury when exposed to welding flashes or to galvanized (Zinc Oxide) metal toxic fumes while grinding/cutting on any type of metal or sheet molded compound, you must work in a properly ventilated area, wearing an approved respirator, eye protection, earplugs, welding gloves, and protective clothing.

Assistant Driving Warning

Warning: An assistant should drive the vehicle while the technician checks for the location of the reported condition. Otherwise, personal injury could result.

Battery Disconnect Warning

Warning: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar®module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power (RAP) should be allowed to time out or be disabled (simply opening the driver door should disable RAP) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with RAP activated may cause activation of the OnStar® Back-Up Battery (BUB) system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The BUB is not rechargeable and once activated the BUB must be replaced.

Brake Dust Warning

Warning: Avoid taking the following actions when you service wheel brake parts:

- Do not grind brake linings.
- Do not sand brake linings.
- Do not clean wheel brake parts with a dry brush or with compressed air.

Some models or aftermarket brake parts may contain asbestos fibers which can become airborne in dust. Breathing dust with asbestos fibers may cause serious bodily harm. Use a water-dampened cloth in order to remove any dust on brake parts. Equipment is available commercially in order to perform this washing function. These wet methods prevent fibers from becoming airborne.

Brake Fluid Irritant Warning

Warning: Brake fluid may irritate eyes and skin. In case of contact, take the following actions:

- Eye contact--rinse thoroughly with water.
- Skin contact--wash with soap and water.
- If ingested--consult a physician immediately.

Checking Hot Transmission Fluid through Drain Plug Hole Warning

Warning: The engine must be running when the transmission fluid fill plug is removed, or excessive fluid loss will occur. Transmission fluid may be hot. Since the actual fluid level is unknown, stand clear when removing the fill plug. Have a container ready to capture any lost fluid. Do not turn the engine off with the fill plug removed, as you can be injured by hot transmission fluid being expelled out of the oil fill opening.

Cleaning Solvent Warning

Warning: Bodily injury may occur if the cleaning solvent is inhaled or exposed to the skin.

Collision Sectioning Warning

Warning: Sectioning should be performed only in the recommended areas. Failure to do so may compromise the structural integrity of the vehicle and cause personal injury if the vehicle is in a collision.

Cracked Window Warning

Warning: If a window is cracked but still intact, crisscross the window with masking tape in order to reduce the risk of damage or personal injury.

Defroster Outlet Warning

Warning: If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.

Exhaust Service Warning

Warning: In order to avoid being burned, do not service the exhaust system while it is still hot. Service the system when it is cool.

Express Window Down Warning

Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.

Eye Protection Warning

Warning: Approved safety glasses and gloves should be worn when performing this procedure to reduce the chance of personal injury.

Foam Sound Deadeners Warning

Warning: Foam sound deadeners must be removed from areas within 152.4 mm (6 in) of where flame is to be used for body repairs. When reinstalling foam sound deadeners, avoid inhaling fumes as bodily injury may result.

Fuel and Evaporative Emission Pipe Warning

Warning: In order to reduce the risk of fire and personal injury observe the following items:

- Replace all nylon fuel pipes that are nicked, scratched or damaged during installation, do not attempt to repair the sections of the nylon fuel pipes
- Do not hammer directly on the fuel harness body clips when installing new fuel pipes. Damage to the nylon pipes may result in a fuel leak.
- Always cover nylon vapor pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115°C (239°F) for more than one hour, or more than 90°C (194°F) for any extended period.
- Apply a few drops of clean engine oil to the male pipe ends before connecting fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. (During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.)

It works!

This is the default web page for this server.

The web server software is running but no content has been added, yet.

Fuel Gage Leak Warning

Warning: Wrap a shop towel around the fuel pressure connection in order to reduce the risk of fire and personal injury. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gage. Place the towel in an approved container when the connection of the fuel pressure gage is complete.

Fuel Pipe Fitting Warning

Warning: Always apply a few drops of clean engine oil to the male pipe ends before connecting the fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. Always replace O-rings.

Fuel Storage Warning

Warning: Do not drain the fuel into an open container. Never store the fuel in an open container due to the possibility of a fire or an explosion.

Fuel Vapour in Evaporative Emission Components Warning

Warning: Do not breathe the air through the EVAP component tubes or hoses. The fuel vapours inside the EVAP components may cause personal injury.

Gasoline/Gasoline Vapors Warning

Warning: Fuel and fuel vapours are highly flammable. A fire could occur if an ignition source is present. Never drain or store petrol or diesel fuel in an open container, due to the possibility of fire or explosion. Follow national legal regulations.

Glass and Sheet Metal Handling Warning

Warning: When working with any type of glass or sheet metal with exposed or rough edges, wear approved safety glasses and gloves in order to reduce the chance of personal injury.

Halogen Bulb Warning

Warning: Halogen bulbs contain gas under pressure. Handling a bulb improperly could cause it to shatter into flying glass fragments. To help avoid personal injury:

- Turn off the lamp switch and allow the bulb to cool before changing the bulb.
- Leave the lamp switch OFF until the bulb change is complete.
- Always wear eye protection when changing a halogen bulb.
- Handle the bulb only by its base. Avoid touching the glass.
- Keep dirt and moisture off the bulb.
- Properly dispose of the used bulb.
- Keep halogen bulbs out of the reach of children.

Bonnet Hold-Open Device Warning

Warning: When a bonnet hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.

Hot Exhaust System Warning

Warning: While engine is operating, the exhaust system will become extremely hot. To prevent burns avoid contacting a hot exhaust system.

Moving Parts and Hot Surfaces Warning

Warning: Avoid contact with moving parts and hot surfaces while working around a running engine in order to prevent physical injury.

Protective Goggles and Glove Warning

Warning: Always wear protective goggles and gloves when removing exhaust parts as falling rust and sharp edges from worn exhaust components could result in serious personal injury.

Relieving Fuel Pressure Warning

Warning: Remove the fuel tank cap and relieve the fuel system pressure before servicing the fuel system in order to reduce the risk of personal injury. After you relieve the fuel system pressure, a small amount of fuel may be released when servicing the fuel lines, the fuel injection pump, or the connections. In order to reduce the risk of personal injury, cover the fuel system components with a shop towel before disconnection. This will catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

Road Test Warning

Warning: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

Safety Glasses and Compressed Air Warning

Warning: Wear safety glasses when using compressed air in order to prevent eye injury.

Safety Glasses Warning

Warning: Wear safety glasses in order to avoid eye damage.

Safety Goggles and Fuel Warning

Warning: Always wear safety goggles when working with fuel in order to protect the eyes from fuel splash.

SIR Deployed Inflator Modules Are Hot Warning

Warning: After deployment, the metal surfaces of the SIR component may be very hot. To help avoid a fire or personal injury:

- Allow sufficient time for cooling before touching any metal surface of the SIR component.
- Do not place the deployed SIR component near any flammable objects.

SIR Inflatable Module Deployment Outside Vehicle Warning

Warning: When you are deploying an inflator module for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

SIR Inflator Module Disposal Warning

Warning: In order to prevent accidental deployment and the risk of personal injury, do not dispose of an undeployed inflator module as normal shop waste. Undeployed inflator modules contain substances that could cause severe illness or personal injury if their sealed containers are damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed inflator module. Failure to observe the following disposal methods may be a violation of federal, state, or local laws.

SIR Inflator Module Handling and Storage Warning

Warning: When carrying an undeployed inflator module:

- Do not carry the inflator module by the wires or connector.
- Make sure the air bag opening points away from you.

When storing an undeployed inflator module:

- Make sure the air bag opening points away from the surface on which the inflator module rests.
- Provide free space for the air bag to expand in case of an accidental deployment.
- When storing a steering column, do not rest the column with the air bag opening facing down and the column vertical. Lay the column on its side.

Failure to observe these guidelines may result in personal injury.

SIR Seatbelt Pretensioner Handling Warning

Warning: When carrying an undeployed inflatable restraint seat belt retractor pretensioner:

- Do not carry the seat belt pretensioner by the seat belt webbing or pigtail connector, if equipped.
- Carry the seat belt pretensioner by the housing, keeping hands and fingers away from the seat belt webbing.
- Make sure the opening, from which the seat belt webbing extends, faces downward and the seat belt webbing hangs freely.

Failure to observe these guidelines may result in personal injury.

SIR Special Tool Warning

Warning: Failure to observe the special tool recommendations and instructions could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

SIR Warning

Warning: This vehicle is equipped with a Supplemental Inflatable Restraint (SIR) System. Failure to follow the correct procedure could cause the following conditions:

- Air bag deployment
- Personal injury
- Unnecessary SIR system repairs

In order to avoid the above conditions, observe the following guidelines:

- Refer to SIR Component Views in order to determine if you are performing service on or near the SIR components or the SIR wiring.
- If you are performing service on or near the SIR components or the SIR wiring, disable the SIR system. Refer to Disabling the SIR System.

Steering Angle Sensor Initialisation Warning

Warning: For vehicles with electric power steering (EPS) and without a vehicle stability enhancement program, the steering angle sensor **MUST** always be initialised after the battery has been disconnected. Failure to initialise the steering angle sensor could limit the operation of the EPS system and result in personal injury.

To ensure proper initialisation of the EPS system, do the following:

1. The engine should be running with the vehicle stationary.
2. Turn the steering wheel anti-clockwise until it stops.
3. Turn the steering wheel clockwise until it stops.

Torque-to-Yield Fastener Warning

Warning: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause bodily injury and damage to the vehicle or component.

Window Retention Warning

Warning: When replacing stationary windows, only use a single component adhesive kit, or an adhesive system meeting GM Specifications, to maintain original installation integrity. Failure to use the single component adhesive kit will result in poor retention of the window, which may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

Work Stall Test Warning

Warning: One or more of the following guidelines may apply when performing specific required tests in the work stall:

- When a test requires spinning the drive wheels with the vehicle jacked up, adhere to the following precautions:
 - Do not exceed 56 km/h (35 mph) when spinning one drive wheel with the other drive wheel stopped. This limit is necessary because the speedometer indicates only one-half the actual vehicle speed under these conditions. Personal injury may result from excessive wheel spinning.
 - If all of the drive wheels are spinning at the same speed, do not exceed 112 km/h (70 mph). Personal injury may result from excessive wheel spinning.
 - All persons should stay clear of the rotating components and the balance weight areas in order to avoid possible personal injury.
 - When running an engine in the repair stall for an extended period of time, use care not to overheat the engine and the transmission.
- When a test requires jacking up the vehicle and running with the wheels and brake rotors removed, adhere to the following precautions:
 - Support the suspension at normal ride height.
 - Do not apply the brake with the brake rotors removed.
 - Do not place the transmission in PARK with the drive axles spinning.
 - Turn Off the ignition in order to stop the powertrain components from spinning.
- When running an engine in the work stall, use the exhaust removal system to prevent breathing dangerous gases.

Air in the Power Steering System Caution

Caution: If the power steering system has been serviced, an accurate fluid level reading cannot be obtained unless air is bled from the steering system. The air in the fluid may cause pump cavitation noise and may cause pump damage over a period of time.

Avoid Chipping or Scratching the Coating Caution

Caution: Care should be taken to avoid chipping or scratching the coating when handling the suspension coil spring. Damage to the coating can cause premature failure.

Ball Stud Removal Caution

Caution: Do not free the ball stud by using a pickle fork or a wedge-type tool. Damage to the seal or bushing may result.

Belt Dressing Caution

Caution: Do not use belt dressing on the drive belt. Belt dressing causes the breakdown of the composition of the drive belt. Failure to follow this recommendation will damage the drive belt.

Brake Caliper Caution

Caution: Support the caliper with a piece of wire to prevent damage to the brake line.

Brake Fluid Effects on Paint and Electrical Components Caution

Caution: Avoid spilling brake fluid onto painted surfaces, electrical connections, wiring, or cables. Brake fluid will damage painted surfaces and cause corrosion to electrical components. If any brake fluid comes in contact with painted surfaces, immediately flush the area with water. If any brake fluid comes in contact with electrical connections, wiring, or cables, use a clean shop cloth to wipe away the fluid.

Clearcoat/Ultraviolet Screeners Caution

Caution: Removing more than 0.5 mils of the clearcoat can result in early paint failure. The clearcoat contains ultraviolet screeners. Do not finesse sand more than what is required to remove the defect.

Component Fastener Tightening Caution

Caution: Replacement components must be the correct part number for the application. Components requiring the use of the thread locking compound, lubricants, corrosion inhibitors, or sealants are identified in the service procedure. Some replacement components may come with these coatings already applied. Do not use these coatings on components unless specified. These coatings can affect the final torque, which may affect the operation of the component. Use the correct torque specification when installing components in order to avoid damage.

Drive Axle Caution

Caution: Support the lower control arms in the normal horizontal position in order to avoid damage to the drive axles. Do not operate the vehicle in gear with the wheels hanging down at full travel.

Engine Coolant Thermostat Housing Caution

Caution: Use care when performing this procedure. Use of excessive force may damage the coolant thermostat.

Exterior Trim Emblem Removal Caution

Caution: Use a plastic, flat-bladed tool to prevent paint damage when removing an emblem/name plate.

Fastener Caution

Caution: Use the correct fastener in the correct location. Replacement fasteners must be the correct part number for that application. Do not use paints, lubricants, or corrosion inhibitors on fasteners, or fastener joint surfaces, unless specified. These coatings affect fastener torque and joint clamping force and may damage the fastener. Use the correct tightening sequence and specifications when installing fasteners in order to avoid damage to parts and systems. When using fasteners that are threaded directly into plastic, use extreme care not to strip the mating plastic part(s). Use hand tools only, and do not use any kind of impact or power tools. Fastener should be hand tightened, fully seated, and not stripped.

Filling the Master Cylinder Caution

Caution: When filling the master cylinder, use only Super DOT-4 brake fluid, or equivalent DOT-4 brake fluid. Do not use a container which has been used for petroleum based fluids, or a container which is wet with water. Petroleum based fluids will cause swelling and distortion of rubber parts in the hydraulic brake system, and water will mix with brake fluid, lowering the boiling point. Keep all fluid containers capped to prevent contamination.

Fuel and Evaporative Emission Hose/Pipe Connection Cleaning Caution

Caution: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

Heated Oxygen and Oxygen Sensor Caution

Caution: Do not remove the pigtail from either the heated oxygen sensor (HO2S) or the oxygen sensor (O2S). Removing the pigtail or the connector will affect sensor operation.

Handle the oxygen sensor carefully. Do not drop the HO2S. Keep the in-line electrical connector and the louvered end free of grease, dirt, or other contaminants. Do not use cleaning solvents of any type.

Do not repair the wiring, connector or terminals. Replace the oxygen sensor if the pigtail wiring, connector, or terminal is damaged.

This external clean air reference is obtained by way of the oxygen sensor signal and heater wires. Any attempt to repair the wires, connectors, or terminals could result in the obstruction of the air reference and degraded sensor performance.

The following guidelines should be used when servicing the heated oxygen sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor causing poor performance.
- Do not damage the sensor pigtail and harness wires in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.
- Ensure the sensor or vehicle lead wires are not bent sharply or kinked. Sharp bends or kinks could block the reference air path through the lead wire.
- Do not remove or defeat the oxygen sensor ground wire, where applicable. Vehicles that utilize the ground wired sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will cause poor engine performance.
- Ensure that the peripheral seal remains intact on the vehicle harness connector in order to prevent damage due to water intrusion. The engine harness may be repaired using Packard's Crimp and Splice Seals Terminal Repair Kit. Under no circumstances should repairs be soldered since this could result in the air reference being obstructed.

Heated Oxygen Sensor Resistance Learn Reset Caution

Caution: When replacing the HO2S perform the following:

- A code clear with a scan tool, regardless of whether or not a DTC is set
- HO2S heater resistance learn reset with a scan tool, where available

Perform the above in order to reset the HO2S resistance learned value and avoid possible HO2S failure.

Installing Hoses without Twists or Bends Caution

Caution: The inlet and outlet hoses must not be twisted during installation. Do not bend or distort the inlet or outlet hoses to make installation easier. Failure to follow these procedures could result in component damage.

Paint Damage Caution

Caution: To avoid paint damage, protect the area surrounding the part which you are removing or installing.

Pipe Wrench Positioning Caution

Caution: The pipe wrench must be placed at the valve end of the steering gear and positioned up against the inner tie rod housing. Placing the pipe wrench in any other location will cause damage to the steering gear.

Power Steering Hose Disconnected Caution

Caution: Do not start the vehicle with any power steering gear inlet or outlet hoses disconnected. When disconnected, plug or cap all openings of components. Failure to do so could result in contamination or loss of power steering fluid and damage to the system.

Silicon Contamination of Heated Oxygen Sensors Caution

Caution: Contamination of the oxygen sensor can result from the use of an inappropriate RTV sealant (not oxygen sensor safe) or excessive engine coolant or oil consumption. Remove the HO2S and visually inspect the portion of the sensor exposed to the exhaust stream in order to check for contamination. If contaminated, the portion of the sensor exposed to the exhaust stream will have a white powdery coating. Silicon contamination causes a high but false HO2S signal voltage (rich exhaust indication). The control module will then reduce the amount of fuel delivered to the engine, causing a severe driveability problem. Eliminate the source of contamination before replacing the oxygen sensor.

Steering Column in Lock Position Caution

Caution: With wheels of the vehicle facing straight ahead, secure the steering wheel utilising steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The steering shaft coupling
- The intermediate shaft(s)

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

Steering Gear Preload Adjustment Caution

Caution: Do not change the steering gear preload adjustment before moving the inner tie rod from the steering gear. Changing the steering gear preload adjustment before moving the inner tie rod could result in damage to the pinion and the steering gear.

Steering Wheel in the Full Turn Position Caution

Caution: Do not hold the steering wheel in the full turn position longer than 5 seconds, as damage to the steering pump may result.

Steering Wheel Straight and Column Locked Caution

Caution: With wheels of the vehicle facing straight ahead, secure the steering wheel utilising steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

Test Probe Caution

Caution: Do not insert test equipment probes (DMM etc.) into any connector or fuse block terminal. The diameter of the test probes will deform most terminals. A deformed terminal will cause a poor connection, which will result in a system failure. Always use the EL-38125-580 GM Approved Terminal Release Tool Kit in order to front probe terminals. Do not use paper clips or other substitutes to probe terminals.

When using the EL-38125-580 GM Approved Terminal Release Tool Kit , ensure the terminal test adapter choice is the correct size for the connector terminal. Do not visually choose the terminal test adapter because some connector terminal cavities may appear larger than the actual terminal in the cavity. Using a larger terminal test adapter will damage the terminal. Refer to the EL-38125-580 GM Approved Terminal Release Tool Kit label on the inside of the EL-38125-580 GM Approved Terminal Release Tool Kit for the correct adapter along with the connector end view for terminal size.

Three-Way Catalytic Converter Damage Caution

Caution: In order to avoid damaging the replacement three-way catalytic converter, correct the engine misfire or mechanical fault before replacing the three-way catalytic converter.

Torque Reaction Against Timing Drive Chain Caution

Caution: A wrench must be used on the hex of the camshaft when loosening or tightening in order to prevent component damage. Failure to prevent the torque reaction against the timing drive chain can lead to timing drive chain failure.

Torque-to-Yield Fastener Caution

Caution: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause damage to the vehicle or component.

Transmission Fluid Vent Cap Removal Caution

Caution: The fluid vent cap must be removed before checking the fluid level, in order to ensure the proper level. Improper fluid level may damage the transmission.

Transmission Overfill Caution

Caution: Check the transmission fluid level immediately after adding fluid and before vehicle operation. Do not overfill the transmission. An overfilled transmission may result in foaming or fluid to be expelled out the vent tube when the vehicle is operated. Overfilling will result in possible damage to the transmission.

Using Proper Power Steering Fluid Caution

Caution: When adding fluid or making a complete fluid change, always use the proper power steering fluid. Failure to use the proper fluid will cause hose and seal damage and fluid leaks.

Tappet Priming Caution

Caution: Ensure each tappet is filled with clean engine oil and the tappet does not tip over (plunger down) before the installation of the tappets. The loss of oil in the tappet lower pressure chamber or the dry stroking/cycling of the tappet plunger will allow air to travel into the high pressure chamber of the tappet. Air in the high pressure chamber of the tappet may not be purged causing extensive engine component damage.

Window Edge Damage Caution

Caution: Avoid damage to the window from impacting objects due to an exposed edge. The window must be 1 mm (0.025 in) below the surface of the sheet metal to avoid window damage.

Safety Regulations for Hybrid/Electric Vehicles

General

Danger: Follow the safety regulations for hybrid/electric vehicles. The High Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations. Failure to follow the regulations exactly as written may result in serious injury or death.

- The handling of high voltage vehicles is subject to various national laws and standards which must be observed at all times. High voltage gloves, high voltage face shields, and protective clothing are personal protective equipment. Their usage is dependent upon the kind of work being performed and the national laws and regulations.
- Only trained and qualified personnel are allowed to work on high voltage vehicles. Depending upon the operation, the following levels of qualification are required:
 - High Voltage Qualified Technician
 - Electrically Aware Technician
- Furthermore, all qualifications require a vehicle-type specific training. In case of any questions regarding high voltage qualification training, please contact the GM Academy.
- The enabling and disabling of high voltage systems shall only be performed by High Voltage Qualified Technicians. The enabling/disabling of a high voltage system must be documented, and this documentation must be kept and filed with the accompanying vehicle documents.
- Only "Electrically Aware Technicians" are allowed to work on high voltage vehicles. Working alone on high voltage components is not allowed.
- High voltage components can be identified by orange-coloured wiring harnesses. In addition all high voltage components are tagged with warning labels.
- The High Voltage system incorporates the following components:
 - (A4) Hybrid/EV Battery Pack
 - (S15) Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever
 - (K1) 14V Power Module
 - (T18) Battery Charger
 - (X98) Hybrid/EV Battery Charger Receptacle
 - (T6) Power Inverter Module
 - (T12) Automatic Transmission Assembly
 - (K10) Coolant Heater Control Module
 - (K118) Electric A/C Compressor Control Module
 - High voltage related wiring harness (orange insulation)

- The vehicle has a low front slope angle of 8°. Careful handling is recommended.
- The vehicle can be only towed with a lifted front axle.
- The 12V battery is located in the boot. There are additional ground and B+ terminals in the engine compartment. These terminals have to be used for external charging, but cannot be used for jump-starting other vehicles.
- Installation of accessories to high voltage components or wiring harnesses is not permitted.

Transportation and Storage of Hybrid/EV Battery Packs

- Only instructed personnel are allowed to transport and store battery packs by adhering to the safety regulations.
- If the diagnostic procedure requires replacement of the battery pack, ensure that the following steps are followed:
 - Inform the Technical Assistance Centre and ask them to confirm the battery pack replacement. Use the required form.
 - Order the replacement battery pack. Use the standard parts ordering system.
 - Prepare the defective battery pack for return.
- Use only the specially designed carrier (special tool) for removing, transporting, and storing battery packs.
- For transportation to another location, use only the special aftersales transport packaging including the covers for cooling and high voltage sockets. If not available, these items must be ordered via Parts and Accessories.
- The carrier has to be ordered from SPX. The transportation case and covers have to be ordered from Parts and Accessories. If the battery pack needs to be replaced, these parts will be used in a recycling process. When the new or refurbished high voltage battery pack has been delivered and installed, the transportation case, the carrier, and the covers will be available for the next battery pack exchange.
- Until pickup or re-installation, the battery pack must be stored in a secure place. Storage with other hazardous materials (e.g., chemicals or paint) is prohibited. The storage area must be identified with the correct hazard symbols and must have suitable fire prevention equipment.

Registration

The Technical Assistance Centre must agree to the replacement of high voltage batteries and their consent is required before the batteries can be exchanged. They will also supply the necessary registration documents. Use the diagnostic tester to read out the high voltage battery's serial number.

Diagnostics

- If the high voltage components are in perfect working order, the display shows no error message after "Power on". Vehicles with an active DTC and an error message regarding the high voltage system must not be handed over to the customer.
- While performing diagnostics on high voltage systems, strictly follow each diagnostic procedure. Do not use any other tools than the specified diagnostic tester and/or special tools.

Repair Information

- While working on high voltage vehicles, strictly follow each service instruction and diagnostic procedure. Failure to follow the procedures may result in damage to components, serious injury, or death!

- While working on a high voltage vehicle, the danger zone must be clearly identified with warning cones and warning tape on all sides of the vehicle. Warning cones are available from the special tools programme.
- Disabling the high voltage system must only be performed by qualified personnel. The instructions for disabling / enabling high voltage systems are part of the service manual.
- Always perform the high voltage disabling procedure prior to servicing any high voltage component or connection. To determine when this is necessary, consult the relevant diagnostic or repair procedure. This is also valid for operations close to high voltage components, connectors or harnesses, if there is the risk of damage to these components.
- If a disabling of the high voltage supply is not possible, contact the Technical Assistance Centre. Working on live high voltage systems is strictly prohibited. It is not permitted to open the housing of high voltage components, wiring plugs, or the battery housing.
- Repairs on high voltage components are not permitted. These components must never be opened or modified. Defective components have to be replaced.
- Repair of high voltage cables and harnesses, including plugs and terminals, is not permitted. Defective wiring harnesses have to be replaced.
- High voltage battery and high voltage control units are sensitive to impact and must therefore be handled with special care. They must be replaced after an impact, e. g., in case a control unit falls to the ground.
- Do not expose the high voltage battery to an object temperature exceeding 60°C / 140°F and for a time of more than 60 minutes.
- For sheet metal, soldering, or welding operations always disconnect the ground cable from the 12 Volt battery.
- If the earth terminal of the welding equipment is too far away from the welding point, the welding current can destroy electric and electronic components. Therefore always attach the earth terminal of the welding equipment as close as possible to the welding point. Remove control units and harnesses that are located close to the welding point.
- Ensure availability of all necessary high voltage safety equipment and tools. Before performing measurements on high voltage systems, check all display segments of the voltmeter and the test leads. In addition, a DC test probe (e. g., 12 Volts) is necessary. Defective components have to be replaced.
- High Voltage wiring harnesses must always be replaced if damage is evident. This is the case if
 - the insulation is damaged (the shielding is visible)
 - defective plug housings, terminals, or lock
 - loss of plug-ability
 - defective sealing
 - fire damage
 - heavily pinched (permanent deformation)
- After each accident a visual check is required by qualified personnel and special attention is required for damages to the fascia, at the underbody, and rear damage. Defective components have to be replaced.
- Especially the battery pack has to be inspected for following damages:
 - crack formation and deformation at the housing
 - crack formation at attachment points
 - damages to the 12 V connectors
 - damages to the high voltage connectors including the socket of the manual disconnect lever
 - crack formation and other damages at the coolant connectors
- If any of these defects are found, the battery pack must be replaced.

- Please contact the Technical Assistance Centre if you have any questions.

Arrows and Symbols

This service manual uses various symbols in order to describe different service operations.

- (1) Front of Vehicle
- (2) View Detail
- (2) View Detail
- (3) Ambient Air Mixed with Another Gas or Indicate Temperature Change
- (4) Motion or Direction
- (5) View Angle
- (6) Dimension (1:2)

- (7) Ambient/Clean Air Flow or Cool Air Flow
- (8) Lubrication Point -- Oil or Fluid
- (9) Task Related
- (10) Sectioning (1:3)
- (11) Gas Other Than Ambient Air or Hot Air Flow
- (12) Lubrication Point -- Grease or Jelly
- (13) Multidirectional Arrow

Vehicle, Engine and Transmission ID and VIN Location, Derivative and Usage

[VIN Plate](#)

The vehicle identification number (VIN) plate (1) is the legal identifier of the vehicle. The VIN plate is located on the upper left corner of the instrument panel (I/P) and can be seen through the windshield from the outside of the vehicle.

[VIN Body Stamping](#)

The stamping is located on the front floor panel under the front right-hand floor mat. It can be seen under the VIN Plate Opening Access Cover (1).

Position	Definition	Character	Description
1	Region of Build	1	United States
2	Manufacturer	G	General Motors
3	Vehicle Brand/Type	1	Chevrolet Passenger Car
		0	Opel Passenger Car

XQ2	Equipment - Vauxhall

Fasteners

Table 1: [Metric Prevailing Torque Fastener Minimum Torque Development](#)

Table 2: [English Prevailing Torque Fastener Minimum Torque Development](#)

Metric Fasteners

This vehicle provides fastener dimensions using the metric system. Most metric fasteners are approximate in diameter to equivalent English fasteners. Make replacements using fasteners of the same nominal diameter, thread pitch, and strength.

A number marking identifies the OE metric fasteners except cross-recess head screws. The number also indicates the strength of the fastener material. A Posidrive® or Type 1A cross-recess identifies a metric cross-recess screw. For best results, use a Type 1A cross-recess screwdriver, or equivalent, in Posidrive® recess head screws.

GM Engineering Standards and North American Industries have adopted a portion of the ISO-defined standard metric fastener sizes. The purpose was to reduce the number of fastener sizes used while retaining the best thread qualities in each thread size. For example, the metric M6.0 X 1 screw, with nearly the same diameter and 25.4 threads per inch replaced the English 1/4–20 and 1/4–28 screws. The thread pitch is midway between the English coarse and fine thread pitches.

Fastener Strength Identification

- (1) English Bolt, Grade 2 (Strength Class)
- (2) English Bolt, Grade 5 (Strength Class)
- (3) English Bolt, Grade 7 (Strength Class)
- (4) English Bolt, Grade 8 (Strength Class)
- (5) Metric Nut, Strength Class 9
- (6) Metric Bolts, Strength Class Increases as Numbers Increase

The most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt. The English, inch strength classes range from grade 2 to grade 8. Radial lines are embossed on the head of each bolt in order to identify the strength class. The number of lines on the head of the bolt is 2 lines less than the actual grade. For example, a grade 8 bolt will have 6 radial lines on the bolt head. Some metric nuts are marked with a single digit strength identification number on the nut face.

The correct fasteners are available through GM SPO. Many metric fasteners available in the aftermarket parts channels are designed to metric standards of countries other than the United States, and may exhibit the following:

- Lower strength
- No numbered head marking system
- Wrong thread pitch

The metric fasteners on GM products are designed to new, international standards. The following are the common sizes and pitches, except for special applications:

- M6.0 x 1
- 8 x 1.25
- M10 x 1.5
- M12 x 1.75
- M14 x 2.00
- M16 x 2.00

Prevailing Torque Fasteners

Prevailing torque fasteners create a thread interface between the fastener and the fastener counterpart in order to prevent the fastener from loosening.

All Metal Prevailing Torque Fasteners

These fasteners accomplish the thread interface by a designed distortion or deformation in the fastener.

Nylon Interface Prevailing Torque Fasteners

These fasteners accomplish the thread interface by the presence of a nylon material on the fastener threads.

Adhesive Coated Fasteners

These fasteners accomplish the thread interface by the presence of a thread-locking compound on the fastener threads. Refer to the appropriate repair procedure in order to determine if the fastener may be reused and the applicable thread-locking compound to apply to the fastener.

- (1) Prevailing Torque Nut, Centre Lock Type
- (2) Prevailing Torque Nut, Top Lock Type
- (3) Prevailing Torque Nut, Nylon Patch Type
- (4) Prevailing Torque Nut, Nylon Washer Insert Type
- (5) Prevailing Torque Nut, Nylon Insert Type
- (6) Prevailing Torque Bolt, Dry Adhesive Coating Type
- (7) Prevailing Torque Bolt, Thread Profile Deformed Type
- (8) Prevailing Torque Bolt, Nylon Strip Type
- (9) Prevailing Torque Bolt, Out-of-Round Thread Area Type

A prevailing torque fastener may be reused ONLY if:

- The fastener and the fastener counterpart are clean and not damaged
- There is no rust on the fastener

- The fastener develops the specified minimum torque against its counterpart prior to the fastener seating

Thread Inserts

General Purpose Thread Repair Kits.

These kits are available commercially.

[Repair Procedure](#)

Warning: Refer to [Safety Glasses Warning](#) in the Preface section.

Note: Refer to the thread repair kit manufacturer's instructions regarding the size of the drill and tap to use.

Avoid any buildup of swarf. Back out the tap every few turns and remove the swarf.

1. Determine the size, the pitch, and the depth of the damaged thread. If necessary, adjust the stop collars on the cutting tool and tap to the required depth.
2. Drill out the damaged threads. Clean out any swarf.
3. Lubricate the tap with light engine oil. Tap the hole. Clean the threads.

4. Thread the thread insert onto the mandrel of the installer. Engage the tab of the insert onto the end of the mandrel.

Note: The insert should be flush to one turn below the surface.

5. Lubricate the insert with light engine oil, except when installing in aluminium and install the insert.
6. If the tab of the insert does not break off when backing out the installer, break the tab off with a drift.

Lifting and Jacking the Vehicle

Note: The use of a LOW PROFILE LIFT ARMS SYSTEM may be required to avoid unwanted contact with the vehicle's body and structure depending on lifting equipment used. Refer to the manufacture's recommendation for their applications of low profile lift arms system for their lifting equipment.

Caution: Lifting the vehicle improperly can damage the vehicle and result in costly repairs not covered by the warranty.

Caution: Perform the following steps before beginning any vehicle lifting or jacking procedure:

- Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.
- The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.
- The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.
- Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.
- Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

Vehicle Lifting - Frame Contact Lift

Danger: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.

Note: The hoist pads must not contact the rocker panel mouldings or the underbody air deflectors. Additional clearance may be required for the lifting points.

Front Lift Pads

When lifting the vehicle with a frame-contact lift, place the front lift pads on the rocker outer panel weld flange, as shown

Rear Lift Pads

When lifting the vehicle with a frame-contact lift, place the rear lift pads on the rocker outer panel weld flange, as shown.

Vehicle Lifting - Service Jack

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Danger: To avoid any vehicle damage, serious personal injury or death, always use the jackstands to support the vehicle when lifting the vehicle with a jack.

Caution: Lifting the vehicle improperly can damage the vehicle and result in costly repairs not covered by the warranty.

Caution: When you are jacking the vehicle at the front locations, be certain that the jack or the jack lift pad does not contact the front fascia, front fascia air dam, rocker moulding, or the front wings. If such contact occurs, vehicle damage may result. When jacking at selected front locations additional clearance may be required for the jacking points.

Note: It may be necessary to put ramps under the Volt's front tyres in order to provide necessary clearance for certain service jacks.

Front Service Jack Location

When lifting the vehicle with a service jack, place the lift pad on the front cradle rear mount bracket, as shown.

Rear Service Jack Location

When lifting the vehicle with a service jack, place the lift pad on the rear spring support, as shown.

Customer Concern Verification Sheets

The GM Customer Concern Verification Sheets have been designed to improve communications between the service customer and the technician. The more clearly the technician understands the concern and its symptoms, the more likely the concern will be fixed right the first time.

The GM-wide Customer Concern Verification Sheets are available in GM GlobalConnect. The Customer Concern Verification Sheets may be printed and reproduced locally.

Special Tools Ordering Information

The special service tools shown in this service manual that have product numbers beginning with J, SA or BT are available for worldwide distribution from:

OE Tool and Equipment Group
Kent-Moore
28635 Mound Road
Warren, MI, U.S.A 48092-3499

Phone: 1-800-345-2233 or 586-574-2332

Monday through Friday

8:00 am-7:00 pm Eastern Standard Time

Fax: 1-800-578-7375 or 586-578-7321

The TECH 2 scan tool and accessories can be purchased through:

Dealer Equipment and Services
5775 Enterprise Dr.
Warren, MI, U.S.A 48092-3463

Phone: 1-800-GM-TOOLS or 586-574-2332

Monday through Friday

8:00 am-6:00 pm EST

Fax: 1-586-578-7205

Air/Wind Noise

Warning: Refer to [Assistant Driving Warning](#) in the Preface section.

To analyse a reported wind noise condition, test drive the vehicle to determine the origin of the noise.

Choose a regular route with smooth and straight streets that run in all 4 directions: North, South, East, and West. The area should have little traffic or little noise in order to eliminate interference with the test.

Note: Often there is one primary leak source and one or more secondary leaks that contribute to the noise condition. Repairing only one of the contributing leak sources may not completely repair the total condition but only reduce the condition.

Drive the vehicle at the speed in which the noise was noticed, or until the noise is heard. Maintain safe and legal speeds.

Many of the water leak diagnosis tests are also used for the wind noise diagnosis.

Most wind noise is caused either by leaking seals or by misaligned body surfaces. You can diagnose the following types of windnoise.

- Wind whistle
- Wind roar
- Wind rush

When moving at motorway speeds, air pressure inside the vehicle becomes greater than the air pressure outside. When a leak occurs, the escaping air causes a hiss or a whistle.

Wind roar occurs when air passes over or through an opening between the 2 body surfaces. To correct the condition, adjust the alignment to the body surfaces.

Wind rush occurs when air presses over the vehicle's body, and is related to the aerodynamics of the vehicle. Wind whistle and wind roar are repairable. Rule out wind whistle and wind roar before concluding that the wind noise is due to wind rush.

Use the following inspections in order to aid in diagnosing wind whistle or wind roar:

1. Note the details for wind noise:
 - The perceived location
 - The location where the noise is loudest
 - When the noise occurs

- The vehicle speed
 - The interior fan speed
 - The position of the windows
 - What the noise sounds like
2. Inspect the vehicle for the possible cause of the wind noise.
 3. Test drive the vehicle and determine if the wind noise is external or internal.
 4. Perform a visual inspection of the following components:
 - Loose fasteners
 - Torn weatherstrips
 - Broken weld joints
 - Sealer and/or adhesive skips

Tracing Powder or Chalk Test

Clean the weatherstrips and the contact surfaces with cleaning solvent.

1. Apply powder or chalk in an unbroken line to the contact surface of the weatherstrip surrounding the perimeter of the suspected areas.
2. Close the panel completely without slamming the panel. Closing the panel completely presses the weatherstrip firmly against the mating surface.
3. Inspect the applied line on the weatherstrip. The applied line is marred where contact is good. A corresponding imprint is on the mating surfaces.
4. Gaps or irregularities in the powder or the chalk line on the mating surfaces indicate the areas with a poor seal.

Air Pressure Test

1. Mask off both the pressure relief valves.
2. Close all the windows.
3. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode.
4. Unlock and close the doors.
5. Listen for escaping air along the door and the window seals with a stethoscope or a length of heater hose.

Soap Suds or Bubble Test

1. Mask off the pressure relief valves.
2. Close all the windows and the doors.
3. Turn the vehicles ventilation fan to the on position, with the selector on high speed and in the defrost mode.
4. Unlock and close the doors.
5. Apply the soap solution to the potential leak areas.
6. Look for bubbles revealing escaping air.

Approximate Fluid Capacities

The following approximate capacities are given in US English and metric conversions. Refer to [Fluid and Lubricant Recommendations](#) for more information. All capacities are approximate. When adding, be sure to fill to the approximate level as recommended in this manual. Recheck fluid level after filling.

Application	Specification	
	Metric	US English
Cooling Systems		
Engine Cooling	6.3 L	6.7 qt
High Voltage Battery Pack Cooling	6.0 L	6.3 qt
Power Electronics Cooling	3.0 L	3.2 qt
Engine Oil with Filter	3.5 L	3.7 qt
Fuel Tank	35.2 L	9.3 gal
Electric Drive Unit Fluid	8.45 L	8.93 qt

Fluid and Lubricant Recommendations

Usage	Fluid/Lubricant
Engine Oil	The engine requires engine oil approved to the dexos™ specification. Oils meeting this specification can be identified with the dexos™ certification mark. Look for and use only an engine oil that displays the dexos™ certification mark of the proper viscosity grade. SAE 5W-30 is the best viscosity grade for the vehicle. Do not use other viscosity oils such as SAE10W-30, 10W-40, or 20W-50.
Engine Coolant	50/50 mixture of clean, drinkable water and use only DEX-COOL Coolant.
High Voltage Battery Cooling System	Always use the pre-mixed 50/50 mixture of deionised water and DEX-COOL Coolant available at your dealer.
Power Electronics Cooling System	Always use the pre-mixed 50/50 mixture of deionised water and DEX-COOL Coolant available at your dealer.
Hydraulic Brake System	DOT 3 Hydraulic Brake Fluid GM P/N 88863461 (Canadian P/N 88863462)
Windscreen Washer	Optikleen® Washer Solvent
Parking Brake Cable Guides	Chassis Lubricant GM P/N 12377985 (Canadian P/N 88901242) or lubricant meeting requirements of NLGI #2, Category LB or GC-LB
Electric Drive Unit	DEXRON®-VI Automatic Transmission Fluid
Key Lock Cylinders	Multi-Purpose Lubricant, Superlube GM P/N 12346241 (Canadian P/N 10953474)
Bonnet Latch Assembly, Secondary Latch, Pivots, Spring Anchor, and Release Pawl	Lubriplate Lubricant Aerosol GM P/N 89021668 (Canadian P/N 89021674) or lubricant meeting requirements of NLGI #2, Category LB or GC-LB
Bonnet, Hatch, and Rear Folding Seat Hinges	Multi-Purpose Lubricant, Superlube GM P/N 12346241 (Canadian P/N 10953474)
Weatherstrip Conditioning	Weatherstrip Lubricant GM P/N 3634770 (Canadian P/N 10953518) or Dielectric Silicone Grease GM P/N 12345579 (Canadian P/N 992887)

GM Oil Life System Resetting

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which includes engine revs and engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated may vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed.

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A CHANGE ENGINE OIL SOON message comes on. Change the oil as soon as possible within the next 1 000 km (600 miles). It is possible that, if driving under the best conditions, the oil life system might indicate that an oil change is not necessary for up to two years. The engine oil and filter must be changed at least once every two years and, at this time, the system must be reset. Your dealer has trained service personnel who will perform this work using genuine parts and reset the system. It is also important to check the oil regularly over the course of an oil drain interval and keep it at the proper level.

If the system is ever reset accidentally, the oil must be changed at 5 000 km (3,000 miles) since the last oil change. Remember to reset the oil life system whenever the oil is changed.

[How to Reset the Engine Oil Life System](#)

Reset the system whenever the engine oil change is changed so that the system can calculate the next engine oil change. To reset the system:

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

If the Change Engine Oil Soon message comes back on when the vehicle is started, the engine oil life system has not reset. Repeat the procedure.

Tyre and Wheel Runout Specifications

Vibration Analysis - Hub and/or Axle Input

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table:

1. This test will determine the effect of turning input on the vibration.
5. This test will determine the effect of an initial heavy torque load on the vibration.
6. Damaged or worn wheel drive shafts may cause a noise or vibration that may be transferred into the passenger compartment.
7. Damaged or worn wheel bearings may cause a noise or vibration that may be transferred into the passenger compartment.
8. Damaged or worn suspension components may cause a noise or vibration that may be transferred into the passenger compartment.
9. Damaged or worn powertrain mounts and/or exhaust mounts may cause a noise or vibration that may be transferred into the passenger compartment.
10. Incorrect trim height may cause binding and/or interference between components that may produce a vibration.

Step	Action	Yes	No
Warning: Refer to Road Test Warning in the Preface section.			
1	<ol style="list-style-type: none"> 1. Operate the vehicle at the speed of the vibration concern. 2. While maintaining the concern speed, drive the vehicle through slow, sweeping turns - first in one direction, then in the other direction. 3. Observe the vehicle for changes in the vibration disturbance. 4. Select a smooth, level surface, such as an empty parking lot or a remote road. 5. While maintaining the vehicle at the concern speed if possible, drive the vehicle through sharp turns; 360 degrees - first in one direction, then in the other direction. 6. Observe the vehicle for changes in the vibration disturbance. <p>Did the characteristics of the vibration change significantly--become worse or go away--during these steps?</p>	Go to Step 2	Go to Step 5

Vibration Analysis - Engine

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table.

1. If powertrain related DTCs are present, there may be a powertrain performance condition present which could be a contributing cause to the customer's concern.
4. Making comparisons of the customer's vehicle with an equally equipped, same model year and type, KNOWN GOOD vehicle will help determine if certain disturbances may be characteristic of a vehicle design.

Step	Action	Yes	No
Warning: Refer to Work Stall Test Warning in the Preface section.			
1	Using a scan tool, determine if any DTCs are set. Were any DTCs set?	Go to Diagnostic Starting Point - Vehicle	Go to Step 2
2	<ol style="list-style-type: none"> 1. Block the front wheels. 2. Apply BOTH the service brakes and the handbrake. 3. Install a scan tool. 4. Install a vibration analyser, if available. 5. Start the engine. 6. Place the transmission in NEUTRAL or PARK. 7. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 8. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on a vibration analyser. 9. Place the transmission in DRIVE. 10. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 11. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on a vibration analyser. 12. If no frequency data was obtained, or if a vibration analyzer is not available, place the transmission into REVERSE, then repeat steps 8 and 9. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. 		Go to Vibration Diagnostic Aids - Vibration Intermittent or

	Were you able to duplicate the customer's concern?	Go to Step 3	Not Duplicated
3	Did a vibration analyser, detect a dominant frequency, or was a significant vibration present?	Go to Vibration Analysis - Engine/Accessory Isolation	Go to Step 4
4	<p>Compare the test results of the customer's vehicle to the results of the same tests run, at the same engine RPM, on an equally-equipped, same model year and type, KNOWN GOOD vehicle.</p> <ol style="list-style-type: none"> 1. Install a scan tool into the known good vehicle. 2. Install a vibration analyzer, if available, into the known good vehicle; place the sensor in exactly the same location as it was placed in the customer's vehicle. 3. Block the front wheels. 4. Apply BOTH the service brakes and the handbrake. 5. Start the engine. 6. Place the transmission in NEUTRAL or PARK. 7. Slowly increase the engine RPM to the level at which the disturbance was most noticeable in the customer's vehicle. 8. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on a vibration analyser. 9. Place the transmission in DRIVE. 10. Slowly increase the engine RPM to the level at which the disturbance was most noticeable in the customer's vehicle. 11. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on a vibration analyser. 12. If no frequency data was obtained, or if a vibration analyser, is not available, place the transmission into REVERSE, then repeat steps 10 and 11. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. <p>Did both of the vehicles exhibit the same characteristics?</p>	<p>Go to Vibration Diagnostic Aids - Vibration Intermittent or Not Duplicated</p>	<p>Go to Vibration Analysis - Engine/Accessory Isolation</p>

Engine Order Classification

Engine First Order Classification

1. Convert the engine speed in revolutions per minute (RPM), recorded during duplication of the disturbance into Hertz , revolutions per second (RPS), by dividing the RPM by 60 seconds. Refer to the following example:

1,200 RPM divided by 60 = 20 Hz (or RPS)
2. Compare the dominant frequency in Hz, recorded during duplication of the disturbance with the engine speed just converted into Hz, to determine if they are related.
3. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine speed, converted into Hz, ARE related, then an engine FIRST ORDER related disturbance is present. Engine first order disturbances are usually related to an imbalanced component. Refer to the Engine Order Related Disturbances table.
4. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine speed, converted into Hz, are NOT related, then determine if the disturbance is related to the engine's firing frequency. Proceed to Engine Firing Frequency Classification.

Engine Firing Frequency Classification

Engine firing frequency is a term used to describe the number of firing pulses (one firing pulse = one cylinder firing) that occur during ONE complete revolution of the crankshaft, multiplied by the number of crankshaft revolutions per second, Hz.

1. Calculate the engine firing frequency.
 - To determine the firing frequency of a 4-stroke engine during ONE complete revolution of the crankshaft, multiply the engine speed, converted into Hz, by HALF of the total number of cylinders in the engine.
 - For example: The engine speed, converted into Hz, was 20 Hz; if the vehicle was equipped with a V8 engine, 4 of the 8 cylinders would actually fire during ONE complete revolution of the crankshaft.
 - Multiply the converted engine speed (20 Hz) by 4 cylinders firing.
 - $20 \text{ Hz} \times 4 = 80 \text{ Hz}$
 - The engine firing frequency for a V8 engine at the original engine speed of 1,200 RPM, recorded during duplication of the disturbance, would be 80 Hz.
 - In like manner, a 6-cylinder engine would have a firing frequency of 60 Hz at the same engine speed of 1,200 RPM.
 - $20 \text{ Hz} \times 3 = 60 \text{ Hz}$
2. Compare the dominant frequency in Hz, recorded during duplication of the disturbance with the engine firing frequency in Hz, just calculated, to determine if they are related.
3. If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine firing frequency in Hz, just calculated ARE related, then an engine

FIRING FREQUENCY related disturbance is present. Engine firing frequency disturbances are usually related to improper isolation of a component. Refer to the Engine Order Related Disturbances table.

- If the dominant frequency in Hz, recorded during duplication of the disturbance and the engine firing frequency in Hz, just calculated are NOT related, then determine if the disturbance is related to another engine order classification. Proceed to Other Engine Order Classification.

Other Engine Order Classification

- Multiply the engine speed, converted into Hz, recorded during duplication of the disturbance by different possible order-numbers, other than 1 (first order) or the number used to determine the firing frequency of the engine.
- Compare the dominant frequency in Hz, recorded during duplication of the disturbance with the other possible engine orders just calculated, to determine if they are related.
- If the dominant frequency in Hz, recorded during duplication of the disturbance and one of the other engine order frequencies in Hz, just calculated ARE related, then an engine related disturbance of that order is present. If an engine related disturbance is present that is NOT related to first order or firing frequency, then it could be related to an engine driven accessory system. Proceed to Engine Driven Accessories Related to Engine Order.

Engine Driven Accessories Related to Engine Order

Engine driven accessory systems can be related to specific engine orders depending upon the relationship of the accessory pulley diameter to the crankshaft pulley diameter. For example:

- If the crankshaft pulley measured 20 cm (8 in) in diameter and one of the engine driven accessory pulleys measured 10 cm (4 in) in diameter, then that accessory pulley would rotate 2 times for every one rotation of the crankshaft pulley. If that accessory system was not isolated properly, or was not operating properly, it would be identifiable as a 2nd order engine related disturbance.
- In like manner, if an engine driven accessory pulley measured 5 cm (2 in) in diameter, then that accessory pulley would rotate 4 times for every one rotation of the crankshaft pulley. If that accessory system was not isolated properly, or was not operating properly, it would be identifiable as a 4th order engine related disturbance.

Engine driven accessories that contribute to, are excited by, or are the sole cause of a disturbance are usually doing so because of improper isolation that causes a transfer path into the passenger compartment or to another major component of the vehicle body.

Using the *EL-38792-VS* Vibrate Software , accurately measuring the diameters of the accessory pulleys and the crankshaft pulley, and performing the appropriate diagnostic procedures completely will lead to the specific accessory system which is either contributing to or causing the customer's concern.

Vibration Analysis - Engine/Accessory Isolation

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5. A loose, damaged, misaligned, or defective powertrain insulator and/or bracket may create a transfer path into the passenger compartment.
6. A loose, damaged, misaligned, or defective exhaust system insulator and/or bracket may create a transfer path into the passenger compartment.
7. Incorrectly seated and/or aligned powertrain components and/or exhaust system components may create a transfer path into the passenger compartment.

When loosening powertrain mounts in order to re-bed the powertrain observe the following:

Do not loosen the mount bracket-to-engine bolts/nuts, do not loosen the mount bracket-to-vehicle frame bolts/nuts if mount brackets are used.

Loosen the mount-to-mount bracket bolts/nuts if mount brackets are used, or loosen the mount-to-slotted holes in vehicle frame bolts/nuts if a direct-mount design is used.

8. Non-rotating engine driven accessory component systems can no longer produce a unique disturbance.
9. Non-rotating engine driven accessory components can no longer produce a unique disturbance. If a disturbance is still present, but the characteristics have been altered, it is possible that these component systems are acting as a transfer path for engine firing frequency or a first order engine disturbance.

If a disturbance is still present, but the characteristics have NOT been altered, it is NOT likely that these component systems are acting as a transfer path for engine firing frequency or a first order engine disturbance.
10. If the mark placed on the face of an engine driven accessory pulley seems to stand still while running this test, then that accessory system is either responding to an existing frequency, such as engine firing pulses, or creating a disturbance.
11. A loose, damaged, misaligned, or defective engine driven accessory system insulator and/or bracket may create a transfer path into the passenger compartment.
12. Removing the engine driven accessory and bracket, or brackets from the engine allows a thorough inspection to determine if any conditions are present that may create a transfer path into the passenger compartment.

Step	Action	Yes	No

Warning: Refer to [Work Stall Test Warning](#) in the Preface section.

1	Were you sent here from the Vibration Analysis - Engine table?	Go to Step 2	Go to Vibration Analysis - Engine
2	Is a vibration analyser available?	Go to Step 3	Go to Step 5
3	<p>1. Using the engine RPM and frequency data recorded for the customer's vehicle, determine the order of engine rotation to which the disturbance is related.</p> <p>2. Determine the possible causes of the disturbance as it relates to a specific order of engine rotation.</p> <p>Refer to Engine Order Classification .</p> <p>Does the Engine Order Classification table indicate that the disturbance is of the same order as the engine firing frequency?</p>	Go to Step 5	Go to Step 4
4	Does the Engine Order Classification table indicate that the disturbance is likely related to engine driven accessories?	Go to Step 8	Go to Step 5
5	<p>Inspect the powertrain mounts--engine, transmission, transfer case, and direct-mount drive shaft, if equipped--and any powertrain braces for the following conditions:</p> <ul style="list-style-type: none"> • Loose and/or missing fasteners • Improper alignment • Cracked, dry-rotted, and/or oil-soaked insulators • Twisted, broken, torn, and/or collapsed insulators • Bent, twisted, and/or deformed brackets <p>Realign or replace powertrain mounts as indicated by the inspection.</p> <p>Did you find and correct a condition?</p>	Go to Step 13	Go to Step 6

Using the inductive pickup timing light, check each of the suspected accessory pulleys to determine if any of them is related to the frequency of the disturbance.</p> <p>Check each of the accessory systems, both engaged and under maximum load and disengaged or under minimum load.</p> <p>10. Allow the engine to idle, then place the transmission in DRIVE.</p> <p>11. Slowly increase the engine RPM to the level recorded during duplication of the disturbance, then maintain that speed closely.</p> <p>12. Using the inductive pickup timing light, check each of the suspected accessory pulleys to determine if any of them is related to the frequency of the disturbance.</p> <p>Check each of the accessory systems, both engaged and under maximum load and disengaged or under minimum load.</p> <p>13. Turn OFF the ignition.</p> <p>Did you identify an engine driven accessory system as being related to the frequency of the disturbance?</p>	<p>Go to Step 11</p>	<p>Go to Vibration Diagnostic Aids - Vibration Intermittent or Not Duplicated</p>
<p>11</p>	<p>Inspect the components of the engine driven accessory system for the following:</p> <ul style="list-style-type: none"> • Loose and/or missing fasteners <ul style="list-style-type: none"> - Heat Shields, if equipped - Joints and/or couplings: <ul style="list-style-type: none"> Nuts, bolts, studs, clamps, straps - Bracket and/or insulator mounting • Inadequate clearance to body and/or chassis components <ul style="list-style-type: none"> Inspect with the accessory system both under a LOAD and NOT loaded • Improper alignment • Bent or damaged pulleys • Disconnected and/or missing insulators • Cracked, dry-rotted, and/or oil-soaked component insulators • Stretched, twisted, broken, torn, and/or collapsed component insulators • Bent, twisted, cracked and/or deformed component brackets <p>Repair, replace, and/or realign the engine driven accessory system components as indicated by the inspection.</p>		

	Did you find and correct a condition?	Go to Step 13	Go to Step 12
12	<ol style="list-style-type: none"> 1. Remove the engine driven accessory and bracket, or brackets from the engine. 2. Thoroughly inspect the accessory bracket, or brackets, bolts/nuts/studs, and the accessory itself for signs of the following: Bent, twisted, cracked and/or deformed conditions 3. Replace any of the components found to exhibit any of these conditions. 4. Reinstall the components to the engine. 		
	Did you find and correct a condition?	Go to Step 13	Go to Step 17
13	<p>Check the vehicle to determine if the disturbance is now significantly reduced or eliminated. Perform the following steps:</p> <ol style="list-style-type: none"> 1. Install a scan tool into the customer's vehicle. 2. Install the vibration analyser, if available, into the customer's vehicle; place the sensor in exactly the same location as it was originally placed in the vehicle. 3. Block the front wheels. 4. Apply BOTH the service brakes and the handbrake. 5. Start the engine. 6. Place the transmission in NEUTRAL or PARK. 7. Slowly increase the engine RPM to the level at which the disturbance was most noticeable. 8. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the vibration analyzer, if available. 9. Place the transmission in DRIVE. 10. Slowly increase the engine RPM to the level at which the disturbance was most noticeable. 11. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the vibration analyzer, if available. 12. If the disturbance has been significantly reduced or eliminated, confirm the results by placing the transmission into REVERSE, then repeat steps 10 and 11. Reverse-loading of the powertrain may increase or change the characteristics of the vibration. 		
	Has the disturbance been significantly reduced or eliminated?	Go to Step 18	Go to Step 14
14	Have you investigated powertrain isolation as a possible cause of the disturbance?	Go to Step 15	Go to Step 5
15	Have you investigated engine driven accessories as a possible cause of the disturbance?	Go to Vibration Analysis - Engine Balance	Go to Step 16
16	Is the vibration analyser available?	Go to Step 8	Go to Vibration Diagnostic Aids - Vibration Intermittent or Not Duplicated

17	Replace the engine driven accessory component causing the disturbance. Did you complete the replacement?	Go to Step 18	--
18	Install or connect any components that were removed or disconnected during diagnosis. Is the disturbance still present?	Go to Step 2	System OK

Vibration Analysis - Engine Balance

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table.

4. If sufficient clearance exists to separate the transmission torque converter from the engine flywheel/flexplate, then further tests can be used to isolate the transmission from the engine.
5. An engine flywheel/flexplate that has excessive lateral runout, when combined with the mass of the transmission torque converter, can produce a disturbance.
6. An engine flywheel/flexplate that is loose at the engine crankshaft or that is cracked or damaged, when combined with the mass of the transmission torque converter, can produce a disturbance.
7. This step is designed to isolate the transmission from the engine to determine if the disturbance is related to the engine ONLY.
9. Re-indexing the transmission torque converter to the engine flywheel/flexplate alters the balance relationship between the torque converter and the rear of the engine.
11. If an electronic vibration analyser, is available, place the sensor onto the underside of the engine oil pan along the FRONT and the REAR edge allows for a determination to be made, which will help to narrow down the cause of the disturbance.
13. An engine flywheel that has excessive lateral runout, when combined with the extra mass of the clutch pressure plate and clutch driven plate, can produce a disturbance.
14. The clutch pressure plate and the engine flywheel are marked for proper indexing of the heavy-spot of one to the light-spot of the other. Improper indexing of the pressure plate to the flywheel can produce a disturbance.
15. An engine flywheel that is loose at the engine crankshaft or that is cracked, damaged and/or missing balance weights; and/or a clutch pressure plate and clutch driven plate that has loose springs, cracks, warpage, damage and/or missing balance weights - can produce a disturbance when their mass is combined.
16. An engine flywheel that is loose at the engine crankshaft or that is cracked, damaged and/or missing balance weights; and/or a clutch pressure plate and clutch driven plate that has loose springs, cracks, warpage, damage and/or missing balance weights - can produce a disturbance when their mass is combined.
17. Re-indexing the pressure plate to the engine flywheel alters the balance relationship between the pressure plate/flywheel assembly and the rear of the engine.
18. An engine flywheel/flexplate that is damaged, misaligned, and/or imbalanced, can produce a disturbance.

19. An engine crankshaft balancer that is damaged, misaligned, and/or imbalanced, can produce a disturbance.

Step	Action	Yes	No
<p>Warning: Refer to Work Stall Test Warning in the Preface section.</p>			
1	Were you sent here from the Vibration Analysis - Engine/Accessory Isolation table?	Go to Step 2	Go to Vibration Analysis - Engine/Accessory Isolation
2	Is an electronic vibration analyser available?	Go to Step 3	Go to Vibration Diagnostic Aids - Vibration Intermittent or Not Duplicated
3	Is the vehicle equipped with a manual gearbox?	Go to Step 11	Go to Step 4
4	<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <ol style="list-style-type: none"> Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . Remove the flywheel/flexplate-to-torque converter bolts access cover, if equipped. Determine if sufficient clearance exists to separate the transmission torque converter away from the engine flywheel/flexplate and safely secure the torque converter from accidentally engaging with the flywheel/flexplate. <p>Is there sufficient clearance to separate and safely secure the transmission torque converter away from the engine flywheel/flexplate?</p>	Go to Step 5	Go to Step 11
5	<ol style="list-style-type: none"> With the flywheel/flexplate-to-torque converter access cover still removed, and with the vehicle still raised, mark the position of the transmission torque converter in relation to the engine flywheel/flexplate. Disconnect the torque converter and move it away from the flywheel/flexplate. Secure the transmission torque converter away from the engine flywheel/flexplate to avoid accidental engagement with the flywheel/flexplate. Lower the vehicle, start the engine and allow the engine to idle. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . Visually inspect the flywheel/flexplate for excessive lateral runout. Lower the vehicle. Turn OFF the ignition. <p>Did the flywheel/flexplate exhibit excessive lateral runout?</p>	Go to Step 8	Go to Step 6
	<ol style="list-style-type: none"> Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . Inspect the flywheel/flexplate for the following: <ul style="list-style-type: none"> Looseness at the engine crankshaft 		

6	<ul style="list-style-type: none"> • Cracks and/or damage • Missing balance weights <p>Did the flywheel/flexplate exhibit any of the conditions listed?</p>	Go to Step 8	Go to Step 7
7	<ol style="list-style-type: none"> 1. With the transmission torque converter still secured away from the engine flywheel/flexplate to avoid accidental engagement with the flywheel/flexplate, lower the vehicle. 2. Block the front wheels. 3. Apply BOTH the service brakes and the handbrake. 4. With the scan tool and the electronic vibration analyser still installed, start the engine. 5. Place the transmission in NEUTRAL or PARK. 6. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 7. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on a electronic vibration analyser. 8. Turn OFF the ignition. <p>Has the disturbance been significantly reduced or eliminated?</p>	Go to Step 9	Go to Step 11
8	<ol style="list-style-type: none"> 1. If the flywheel/flexplate is loose at the engine crankshaft, tighten the flywheel/flexplate mounting bolts in sequence and to specification. 2. If the flywheel/flexplate is cracked, damaged, and/or has missing balance weights, replace the damaged flywheel/flexplate. <p>Did you complete the tightening or replacement?</p>	Go to Step 20	—
9	<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Re-index the transmission torque converter to the engine flywheel/flexplate, 120 degrees from its original position. 3. Reconnect the transmission torque converter to the engine flywheel/flexplate. 4. Lower the vehicle. 5. Block the front wheels. 6. Apply BOTH the service brakes and the handbrake. 7. With the scan tool and a electronic vibration analyser still installed, start the engine. 8. Place the transmission in NEUTRAL or PARK. 9. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 10. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on a electronic vibration analyser. 11. If the disturbance is still noticeable, re-index the torque converter again to obtain the least amount of disturbance. <p>Has the disturbance been significantly reduced or eliminated?</p>	Go to Step 20	Go to Step 10
10	Replace the out-of-balance transmission torque converter.		—

	Did you complete the replacement?	Go to Step 20	
11	<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Position the <i>GE-38792-A</i> Electronic Vibration Analyzer (EVA) 2 sensor onto the underside of the engine sump, along the FRONT edge. 3. Lower the vehicle. 4. Block the front wheels. 5. Apply BOTH the service brakes and the handbrake. 6. With the scan tool and the <i>GE-38792-A</i> Electronic Vibration Analyzer (EVA) 2 , still installed, start the engine. 7. Place the transmission in NEUTRAL or PARK. 8. Slowly increase the engine RPM to the level at which the disturbance is most noticeable. 9. Record the engine RPM obtained on the scan tool and the most dominant frequency reading if obtained on the <i>GE-38792-A</i> Electronic Vibration Analyzer (EVA) 2 from the underside of the engine sump. 10. Repeat steps 1 through 9, placing the <i>GE-38792-A</i> Electronic Vibration Analyzer (EVA) 2 sensor onto the underside of the engine sump, along the REAR edge. <p>Is the disturbance greater along the FRONT of the engine?</p>	Go to Step 19	Go to Step 12
12	Is the vehicle equipped with an automatic transmission?	Go to Step 18	Go to Step 13
13	<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the flywheel inspection cover. 3. Start the engine. Allow the engine to idle. 4. Vibration Diagnostic Aids - Vibration Intermittent or Not Duplicated

If you have not been able to duplicate the vibration concern or have only been able to duplicate the concern intermittently, review the following information.

Most vibration concerns that cannot be duplicated are due to either specific conditions that are not present during the duplicating attempts, or due to not following the procedures designed to duplicate concerns properly and in the sequence indicated.

[Specific Conditions Can Affect the Condition](#)

Consider the following conditions which may not have been present while attempts were made to duplicate the vibration concern. Attempt to obtain more specific information from the customer as to the EXACT conditions that are present when they experience the vibration which they are concerned about. Attempt to duplicate the vibration concern again while recreating the EXACT conditions necessary, except those which pose a safety concern or are outside the boundaries of normal operating conditions, such as loading the vehicle beyond its designed weight ratings, etc.

Most attempts to duplicate a vibration concern are made after the vehicle has been driven to the repair facility and perhaps even sat inside the building for a time; the vehicle may be too warm to detect the concern during duplication efforts. The opposite could also occur; perhaps the vehicle has sat out in the cold for a time and fails to reach full operating temperatures during attempts to duplicate the concern.

[Temperature, Ground-Out, Accessory Load](#)

Flat Spots on tyres

Tyres which have sat and been cool for a time can develop flat spots.

Irregular Wear on tyre Treads

Tyres which have sat and been cool for a time will be stiffer and any irregular wear conditions will be more noticeable than they will be once the tyres have warmed and softened.

Exhaust System Growth

Exhaust systems may exhibit a ground-out condition when cool which goes away once the system is hot. The opposite may be true that the exhaust system is fine when cool but a ground-out condition occurs once the system reaches operating temperatures. Exhaust systems can grow by 2½–5 cm (1–2 in) when hot.

Engine-Driven Accessory Noises

Note: When a stethoscope equipped with a probe is used to assist in identifying possible vibrating components, the results must be compared to the sound quality of the same accessory, in a equally-equipped, same model year and type, KNOWN GOOD vehicle, and under the same conditions.

A stethoscope equipped with a probe can be used as an additional means to assist in identifying accessories which may be causing or contributing to a vibration concern.

- **Belt Whipping**

An engine accessory drive belt, or belts could exhibit a whipping condition if a belt is deteriorating and deposits are building up on the underside of the belt.

- **Loose Mounting Brackets or Component Ground-Out**

Engine-driven accessories such as an alternator, a power steering pump, or an air conditioning compressor could exhibit noise conditions due to either loose mounting brackets or due to related components of the system in a ground-out condition during certain operation of that accessory system.

- **Cold or Hot**

Accessories could exhibit noise conditions when cool which go away once they are fully warmed-up, or the opposite may be true.

- **Load on an Accessory Component**

Accessories could exhibit a noise condition while under a heavy load - perhaps when combined with a cool or fully warmed-up condition.

- **Bent or Misaligned Pulleys**

Bent or mis-aligned pulleys in one or more engine-driven accessory systems could contribute to a noise or vibration condition.

- **Fluid Level in Accessory Systems**

Accessories could exhibit a noise condition due to an abnormal amount of fluid contained in the system of which the accessory is a part. For example:

- An improper power steering fluid level could produce noises in the power steering system.
- An improper air conditioning refrigerant level or an excessive amount of refrigerant oil could produce noises or possibly vibrations in the air conditioning system.

- **Incorrect Fluid Type in Accessory Systems**

Accessories could exhibit a noise condition due to the incorrect type of fluid contained in the system of which the accessory is a part.

Vehicle Payload

The vibration concern may only occur when the vehicle is carrying heavy payloads or towing a trailer; the vehicle may have been empty during duplication efforts.

Heavy Payload

The vehicle may have been empty during attempts to duplicate the vibration concern, but the customer may actually experience the vibration concern while the vehicle is carrying a large payload.

Trailer Towing

The customer may experience the vibration concern only while towing a trailer.

Roadway Selection

The selection of roadways used to perform the vibration duplication procedures is likely to be in the near vicinity of the repair facility and may not provide a road surface that is similar enough to the surface on which the customer usually drives the vehicle.

The customer may only experience the vibration on a particular roadway. Perhaps the roadway is overly crowned or is very bumpy or rough.

Brake Disc/Drum Balance Inspection

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Support the vehicle drive axle on a suitable hoist. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assemblies from the drive shaft. Refer to [Tyre and Wheel Removal and Installation](#) .

Warning: Refer to [Work Stall Test Warning](#) in the Preface section.

3. Reinstall the wheel nuts in order to retain the brake discs.
4. Run the vehicle at the concern speed while inspecting for the presence of the vibration.

Caution: Do not depress the brake pedal with the brake discs and/or the brake drums removed, or with the brake callipers repositioned away from the brake discs, or damage to the brake system may result.

5. If the vibration is still present, remove the discs from the drive shaft, then run the vehicle back to the concern speed.
6. If the vibration is eliminated when the brake discs are removed from the drive shaft, repeat the test with one disc installed at a time. Replace the disc that is causing or contributing to the vibration concern.

7. If a brake disc was replaced as a result of following the previous steps, or if necessary to confirm the results obtained during the previous steps, and/or to check the non-drive shaft components, perform the following:
 - 7.1. Mount the brake disc/drum on a balancer in the same manner as a tyre and wheel assembly.

Note: Check brake rotors/drums for static imbalance only; ignore the dynamic imbalance readings.

- 7.2. Inspect the disc/drum for static imbalance.

There is not a set tolerance for brake disc/drum static imbalance. However, any brake disc/drum measured in this same manner which is over 21 g ($\frac{3}{4}$ oz) may have the potential to cause or contribute to a vibration. Discs/drums suspected of causing or contributing to a vibration should be replaced. Any disc/drum that is replaced should be checked for imbalance in the same manner.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Bonnet Rear Reveal Moulding Nut	4.7 N·m	42 lb in
Tailgate Side Applique Nut	6 N·m	53 lb in
Rear End Spoiler Nut	6 N·m	53 lb in

Emblem/Nameplate Replacement

Special Tools

EL-25070 Heat Gun

For equivalent regional tools, refer to [Special Tools](#) .

Caution: Refer to [Exterior Trim Emblem Removal Caution](#) in the Preface section.

1. The part and vehicle surface should be 21°C (70°F) prior to installation. The vehicle should remain inside in a temperature range of 21°C (70°F) for 1 hour after assembly to allow the adhesive to develop sufficient bond strength.
2. Using masking tape, mark two sides of the placement where the old emblem/nameplate was placed.
3. Use a *EL-25070* heat gun or equivalent, to heat the adhesive backed emblem/nameplates.
4. A flat-bladed plastic tool can assist in the removal process.
5. Wipe the vehicle surface area with a 50/50 solution by volume of isopropyl alcohol and clean drinkable water.
6. Dry the area with a clean lint-free cotton cloth.
7. Close any doors, tailgates, endgates and rear compartment lids where emblem/nameplates are to be placed.
8. When removing protective liners from adhesive backed emblem/nameplates, be careful not to touch the adhesive tape or allow the tape to come in contact with dirt or any foreign matter prior to the placement and adhesion.
9. Remove the protective liner from the emblem/nameplate.
10. Position, align and press the emblem/nameplate to the previously marked location.
11. Using a clean towel and the palm of the hand, press firmly for approximately 30 seconds, the emblem/nameplate to the vehicle body panel surface.
12. Ensure the emblem/nameplate is attached firmly to the body panel surface.
13. Remove the masking tape and clean all tape residue from the vehicle body panel surface around the emblem/nameplate attachment location.

Body Panel Paint Protector Replacement - VGC

1. The paint protective film and vehicle surface temperature should be 13-32°C (55-90°F) for best results.
2. Automatic car washes should be avoided for at least 24 hours after the paint protective film application.
3. Wipe the vehicle surface with isopropyl alcohol or flash naphtha at the application area.
4. Dry the surface with a clean lint-free cloth.
5. Create a mixture of 25 percent isopropyl alcohol and 75 percent water and two drops of baby shampoo per 16 oz of fluid mixture.
6. Remove the backing liner from the protective film patch.
7. Use the solution to liberally spray the adhesive side of the protective patch, the mounting location along with your hands.
8. Position the paint protective film patch to the desired location on the vehicle.
9. Spray the surface of the film with the alcohol, water and soap solution.
10. Using a dampened squeegee, start at the centre of the protective patch, working outward in order to remove the air and solution from under the protective patch.
11. Release any air bubbles with a pin.
12. Dry the surface with a clean, lint-free cotton cloth.

Front Side Door Window Frame Rear Applique Replacement

Stripes or Decals

The stripes and decals adhere to a painted surface using pressure sensitive adhesive.

The use of a wetting solution aids the technician in lifting and positioning the stripe or decal during the installation. The wetting solution ensures a better bond between the stripe or decal and the panel assembly. Use a wetting solution when applying large stripe and decal packages.

Complete the following procedures before you apply a stripe or a decal:

- Metal repair or refinishing after a collision
- Painting the underlying surface

Maintain a temperature 21-38°C (70-100°F) on the body surfaces and the decals prior to installation. The decal requires auxiliary heat sources in order to warm the body surfaces and decals. If the temperature is below 21°C (70°F) the decal may not adhere to the body surface properly.

Note: You may apply stripes or decals using the dry method. Use the wet method if the dry method does not result in a bubble free application. This may be the case in large graphics packages.

Use the wet method in order to apply the stripes or decals that are applied on flexible surfaces (fascias, etc.). This will reduce the formation of bubbles under the decal due to the outgassing potential of the flexible materials.

Use the following equipment and materials in order to apply a stripe or a decal:

- A wetting solution
 - A foaming type of window cleaner that does not contain ammonia.
- A silicone, wax and grease remover
- Varnish Makers and Painters (VM&P) naphtha
- Isopropyl alcohol
- A squeegee
 - 75-100 mm (3-4 in) wide
 - Made of plastic or hard rubber

Remove the burrs from any sharp or rough edges in order to prevent scratching of the stripe or decal.

- A water bucket and sponge or spray bottle
- Sandpaper
 - 800 grit or finer
 - Wet or dry type
- A heat gun or heat lamp
- A clean, lint-free wiping cloth
- A sharp knife or razor blade
- A pair of scissors
- A fine pin or needle
- A marking pencil

Stripe or Decal Removal

1. Remove the following components:
 - Necessary mouldings or trim panel
 - Moulding attaching clips
 - Handles
 - Sidemarker lamps
 - Other stripe or decal overlapping parts
2. Clean the following areas as needed:
 - The repair surfaces
 - The adjacent panels
 - The openings
3. Use 3M™ ScotchBrite moulding adhesive remover disk 3M™ P/N 07501 or equivalent in order to remove the stripe or decal from the body panel.
4. Use Varnish Makers and Painters (VM&P) naphtha in order to remove all traces of adhesive residue from the painted surfaces.

Stripe or Decal Installation -- Wet Method

1. Prepare the surface.

Note: Remove any imperfections that would appear through the stripe or decal if the area has been refinished.

2. Clean the painted surface using the following types of removers:
 - Silicone
 - Wax
 - Grease

3. Clean the area where the stripe or decal will be applied using a 50/50 mixture of isopropyl alcohol and water.
4. Wipe the panel surface using a clean cloth while the solvent is still wet. Allow the panel surface to dry.
5. Apply the wetting solution to the area where you are installing the stripe or decal.

Application of a soapy wetting solution on the top side of the stripe or decal will ease the pull of the squeegee on the stripe or decal and help to eliminate damage.

Note: Do not touch the adhesive backing of the stripes.

6. Apply the wetting solution on the adhesive side of the stripe or decal.

Remove the backing material of the stripe or the decal as needed.

7. Apply the strip or decal to the panel. The wetting solution will allow movement for proper positioning on the panel surface.
8. Working from the centre where possible, squeegee the stripe or decal into position. Apply additional wetting solution as needed in order to ease installation.
9. Apply heat to the stripe or decal at the recessed areas. Press the stripe or decal into the recess in order to obtain a firm bond.
10. Use adequate light reflection in order to inspect the stripe or decal from a critical angle. This technique detects any irregularities that may have developed during the installation.

Note: Do not use a razor blade or a knife edge in order to pierce the air bubbles.

11. Remove all air bubbles by piercing the bubble with one of the following items:
 - A safety pin
 - A needle
 - A tool with the same size piercing tip
12. Pierce the bubble on the outer edge. Force the air out through the opposite edge using the blade of the squeegee.
13. Install any previously removed components. Clean the components as needed.

Liftgate Side Applique Replacement

Callout

Component Name

Preliminary Procedures

1. Open and suitably support the tailgate assembly.
2. Remove the liftgate lower trim finish panel. Refer to [Liftgate Lower Trim Finish Panel Replacement](#) .

1	<p>Tailgate Side Applique Nut (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 6 N·m (53 lb in)</p>
2	<p>Liftgate Side Applique</p> <p>Procedure</p> <ol style="list-style-type: none">1. There is a tab type latch at the centre bottom of the applique that will need to be slightly moved to the left using a small flat bladed tool in order to release the applique from the outer tailgate panel.2. Lift the applique up from the tailgate and release the tab in order to remove.

Quarter Panel Tail Lamp Upper Moulding Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1463 782 1495">1. Open and support the tailgate assembly.<li data-bbox="163 1500 1714 1533">2. Remove the rear bumper fascia. Refer to Rear Bumper Fascia Removal and Installation : Volt → Ampera .	

1	Quarter Panel Tail Lamp Moulding Screw (Qty: 3) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Rear Bumper Fascia Upper Retainer Grommet
3	Quarter Panel Tail Lamp Moulding Tip Lift the quarter panel tail lamp moulding from the tail lamp pocket.

[Stripes or Decals](#)

The stripes and decals adhere to a painted surface using pressure sensitive adhesive.

The use of a wetting solution aids the technician in lifting and positioning the stripe or decal during the installation. The wetting solution ensures a better bond between the stripe or decal and the panel assembly. Use a wetting solution when applying large stripe and decal packages.

Complete the following procedures before you apply a stripe or a decal:

- Metal repair or refinishing after a collision
- Painting the underlying surface

Maintain a temperature 21-38°C (70-100°F) on the body surfaces and the decals prior to installation. The decal requires auxiliary heat sources in order to warm the body surfaces and decals. If the temperature is below 21°C (70°F) the decal may not adhere to the body surface properly.

Note: You may apply stripes or decals using the dry method. Use the wet method if the dry method does not result in a bubble free application. This may be the case in large graphics packages.

Use the wet method in order to apply the stripes or decals that are applied on flexible surfaces (fascias, etc.). This will reduce the formation of bubbles under the decal due to the outgassing potential of the flexible materials.

Use the following equipment and materials in order to apply a stripe or a decal:

- A wetting solution
 - A foaming type of window cleaner that does not contain ammonia.
- A silicone, wax and grease remover
- Varnish Makers and Painters (VM&P) naphtha
- Isopropyl alcohol
- A squeegee
 - 75-100 mm (3-4 in) wide
 - Made of plastic or hard rubber

Remove the burrs from any sharp or rough edges in order to prevent scratching of the stripe or decal.

- A water bucket and sponge or spray bottle
- Sandpaper
 - 800 grit or finer
 - Wet or dry type
- A heat gun or heat lamp
- A clean, lint-free wiping cloth
- A sharp knife or razor blade
- A pair of scissors
- A fine pin or needle
- A marking pencil

Stripe or Decal Removal

1. Remove the following components:
 - Necessary mouldings or trim panel
 - Moulding attaching clips
 - Handles
 - Sidemarker lamps
 - Other stripe or decal overlapping parts
2. Clean the following areas as needed:
 - The repair surfaces
 - The adjacent panels
 - The openings
3. Use 3M™ ScotchBrite moulding adhesive remover disk 3M™ P/N 07501 or equivalent in order to remove the stripe or decal from the body panel.
4. Use Varnish Makers and Painters (VM&P) naphtha in order to remove all traces of adhesive residue from the painted surfaces.

Stripe or Decal Installation -- Wet Method

1. Prepare the surface.

Note: Remove any imperfections that would appear through the stripe or decal if the area has been refinished.

2. Clean the painted surface using the following types of removers:
 - Silicone
 - Wax
 - Grease

3. Clean the area where the stripe or decal will be applied using a 50/50 mixture of isopropyl alcohol and water.
4. Wipe the panel surface using a clean cloth while the solvent is still wet. Allow the panel surface to dry.
5. Apply the wetting solution to the area where you are installing the stripe or decal.

Application of a soapy wetting solution on the top side of the stripe or decal will ease the pull of the squeegee on the stripe or decal and help to eliminate damage.

Note: Do not touch the adhesive backing of the stripes.

6. Apply the wetting solution on the adhesive side of the stripe or decal.

Remove the backing material of the stripe or the decal as needed.

7. Apply the strip or decal to the panel. The wetting solution will allow movement for proper positioning on the panel surface.
8. Working from the centre where possible, squeegee the stripe or decal into position. Apply additional wetting solution as needed in order to ease installation.
9. Apply heat to the stripe or decal at the recessed areas. Press the stripe or decal into the recess in order to obtain a firm bond.
10. Use adequate light reflection in order to inspect the stripe or decal from a critical angle. This technique detects any irregularities that may have developed during the installation.

Note: Do not use a razor blade or a knife edge in order to pierce the air bubbles.

11. Remove all air bubbles by piercing the bubble with one of the following items:
 - A safety pin
 - A needle
 - A tool with the same size piercing tip
12. Pierce the bubble on the outer edge. Force the air out through the opposite edge using the blade of the squeegee.
13. Install any previously removed components. Clean the components as needed.

Radiator Grille Replacement

Callout	Component Name
Preliminary Procedures	
Warning: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.	
1. Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .	

2. Drill and remove the two upper rivets from the corners of the front bumper upper fascia.
3. Remove the two locking retainers from the rear of the radiator grille.

1	Rivet (Qty: 2)
3	<p>Radiator Grille Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove the grille assembly from the rear of the front bumper fascia.2. Transfer the radiator grille emblem. Refer to Emblem/Nameplate Replacement .

Bonnet Rear Reveal Moulding Replacement

Callout	Component Name
Preliminary Procedure	
Open and suitably support the bonnet assembly.	
	Bonnet Rear Reveal Moulding Nut (Qty: 2)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 4.7 N·m (42 lb in)</p>
2	<p>Bonnet Rear Reveal Moulding Retainer (Qty: 8)</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Access the two nuts from the bottom of the bonnet assembly. 2. Using a trim-type release tool, insert the tool between the rear of the outer bonnet panel and rear reveal moulding. 3. Gently pry each retainer upward, one retainer at a time 4. Remove the moulding from the rear edge of the bonnet.
3	<p>Bonnet Rear Reveal Moulding Assembly</p> <p>Caution: Refer to Exterior Trim Emblem Removal Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Using a plastic flat-bladed tool, clean any adhesive tape residue from the bonnet panel surface. 2. Use a 50 / 50 mixture by volume of isopropyl alcohol and clean drinkable water to clean any tape residue off the bonnet panel. 3. Dry the bonnet surface thoroughly before installing the new bonnet rear reveal moulding. 4. Peel the adhesive tape backing from the new bonnet rear reveal moulding. 5. Align the centre alignment pin to the centre bonnet hole. 6. Align and secure all of the retainers using a dry clean cotton shop towel and the palm of the hand. 7. Wet out the adhesive tape strip. 8. Secure the two outer nuts.

Front Wing Upper Rear Moulding Replacement

Callout	Component Name
Preliminary Procedure	
Caution: Refer to Exterior Trim Emblem Removal Caution in the Preface section.	
Open the front door on the side the front wing upper rear moulding will be serviced.	
1	W-clip Retainer (Qty: 4) Preliminary Procedure 1. Ensure to apply two layers of masking tape around the front edge of the moulding to prevent any paint surface damage. 2. Using a trim-type release tool, disengage the w-clip from the wing.
	Garnish Clip Retainer

2	<p>Procedure</p> <ol style="list-style-type: none">1. Begin at the forward edge and release the garnish retainer from the bodyside wing.2. Release the three lower retainer clips.3. Release the upper retainer clip using a trim-type release tool.4. Remove the front wing upper rear moulding from the wing.
3	<p>Adhesive Tape</p> <p>Procedure</p> <ol style="list-style-type: none">1. Clean any adhesive tape residue from the front wing using a 50 / 50 mixture by volume of isopropyl alcohol and clean drinkable water.2. Dry the wing surface thoroughly with a lint-free cotton towel.
4	<p>Front Wing Upper Rear Moulding Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Upon installation, align both lower alignment pins to the wing and then remove the adhesive tape backing.2. Using the palm of the hand, secure each retainer location until fully seated to the wing.

Sill Panel Moulding Replacement

Callout	Component Name
---------	----------------

Preliminary Procedures

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Open both doors on the side the lower rocker moulding will be serviced.

1	<p>Front Wheelhouse Rear Screw (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 2.5 N·m (22 lb in)</p>
2	<p>Rear Wheelhouse Front Screw (Qty: 2)</p> <p>Tighten 2.5 N·m (22 lb in)</p>
3	<p>Rocker Panel Molding Retainer (Qty: 24)</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Begin with the six bottom retainers, using a trim-type release tool disengage the retainers from the rocker outer panel reinforcement. 2. Disengage one retainer from the hinge pillar lower reinforcement bracket. 3. Disengage two lower retainers from the bottom edge of the front wing. 4. Disengage the remainder of the retainers from the bodyside outer frame assembly.
4	<p>Rocker Panel Moulding Assembly</p> <p>Tip Replace any damaged or broken retainers prior to installing the rocker panel moulding.</p>

Roof Panel Joint Finish Moulding Replacement

Callout

Component Name

Preliminary Procedure

Caution: Refer to [Exterior Trim Emblem Removal Caution](#) in the Preface section.

1. Begin at the rear edge of the roof panel joint finish moulding and carefully pry the moulding from the roof ditch clip.

2. Pull the moulding forward out of the ditch.
3. Carefully lift the front edge from the second roof ditch clip.
4. Clean any adhesive residue from the ditch using a 50 / 50 mixture by volume of isopropyl alcohol and clean drinkable water.
5. Dry the ditch with a lint free cotton towel.

Roof Panel Joint Finish Moulding

Procedure

1. Insert the front edge of the moulding to the edge of glass.
2. Using a roller-type tool, roll the moulding into the ditch front to rear to ensure full adhesion is made.
3. Tuck the rear lip of the finish moulding to the edge of the rear tailgate panel.
4. Inspect the moulding to roof ditch fit.

Rear End Spoiler Replacement

Callout

Component Name

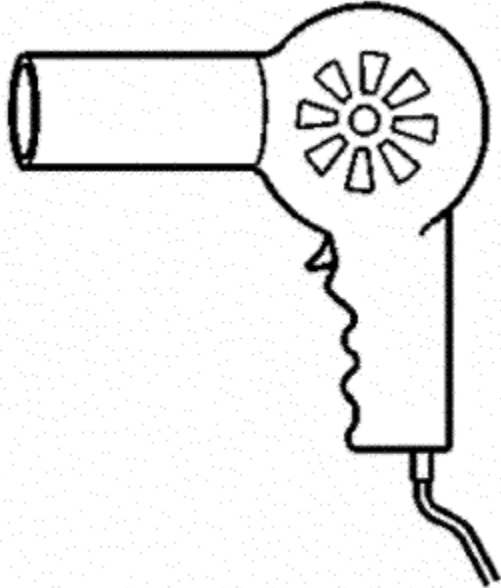

Preliminary Procedures

1. Open and support the rear tailgate assembly.
2. Remove the liftgate trim finish panel. Refer to [Liftgate Lower Trim Finish Panel Replacement](#)
3. Disconnect the high mount brake lamp electrical connector from the tailgate main electrical harness.

1	High Mount Brake Lamp Electrical Connector
2	Rear End Spoiler Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
3	Rear End Spoiler Nut (Qty: 6) Tighten 6 N·m (53 lb in)
4	Rear End Spoiler Retainer (Qty: 4) Tip Replace any broken retainers and ensure the water management foam gaskets are all in place prior to securing the rear end spoiler to the tailgate.
5	Rear End Spoiler Procedure Transfer the high mount brake lamp. Refer to High Mount Brake lamp Replacement

Special Tools

Illustration	Tool Number/ Description
	<p>EL 25070 J-25070 Heat Gun - 500-700°F</p>

Adhesives, Fluids, Lubricants, and Sealers

Application	Type of Material	GM Part Number
GM Vehicle Care Odour Eliminator	Fluids	Refer to Electronic Parts Catalogue.

Eliminating Unwanted Odors in Vehicles

GM Vehicle Care Odour Eliminator, Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) , may control or eliminate odours in the interior and luggage compartment areas of GM vehicles. This non-toxic, biodegradable, odorless product has been shown to greatly reduce or remove the following types of odor:

- Objectionable smells of mold and mildew resulting from vehicle water leaks
- Customer created odors, such as smoke

You may safely use GM Vehicle Care Odor Eliminator on fabrics, vinyl, leather, carpet, and sound deadening materials. You may also induce this product into HVAC modules and instrument panel ducts for the control of non-bacterial related odors.

Note: This product leaves no residual scent and should not be used as an air freshener.

This product may result in the permanent elimination of an odor and may be preferable to customers whose allergies make them sensitive to perfumes. This product may effectively remove odors when directly contacting the odor source. In cases such as water leaks, use this product with diagnostic procedures to first eliminate the primary cause of the odor. Then use further applications on the residual odor to permanently correct the vehicle condition.

How to Use this Product

- Spray GM Vehicle Care Odor Eliminator directly or as an additive with carpet shampoo in steam cleaners.
- Do not use on any interior surface that plain water would deteriorate, because this product will have the same effect. Also avoid letting this product come into contact with vinegar or any acidic substance. Acid-based products will hamper the effectiveness of GM Vehicle Care Odor Eliminator.
- Complete eight page treatment sheets are enclosed within each case of GM Vehicle Care Odour Eliminator. These treatment instructions range from simple vehicle odor elimination to full step by step procedures for odor removal from water leaks.
- Instructions and cautions are printed on the bottle, but additional help is available. If you encounter a persistent or recurring odour, you may call to obtain additional information and usage suggestions.

Floor Carpet Drying

If the carpet or the pad or insulator is wet, use the following criteria for drying or for replacing the components:

- For a 1-piece carpet assembly bonded to a cotton or a fibre padding, replace the entire assembly.
- For a 2-piece carpet assembly with a cotton or a fibre padding, replace the padding only. While the carpet is out of the vehicle, dry the carpet using the method described below.
- For a 1-piece carpet assembly bonded to a foam padding or attached to a synthetic padding, dry the carpet using the method described below.
- For a 2-piece carpet assembly with a synthetic padding, dry the assembly using the method described below.
- For a 1-piece carpet assembly with a separate cotton or a fibre padding, replace the cotton or fibre padding. While the carpet is out of the vehicle, dry the carpet using the method described below.

Drying Method

1. If you observe puddles of liquid on the carpet face, use a wet vacuum to remove the excess moisture.
2. Blot the face of the carpet with a towel in order to absorb as much moisture as possible.
3. Point a fan at the affected area and air dry the carpet.

Front Floor Panel Carpet Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front seat. Refer to Driver or Passenger Seat Replacement .2. Remove the front floor console. Refer to Front Floor Console Replacement .3. Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .	

4. Remove the front side door opening floor carpet retainer. Refer to [Front Side Door Opening Floor Carpet Retainer Replacement](#) .
5. Remove the rear side door opening floor carpet retainer. Refer to [Rear Side Door Opening Floor Carpet Retainer Replacement](#) .
6. Remove the center pillar trim panel. Refer to [Centre Pillar Trim Panel Replacement](#) .

Front Floor Panel Carpet Assembly

Front Side Door Opening Floor Carpet Retainer Replacement

Callout	Component Name
1	Front Side Door Opening Floor Carpet Retainer Assembly
	Procedure Pull up at the rear edge first, then pull rearward to remove.

Rear Side Door Opening Floor Carpet Retainer Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement .	
	Rear Side Door Opening Floor Carpet Retainer Assembly

1

Procedure

Pull up at the front edge first, then pull rearward to remove.

Headlining Trim Panel Replacement

Callout

Component Name

Warning: Do not attempt to repair or alter the head impact energy-absorbing material glued to the headliner or to the garnish trims. If the material is damaged, replace the headliner and/or the garnish trim. Failure to do so could result in personal injury.

Caution: Use care when working around the head curtain inflator module. Sharp tools may puncture the curtain airbag. If the head curtain inflator module is damaged in any way, it must be replaced.

Caution: If a vehicle is equipped with a head curtain inflator module ensure that the inflator module and tether are undamaged. If tether or curtain airbag are damaged in any way, they must be replaced.

Preliminary Procedures

1. Disable the roof rail SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Fold the rear seats down.
3. Move front seats to full forward position and recline fully.
4. Remove the windshield side garnish molding. Refer to [Windscreen Side Garnish Molding Replacement](#) .
5. Remove the sunshade supports. Refer to [Sunshade Support Replacement](#) .
6. Remove the sunshade assembly. Refer to [Sunshade Replacement](#) .
7. Remove the roof rail rear assist handle assembly. Refer to [Roof Rail Rear Assist Handle Replacement](#) .
8. Remove the roof console assembly. Refer to [Roof Console Replacement](#) .
9. Remove the center pillar trim panel. Refer to [Centre Pillar Trim Panel Replacement](#) .
10. Remove the body lock pillar upper trim panel. Refer to [Body Lock Pillar Upper Trim Panel Replacement](#) .
11. Remove the reading lamp. Refer to [Reading Lamp Replacement](#) .
12. Remove the inside rearview mirror mount plate cover. Refer to [Inside Rearview Mirror Mount Plate Cover Replacement](#) .

1	Headliner Trim Panel Retainer (Qty: 2)
2	<p>Headliner Trim Panel Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Prior to removal, note the routing of the wire harness to aid in reassembly and to ensure proper installation.2. Disconnect the electrical connectors.3. Removal and installation of the headliner must be completed through the tailgate opening with the aid of an assistant to prevent kinking or damage to the headliner. <p>Tip</p> <p>When installing a new headliner, tape any unused connector to the headliner with a high adhesive tape.</p>

Fastener Tightening Specifications

1	Instrument Panel Side Trim Panel - Left
	Procedure
	Use a flat bladed plastic trim tool to aid in the removal of the side trim panel from the instrument panel assembly.

Instrument Panel Side Trim Panel - Right

2

Procedure

Use a flat bladed plastic trim tool to aid in the removal of the side trim panel from the instrument panel assembly.

Instrument Panel Upper Trim Panel Replacement

Callout	Component Name
1	<p data-bbox="284 1382 935 1414">Instrument Panel Upper Trim Panel Assembly</p> <p data-bbox="284 1463 446 1495">Procedure</p> <ol data-bbox="319 1539 1983 1572" style="list-style-type: none">1. Use a flat bladed plastic trim tool to aid in the removal of the upper trim panel from the instrument panel assembly.

2. Disconnect the electrical connections.
3. When replacing the upper trim panel assembly, transfer all necessary components.

Instrument Panel Cluster Trim Plate Cover Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1458 1733 1490">1. Remove the instrument panel cluster trim plate. Refer to Instrument Panel Cluster Trim Plate Replacement .<li data-bbox="163 1495 1405 1528">2. Remove the instrument cluster assembly. Refer to Instrument Cluster Replacement .	

1	Instrument Panel Cluster Trim Plate Cover Fasteners (Qty: 4) Caution: Refer to Fastener Caution in the Preface section.
2	Instrument Panel Cluster Trim Plate Cover Assembly

Instrument Panel Cluster Trim Plate Replacement

Callout

Component Name

Note: The instrument panel cluster trim plate and the steering column upper trim cover must be removed as an assembly, do not attempt to separate.

Preliminary Procedures

Disable the SIR system. Refer to [SIR Disabling and Enabling](#)

Instrument Panel Cluster Trim Plate and Steering Column Upper Trim Cover Assembly

Procedures

1

1. Turn the steering wheel to the left in order to release the left tab securing the upper trim cover to the lower trim cover.
2. Release the retainers along the left side of the upper trim cover securing it to the lower trim cover.
3. While holding the left side of the trim cover up, turn the steering wheel enough to release the right retainer tab securing the right side of the upper trim cover to the lower trim cover.
4. Release the retainers along the right side of the upper trim cover securing it to the lower trim cover.
5. Grasp the instrument panel cluster trim plate and steering column upper trim cover assembly and pull rearward releasing the clips securing the assembly to the instrument panel.

2

Steering Column Upper Trim Cover

3

Instrument Panel Cluster Trim Plate Assembly

Procedure

When replacing either the instrument panel cluster trim plate or the steering column upper trim cover snap the two pieces together prior to installing them into the vehicle.

Instrument Panel Upper Outer Trim Panel Replacement - Right Side

[Removal Procedure](#)

Warning: Refer to [SIR Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Remove the instrument panel lower compartment. Refer to [Instrument Panel Lower Compartment Replacement](#) .
3. Disconnect the electrical connection to the instrument panel inflatable restraint module.

4. Remove the 3 bolts (1) securing the instrument panel inflatable restraint module to the instrument panel tie bar assembly.

5. Use a flat bladed plastic trim tool to aid in the removal of the upper outer trim panel from the instrument panel assembly.

Note: When the instrument panel inflatable restraint module is to be replaced, both the inflatable restraint module and the upper outer trim panel needs to be purchased.

6. When the instrument panel inflatable restraint is to be reused follow the steps outlined below.

- Using a suitable sharp bladed tool, carefully cut the four tabs located on the rear side of the instrument panel upper outer trim panel.

- Using a suitable sharp bladed tool, carefully cut the five tabs located on the front side of the instrument panel upper outer trim panel.
- Remove the inflatable restraint module from the upper outer trim panel.

[Installation Procedure](#)

1. Install the instrument panel inflatable restraint module into the instrument panel upper outer trim panel. Refer to [Instrument Panel Inflatable Restraint Module Replacement](#) .

2. Position the instrument panel upper outer trim panel assembly to the opening in the instrument panel assembly.
3. Push the trim panel downward ensuring the retainer tabs secure the trim panel to the instrument panel assembly.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the 3 bolts (1) securing the instrument panel inflatable restraint module to the instrument panel tie bar assembly and tighten to **9 N·m (80 lb in)**.
5. Connect the electrical connection to the instrument panel inflatable restraint module.
6. Install the instrument panel lower compartment. Refer to [Instrument Panel Lower Compartment Replacement](#) .
7. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Instrument Panel Upper Outer Trim Panel Replacement - Left Side

Callout	Component Name

Instrument Panel Compartment Door Dampener Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel lower compartment assembly. Refer to Instrument Panel Lower Compartment Replacement .	
	Instrument Panel Compartment Door Dampener

1

Procedure

Unsnap the dampener from the instrument panel assembly.

Instrument Panel Tie Bar Replacement

Table 1: [Preliminary Procedures](#)

Table 2: [Instrument Panel Electrical Centres Service Positioning](#)

Table 3: [Communication Interface Module Bracket Service Positioning](#)

Table 4: [Instrument Panel Tie Bar](#)

[Preliminary Procedures](#)

Note: All procedures must be followed in the order shown to be able to remove the instrument panel tie bar assembly.

[Preliminary Procedures](#)

1. Remove the inner and outer instrument panel lower trim pad retainers. Refer to [Lower Trim Pad Retainer Replacement](#) : [Outer](#) → [Inner](#) .
2. Remove the instrument panel lower trim panel insulator. Refer to [Instrument Panel Lower Trim Panel Insulator Replacement](#) .
3. Remove the right and left front side door opening floor carpet retainers. Refer to [Front Side Door Opening Floor Carpet Retainer Replacement](#) .
4. Remove the steering column assembly. Refer to [Steering Column Replacement](#) .
5. Release the bonnet latch release handle from the tie bar assembly and position out of the way.
6. Release the data link connector from the instrument panel tie bar assembly, and position out of the way.

[Instrument Panel Electrical Centres Service Positioning](#)

Note: The instrument panel electrical centres are an integral part of the instrument panel wiring harness and are not a separate serviceable item.

Instrument Panel Electrical Centres Service Positioning

Callout	Component Name
1	Right Instrument Panel Electrical Centre Fasteners (Qty: 2) Caution: Refer to Fastener Caution in the Preface section.
2	Right Instrument Panel Electrical Centre Assembly Procedure Position the electrical centre assembly out of the way.
3	Left Instrument Panel Electrical Centre Fasteners (Qty: 2)
	Left Instrument Panel Electrical Centre Assembly

Position the electrical centre assembly out of the way.

Communication Interface Module Bracket Service Positioning

Note: It is not necessary to disconnect the electrical wiring to the modules or remove the modules from the communications interface module bracket when following the service positioning procedure.

Communication Interface Module Bracket Service Positioning

Callout	Component Name
1	Communication Interface Module Bracket Fasteners (Qty: 4)

2

Procedure

Position the communication interface module bracket assembly out of the way.

Instrument Panel Tie Bar

Instrument Panel Tie Bar

Callout	Component Name
	Instrument Panel Tie Bar to Brake Pedal Bracket Bolts (Qty: 4)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 12 N·m (9 lb ft)</p>
2	Instrument Panel Tie Bar to HVAC Module Bolts (Qty: 2)
3	Instrument Panel Tie Bar to HVAC Module Nuts (Qty: 2)
4	<p>Instrument Panel Tie Bar to HVAC Module Bolt</p> <p>Tip This bolt is driven from front of vehicle rearward.</p>
5	<p>Instrument Panel Tie Bar to Front Floor Tunnel Panel Nuts (Qty: 2)</p> <p>Tighten 22 N·m (17 lb ft)</p>
6	<p>Instrument Panel Tie Bar to Vehicle Body Bolts (Qty: 4)</p> <p>Tighten 22 N·m (17 lb ft)</p>
7	<p>Instrument Panel Tie Bar Assembly</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Note location and routing of the instrument panel wiring harness assembly in order to ensure proper reinstallation. 2. Remove all fasteners securing the instrument panel wiring harness to the tie bar assembly. 3. With the aid of an assistant, remove the tie bar assembly from the vehicle. 4. When replacing the tie bar assembly, transfer all necessary components.

Instrument Panel Wiring Harness Replacement

[Removal Procedure](#)

Note: Arrange a place to embed the removed parts.

1. Install the MDI, start the ignition and read the diagnostic trouble codes.
 - 1.1. Delete all diagnostic trouble codes and read diagnostic trouble codes again.
 - 1.2. Notice ALL diagnostic trouble codes.
2. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Remove the inner and outer instrument panel lower trim pad retainer. Refer to [Lower Trim Pad Retainer Replacement](#) : [Outer](#) → [Inner](#) .
4. Remove the communication interface module. Refer to [Communication Interface Module Replacement](#) .

5. Remove the fasteners (1, 2), then remove the left and right instrument panel electrical centre assembly (3, 4).

6. Remove the fasteners (2), then remove the communication interface module bracket (1).
7. Release all mass cables from the tie bar and body weld studs.
8. Release the instrument panel wiring harness. Take pictures from the routing and fixing points of the instrument panel wiring harness for the orientation.
9. Disconnect all electrical connectors and unscrew ground cables.
 - 9.1. Release all fixations.
 - 9.2. Take care about destroyed cable straps and harness guidance regarding noises and rattles.

10. Remove the instrument panel wiring harness (1) from the instrument panel tie bar (2) and lay it on the floor. Unpack the new instrument panel wiring harness and compare the old with the new harness concerning quantity of fixing points, cable straps, guides, part numbers and pin assignments.

[Installation Procedure](#)

1. After comparing the new with the old harness (1) install the harness on the tie bar (2).
 - Check if there is no twisting and bending and fix the new wiring harness.
 - Use new cable straps and pins. Connect all electrical connectors.
 - Take care for the correct counterpart and the pin assignment.
 - Use the pictures for orientation.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Tighten all mass cables to the weld studs to **9 N·m (80 lb in)**.

3. Install the communication interface module bracket (1) and tighten the fasteners (2) to **2.5 N·m (22 lb in)**.

4. Install the left and right instrument panel electrical centre assembly (3, 4) and tighten the fasteners (1, 2) to **2.5 N·m (22 lb in)**.
5. Install the communication interface module. Refer to [Communication Interface Module Replacement](#) .
6. Install the inner and outer instrument panel lower trim pad retainer. Refer to [Lower Trim Pad Retainer Replacement](#) : [Outer](#) → [Inner](#) .
7. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
8. Install the MDI, start the ignition and read the diagnostic trouble codes. Delete all diagnostic trouble codes and read trouble codes again.
9. Check all electrical functions and perform a test run.

Front Floor Console Compartment Door Hinge Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console armrest assembly. Refer to Front Floor Console Armrest Replacement .	
1	Front Floor Console Armrest Hinge Cover Fasteners (Qty: 6)

	Caution: Refer to Fastener Caution in the Preface section.
2	Front Floor Console Armrest Hinge Cover Assembly
3	Front Floor Console Armrest Hinge Assembly Procedure Transfer all remaining necessary components.

Front Floor Console Compartment Door Latch Replacement

Callout	Component Name
1	Front Floor Console Armrest Hinge Cover Fasteners (Qty: 6) Caution: Refer to Fastener Caution in the Preface section.
2	Front Floor Console Armrest Hinge Cover Assembly
3	Front Floor Console Compartment Door Latch Assembly

Front Floor Console Side Cover Replacement

Callout	Component Name
Note:: Left Side Shown, Right Side Similar.	
Preliminary Procedure	
Remove the front floor console assembly. Refer to Front Floor Console Replacement .	

1	Front Floor Console Rear Cover Assembly Procedure Grasp the rear cover assembly and pull rearward releasing the clips securing the rear cover to the console assembly.
2	Front Floor Console Side Cover Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Procedures <ol style="list-style-type: none">1. Grasp the side cover and pull outward releasing the clips securing the side cover to the console assembly.2. Disconnect the connectors securing the console wiring harness to the side cover, when applicable.
3	Front Floor Console Side Cover Assembly

Front Floor Console Extension Replacement - Right Side

Callout	Component Name
Preliminary Procedure	
	Move the right front seat to the full rearward position.
	Front Floor Console Extension Assembly - Right

1

Procedure

Use a flat bladed plastic trim tool to aid in the removal of the extension assembly.

Front Floor Console Extension Replacement - Left Side

Callout	Component Name
Preliminary Procedure	
Move the left front seat to the full rearward position.	
	Front Floor Console Extension Assembly - Left

1

Procedure

Use a flat bladed plastic trim tool to aid in the removal of the extension assembly.

Front Floor Console Retainer Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console armrest assembly. Refer to Front Floor Console Armrest Replacement .	
1	Front Floor Console Trim Plate Fasteners (Qty: 4)

Caution: Refer to [Fastener Caution](#) in the Preface section.

2	Front Floor Console Trim Plate Assembly
3	Front Floor Console Retainer Assembly

Front Floor Console Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front floor rear console assembly. Refer to Front Floor Rear Console Replacement .2. Remove the front floor console applique. Refer to Front Floor Console Applique Replacement .3. Remove the left and right front floor console extensions. Refer to Front Floor Console Extension Replacement - Left Side and Front Floor Console Extension	

[Replacement - Right Side](#) .

1	Front Floor Console Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section.
2	Front Floor Console Bolt (Qty: 4) Tighten 9 N·m (80 lb in)
3	Front Floor Console Assembly Procedures <ol style="list-style-type: none">1. Disconnect the electrical connections.2. When replacing the front floor console assembly, transfer all necessary components.

Front Floor Rear Console Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the rear seat cushions. Refer to Rear Seat Cushion Replacement .2. Fold the rear seat backs down.	

Front Floor Rear Console Assembly.

Procedure

- 1
1. Grasp the rear of the console assembly and pull upwards disengaging the clips securing the rear of the console to the vehicle.
2. Grasp the front of the console assembly and pull upwards disengaging the clips securing the front of the console to the vehicle.
3. Disconnect the electrical connections.
4. When replacing the front floor rear console assembly, transfer all necessary components.

Front Floor Console Armrest Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1458 1521 1490">1. Remove the front floor console from the vehicle. Refer to Front Floor Console Replacement .<li data-bbox="163 1495 1811 1528">2. Remove the right and left front floor console side covers. Refer to Front Floor Console Side Cover Replacement .

Front Floor Console Armrest Hinge Cover Replacement

Callout	Component Name
1	Front Floor Console Armrest Hinge Cover Fasteners (Qty: 6) Caution: Refer to Fastener Caution in the Preface section.
2	Front Floor Console Armrest Hinge Cover Assembly

Front Floor Console Trim Plate Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console armrest assembly. Refer to Front Floor Console Armrest Replacement .	
1	Front Floor Console Trim Plate Fasteners (Qty: 4)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Front Floor Console Trim Plate Assembly

2

Procedure

Transfer any necessary components.

Front Floor Console Applique Replacement

Callout	Component Name
1	Front Floor Console Applique
Procedure	Starting at the rearward edge of the applique, use a flat bladed plastic trim tool and release the retainer clips securing the applique to the console assembly.

Front Floor Console Rear Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor rear console assembly. Refer to Front Floor Rear Console Replacement .	
	Front Floor Console Rear Cover Assembly

1

Procedure

Grasp the rear cover assembly and pull rearward releasing the clips securing the rear cover to the console assembly.

Roof Console Replacement

Callout	Component Name
1	<p data-bbox="263 1373 612 1419">Roof Console Assembly</p> <p data-bbox="263 1455 446 1500">Procedures</p> <ol data-bbox="298 1536 2220 1581" style="list-style-type: none"><li data-bbox="298 1536 2220 1581">1. Grasp the overhead console assembly on both sides and pull downward disengaging the clips securing the console to the headliner.

2. Disconnect the electrical connections.
3. When replacing the roof console assembly, transfer all necessary components.

2. Disconnect the electrical connector from the switch assembly.
3. Transfer parts as necessary.

Front Side Door Trim Replacement

Callout	Component Name
1	Front Side Door Inside Handle Bolt Finish Cap
2	Front Side Door Inside Handle Fastener Caution: Refer to Fastener Caution in the Preface section.
3	Front Side Door Armrest Opening Cover Assembly

4	Front Side Door Armrest Pull Cup Fastener (Qty: 2)
5	<p>Front Side Door Trim Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Use the appropriate plastic trim tool to aid in the removal of the door trim.2. Pull upwards on the door lock retainer cable to disengage.3. Disconnect electrical connectors. <p>Tip</p> <p>When the door trim is removed, all retainers should be replaced. Failure to replace the retainers may cause loss of retainer retention.</p>

Rear Side Door Window Garnish Moulding Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door trim. Refer to Rear Side Door Trim Replacement .	
	Rear Side Door Window Garnish Moulding Retainer (Qty: 2)

1	Procedure Use a door trim panel removal tool or equivalent to aid in the removal of the retainers.
2	Rear Side Door Window Garnish Moulding Assembly Procedure Pull outward starting at the front and moving slowly rearward to remove the moulding.

Front Side Door Window Garnish Moulding Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the front side door trim. Refer to Front Side Door Trim Replacement .
	Front Side Door Window Garnish Moulding Retainer (Qty: 2)

1	Procedure Use a door trim panel removal tool or equivalent to aid in the removal of the retainers.
2	Front Side Door Window Garnish Moulding Assembly Procedure Pull outward starting at the front and moving slowly rearward to remove the moulding.

Roof Rail Rear Assist Handle Replacement

Callout	Component Name
	<p>Roof Rail Rear Assist Handle Fastener (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p>

1	<ol style="list-style-type: none">1. Fold the assist handle downward and hold.2. Use a small flat-bladed tool to open the assist handle covers to access the screws. <p>Tighten 6 N·m (53 lb in)</p>
2	Roof Rail Rear Assist Handle Assembly

Inside Rearview Mirror Mount Plate Cover Replacement

Callout	Component Name
1	<p>Inside Rearview Mirror Mount Plate Cover Replacement</p> <p>Procedure</p> <p>1. From inside the vehicle, position the inside rearview up and away from the inside rearview mirror mount plate cover.</p>

2. Grasp the top centre of the mounting plate cover push upward and pull rearward at the same time this will release the cover from the top retainers.
3. Pushing down until the cover fully releases from the mounting plate lower retainers.

Tip

The lower retainer must be engaged first before the two upper bars are attached.

Sunshade Replacement

Callout	Component Name
Preliminary Procedure	
Lower the front of the headliner to access the sunshade electrical connector, if necessary. Refer to Headlining Trim Panel Replacement .	
1	Visor Retainer Bolt Cover
	Sunshade Fastener (Qty: 3)

2	Caution: Refer to Fastener Caution in the Preface section.
3	Sunshade Assembly Procedure <ol style="list-style-type: none">1. Squeeze the tabs at the base of the sunshade assembly to remove from the headliner.2. Disconnect the electrical connector.

Sunshade Support Replacement

Callout	Component Name
1	<p>Sunshade Support Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tip Pull the cover downward to access the fastener.</p>

2	Sunshade Support Assembly Procedure Unclip the sunshade from the support and reposition.
---	-------------------------------------------------------------------------------------------------------

Windscreen Side Garnish Molding Replacement

Callout	Component Name
Preliminary Procedures	
Disable the roof rail SIR system. Refer to SIR Disabling and Enabling .	
1	Inflatable Restraint Airbag Plate
	Windscreen Side Garnish Moulding Retainer Fastener

2	Caution: Refer to Fastener Caution in the Preface section.
3	Windscreen Side Garnish Moulding Assembly Procedure <ol style="list-style-type: none">1. Tabs must be installed prior to retainers.2. Tabs to be fully seated in I/P upper trim pad retainer assembly.3. Disconnect electrical connectors.

Centre Pillar Trim Panel Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Disable the roof rail SIR system. Refer to SIR Disabling and Enabling .2. Pull up on forward edge of rear side door opening floor carpet retainer to disengage tab. Refer to Rear Side Door Opening Floor Carpet Retainer Replacement .3. Pull up on rearward edge of front side door opening floor carpet retainer to disengage tab. Refer to Front Side Door Opening Floor Carpet Retainer Replacement .	

4. Remove the seat belt tensioner fastener and feed seat belt through centre pillar trim panel. Refer to [Driver or Passenger Seat Retractor Side Belt Replacement](#) .

1	Inflatable Restraint Airbag Name Plate
2	Centre Pillar Upper Trim Panel Fastener Caution: Refer to Fastener Caution in the Preface section.
3	Centre Pillar Trim Panel Assembly Procedure Pull the trim panel toward the inside of the vehicle to disengage the retainers.

Body Lock Pillar Upper Trim Panel Replacement

Callout	Component Name
Preliminary Procedure	
Disable the SIR system. Refer to SIR Disabling and Enabling .	
	Body Lock Pillar Upper Trim Panel

1

Procedure

1. Pull outward from the top front to release the upper portion of the moulding, then move upward to release the tabs.
2. Release the tether to remove.

Quarter Inner Trim Finish Panel Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the rear side door opening floor carpet retainer. Refer to [Rear Side Door Opening Floor Carpet Retainer Replacement](#) .
2. Remove the rear seat cushion. Refer to [Rear Seat Cushion Replacement](#) .
3. Remove rear seat back. Refer to [Rear Seat Back Cushion Replacement](#) .

4. Remove the body lock pillar upper trim panel. Refer to [Body Lock Pillar Upper Trim Panel Replacement](#) .
5. Remove the rear compartment floor panel trim. Refer to [Rear Compartment Floor Panel Trim Replacement](#) .
6. Remove the rear compartment floor stowage trim compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .
7. Remove the rear end trim finish panel. Refer to [Rear End Trim Finish Panel Replacement](#) .
8. Reposition the rear shoulder belt around the panel and through the opening in the panel. Refer to [Shoulder Belt Replacement - Rear](#) .

1	<p>Quarter Inner Trim Finish Panel Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p>
2	<p>Convenience Net Upper Retainer</p>
3	<p>Cargo Screen Retainer Assembly (Qty: 2)</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Turn the left front and right rear cargo screen retainer anticlockwise one quarter turn to disengage the 2 integral tabs. 2. Turn the left rear and right front cargo screen retainer clockwise one quarter turn to disengage the 2 integral tabs.
4	<p>Quarter Inner Trim Finish Panel</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Use a trim tool or equivalent to aid in removal. 2. Remove the quarter trim panel cover. 3. Disconnect the electrical connector, if necessary. <p>Tip After installation of the quarter inner trim panel, ensure the rear seat belt is not trapped under the trim panel. Pull up on the belt to verify full movement of the belt.</p>

Rear End Trim Finish Panel Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the rear compartment floor panel trim. Refer to Rear Compartment Floor Panel Trim Replacement .2. Remove the rear compartment floor stowage trim compartment. Refer to Rear Compartment Floor Stowage Trim Compartment Replacement .3. Partially remove the tailgate weatherstrip. Refer to Tailgate Weatherstrip Replacement .	

1	Cargo Tie Down Loop Trim Cover (Qty: 2)
2	Rear End Trim Finish Panel Assembly Procedure Tilt the rear compartment floor panel trim up to gain access to the panel.

Rear Compartment Floor Stowage Compartment Cover Handle Replacement

Callout	Component Name
1	Rear Compartment Floor Stowage Compartment Cover Handle Fastener Caution: Refer to Fastener Caution in the Preface section. Procedure

	Open cover to access fastener.
2	Rear Compartment Floor Stowage Compartment Cover Handle Assembly

Rear Side Door Trim Replacement

Callout	Component Name
1	Rear Side Door Inside Handle Bolt Cap
	Rear Side Door Inside Handle Bolt Fastener
2	Caution: Refer to Fastener Caution in the Preface section.

	<p>Procedure</p> <p>Pull handle back to remove cap. Use suitable tool to unsnap.</p>
3	Rear Side Door Armrest Pull Cup Cover
4	Rear Side Door Armrest Pull Cup Fastener (Qty: 2)
5	<p>Rear Side Door Trim Panel</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Use the appropriate plastic trim tool to aid in the removal of the door trim. 2. Pull upwards on the door lock retainer cable to disengage. 3. Disconnect the electrical connector. <p>Tip</p> <p>When the door trim is removed, all retainers should be replaced. Failure to replace the retainers may cause loss of retainer retention.</p>

Liftgate Window Side Garnish Moulding Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the tailgate window upper garnish moulding. Refer to Tailgate Window Upper Garnish Moulding Replacement .</p>	
	<p>Tailgate Window Side Garnish Moulding Assembly</p>

1

Procedure

Pull outward to disengage the retainers.

Tailgate Window Upper Garnish Moulding Replacement

Callout	Component Name
1	<p>Tailgate Window Upper Garnish Moulding Assembly</p> <p>Procedure</p> <p>Pull outward to disengage the retainers.</p>

Liftgate Upper Trim Finish Panel Replacement

Callout	Component Name
Preliminary Procedure	

1. Remove the liftgate window side garnish molding. Refer to [Liftgate Window Side Garnish Moulding Replacement](#) .
2. Remove the liftgate lower trim finish panel. Refer to [Liftgate Lower Trim Finish Panel Replacement](#) .

Tailgate Upper Trim Finish Panel Assembly

Procedure

1

1. Use a trim panel removal tool to aid in the removal of the trim panel from the tailgate assembly.
2. Disconnect the electrical connector, if equipped.

Tip

Remove the upper and lower tailgate trim finish panels together and then separate them.

Liftgate Lower Trim Finish Panel Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the liftgate window side garnish molding. Refer to Liftgate Window Side Garnish Moulding Replacement .2. Remove the tailgate window upper garnish moulding. Refer to Tailgate Window Upper Garnish Moulding Replacement .	

1	Tailgate Inside Pull Handle Cover
2	Tailgate Inside Pull Handle Cover Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section.
3	Tailgate Latch Closeout Cover
4	Tailgate Lower Trim Finish Panel Assembly Procedure <ol style="list-style-type: none">1. Use a trim panel removal tool to aid in the removal of the trim panel from the tailgate assembly.2. Disconnect the electrical connector, if equipped. Tip Remove the upper and lower tailgate trim finish panels together and then separate them.

Body Side Air Outlet Deflector Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear bumper fascia. Refer to Rear Bumper Fascia Removal and Installation : Volt → Ampera	
1	Body Side Air Outlet Deflector Replacement

DTC B3006

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3006 01: Hood Ajar Circuit Short to Battery

DTC B3006 02: Hood Ajar Circuit Short to Ground

DTC B3006 04: Hood Ajar Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3006 02	B3006 04	B3006 01	-
Ground	-	B3006 04	-	-

[Circuit/System Description](#)

The body control module (BCM) applies B+ to the bonnet ajar signal circuit and monitors the voltage to determine the position of the bonnet. The bonnet ajar switch contains a multiplexed resistor. This resistor will vary the voltage seen by the BCM by pulling down the applied voltage based on the position of the switch.

[Conditions for Running the DTC](#)

The BCM continuously monitors for this DTC

[Conditions for Setting the DTC](#)

B3006 01

The BCM detects that the bonnet ajar switch signal circuit is shorted to battery.

B3006 02

The BCM detects that the bonnet ajar switch signal circuit is shorted to ground.

B3006 04

The BCM detects that the bonnet ajar switch signal circuit is open.

Action Taken When the DTC Sets

- The bonnet ajar switch input will be ignored as a content theft deterrent trigger.
- Remote vehicle start will be disabled.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction free ignition cycles.

- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Observe the scan tool Bonnet Ajar Switch parameter. With the bonnet open, the Bonnet Ajar Switch parameter should be Open. With the bonnet closed, the Bonnet Ajar Switch parameter should be Closed.
If the parameter does not change
Refer to Circuit/System Testing.
If the parameter changes
3. All OK.

[Circuit/System Testing](#)

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B55 bonnet ajar switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.**If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for B+ between the signal circuit terminal B and ground.
If less than B+
 - 4.1. Vehicle OFF, disconnect the harness connector at the BCM.
 - 4.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If Infinite resistance.
 - 4.3. Test for less than 2 Ω in the B+ circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the BCM.

If B+

5. Vehicle OFF, disconnect the X4 and X7 harness connector at the K9 BCM. Vehicle in Service Mode.
6. Test for less than 1 V between the signal circuit terminal B and ground.

If 1 V or greater

Repair the short to voltage on the circuit.

If less than 1 V

7. Test or replace the B55 bonnet ajar switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Bonnet Primary and Secondary Catch Replacement](#) : [Volt](#) → [Ampera](#)

DTC P257D-P257F

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P257D: Bonnet Switch Performance

DTC P257E: Bonnet Switch Circuit Low Voltage

DTC P257F: Bonnet Switch Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Bonnet Ajar Switch Signal 1	B3006 02	B3006 04	B3006 01	-
Bonnet Ajar Switch Signal 2	P257E	P257F	P257F	P257D
Ground	-	B3006 04, P257F	-	-

[Circuit/System Description](#)

The hybrid powertrain control module 2 applies B+ to the bonnet ajar signal 2 circuit and monitors the voltage to determine the position of the bonnet. The bonnet ajar switch contains a multiplexed resistor. This resistor will vary the voltage seen by the hybrid powertrain control module 2 by pulling down the applied voltage based on the position of the switch.

[Conditions for Running the DTC](#)

Propulsion system is active.

Conditions for Setting the DTC

P257D

The bonnet ajar switch signal 2 voltage as measured by the hybrid powertrain control module 2 is not within a valid voltage range.

P257E

The hybrid powertrain control module 2 detects a short to ground in the bonnet ajar signal input to the hybrid powertrain control module 2.

P257F

The hybrid powertrain control module 2 detects a short to voltage or an open/high resistance in the bonnet ajar signal input to the hybrid powertrain control module 2.

Action Taken When the DTC Sets

The engine will start and run whenever the vehicle is in Service Mode or the vehicle speed is less than 5 kph (3 mph).

Conditions for Clearing the DTC

DTCs P257D, P257E, and P257F are Type B DTCs.

If 10 Ω or greater
 - 2.1. Vehicle OFF
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.**If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify DTC P257F is set as current
If DTC P257F is not set as current
 - 4.1. Vehicle OFF, disconnect the harness connector at the ECM.
 - 4.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the ECM**If DTC P257F is set as current**

5. Install a 5 A fused jumper wire between the signal circuit terminal A and earth.
6. Verify DTC P257E is set as current.

If DTC P257E is not set as current

- 6.1. Vehicle OFF, disconnect the harness connector at the ECM.
- 6.2. Test for less than 1 V between the signal circuit and earth.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V
- 6.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the BCM.

If DTC P257E is set as current

7. Test or replace the B55 bonnet ajar switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Bonnet Primary and Secondary Catch Replacement](#) : [Volt](#) → [Ampera](#)
- [Control Module References](#) for hybrid powertrain control module 2 replacement, programming and setup

Symptoms - Bolted Exterior Body Panels and Closures

Important: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to [Bonnet Ajar Indicator Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Bonnet Ajar Indicator/Message Malfunction](#) in order to diagnose the symptom.

Bonnet Ajar Indicator/Message Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3006 02	B3006 04	B3006 01	-
Ground	-	B3006 04	-	-

[Circuit/System Description](#)

The body control module (BCM) applies B+ to the bonnet ajar signal circuit and monitors the voltage to determine the position of the bonnet. The bonnet ajar switch contains a multiplexed resistor. This resistor will vary the voltage seen by the BCM by pulling down the applied voltage based on the position of the switch.

[Reference Information](#)

Schematic Reference

[Immobiliser Schematics](#)

Connector End View Reference

[Component Connector End Views](#)

Description and Operation

[Keyless Entry System Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Observe the scan tool Bonnet Ajar Switch parameter. With the bonnet open, the Bonnet Ajar Switch parameter should be Open. With the bonnet closed, the Bonnet Ajar Switch parameter should be Closed.
If the parameter does not change
Refer to Circuit/System Testing.
If the parameter changes
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B55 bonnet ajar switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.**If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for B+ between the signal circuit terminal B and ground.
If less than B+
 - 4.1. Vehicle OFF, disconnect the harness connector at the BCM.
 - 4.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.

If Infinite resistance.

4.3. Test for less than 2 Ω in the B+ circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the BCM.

If B+

5. Vehicle OFF, disconnect the X4 and X7 harness connector at the K9 BCM. Vehicle in Service Mode.

6. Test for less than 1 V between the signal circuit terminal B and ground.

If 1 V or greater

Repair the short to voltage on the circuit.

If less than 1 V

7. Test or replace the B55 bonnet ajar switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Bonnet Primary and Secondary Catch Replacement](#) : [Volt](#) → [Ampera](#)
- [Control Module References](#) for BCM replacement, programming and setup

Front Suspension Strut Housing Brace Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air inlet grille panel. Refer to Air Inlet Grille Panel Replacement .	
	Front Suspension Strut Housing Brace Push--In Retainer (Qty: 3)

1	Procedure Remove the plenum upper panel insulator.
2	Front Suspension Strut Housing Brace Bolt (Qty: 4) Caution : Refer to Fastener Caution in the Preface section. Tighten 10 N·m (89 lb in)
3	Front Suspension Strut Housing Brace

Bonnet Primary Catch Release Cable Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the front compartment side sight shield. Refer to [Front Compartment Side Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .
2. Remove the front fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
3. Remove the left headlamp. Refer to [Headlamp Replacement](#) : [Volt](#) → [Ampera](#) .

4. Remove the air inlet grille. Refer to [Air Inlet Grille Panel Replacement](#) .

1	Bonnet Primary Latch Cable Procedure Disconnect the bonnet primary latch release cable from the primary bonnet latch. Refer to Bonnet Primary and Secondary Catch Replacement : Volt → Ampera .
2	Bonnet Primary Latch Release Cable Retainer Procedure Disconnect the bonnet release cable retainers from the bonnet release cable.
3	Bonnet Primary Latch Release Cable Grommet Procedure Compress the grommet and press through the hole toward the passenger compartment.
4	Bonnet Primary Catch Release Cable Procedure <ol style="list-style-type: none">1. Remove the bonnet primary latch release cable handle by pressing the release cable handle upward to release the retainers from the instrument panel bracket.2. Pull the bonnet primary latch release cable out from the passenger compartment.

Front Side Door Adjustment

[Removal Procedure](#)

Up/Down or In/Out Adjustment

1. Open the door.

Caution : Refer to [Paint Damage Caution](#) in the Preface section.

Note : The door side upper and lower hinge bolts must remain tight enough to retain door adjusted position.

2. Apply masking tape to the wing and the door edges.

Loosen the door side hinge bolts.

Do not remove the bolts from the door.

3. Adjust the door up or down by repositioning the door as needed.
4. Adjust the door in or out by repositioning the door as needed.

[Installation Procedure](#)

1. If doing this portion of the adjustment to the (Driver's Door Only) do the following: disable the high voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the battery charger receptacle. Refer to [Drive Motor Battery Charger Receptacle Replacement](#) .
3. Remove the charger port door actuator. Refer to [Charge Port Housing Replacement](#) .

Caution : Refer to [Fastener Caution](#) in the Preface section.

4. Install the door side hinge bolts.

Tighten

Tighten the bolts to 30 N·m (22 lb ft).

5. Inspect the door for proper operation and alignment.
6. Remove the masking tape.

Removal Procedure

Fore/Aft Adjustment

Caution : Refer to [Paint Damage Caution](#) in the Preface section.

Note : The door side upper and lower hinge bolts must remain tight enough to retain door adjusted position.

1. Apply masking tape to the wing and door edges.

Loosen the body side hinge bolts.

Do not remove the bolts from the door.

2. Adjust the door fore and aft by repositioning the door as needed.

Installation Procedure

Caution : Refer to [Fastener Caution](#) in the Preface section.

1. Install the body side hinges bolts.

Tighten

Tighten the bolts to 30 N·m (22 lb ft).

2. Inspect the door for proper operation and alignment.
3. Remove the masking tape.

Front Side Door Replacement

Callout	Component Name
	<p>Front Side Door Check Link Bolt</p> <p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p>

1	<ol style="list-style-type: none"> 1. Apply masking tape to the wing and door edges. 2. Disconnect the door electrical connector. 3. Support the door before removing the hinge bolts. <p>Tighten 22 N·m (16 lb ft)</p>
2	<p>Front Side Door Upper Hinge to Door Bolts (Qty: 2)</p> <p>Tighten 30 N·m (22 lb ft)</p>

Front Wing Replacement - Left Side

Callout	Component Name
	<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p> <p>The High Voltage Disabling procedure will perform the following tasks:</p> <ul style="list-style-type: none"> Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

Preliminary Procedures

1. Remove the front fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Remove the air inlet extension. Refer to [Air Inlet Grille Panel Extension Replacement](#) .
3. Remove the front wing upper rear moulding. Refer to [Front Fender Upper Rear Moulding Replacement](#) .
4. Remove the front compartment side sight shield. Refer to [Front Compartment Side Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .
5. Remove the front wheelhouse front liner. Refer to [Front Wheelhouse Front Liner Replacement](#) .
6. Remove the front wheelhouse rear liner. Refer to [Front Wheelhouse Rear Liner Replacement](#) .
7. Remove the sill panel moulding. Refer to [Sill Panel Moulding Replacement](#) .
8. Remove the left headlamp. Refer to [Headlamp Replacement](#) : [Volt](#) → [Ampera](#) .
9. Disconnect all electrical connectors to remove the wing.

1	<p>Left Wing Bolt (Qty: 7)</p> <p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Front Wing</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the wing slowly to ensure all electrical connectors are disconnected. 2. Remove the charge port housing, if required. Refer to Charge Port Housing Replacement . 3. Transfer additional parts as required.

Front Wing Replacement - Right Side

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .2. Remove the air inlet extension. Refer to Air Inlet Grille Panel Extension Replacement .3. Remove the front wing upper rear moulding. Refer to Front Fender Upper Rear Moulding Replacement .	

4. Remove the front compartment side sight shield. Refer to [Front Compartment Side Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .
5. Remove the front wheelhouse front liner. Refer to [Front Wheelhouse Front Liner Replacement](#) .
6. Remove the front wheelhouse rear liner. Refer to [Front Wheelhouse Rear Liner Replacement](#) .
7. Remove the sill panel moulding. Refer to [Sill Panel Moulding Replacement](#) .
8. Remove the right headlamp. Refer to [Headlamp Replacement](#) : [Volt](#) → [Ampera](#) .

1	<p>Right Wing Bolt (Qty: 7)</p> <p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Front Wing</p> <p>Procedure</p> <p>Transfer parts as needed.</p>

Liftgate Adjustment

1. Lower the rear headliner area to access the hinge bolts.
2. Loosen the striker.
3. Loosen the hinge-to-roof panel bolts for forward or rearward adjustments.
4. Move the tailgate within the tailgate opening to achieve the best alignment and operation.
5. Adjust the striker to achieve the best operation and alignment of the tailgate.
6. Inspect the seals for proper engagement.

Caution : Refer to [Fastener Caution](#) in the Preface section.

7. Tighten the bolts when the proper adjustment is achieved. Tighten the liftgate hinge and striker bolts to **25 N·m (18 lb ft)**.

Liftgate Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Use a grease pencil to mark the liftgate hinge position.2. Lower the rear of the headliner enough to access the hinge bolts. Refer to Headlining Trim Panel Replacement .3. Disconnect the electrical connectors.	

4. Disconnect the liftgate struts. Refer to [Liftgate Strut Replacement](#) .

1	Tailgate Hinge Bolt (Qty: 4) Caution : Refer to Fastener Caution in the Preface section. Tighten 25 N·m (18 lb ft)
2	Liftgate Procedure <ol style="list-style-type: none">1. Transfer parts as needed.2. Adjust the tailgate if needed. Refer to Liftgate Adjustment .

Front Side Door Upper Hinge and Lower Hinge Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. If replacing the driver side door hinges only, disable the high voltage system. Refer to High Voltage Disabling .2. Remove the battery charger receptacle. Refer to Drive Motor Battery Charger Receptacle Replacement .3. Remove the charger port door actuator. Refer to Charge Port Housing Replacement .	

4. Remove the front side door. Refer to [Front Side Door Replacement](#) .

1	Front Side Door Upper Hinge to Body Bolts (Qty: 2) Caution : Refer to Fastener Caution in the Preface section. Tighten 30 N·m (22 lb ft)
2	Front Side Door Upper Hinge to Door Bolts (Qty: 2) Tighten 30 N·m (22 lb ft)
3	Front Side Door Upper Hinge
4	Front Side Door Lower Hinge to Body Bolts (Qty: 2) Procedure Front side door check link bolt. Refer to upper front hinge removal. Tighten 30 N·m (22 lb ft)
5	Front Side Door Lower Hinge to Door Bolts (Qty: 2) Tighten 30 N·m (22 lb ft)
6	Front Side Door Lower Hinge Procedure Inspect the door for proper operation and alignment. Refer to Front Side Door Adjustment .

Bonnet Hinge Replacement - Volt

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1458 1185 1490">1. Remove the bonnet. Refer to Bonnet Replacement : Volt → Ampera .<li data-bbox="163 1495 2018 1528">2. Remove the front compartment side sight shield. Refer to Front Compartment Side Sight Shield Replacement : Volt → Ampera .	

1	Bonnet Hinge Bolt (Qty: 2) Caution : Refer to Fastener Caution in the Preface section. Tighten 25 N·m (18 lb ft)
2	Bonnet Hinge Procedure Adjust the bonnet and hinge if needed.

Tailgate Hinge Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none">1. Remove the liftgate. Refer to Liftgate Replacement .2. Use a grease pencil to mark the tailgate hinge position to the body prior to removal.	

1	Tailgate Hinge Bolt (Qty: 2) Caution : Refer to Fastener Caution in the Preface section. Tighten 25 N·m (18 lb ft)
2	Liftgate Hinge Procedure Adjust the tailgate if needed. Refer to Liftgate Adjustment .

Rear Side Door Upper Hinge and Lower Hinge Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door. Refer to Rear Side Door Replacement .	
	Rear Side Door Upper Hinge to Body Bolts (Qty: 2)

	<p>Caution : Refer to Fastener Caution in the Preface section.</p>
1	<p>Tighten: 30 N·m (22 lb ft).</p> <p>Tip Open the front door to access the rear door hinge bolts, keeping the rear door closed.</p>

6	<p>Rear Side Door Lower Hinge</p> <p>Procedure</p> <p>Inspect the door for proper operation and alignment. Refer to Rear Side Door Adjustment .</p>

Bonnet Adjustment

Callout	Component Name
Bonnet	
Caution : Refer to Fastener Caution in the Preface section.	
Procedure	

1

1. Loosen the 4 bonnet hinge nuts.
2. Adjust the bonnet in order to obtain an even gap on both sides between the bonnet and the wings, the headlamps and the front bumper fascia and so that the bonnet is flush with both wings on the front edge, the front bumper fascia and the headlamps.

Adjustment:

- Bonnet to front wing (a) 3.0 mm \pm 0.75 mm (0.12 in \pm 0.03 in)
- Bonnet to front wing (b) 3.0 mm \pm 0.75 mm (0.12 in \pm 0.04 in)
- Bonnet to headlamp (c) 6.0 mm \pm 1.5 mm (0.25 in \pm 0.03 in)

Tighten

25 N·m (18 lb ft)

Bonnet Replacement - Volt

Callout	Component Name
1	Bonnet Hinge Nut (Qty: 4) Caution : Refer to Fastener Caution in the Preface section. Procedure

Mark the location of the hinge to the bonnet with a grease pencil to help with alignment.

Tighten

25 N·m (18 lb ft)

Bonnet

2

Procedure

1. Disconnect the wiper washer hoses from the bonnet.
2. Transfer parts as needed.
3. Adjust the bonnet if needed.

Bonnet Insulator Replacement - Volt

Callout	Component Name
1	Hood Insulator Plastic Retainer (Qty: 5)
2	Bonnet Insulator Procedure

Ensure the 3 integral tabs are secured to the bonnet.

Bonnet Primary and Secondary Catch Replacement - Volt

Callout	Component Name
Preliminary Procedure	
Remove the front compartment front sight shield. Refer to Front Compartment Front Sight Shield Replacement : Volt → Ampera .	
	Bonnet Primary and Secondary Latch Bolt (Qty: 2)

1	Caution : Refer to Fastener Caution in the Preface section. Tighten 25 N·m (18 lb ft)
2	Bonnet Primary and Secondary Catch Procedure Disconnect the bonnet release cable and the electrical connector.

Front Side Door Check Link Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door trim panel. Refer to Front Side Door Trim Replacement .	
	Front Side Door Check Link Bolt to Body

1	<p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Tighten 22 N·m (16 lb ft)</p>
2	<p>Front Side Door Check Link Nut to Door (Qty: 2)</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Place the door in the full open position. 2. Place the window in the full up position. 3. Remove the front door speaker. Refer to Radio Front Side Door Speaker Replacement . <p>Tighten 10 N·m (89 lb in)</p>
3	<p>Front Side Door Check Link</p>

Rear Side Door Check Link Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door trim panel. Refer to Rear Side Door Trim Replacement .	
	Rear Side Door Check Link Bolt to Body

1	<p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Tighten 22 N·m (16 lb ft)</p>
2	<p>Rear Side Door Check Link Nut to Door (Qty: 2)</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Place the door in the full open position. 2. Place the window in the full up position. 3. Remove the rear door speaker. Refer to Radio Rear Side Door Speaker Replacement . <p>Tighten 10 N·m (89 lb in)</p>
3	Rear Side Door Check Link

Fuel Tank Filler Door Replacement

Callout	Component Name
1	<p data-bbox="244 1377 548 1414">Fuel Tank Filler Door</p> <p data-bbox="244 1458 405 1495">Procedure</p> <p data-bbox="244 1539 2580 1576">Position the fuel tank filler door to the full open position. Front Compartment Front Sight Shield Replacement - Volt

Callout	Component Name
1	Front Compartment Front Sight Shield Plastic Retainer (Qty: 10)
2	Front Compartment Front Sight Shield

Front Compartment Side Sight Shield Replacement - Volt

Callout	Component Name
1	Front Compartment Side Sight Shield Push-In Retainer
	Front Compartment Side Sight Shield
2	<p>Procedure</p>

1. Reposition the bonnet rear bonnet weatherstrip.
2. Release the retainer on the bottom of the sight shield.
3. Slide the sight shield rearward and upward to remove the front compartment side sight shield.

Liftgate Strut Replacement

Callout	Component Name
Liftgate Strut	
Warning : When a tailgate hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.	
Caution: Apply pressure only at the end of the liftgate/bonnet assist rod that you are removing or attaching. Do NOT apply pressure to the middle of the rod because	

1

damage or bending will result.

Procedure

1. Release the locking tabs on the strut.
2. Ensure that the clip is fully seated when the strut is reinstalled. If the clip cannot be fully seated, a new strut should be installed.
3. Ensure that the arrow on the strut is pointing toward the roof structure.

Front or Rear Side Door Lower Weatherstrip Replacement

Callout	Component Name
1	Front and Rear Door Lower Weatherstrip Retainer (Qty: 15) Procedure 1. Open both doors on the side that the weatherstrip is being serviced.

	2. Use a suitable tool, removal of the weatherstrip retainers.
2	Front and Rear Door Lower Weatherstrip

Front Side Door Weatherstrip Replacement - Door Side

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front outside rearview mirror. Refer to Outside Rearview Mirror Replacement .2. Remove the front side mirror applique. Refer to Outside Rearview Mirror Applique Replacement .3. Remove the front door check link from the body. Refer to Front Side Door Check Link Replacement .	

1	Front Side Door Weatherstrip Front Push-In Retainer (Qty: 3)
2	Front Side Door Weatherstrip Push-In Retainers (Qty: 27) Procedure <ol style="list-style-type: none">1. Place the door in the full open position.2. Place the window in the full down position.3. Roll the upper rear corner of the weatherstrip to expose the upper push-in retainer.
3	Front Side Door Weatherstrip

Front Side Door Weatherstrip Replacement - Body Side

Callout	Component Name
1	<p>Front Side Door Weatherstrip</p> <p>Procedure</p> <ol style="list-style-type: none">1. Starting in the centre bottom, pull the weatherstrip upward and away from the pinch-weld flange.

2. When installing start in the left upper corner of the pinch-weld flange, push inward on the flange until fully seated.
3. Inspect the door for proper operation.

Liftgate Weatherstrip Replacement

Callout	Component Name
<p>1</p> <p>Procedure</p> <p>Clean the area where the seal will be mounted. Use a suitable solvent with a mixture of 50 percent isopropyl alcohol and 50 percent water by volume, or high-flash</p>	<p>Liftgate Weatherstrip</p>

Rear Side Door Weatherstrip Replacement - Door Side

Callout	Component Name
Preliminary Procedure	
1.	Remove the rear side door trim panel. Refer to Rear Side Door Trim Replacement .
2.	Remove the rear door check link from the body. Refer to Rear Side Door Check Link Replacement .

1	Rear Side Door Weatherstrip Front Retainer (Qty: 3) Note : Though only one retainer is shown, there are also retainers at the upper front corner and at the upper rear corner of the door.
2	Procedure Rear Side Door Weatherstrip Retainers (Qty: 28) Ensure that all retainers are removed.
3	Procedure Rear Side Door Weatherstrip Inspect the door for proper operation.

Rear Side Door Weatherstrip Replacement - Body Side

Callout	Component Name
1	<p>Rear Side Door Weatherstrip</p> <p>Procedure</p> <ol style="list-style-type: none">1. Starting in the centre bottom, pull the weatherstrip upward and away from the pinch-weld flange.

2. When installing start in the left upper corner of the pinch-weld flange, push inward on the flange until fully seated.
3. Inspect the door for proper operation.

Bonnet Ajar Indicator Description and Operation

[Bonnet Ajar Indicator System Components](#)

- Body control module (BCM)
- Hybrid Powertrain Control Module 2
- Driver information centre
- Bonnet ajar switch, part of the bonnet latch assembly

[Bonnet Ajar Operation - Body Control Module](#)

The BCM applies B+ to the bonnet ajar signal circuit and monitors the voltage to determine the position of the bonnet. The bonnet ajar switch contains a multiplexed resistor. This resistor will vary the voltage seen by the BCM by pulling down the applied voltage based on the position of the switch.

[Bonnet Ajar Operation - Hybrid Powertrain Control Module 2](#)

The hybrid powertrain control module 2 applies B+ to the bonnet ajar signal circuit and monitors the voltage to determine the position of the bonnet. The bonnet ajar switch contains a multiplexed resistor. This resistor will vary the voltage seen by the hybrid powertrain control module 2 by pulling down the applied voltage based on the position of the switch.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Front Bumper Fascia Centre Support Bracket Fastener	9 N·m	80 lb in
Front Bumper Fascia Upper/Lower Screws	3 N·m	27 lb in
Front Bumper Lower Fascia Screws	2.5 N·m	22 lb in
Front Bumper Upper Fascia Screws	2.5 N·m	22 lb in
Front End Panel Centre Deflector Bolts	3 N·m	27 lb in
Front End Panel Outer Deflector Bolts	3 N·m	27 lb in
Headlamp Bolt	2.5 N·m	22 lb in
Rear Bumper Fascia Upper/Lower Screws	3 N·m	27 lb in

Rear Bumper Lower Fascia Screws	6 N·m	53 lb in
Rear Bumper Upper Fascia Screws	6 N·m	53 lb in

Front Bumper Energy Absorber Replacement - Volt

Callout	Component Name
Preliminary Procedure	
Remove the front fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .	
	Front Bumper Fascia Energy Absorber

1

Procedure

1. Reposition the electrical harness from the front fascia energy absorber.
2. Release the absorber by pulling the absorber from the front fascia retainers.

Front Bumper Fascia Removal and Installation - Volt

Callout

Component Name

Preliminary Procedures

1. Remove the front end panel outer deflector. Refer to [Front End Panel Outer Deflector Replacement](#) : [Volt](#) → [Ampera](#) .
2. Remove the front compartment front sight shield. Refer to [Front Compartment Front Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .
3. Remove the windscreen washer solvent container filler tube. Refer to [Windscreen Washer Solvent Container Filler Tube Replacement](#) .

4. Remove the side four front screws from the front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .

1	Front Bumper Fascia Upper Push-In Retainer (Qty: 2)
2	Front Bumper Fascia Upper Screw (Qty: 4) Caution : Refer to Fastener Caution in the Preface section. Tighten 3 N·m (27 lb in)
3	Front Bumper Fascia Lower Screw (Qty: 2) Tighten 3 N·m (27 lb in)
4	Front Bumper Fascia Lower Push-In Retainer (Qty: 4)
5	Front Bumper Fascia Procedure <ol style="list-style-type: none">1. Carefully push a small nylon wedge between the fascia and the front fascia retainers. Insert a small flat-bladed tool into the fascia slot and depress the snaps one at a time and pull on the fascia at the same time to gradually remove the fascia from the front fascia retainers of the wing.2. Disconnect any electrical connectors.3. Transfer any parts as needed.

Front Bumper Fascia Guide Replacement

Callout	Component Name
<p>Warning : Refer to Eye Protection Warning in the Preface section.</p> <p>Preliminary Procedure</p> <p>Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .</p>	

1	Front Bumper Fascia Guide Rivet (Qty: 3)
2	Headlamp Bolt Caution : Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
3	Front Bumper Fascia Guide

Front Bumper Fascia Centre Support Replacement

Callout	Component Name
Warning : Refer to Eye Protection Warning in the Preface section.	
Preliminary Procedure	
Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .	

1	Front Bumper Fascia Centre Support Bracket Bolt Caution : Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Front Bumper Fascia Rivet (Qty: 2)
3	Front Bumper Fascia Centre Support

Front Bumper Fascia Center Support Bracket Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the front bumper fascia centre support. Refer to Front Bumper Fascia Centre Support Replacement .
	Front Bumper Fascia Centre Support Bracket Fastener (Qty : 2)

1	Caution : Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Front Bumper Fascia Center Support Bracket

Front Bumper Lower Fascia Replacement - Volt

Callout

Component Name

Preliminary Procedures

1. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Remove the front bumper lower fascia centre grille. Refer to [Front Bumper Lower Fascia Centre Grille Replacement](#) : [Ampera](#) .

Front Bumper Lower Fascia Screw (Qty: 2)

Caution : Refer to [Fastener Caution](#) in the Preface section.

Procedure

1

1. Carefully push a small nylon wedge between the upper fascia and the lower fascia. Insert a small flat-bladed tool into the fascia slot and depress the tabs one at a time and pull on the upper fascia at the same time to gradually remove the lower fascia from the upper fascia.
2. Transfer parts as needed.

Tighten

2.5 N·m (22 lb in)

Callout	Component Name
Preliminary Procedure	
Remove the rear bumper fascia. Refer to Rear Bumper Fascia Removal and Installation : Volt → Ampera .	
	Rear Bumper Impact Bar Nut (Qty: 6)

1	Caution : Refer to Fastener Caution in the Preface section. Tighten 40 N·m (30 lb ft)
2	Rear Bumper Impact Bar Procedure Transfer any parts as needed.

Dimensions - Body

Point-to-point measurements are for reference only. All measurements are given in millimeters. Use these measurements for diagnosing and estimating. Point-to-point measurements are duplicated with tram bar pointers set at equal lengths. All die marks, holes, slots, and fasteners are measured to the centre. All dimensions are symmetrical unless otherwise specified.

Front Bumper Impact Bar Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.

4. Remove the 8 front bumper impact bar bolts (1).

5. Cut the front bumper impact bar (1) left and right.
6. Locate and mark all factory welds.

7. Drill all factory welds (1).

8. Remove the remaining parts of the front bumper impact bar (1).

[Installation Procedure](#)

Structural Rivet Method

Note : The original bumper impact bar bracket to lower rail welds are required to maintain structural integrity of the bumper system. However, as an alternative to MIG plug-welding, structural rivets may be used as a one-to-one weld substitution.

1. Position the service front bumper impact bar (1) to the vehicle.

2. Drill 7 mm (17/64 in) holes (1) for the structural rivets as noted from the original spot weld locations.
3. Apply GM Super Lube or equivalent to drilled locations for corrosion protection.
4. Install structural rivets (1) - GM part number 11610245 or equivalent.

Caution : Refer to [Fastener Caution](#) in the Preface section.

Note : Use only the original front bumper impact bar bolts. Replace bolts if damaged.

5. Install the 8 front bumper impact bar bolts (1) and tighten to **110 N·m (81 lb ft)**.
6. Install all related panels and components.
7. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
8. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

MIG Welding Method

1. Drill 8 mm (5/16 in) plug weld holes (1) in the service part as necessary in the locations noted from the original panel.
2. Prepare all attachment surfaces as necessary.
3. Apply GM-approved weld-thru coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .

4. Position the bumper impact bar (1) to the vehicle.

Caution : Refer to [Fastener Caution](#) in the Preface section.

Note : Use only the original front bumper impact bar bolts. Replace bolts if damaged.

5. Install the 8 front bumper impact bar bolts (1) and tighten to **110 N·m (81 lb ft)**.

6. Plug weld (1) accordingly.
7. Clean and prepare all welded surfaces.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
9. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
10. Install all related panels and components.
11. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Headlamp Mount Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area, as necessary.

7. Locate and mark all the necessary factory welds of the headlamp mount panel (1).
8. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

9. Remove the damaged headlamp mount panel (1).

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding.

3. Apply structural adhesive (1) the attaching surfaces of the headlamp mount panel.

4. Position the headlamp mount panel (1) on the vehicle.
5. Verify the fit of the headlamp mount panel.
6. Clamp the headlamp mount panel into position.

7. Spot weld the headlamp mount panel (1) with 17 spot welds accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area as necessary.
9. Paint the repaired area.
10. Install all related panels and components.
11. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front End Upper Tie Bar Support Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary.

6. Locate and mark all the necessary factory welds of the front end sheet metal cross panel reinforcement (1).
7. Drill and grind all factory welds. Note the number and location of welds for installation of the service assembly.

8. Remove the front end sheet metal cross panel reinforcement (1).

9. Grind the factory welds of the front end upper tie bar support (1) from the inside.

10. Remove the front end upper tie bar support (1).

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding and brazing.

3. Position the front end upper tie bar support (1) on the vehicle.
4. Verify the fit of the front end upper tie bar support.
5. Clamp the front end upper tie bar support into position.

6. Braze the front end upper tie bar support - left side (1) accordingly.

6.1. Brace line (2) - **50 mm**

6.2. Brace line (3) - **70 mm**

6.3. Brace line (4) - **60 mm**

6.4. Brace line (5) - **60 mm**

7. Braze the front end upper tie bar support - right side (1) accordingly.

7.1. Brace line (2) - **60 mm**

7.2. Brace line (3) - **60 mm**

7.3. Brace line (4) - **70 mm**

7.4. Brace line (5) - **50 mm**

8. Spot weld the front end upper tie bar support (1) with 6 spot welds accordingly.

9. Position the front end sheet metal cross panel reinforcement (1) on the vehicle.
10. Verify the fit of the front end sheet metal cross panel reinforcement.
11. Clamp the front end sheet metal cross panel reinforcement into position.

12. Spot weld the front end sheet metal cross panel reinforcement (1) with 12 spot welds accordingly.
13. Use the factory slots (2) for brazing.

14. Install the brackets.

14.1. Bonnet front bumper bracket (2) - 3 spot welds.

Note: This applies to the left side ONLY.

14.2. Drive motor power inverter bracket (3) - 4 **10 mm** braze edge seams

14.3. Headlamp bracket (4) - 2 spot welds.

15. Apply the sealers and anti-corrosion materials to the repair area as necessary.
16. Paint the repaired area.
17. Install all related panels and components.
18. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
19. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front Wheelhouse Front Panel Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary.

6. Locate and mark all the necessary factory welds of the front wheelhouse front panel (1).
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

8. Remove the damaged front wheelhouse front panel (1).

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding.

3. Apply structural adhesive (1).

4. Apply structural adhesive (1).

5. Position the front wheelhouse front panel (1) on the vehicle.
6. Verify the fit of the front wheelhouse front panel.
7. Clamp the front wheelhouse front panel into position.

8. Spot weld the front wheelhouse front panel (1) with 10 spot welds accordingly.

9. Spot weld the front wheelhouse front panel (1) with 6 spot welds accordingly.
10. Apply the sealers and anti-corrosion materials to the repair area as necessary.
11. Paint the repaired area.
12. Install all related panels and components.
13. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
14. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front Wheel housing Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Note : Front wheelhouse rear panel brace (1) remains to the body.

6. Locate and mark all the necessary factory welds of the front wheelhouse panel (2).

7. Drill all factory welds of the front wheelhouse panel (1). Note the number and location of welds for installation of the service assembly.

8. Cut the adhesive in the front area (1) and where the front wheelhouse and the front compartment side rail overlap (2) with an appropriate tool.

9. Remove the front wheelhouse panel (1).

[Installation Procedure](#)

1. Remove the front wheelhouse rear panel brace (1) from service panel.

2. Drill **8 mm (5/16 in)** for plug welding (1) instead of the adhesive noted from the front area of the original panel.

Note : Double the number of drills at the flange where front wheelhouse panel and front compartment side rail overlap (1).

3. Drill **8 mm (5/16 in)** for plug welding along the edges of the front wheelhouse panel (2) as noted from the original panel.
4. Clean and prepare the attaching surfaces for welding.

5. Position the front wheelhouse panel (1) on the vehicle.
6. Verify the fit of the front wheelhouse.
7. Clamp the front wheelhouse into position.

8. Plug weld the front wheelhouse panel (1) accordingly.
9. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
10. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
11. Install all related panels and components.
12. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
13. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front Compartment Upper Side Rail Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

6. Locate and mark all the necessary factory welds and weld seams of the front compartment upper side rail (1).
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

8. Grind factory weld seams (1) of the front compartment upper side rail.

9. Remove the front compartment upper side rail (1).

[Installation Procedure](#)

1. Drill **8 mm (5/16 in)** for plug welding along the edges of the front compartment upper side rail (1) as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.
3. Position the front compartment upper side rail on the vehicle.
4. Verify the fit of the front compartment upper side rail.
5. Clamp the front compartment upper side rail into position.

Note : Plug weld factory slots in the front hinge pillar body area (1) as noted from the original panel.

6. Plug weld the front compartment upper side rail (2) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
8. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
9. Install all related panels and components.
10. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
11. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front Hinge Pillar Body Sectioning

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Collision Sectioning Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area as necessary.

7. Create cut lines on the front hinge pillar (1).

Note : Do not damage any inner panels or reinforcements.

8. Cut the front hinge pillar (1) where the sectioning is to be performed.

9. Locate and mark all the necessary factory welds of the front hinge pillar (1).
10. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

11. Remove the damaged front hinge pillar (1).

[Installation Procedure](#)

1. Cut the front hinge pillar (1) in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Prepare all mating surfaces as necessary.
3. Clean and prepare the attaching surfaces for spot welding.

4. Create 31 **5 x 18 mm (4/16 x 11/16 in)** slots for MIG-brazing to the front hinge pillar (1).

5. Apply structural adhesive to windscreen frame (1) and front hinge pillar reinforcement (2).

6. Position the front hinge pillar (1) on the vehicle.
7. Verify the fit of the front hinge pillar.
8. Clamp the front hinge pillar into position.

9. Spot weld the front hinge pillar accordingly.

Flange front side door opening (1) - 26 spot welds.

10. Braze the front hinge pillar (1) accordingly.
 - 10.1. Front hinge pillar / body side outer upper panel (2) - **185 mm**.
 - 10.2. Front hinge pillar / rocker outer panel (3) - **170 mm**.
 - 10.3. Front hinge pillar / front hinge pillar reinforcement - 31 **5 x 18 mm (4/16 x 11/16 in)** slot brazes.
11. To create a solid braze with minimum heat distortion, make **25 mm** stitch brazes along the seam with **25 mm** gaps between them. Then go back and complete the stitch braze.
12. Apply the sealers and anti-corrosion materials to the repair area as necessary.

13. Paint the repaired area.
14. Install all related panels and components.
15. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
16. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Body Hinge Pillar Lower Reinforcement Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Collision Sectioning Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
6. Section body side outer-hinge pillar area. Refer to [Front Hinge Pillar Body Sectioning](#) .

7. Locate and mark all the necessary factory welds of the body hinge pillar lower reinforcement (1).
8. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

Note : There is a hidden weld on the inside of the pillar reinforcement.

9. Remove hidden spot weld (1) with a chisel.

10. Remove the damaged body hinge pillar lower reinforcement (1).

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.

2. Drill **8 mm (5/16 in)** for plug welding along the edges of the body hinge pillar lower reinforcement (1) as noted from the original panel.

3. Remove weld tab portion (1) from inner bracket with appropriate tool.
4. Clean and prepare the attaching surfaces for welding.

5. Position the body hinge pillar lower reinforcement (1) on the vehicle.
6. Verify the fit of the body hinge pillar lower reinforcement.
7. Clamp the body hinge pillar lower reinforcement into position.

8. Plug weld the body hinge pillar lower reinforcement (1) accordingly.
9. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
10. Install the bodyside outer hinge pillar section. Refer to [Front Hinge Pillar Body Sectioning](#) .
11. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
12. Install all related panels and components.
13. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
14. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Roof Outer Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area as necessary.

7. Locate and mark all the necessary factory welds of the roof outer panel (1).
8. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

9. To remove the damaged roof outer panel (2) cut the adhesive (1) with a suitable tool.

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding.

3. Apply one-part urethane adhesive to the roof bows (1) and apply structural adhesive the attaching surfaces (2) of the roof outer panel.

4. Position the roof outer panel (2) on the vehicle.
5. Verify the fit of the roof outer panel.
6. Clamp the roof outer panel into position.

7. Spot weld the roof outer panel (1) accordingly.
 - 7.1. Flange roof side (2) - 26 spot welds.
 - 7.2. Flange liftgate opening (3) - 18 spot welds.
 - 7.3. Flange roof side (4) - 26 spot welds.
 - 7.4. Flange windscreen opening (5) - 19 spot welds.
8. Apply the sealers and anti-corrosion materials to the repair area as necessary.
9. Paint the repaired area.
10. Install all related panels and components.
11. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Rocker Inner Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Collision Sectioning Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

6. Create cut lines on the body side inner panel (1).

Note : Do not damage any inner panels or reinforcements.

7. Cut the body side inner panel (1) where sectioning is to be performed.

8. Locate and mark all the necessary factory welds of the body side inner panel (1).
9. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

10. Remove the body side inner panel (1).

11. Locate and mark all the necessary factory welds of the rocker inner panel (1).
12. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

13. Remove the damaged rocker inner panel (1).

[Installation Procedure](#)

1. Align the rocker inner panel.

2. Drill 8 mm (5/16 in) for plug welding along the edges of the rocker inner panel (1) as noted from the original panel.
3. Clean and prepare the attaching surfaces for welding.
4. Position the rocker inner panel on the vehicle.
5. Verify the fit of the quarter outer panel.
6. Clamp the rocker inner panel into position.

7. Plug weld the sill inner panel (1) accordingly.

8. Plug weld the body side inner panel (1) accordingly.
9. To create a solid weld with minimum heat distortion, make 25 mm (1 in) stitch welds along the seam with 25 mm (1 in) gaps between them. Then go back and complete the stitch weld.
10. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
11. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
12. Install all related panels and components.
13. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
14. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Rocker Outer Panel Sectioning

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary.

6. Create cut lines on the rocker outer panel (1)

7. Cut the rocker outer panel (1) where the sectioning is to be performed.

8. Locate and mark all the necessary factory welds of the rocker outer panel (1).
9. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

10. Open the wheelhouse flanging of the rocker outer panel (1).

11. Remove the rocker outer panel (1) cut the adhesive (2) with a suitable tool.

[Installation Procedure](#)

1. Cut the body side outer panel (1) in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one and one half times the metal thickness at the sectioning joint.

2. Create 28 **5x 8 mm** slots for MIG-brazing to the rocker outer panel (1).
3. Prepare all mating surfaces as necessary.
4. Clean and prepare the attaching surfaces for spot welding and brazing.

5. Apply structural adhesive (1).

6. Position the rocker outer panel (1) on the vehicle.
7. Verify the fit of the rocker outer panel.
8. Clamp the rocker outer panel into position.

- 9. Spot weld the rocker outer panel (1) accordingly.
- 9.1. Flange front side door opening (2) - 18 spot welds
- 9.2. Flange rear side door opening (3) - 16 spot welds

10. Braze the rocker outer panel (1) accordingly.
 - 10.1. Rocker outer panel / front hinge pillar (2) - **230 mm**
 - 10.2. Rocker outer panel / centre pillar (3) - **340 mm**
 - 10.3. Rocker outer panel / quarter outer panel (4) - **300 mm**
 - 10.4. Rocker outer panel (5) - 28 **5x18 mm** slot brazes
11. To create a solid braze with minimum heat distortion, make **25 mm** stitch brazes along the seam with **25 mm** gaps between them. Then go back and complete the stitch braze.
12. Apply the sealers and anti-corrosion materials to the repair area as necessary.
13. Paint the repaired area.
14. Install all related panels and components.
15. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
16. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Body Side Outer Panel Reinforcement Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#)
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary.

6. Locate and mark all the necessary factory welds of the body side outer panel rear reinforcement (1).
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

8. Remove the body side outer panel rear reinforcement (1).

9. Locate and mark all the necessary factory welds of the body side outer panel reinforcement (1).
10. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

11. To remove the damaged body side outer panel reinforcement (1) cut the adhesive (2) with a suitable tool.

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding.

3. Apply structural adhesive (1).

4. Position the body side outer panel reinforcement (1) on the vehicle.
5. Verify the fit of the body side outer panel reinforcement.
6. Clamp the body side outer panel reinforcement into position.

7. Spot weld the body side outer panel reinforcement (1) accordingly.
 - 7.1. Flange front side door opening (2) - 9 spot welds
 - 7.2. Flange rear side door opening (3) - 6 spot welds
 - 7.3. Lower flange (4) - 32 spot welds

8. Position the body side outer panel rear reinforcement (1) on the vehicle.
9. Verify the fit of the body side outer panel rear reinforcement.
10. Clamp the body side outer panel rear reinforcement into position.

11. Install the body side outer panel rear reinforcement (1) with 10 Spot welds and 6 **10 mm** brazed edge seams accordingly.
12. Apply the sealers and anti-corrosion materials to the repair area as necessary.
13. Paint the repaired area.
14. Install all related panels and components.
15. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
16. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Body Side Inner Panel Sectioning

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Collision Sectioning Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
6. Section quarter outer panel. Refer to [Quarter Outer Panel Sectioning](#) .

7. Create section line (1) on the quarter panel extension.

8. Cut the panel at the section joint (1).

Note: use a heat gun to facilitate removal in areas where structural adhesive is present.

9. Remove quarter panel extension (1).

10. Locate and drill factory welds on the body lock pillar upper reinforcement (1). Note the number and location of welds for installation.

11. Remove reinforcement (1) from quarter inner panel.

Note : Do not damage any other panels or reinforcements.

12. Create a cut line on the body side inner panel (1) **60 mm (2.35 in)** above the rocker outer panel flange.

13. Cut the body side inner panel (1) where sectioning is to be performed.

14. Locate and drill out all factory welds on the body side inner panel (1). Note the number and location of the welds for installation of the service assembly.

15. Remove the damaged body side inner panel (1).

[Installation Procedure](#)

1. Cut the body side inner service assembly **65 mm (2.5 in)** longer at the sectioned joint (1). It should overlap the remaining portion of the original panel.

2. Drill **8 mm (5/16 in)** plug weld holes in the service part (1), as necessary, in the corresponding locations noted on the original panel and along sectioned joint.
3. Prepare all mating surfaces as necessary.
4. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .

5. Position the quarter inner panel (1) to the vehicle using 3-dimensional measuring equipment. Clamp the panel in place.

6. Plug weld the body side inner panel (1) accordingly.

7. To create a solid weld with minimum heat distortion, make **25 mm (1 in)** stitch welds along the seam (1) with **25 mm (1 in)** gaps between them. Then go back and complete the stitch weld.
8. Prepare all mating surfaces as necessary.

9. Position the body lock pillar upper reinforcement (1) to the vehicle using 3-dimensional measuring equipment. Clamp the panel in place.
10. Clean and prepare the attaching surfaces for welding.

11. Plug weld the body lock pillar upper reinforcement (1) accordingly.

12. Grind to bare metal in areas (1) where structural adhesive was present on both attaching parts.

Note : The adhesive has a 40-50 minute working time.

13. Apply a **3-6 mm (1/8-1/4 in)** bead of metal panel bonding adhesive (1) or equivalent, to both of the mating surfaces (1) to attach quarter panel extension.
14. Using a small brush, spread a coat of adhesive to cover all the bare metal surfaces to ensure corrosion protection.

15. Position the quarter panel extension (1) to the vehicle using 3-dimensional measuring equipment. Clamp the panel in place. If adjustments are needed, slide the panels to realign. Do not pull apart.

16. To create a solid weld with minimum heat distortion, make **25 mm (1 in)** stitch welds along the seam (1) with **25 mm (1 in)** gaps between them. Then go back and complete the stitch weld.
17. Prepare all mating surfaces as necessary.
18. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
19. Complete sectioning quarter panel outer. Refer to [Quarter Outer Panel Sectioning](#) .
20. Prepare all mating surfaces as necessary.
21. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
22. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
23. Install all related panels and components.
24. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
25. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Rear Compartment Floor Panel Sectioning

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Sectioning should be performed only in the recommended areas. Failure to do so may compromise the structural integrity of the vehicle and cause personal injury if the vehicle is in a collision.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .

Note :

- The rear floor-pan service part comes as a pre-sectioned assembly. Make sure to follow these steps to prevent unnecessary repairs to the vehicle.
- In areas where structural adhesive is present, use heat to facilitate removal of the components.

3. Remove all related panels and components.
4. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

5. Repair as much of the damaged area as possible. Refer to [Dimensions - Body](#) .

6. Locate welds, drill and remove wheelhouse inner braces (1).

7. Locate the rear edge of cross bar No. 5 (1) and inside edge of the frame rails (2) from under the vehicle.
8. Drill several 1/8 in holes in the floor pan only along the rear edge of cross bar No. 5 and inside frame rails. This will help to identify the location from the top side of the floor pan.

9. Apply a piece of masking tape to the top surface of the rear compartment panel along the holes (1) drilled in the floor pan.

Note : Do not damage any adjacent panels or components when cutting or drilling out spot welds.

10. Cut slightly rearward of the tape along the holes (1) drilled in the floor pan.

11. Remove inner damaged portion of floor panel (1).

12. Cut across remaining portion of floor (1).

13. Chisel remaining portion (1) above frame rails and remove.

[Installation Procedure](#)

Note :

- If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 ½ in) apart.
- Some panels may have structural weld-thru adhesive. It is necessary to replace the weld-thru adhesive with an additional spot weld between each factory spot weld.

1. Drill 8 mm (5/16 in) plug weld holes (1) in the service part as necessary in the corresponding locations noted on the original panel.
2. Lay out and drill an additional row (2) of 8 mm (5/16 in) plug weld holes on top of the no. 5 bar weld flanges.
3. Prepare all mating surfaces for welding as necessary.
4. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .

5. Position the rear floor pan (1) to the vehicle using three-dimensional measuring equipment. Clamp the part in place.

6. Plug weld (1) accordingly.

7. Weld the seam (1) along the front cut edge of the floor panel service part. To create a solid weld along the front of the service part with a minimum of heat distortion, make a stitch weld along the seam with 25 mm (1 in) gaps between each weld.
8. Clean and prepare all welded surfaces.
9. Apply sound deadening materials as necessary.
10. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
11. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
12. Install all related panels and components.
13. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
14. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Rear Wheelhouse Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

6. Locate and mark all the necessary factory welds of the rear inner wheelhouse panel (1).
7. Drill all factory welds.

Note : Note the number and location of welds for installation of the service assembly.

8. Remove the rear inner wheelhouse panel (1).

[Installation Procedure](#)

1. Drill **8 mm (5/16 in)** for plug welding along the edges of the rear inner wheelhouse panel (1) as noted from the original panel.

Note : If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 1/2 in).

2. Clean and prepare the attaching surfaces for welding.

3. Position the rear inner wheelhouse panel (1) on the vehicle.
4. Verify the fit of the rear inner wheelhouse.
5. Clamp the rear inner wheelhouse into position.

6. Plug weld the rear wheelhouse panel (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
8. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
9. Install all related panels and components.
10. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
11. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Quarter Outer Panel Sectioning

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Special Tools

- BO-6392 Flanging Tool Kit
- BO-6396 Bonding Pliers

For equivalent regional tools, refer to [Special Tools](#) .

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Collision Sectioning Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area as necessary.

7. Create cut lines on the quarter outer panel (1).

Note : Do not damage any inner panels or reinforcements.

8. Cut the quarter outer panel (1) where the sectioning is to be performed.

9. Locate and mark all the necessary factory welds of the quarter outer panel (1).
10. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

11. Open the wheelhouse flanging of the quarter outer panel (1).

12. To remove the damaged quarter outer panel (2) cut the adhesive (1) with a suitable tool.

[Installation Procedure](#)

1. Cut the quarter outer panel (1) in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Prepare all mating surfaces as necessary.
3. Clean and prepare the attaching surfaces for spot welding.

4. Create 27 **5 x 18 mm (4/16 x 11/16 in)** (1) slots for MIG-brazing to the quarter outer panel (2).
5. Position the quarter outer panel on the vehicle.
6. Verify the fit of the quarter outer panel.
7. Clamp the quarter outer panel into position.

8. Drill 8 **4,2 mm** holes (1) for rivets to quarter outer panel (2).
9. Remove quarter outer panel from the vehicle.

10. Apply structural adhesive to body side inner panel (1).

11. Apply structural adhesive to body side inner panel filler (1) on right side ONLY.

12. Position the quarter outer panel (1) on the vehicle.
13. Verify the fit of the quarter outer panel.
14. Clamp the quarter outer panel into position.

15. Rivet (2) the quarter outer panel.

16. Spot weld the quarter outer panel (1) accordingly.

Flange rear side door opening (3) - 28 spot welds.

17. Braze the quarter outer panel (1) accordingly.
 - Quarter outer panel / rocker outer panel (2) - **160 mm**.
 - Quarter outer panel / body side outer upper panel (3) - **215 mm**.
 - Quarter outer panel / body side inner panel - **27 5 x 18 mm (4/16 x 11/16 in)** slot brazes.
18. To create a solid braze with minimum heat distortion, make **25 mm** stitch brazes along the seam with **25 mm** gaps between them. Then go back and complete the stitch braze.
19. Pre-flanging the flange with *BO-6396* pliers and *BO-6392* tool kit.

20. Finish closing the wheelhouse flanging.
21. Apply the sealers and anti-corrosion materials to the repair area, as necessary.
22. Paint the repaired area.
23. Install all related panels and components.
24. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
25. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Body Rear End Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

6. Locate and mark all the necessary factory welds of the body rear end outer panel (1).

Note : Note the number and location of welds for installation of the service assembly.

7. Drill all factory welds.

8. Remove the body rear end panel (1).

9. Locate and mark all the necessary factory welds of the body rear end panel (1).

Note : Note the number and location of welds for installation of the service assembly.

10. Drill all factory welds.

11. Remove the body rear end panel (1).

[Installation Procedure](#)

Note : If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 1/2 in).

1. Drill **8 mm (5/16 in)** for plug welding along the edges of the body rear end panel (1) as noted from the original panel.
2. Clean and prepare the attaching surfaces for welding.

3. Position the rear end panel (1) to the vehicle using 3-dimensional measuring equipment. Clamp the rear end panel into place.

4. Plug weld the body rear end panel (1) accordingly.

5. Position the rear end outer panel (1) to the vehicle using 3-dimensional measuring equipment. Clamp the rear end panel into place.

6. Plug weld the body rear end outer panel (1) accordingly.
7. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
8. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
9. Install all related panels and components.
10. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
11. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front Wing Front Bracket Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
2. Remove all related panels and components.
3. Remove the sealers and anti-corrosion materials from the repair area as necessary.

4. Drill off the front wing front bracket (1).

5. Remove the front wing front bracket (1).

[Installation Procedure](#)

1. Align the front wing front bracket (1) and clamp into position.

2. Drill holes **4.2 mm** for rivets to front wing front bracket (1) and front compartment upper side rail.
3. Clean and prepare the attaching surfaces.

4. Apply sealer part no.: 93165589 to attaching surfaces (1).

5. Rivet the front wing front bracket (1) with waterproof steel rivets part no.: 93174636.
6. Use sealer and seal the rivet heads.
7. Apply the sealers and anti-corrosion materials to the repair area as necessary.
8. Paint the repaired area.
9. Install all related panels and components.
10. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Front Rail Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications. Refer to [Dimensions - Body](#) .
5. Note the location and remove the sealers and anti-corrosion materials from the repair area. Refer to [Anti-Corrosion Treatment and Repair](#) .

Note : Do not damage any inner panels or reinforcements.

6. Locate and drill out all factory welds. Note the number and location of the welds for installation of the front rail (1).

7. Remove the damaged front rail (1).

[Installation Procedure](#)

Note: If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1½ in) apart.

Some panels may have structural weld-thru adhesive. Replace the weld-thru adhesive with an additional spot weld between each factory spot weld.

1. Drill 8 mm (5/16 in) plug weld holes in the service part front rail (1) as necessary in the locations noted from the original panel.
2. Prepare all mating surfaces as necessary.
3. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .

4. Position the front rail (1) to the vehicle using 3-dimensional measuring equipment. Clamp the rail in place.

5. Plug weld the front rail (1) accordingly.
6. Clean and prepare all welded surfaces.
7. Install all related panels and components.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
9. Paint the repair area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
10. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
11. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Centre Pillar Inner Panel Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary.

6. Locate and mark all the necessary factory welds of the centre pillar inner panel (1).
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

8. Remove the damaged centre pillar inner panel (1).

[Installation Procedure](#)

1. Create 3 **5x18 mm** slots (2) for MIG-brazing to the centre pillar inner panel (1).
2. Prepare all mating surfaces as necessary.
3. Clean and prepare the attaching surfaces for spot welding and brazing.

4. Position the centre pillar inner panel (1) on the vehicle.
5. Verify the fit of the center pillar inner panel.
6. Clamp the center pillar inner panel into position.

7. Install the centre pillar inner panel (1) accordingly.
 - 7.1. Upper flange (2) - 3 **5x18 mm** slot brazes
 - 7.2. Upper flange (3) - 2 spot welds
 - 7.3. Lower flange (4) - 4 spot welds
8. Apply the sealers and anti-corrosion materials to the repair area as necessary.
9. Paint the repaired area.
10. Install all related panels and components.

11. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Centre Pillar Reinforcement Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area as necessary.

7. Locate and mark all the necessary factory welds of the centre pillar reinforcement (1).
8. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

9. Remove the damaged centre pillar reinforcement (1).

[Installation Procedure](#)

1. Create 20 **6 x 20 mm (4/16 x 11/16 in)** slots for MIG-brazing to the centre pillar reinforcement (1).
2. Prepare all mating surfaces as necessary.
3. Clean and prepare the attaching surfaces for spot welding.

4. Position the centre pillar reinforcement (1) on the vehicle.
5. Verify the fit of the centre pillar reinforcement.
6. Clamp the centre pillar reinforcement into position.

7. Spot weld the centre pillar reinforcement accordingly.
 - 7.1. Flange front side door opening (1) - 22 spot welds.
 - 7.2. Flange rear side door opening (2) - 21 spot welds.

8. Braze the centre pillar reinforcement (1) with 20 **6 x 20 mm (4/16 x 11/16 in)** slot brazes accordingly.
9. Apply the sealers and anti-corrosion materials to the repair area as necessary.
10. Paint the repaired area.
11. Install all related panels and components.
12. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
13. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Centre Pillar Sectioning - Outer

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Collision Sectioning Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area as necessary.

7. Create cut lines on the centre pillar (1).

Note : Do not damage any inner panels or reinforcements.

8. Cut the centre pillar (1) where the sectioning is to be performed.

9. Locate and mark all the necessary factory welds of the centre pillar (1).
10. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

11. Remove the damaged centre pillar (1).

[Installation Procedure](#)

1. Cut the centre pillar (1) in corresponding locations to fit the remaining original panel. The sectioning joint should be trimmed to allow a gap of one-and-one-half-times the metal thickness at the sectioning joint.
2. Prepare all mating surfaces as necessary.
3. Clean and prepare the attaching surfaces for spot welding.

4. Create 5 **5 x 18 mm (4/16 x 11/16 in)** slots for MIG-brazing to the centre pillar (1).

5. Apply structural adhesive to centre pillar reinforcement (1, 2).

6. Position the centre pillar (1) on the vehicle.
7. Verify the fit of the centre pillar.
8. Clamp the centre pillar into position.

9. Spot weld the centre pillar (1) accordingly.
 - 9.1. Flange front side door opening (2) - 25 spot welds.
 - 9.2. Flange rear side door opening (3) - 23 spot welds.

10. Braze the centre pillar accordingly.
 - 10.1. Centre pillar / body side outer upper panel (1) - **750 mm**.
 - 10.2. Centre pillar / rocker outer panel (2) - **160 mm**.
 - 10.3. Centre pillar / rocker outer panel (3) - **170 mm**.
11. To create a solid braze with minimum heat distortion, make **25 mm** stitch brazes along the seam with **25 mm** gaps between them. Then go back and complete the stitch braze.
12. Apply the sealers and anti-corrosion materials to the repair area as necessary.
13. Paint the repaired area.
14. Install all related panels and components.
15. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
16. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Front Side Door Outer Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Note : Before beginning the repair, refer to [Metal Panel Bonding](#) for proper adhesive applicator preparations and general information.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove the door from the vehicle. Refer to [Front Side Door Replacement](#) .
4. Remove the outer door handle.
5. Remove the outside rearview mirror.

6. Grind the edges of the door outer panel (1) to separate the outer door panel from the door shell.

Warning : Inspection of the door guard beam for damage must be performed before replacement of the door outer panel. If damage to the door guard beam is found the door must be replaced. Failure to do so may compromise the structural integrity of the vehicle and may cause personal injury if the vehicle is involved in a collision.

7. Remove the outer door panel (1).
8. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

9. Straighten the edges of the door shell.

[Installation Procedure](#)

1. Using a grinding disk, grind the surface of the door shell mating flanges (1) to bare steel.

2. Scuff the opposing mating surfaces of the door outer panel to remove the gloss of the E-Coat.
3. Clean the mating surfaces.

Note : The adhesive has a 40-50 minute working time. Do not allow the door to totally cure off the vehicle, as proper alignment of the door outer panel to the door shell will be difficult.

4. Apply a 3-6 mm (1/8-1/4 in) bead of metal panel bonding adhesive (1) GM P/N 12378566/7 (Canadian P/N 88901674/5) or equivalent, to both of the mating surfaces.
5. Using a small acid brush, spread a coat of adhesive to cover all the bare metal surfaces to ensure corrosion protection.

Note : Do NOT pull the panels apart after joined together. If necessary, slide the panels against each other to realign the panels.

6. Install the door outer panel (1) to the door shell.

7. Clamp the door outer panel (1) into position, as required.
8. Using a hammer, re-hem the hem flanges around the door shell. Continue to hammer in stages along the hem flanges.
9. Using lacquer thinner remove the excess adhesive from the door panel area.
10. Install the door to the vehicle. Inspect the door outer panel for proper alignment. Adjust the alignment, as required. Refer to [Front Side Door Replacement](#) .
11. Clean and prepare all welded surfaces.

12. Apply Fusor super flexible anti-flutter foam-fast set, or equivalent, in 4-5 evenly spaced locations between the door outer panel and the inner safety beam (1).
13. Apply sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
14. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
15. Install the outer door handle.
16. Install the outside rearview mirror.
17. Install the door to the vehicle. Refer to [Front Side Door Replacement](#) .
18. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .
19. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .

Rear Side Door Outer Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : To avoid personal injury when exposed to welding flashes or to galvanized (Zinc Oxide) metal toxic fumes while grinding/cutting on any type of metal or sheet moulded compound, you must work in a properly ventilated area, wearing an approved respirator, eye protection, earplugs, welding gloves, and protective clothing.

Note : Before beginning the repair, refer to [Metal Panel Bonding](#) for proper adhesive applicator preparations and general information.

Warning : Refer to [SIR Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove the door from the vehicle. Refer to [Rear Side Door Replacement](#) .
4. Remove the outer door handle.

5. Grind the edges of the door outer panel to separate the outer door panel from the door shell.

Warning : Inspection of the door guard beam for damage must be performed before replacement of the door outer panel. If damage to the door guard beam is found the door must be replaced. Failure to do so may compromise the structural integrity of the vehicle and may cause personal injury if the vehicle is involved in a collision.

6. Remove the outer door panel (1) from the door shell.
7. Remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

8. Straighten the edges (1) of the door shell.

[Installation Procedure](#)

1. Using a grinding disk, grind the surface of the door shell mating flanges (1) to bare steel.

2. Scuff the opposing mating surfaces of the door outer panel (1) to remove the gloss of the E-Coat.
3. Clean the mating surfaces.

Note : The adhesive has a 40-50 minute working time. Do not allow the door to totally cure off the vehicle, as proper alignment of the door outer panel to the door shell will be difficult.

4. Apply a 3-6 mm (1/8-1/4 in) bead of metal panel bonding adhesive (1) GM P/N 12378566/7 (Canadian P/N 88901674/5) or equivalent, to both of the mating surfaces.
5. Using a small acid brush, spread a coat of adhesive to cover all the bare metal surfaces to ensure corrosion protection.

Note : Do NOT pull the panels apart after joined together. If necessary, slide the panels against each other to realign the panels.

6. Install the door outer panel (1) to the door shell.

7. Clamp the door outer panel into position, as required.
8. Using a hammer and dolly, re-hem the hem flanges around the door shell. Continue to hammer in stages along the hem flanges.
9. Using lacquer thinner, remove the excess adhesive from the door panel area.
10. Install the door to the vehicle. Inspect the door outer panel for proper alignment. Adjust the alignment, as required.
11. Clean and prepare all welded surfaces.

12. Apply Fusor super flexible anti-flutter foam-fast set, or equivalent in 4-5 evenly spaced locations between the door outer panel and the inner safety beam (1).
13. Apply sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
14. Paint the repaired area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
15. Install the outer door handle.
16. Install the door to the vehicle. Refer to [Rear Side Door Replacement](#) .
17. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .
18. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .

Rail Replacement - Rear Section

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

1. Disable the supplemental inflatable restraint (SIR) System. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications. Refer to [Dimensions - Body](#) .
5. Note the location and remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Note : To remove the rear rail-rear section, the rear spring seat, number five bar extension , and the rear suspension support bracket (1) will have to be removed to gain access to the rail spot welds.

Note : Do not damage any inner panels or reinforcements. In areas where structural adhesive is present, heat the area to facilitate removing the components.

6. Locate and drill out all factory welds (1). Note the number and location of the welds for installation of the rear rail - rear section.

7. Remove the damaged rear rail - rear section (1).

Installation Procedure

Note :

- If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1 ½ in) apart.
- Some panels may have structural weld-thru adhesive. It is necessary to replace the weld-thru adhesive with an additional spot weld between each factory spot weld.

1. Prepare all mating surfaces as necessary.
2. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .

3. Position the rear rail-rear section (1) to the vehicle using 3-dimensional measuring equipment. Clamp the rear rail lower into place.

4. Plug weld accordingly (1).
5. Clean and prepare all welded surfaces.
6. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
7. Paint the repair area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
8. Install all related panels and components.
9. If disabled, enable the high voltage system. Refer to [High Voltage Enabling](#) .
10. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Rear End Lower Panel Reinforcement Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
3. Remove all related panels and components.
4. Visually inspect the damage. Repair as much of the damage as possible.
5. Remove the sealers and anti-corrosion materials from the repair area as necessary.

6. Locate and mark all the necessary factory welds of the rear end lower panel reinforcement (1).
7. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

8. Remove the damaged rear end lower panel reinforcement (1).

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding and brazing.

3. Create 3 **5x18 mm** (2, 3) slots for brazing to the rear end lower panel reinforcement (1).

4. Apply structural adhesive to rear end lower panel reinforcement (1).

5. Position the rear end lower panel reinforcement (1) on the vehicle.
6. Verify the fit of the rear end lower panel reinforcement.
7. Clamp the rear end lower panel reinforcement into position.

8. Spot weld the rear end lower panel reinforcement (1) accordingly.
 - 8.1. Upper flanges rear end lower panel reinforcement (2) - 2 spot welds
 - 8.2. Flanges to body side inner panel (3) - twice 5 spot welds
 - 8.3. Flange to rear compartment filler (4) - 3 spot welds
 - 8.4. Rear bumper energy anchor plate to rear rail (5) - 7 spot welds
 - 8.5. Lower flange rear end lower panel reinforcement (6) - 7 spot welds

8.6. Rear bumper energy anchor plate to rear rail (7) - 7 spot welds

8.7. Flange to rear compartment filler (8) - 3 spot welds

9. Braze the rear end lower panel reinforcement (1) accordingly.

9.1. Rear end lower panel reinforcement / body side inner panel extension (2) - 3 **5x18 mm**

9.2. Rear end lower panel reinforcement / body side inner panel extension (3) - 3 **5x18 mm**

10. Apply the sealers and anti-corrosion materials to the repair area as necessary.

11. Paint the repaired area.
12. Install all related panels and components.
13. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
14. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Rear End Panel Replacement

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Warning : Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Inspect the high voltage system. Refer to [High Voltage System Inspection](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove all related panels and components.
5. Visually inspect the damage. Repair as much of the damage as possible.
6. Remove the sealers and anti-corrosion materials from the repair area as necessary.

7. Locate and mark all the necessary factory welds of the rear end panel (1).
8. Drill all factory welds. Note the number and location of welds for installation of the service assembly.

9. To remove the damaged rear end panel (2) cut the adhesive (1) with a suitable tool.

[Installation Procedure](#)

1. Prepare all mating surfaces as necessary.
2. Clean and prepare the attaching surfaces for spot welding.

3. Apply structural adhesive to the attaching surfaces (1) of the rear end panel.

4. Position the rear end panel (1) on the vehicle.
5. Verify the fit of the rear end panel.
6. Clamp the rear end panel into position.

7. Spot weld the rear end panel (1) with 63 spot welds accordingly.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary.
9. Paint the repaired area.
10. Install all related panels and components.
11. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Resistance Spot Welded Full Panel Replacement

Note : Use this procedure for all panels that are replaced at the factory seams, unless a specific procedure exists in the Collision Repair section of this vehicle's service information.

Removal Procedure

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications.

Warning : Refer to [Foam Sound Deadeners Warning](#) in the Preface section.

5. Note the location and remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Note : Do not damage any inner panels or reinforcements.

6. Locate and drill out all factory welds (1). Note the number and location of the welds for installation of the service part.

7. Remove the damaged part (1).

Installation Procedure

Note : If the location of the original plug weld holes cannot be determined, space the plug weld holes every 40 mm (1½ in) apart. Where structural adhesive was present, space the plug weld holes every 20 mm (¾ in) apart.

1. Prepare all mating surfaces as necessary.
2. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .
3. Position the service part. Clamp in place.

4. Apply welds accordingly (1).
5. Clean and prepare all welded surfaces.
6. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
7. Paint the repair area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
8. Install all related panels and components.
9. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
10. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

MIG-Welded Full Panel Replacement

[Removal Procedure](#)

Warning : Refer to [Approved Equipment for Collision Repair Warning](#) in the Preface section.

Note : Use this procedure for all panels that are replaced at the factory seams, unless a specific procedure exists in the Collision Repair section of this vehicle's service information.

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Remove all related panels and components.
4. Repair as much of the damage as possible to factory specifications.

Warning : Refer to [Foam Sound Deadeners Warning](#) in the Preface section.

5. Note the location and remove the sealers and anti-corrosion materials from the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .

Note : Do not damage any inner panels or reinforcements.

6. Locate and drill out all factory welds (1). Note the number and location of the welds for installation of the service part.

7. Remove the damaged part (1).

[Installation Procedure](#)

Note : If the location of the original plug weld holes can not be determined, space the plug weld holes every 40 mm (1 1/2 in) apart. Where structural adhesive was present, space the plug weld holes every 20 mm (3/4 in) apart.

1. Drill 8 mm (5/16 in) plug weld holes in the service part as necessary in the locations noted from the original panel (1).
2. Prepare all attachment surfaces as necessary.
3. Prepare all mating surfaces as necessary.
4. Apply GM-approved Weld-Thru Coating or equivalent to all mating surfaces. Refer to [Anti-Corrosion Treatment and Repair](#) .
5. Position the service part. Clamp in place.

6. Plug weld accordingly (1).
7. Clean and prepare all welded surfaces.
8. Apply the sealers and anti-corrosion materials to the repair area, as necessary. Refer to [Anti-Corrosion Treatment and Repair](#) .
9. Paint the repair area. Refer to [Basecoat/Clearcoat Paint Systems](#) .
10. Install all related panels and components.
11. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
12. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Dual Phase Steel

This information provides repair recommendations and general guidelines for steel classified as Dual Phase Steel (Dual Phase Steel with a tensile strength up to and including 800 MPa), also known as DP.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Note : The use of heat to repair damage is not recommended for this classification of steel.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- This type of steel can be used as a sleeve, or backer plate, when recommended in a specific sectioning procedure.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

High Strength Low Alloy Steel

This information provides repair recommendations and general guidelines for steel classified as High Strength Low Alloy Steel, also known as HSLA. This type of steel normally has a tensile strength range from 300-700 MPa.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650°C (1200°F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- This type of steel can be used as a sleeve, or backer plate, during sectioning procedures.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

Metal Panel Bonding

This is intended to provide general guidelines for adhesive bonding of exterior panels as an alternative to Metal-Inert Gas (MIG) welding. Panel bonding may be seen as an alternative to MIG welding to provide full panel replacement in regards to collision repair procedures. The benefits of panel bonding is:

- No heat or burn damage when additional welding is not required
- Corrosion protection
- Can act as a sealant
- Improved process for complicated shapes (wheelhouse area)

The General Motors specification for metal bonding adhesives is GM 6449G. The scope of this specification is intended to provide the performance guidelines of structural adhesive systems used to repair (metallic) automotive bodies in the aftermarket. These types of adhesives are intended for use when bonding replacement body panels as an option to welding as the attachment means. GM information outlines the use of room temperature cure acrylic adhesives that contain glass bead technology.

Bonding procedures in general are applicable only to a factory seams type approach.

Sectioning or partial panelling of full panels is not supported by General Motors unless specifically documented in a Service Bulletin or Manual.

Applicable components for this technology are EXTERIOR PANELS ONLY, including door skins, tail panels, roof outer panels and quarter panels.

Important: Do not use adhesives for vehicle underbody or upper body structure type repairs such as structural rails, shock/strut towers, floor pans, upper wing rails, body side pillars, door rings--side or rear, rocker panels, unless specifically documented in a GM Service Bulletin or Manual. If in doubt, use only the procedures referenced in the Service Manual for the specific vehicle being repaired.

Always follow the system manufacturer's instructions for application, handling, and curing.

Adhesives currently meeting the performance requirements include General Motors materials and products manufactured by Lord Adhesives. At this time, ONLY the adhesive products listed below meet this guideline:

Manufacturer and Part Number	Description
GM P/N 12378566 (US)	Fast Set Panel Bonding Adhesive
GM P/N 88901674 (Canada)	
Lord Fusor P/N 110B/111B	
GM P/N 12378567 (US)	Medium Set Panel Bonding Adhesive
GM P/N 88901675 (Canada)	

Lord Fusor P/N 108B/109B	
3M P/N 8116	Panel Bonding Adhesive
Ashland Plio Grip Panel 60	Panel Bonding Adhesive

Mild Steel

This information provides repair recommendations and general guidelines for steel classified as Mild Steel. This type of steel normally has a tensile strength less than 270 MPa. This includes the common steel names of:

- Mild Steel
- Bake Hardenable Steel (BH)
- Solid Solution Strengthened Steel

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Recommended Repairs:

- Cold repairs can be performed on this type of steel, unless the damage includes kinks. If the damage includes kinks, the part should be replaced.
- Controlled use of heat can be used to repair damage, if the heat does not exceed 650°C (1200°F). The heat should be applied a maximum of 2 times, for up to 90 seconds.
- Sectioning or partial replacement of this type of steel is recommended only at approved locations, in a specific sectioning procedure.
- This type of steel can be used as a sleeve, or backer plate, when recommended in a specific sectioning procedure.
- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable
- MIG plug welding and MIG stitch welding can be used on this type of steel.
- MIG Brazing can be used on this type of steel.

Ultra High Strength Dual Phase Steel

This information provides repair recommendations and general guidelines for steel classified as Ultra High Strength Dual Phase Steel (Dual Phase Steel with a tensile strength greater than 800 MPa), also known as DPX.

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Note :

- Repair of this type of steel is not recommended.
- This type of steel should be replaced at factory joints only. Sectioning or partial replacement is not recommended.
- The use of heat to repair damage is not recommended for this type of steel.
- Stitch Welding is not recommended for this type of steel.
- This classification of steel can not be used as a backing reinforcement or a sleeve for a sectioning joint, unless a specific procedure is available.

Recommended Repairs:

- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding can be used to replace factory spot welds.
- MIG Brazing can be used to replace factory spot welds.

Ultra High Strength Steel

This information provides repair recommendations and general guidelines for steel classified as Ultra High Strength Steel, also known as UHSS. This type of steel normally has a tensile strength greater than 700 MPa.

This includes the common steel names of

- Ultra High Strength Steel (UHSS)
- Martensitic Steel (MS)
- Press Hardened Steel (PHS)
- Boron Steel

General Motors recommends the following when repairing or replacing this type of steel during collision repair.

Note :

- Repair of this type of steel is not recommended.
- This type of steel should only be replaced at factory joints. Sectioning or partial replacement is not recommended.
- The use of heat to repair damage is not recommended for this type of steel.
- Stitch Welding is not recommended for this type of steel.
- This type of steel cannot be used as a backing reinforcement or a sleeve for a sectioning joint.

Recommended Repairs

- Squeeze Resistance Spot Welding can be used to replace factory spot welds, where applicable.
- MIG plug welding can be used to replace factory spot welds.
- MIG Brazing can be used to replace factory spot welds.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Drivetrain and Front Suspension Frame Bolt Front	160 N·m	118 lb ft
Drivetrain and Front Suspension Frame Bolt Rear	160 N·m	118 lb ft
Frame Reinforcement Bolts	58 N·m	43 lb ft
Front Stabiliser Shaft Link Nuts	65 N·m	48 lb ft
Power Steering Wiring Harness Bracket Bolt	9 N·m	80 lb in
Radiator Support Bracket Bolts	22 N·m	16 lb ft
Rear Transmission Mount Through Bolt	100 N·m	74 lb ft
Underbody Air Deflector Bolts	2.5 N·m	22 lb in
Underbody Front Air Deflector Bolt - Left or Right	2.5 N·m	22 lb in
Underbody Front Air Deflector Nut - Left or Right	9 N·m	80 lb in
Wheelhouse Panel Liner Nuts - Rear	2 N·m	18 lb in
Wheelhouse Panel Liner Screws - Front and Rear	3 N·m	27 lb in

Underbody Front Air Deflector Replacement - Left Side

Callout	Component Name
<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <p>Preliminary Procedure</p>	

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

1	Underbody Front Air Deflector Bolt (Qty 2) Caution : Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Underbody Front Air Deflector Nut (Qty 4) Tighten 9 N·m (80 lb in)
3	Underbody Front Air Deflector

Underbody Front Air Deflector Replacement - Right Side

Callout	Component Name
<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p>	
<p>Preliminary Procedure</p>	

Remove the exhaust pipe heat shield front. Refer to [Exhaust Pipe Heat Shield Replacement](#) : [Rear](#) → [Centre](#) → [Front](#)

1	Underbody Front Air Deflector Bolt (Qty 3) Caution : Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Underbody Front Air Deflector Nut (Qty 5) Tighten 9 N·m (80 lb in)
3	Underbody Front Air Deflector

Underbody Rear Air Deflector Replacement

Callout	Component Name
Preliminary Procedure	<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p>

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

1	Underbody Rear Air Deflector Bolt (Qty 9) Caution : Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Underbody Rear Air Deflector

Drivetrain and Front Suspension Frame Replacement

Removal Procedure

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .

Caution: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tyres and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centred and cause possible damage to the SIR coil. If you think the SIR coil has become uncentred, refer to your specific SIR coil's centring procedure to re-centre SIR Coil.

2. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
3. Support the radiator and condenser from above using the condenser tabs on each side.
4. Install the engine support fixture. Refer to [Engine Support Fixture](#) .
5. Remove the lower steering intermediate shaft bolt. Refer to [Intermediate Steering Shaft Replacement](#) .
6. Raise the vehicle on a hoist. Refer to [Lifting and Jacking the Vehicle](#) .
7. Remove the catalytic converter. Refer to [Catalytic Converter Replacement](#) .

8. Remove the wheel speed sensor wiring harness (2) from the frame on both sides.

Remove the wiring harness retainers (3) from the frame and the lower control arm.

9. Remove the heater inlet and outlet pipe bolts from frame. Refer to [Heater Inlet And Outlet Pipe Replacement](#) .

10. Position the heater water auxiliary pump and support to the side. Refer to [Heater Water Auxiliary Pump Replacement](#) .

Caution: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labelled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the earth lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

11. Disconnect the electrical connectors from the electronic power steering assembly. Refer to [FEP Connectors](#) : [Steering Gear](#) .

12. Remove the wire harness bracket and bolt from the power steering gear.

13. Remove the lower ball joints from the steering knuckles. Refer to [Steering Knuckle Replacement](#) .

14. Remove the stabiliser link nut from the strut, then discard the nut. Refer to [Stabilizer Shaft Link Replacement](#) .
15. Remove the outer track rods and track rod nuts from the steering knuckles. Refer to [Steering Linkage Outer Track rod Replacement](#) .
16. Remove the rear transmission mount to rear transmission mount bracket through bolt. Refer to [Transmission Rear Mount Replacement](#) .
17. Lower the vehicle until the drivetrain and front suspension frame contacts the engine support table.

18. Remove the frame front bolts (1).
19. Remove the frame rear bolts (2).
20. Remove the frame reinforcements (3).
21. Remove the frame (4) from the vehicle.
22. Remove the following components if replacing the frame:
 - The lower control arms--Refer to [Lower Control Arm Replacement](#) .
 - The stabilizer shaft--Refer to [Stabilizer Shaft Replacement](#) .
 - The radiator support brackets
 - The steering gear--Refer to [Steering Gear Replacement](#) .

- The rear transmission mount--Refer to [Transmission Rear Mount Replacement](#) .

Installation Procedure

Caution : Refer to [Fastener Caution](#) in the Preface section.

1. Install the following components on the drivetrain and front suspension frame, if removed:
 - The rear transmission mount--Refer to [Transmission Rear Mount Replacement](#) .
 - The radiator support brackets--Tighten the fasteners to **22 N·m (16 lb ft)**.
 - The stabilizer shaft--Refer to [Stabilizer Shaft Replacement](#) .
 - The lower control arms--Refer to [Lower Control Arm Replacement](#) .
 - The steering gear--Refer to [Steering Gear Replacement](#) .
2. Install the frame to the vehicle.
3. Install the frame rear bolts (2) and tighten to **160 N·m (118 lb ft)**.
4. Install the frame front bolts (1) and tighten to **160 N·m (118 lb ft)**.
5. Install the frame reinforcements (3) and tighten to **58 N·m (43 lb ft)**.
6. Install the rear transmission mount to rear transmission mount bracket through bolt. Refer to [Transmission Rear Mount Replacement](#) .
7. Install the outer track rods and track rod nuts to the steering knuckles. Refer to [Steering Linkage Outer Track rod Replacement](#) .

Caution: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labelled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the earth lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

8. Install the wire harness bracket to the power steering gear. Tighten the wire harness bracket bolts to **9 N·m (80 lb in)**.
9. Connect the electrical connectors to the electronic power steering assembly. Refer to [FEP Connectors](#) : [Steering Gear](#) .

10. Install the stabiliser shaft link. Tighten the steering linkage tie rod nut stabiliser shaft link nuts to **65 N·m (48 lb ft)**.
11. Install the lower ball joints to the steering knuckles. Refer to [Steering Knuckle Replacement](#) .

12. Install the wheel speed sensor wiring harness (2) to the frame on both sides.

Install the wiring harness retainers (3) to the frame and the lower control arm.

13. Install the heater water auxiliary pump and support to the frame. Refer to [Heater Water Auxiliary Pump Replacement](#) .

14. Install the heater inlet and outlet pipe fasteners to the frame. Refer to [Heater Inlet And Outlet Pipe Replacement](#) .

15. Install the catalytic converter. Refer to [Catalytic Converter Replacement](#) .

16. Lower the vehicle.

17. Remove the support of the radiator and condenser.

18. Install the lower steering intermediate shaft. Refer to [Intermediate Steering Shaft Replacement](#) .

19. Remove the engine support fixture from the vehicle.

20. Install the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .

21. Check the wheel alignment. Refer to [Wheel Alignment Measurement](#) .

22. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

Drivetrain and Front Suspension Frame Front Insulator Replacement

Special Tools

- *CH-906-14* Adapter
- *CH-906-42* Adapter
- *CH-50342* Threaded Rod

For equivalent regional tools. Refer to [Special Tools](#) .

[Removal Procedure](#)

1. Remove the drivetrain and front suspension frame. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .

2. Mark Installation position of insulator (2) at frame (1).

Note : Drilling holes into the insulator rubber to ease removal of the core.

3. Cut out frame insulator core (1) from frame insulator (2).

4. Remove frame insulator core (1) from outer frame insulator (2).

5. Remove the frame insulator (3) from drivetrain and front suspension frame (1) using a chisel (2) or equivalent.

[Installation Procedure](#)

1. Install the following components on the drivetrain and front suspension frame:

- *CH-906-14* Adapter .
- *CH-906-42* Adapter .
- *CH-50342* Threaded Rod.

Note: Check marking of frame insulator.

- Align the insulator tab with the alignment marks (1) on the frame.
2. Carefully install the frame insulator in to the front suspension frame.
3. Install the drivetrain and front suspension frame. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .

Front Wheelhouse Front Liner Replacement

Callout	Component Name
Preliminary Procedure	
Remove the tyre and wheel assembly. Refer to Tyre and Wheel Removal and Installation .	
1	Front Wheelhouse Liner Push-In Retainer - Front (Qty: 2)
	Front Wheelhouse Liner Screw - Front (Qty: 4)

2	Caution : Refer to Fastener Caution in the Preface section. Tighten 3 N·m (27 lb in)
3	Front Wheelhouse Liner - Front Lower Screw (Qty: 3) Tighten 3 N·m (27 lb in)
4	Front Wheelhouse Liner - Front Lower Front Screw (Qty: 5) Tighten 3 N·m (27 lb in)
5	Front Wheelhouse Liner - Front Procedure Disengage the upper interlocking retainers.

Front Wheelhouse Rear Liner Replacement

Callout	Component Name
Preliminary Procedure	
Remove the tyre and wheel assembly. Refer to Tyre and Wheel Removal and Installation .	
1	Front Wheelhouse Rear Liner Push-In Retainer (Qty: 3)
	Front Wheelhouse Rear Liner Screw (Qty: 3)

2	Caution : Refer to Fastener Caution in the Preface section. Tighten 3 N·m (27 lb in)
3	Front Wheelhouse Rear Liner Procedure Disengage the upper interlocking retainers.

Rear Wheelhouse Panel Liner Replacement

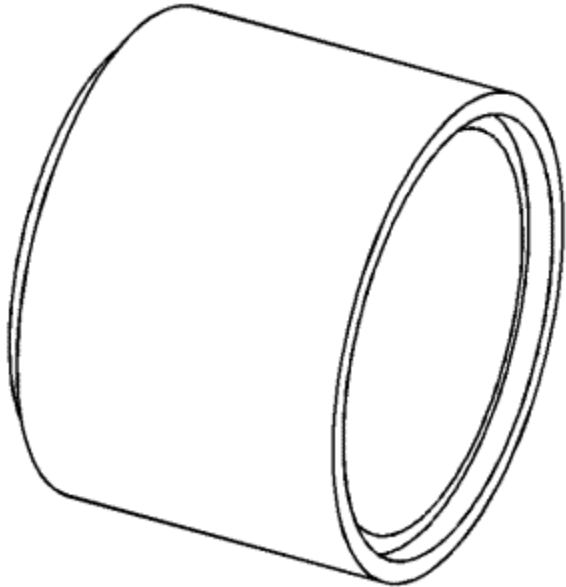

Callout	Component Name
Preliminary Procedure	
Remove the tyre and wheel assembly. Refer to Tyre and Wheel Removal and Installation .	
1	Rear Wheelhouse Panel Liner Push-In Retainer (Qty: 2)
	Rear Wheelhouse Panel Liner Screw (Qty: 6)

2	Caution : Refer to Fastener Caution in the Preface section. Tighten 3 N·m (27 lb in)
3	Rear Wheelhouse Panel Liner Nut Tighten 2 N·m (18 lb in)
4	Rear Wheelhouse Panel Liner

DTC B0283

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B0283 02: Rear Defrost Circuit Short To Ground

DTC B0283 05: Rear Defrost Circuit High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Outside Wing Mirror Heater Relay Control	B0283 02	1	B0283 05	--
Rear Demister Relay Control	B0283 02	1	B0283 05	--
1. Rear Demister Inoperative				

[Circuit/System Description](#)

When the HVAC control module receives a rear window demist request from the HVAC control faceplate, the HVAC control module will supply voltage to the relay coil. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input to flow through the switch contacts and out the relay switched output to the rear window demister grid.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16 V.

[Conditions for Setting the DTC](#)

B0283 02

The HVAC control module detects a short to ground on a relay control circuit for 1 second or greater.

B0283 05

The HVAC control module detects a short to voltage or an open/high resistance a relay control circuit for 1 second or greater.

Action Taken When the DTC Sets

B0283 02

The rear window demister will be inoperative.

B0283 05

The rear window demister will malfunction.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Vehicle ON, command the Rear Demist ON and OFF with a scan tool, the upper and lower rear window demister grids should turn ON and OFF when changing between the commanded states.

Circuit/System Testing

1. Vehicle OFF, disconnect the KR5 rear window demister relay.
2. Vehicle OFF, disconnect the KR4B outside wing mirror heater relay.
3. Connect a test lamp between the control circuit terminal 85 and the ground circuit terminal 86 of the KR4B outside wing mirror heater relay.
4. Vehicle ON, command the Rear Demist ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K33 HVAC control module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K33 HVAC control module.
5. Vehicle OFF, connect the KR4B outside wing mirror heater relay.
6. Vehicle ON, command the Rear Demist ON and OFF with a scan tool, DTC B0283 should not reset.
If DTC B0283 is current, test or replace the KR4B outside wing mirror heater relay.
7. If all circuits test normal, test or replace the KR5 rear window demister relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the appropriate relay.
2. Test for 60-180 Ω between terminals 85 and 86.
If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87

-
- 30 and 85
- 85 and 87

If not the specified value, replace the relay.

4. Install a 3A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

If greater than the specified range, replace the relay.

DTC B316B, B317A, B318A, or B319A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B316B 00: Driver Window Switch

DTC B316B 02: Driver Window Switch Short to Ground

DTC B316B 39: Driver Window Switch Internal Electronic Failure

DTC B317A 02: Right Front/Passenger Window Switch Short to Ground

DTC B318A 02: Left Rear Window Switch Short to Ground

DTC B319A 02: Right Rear Window Switch Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Window Motor Control	B316B 02	1	1	--
1. Driver Window Malfunction				

[Circuit/System Description](#)

The body control module (BCM) monitors, receives and transmits serial data to each of the doors switches and window motors. When a window switch has been activated on the driver window switch, a signal is sent to the BCM which sends a signal to the appropriate window motor and the window motor will move in the direction commanded.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16 V.

[Conditions for Setting the DTC](#)

B316B 00

The BCM has detected the driver right front or left rear or right rear window switch is active for greater than 60 seconds.

B316B 02

The BCM has detected the driver left front window switch is active for greater than 60 seconds.

B317A 02

The BCM has detected the passenger window switch is active for greater than 60 seconds.

B318A 02

The BCM has detected the left rear window switch is active for greater than 60 seconds

B319A 02

The BCM has detected the right rear window switch is active for greater than 60 seconds

[Action Taken When the DTC Sets](#)

The affected power window will malfunction.

[Conditions for Clearing the DTC](#)

B316B 00, B316B 02, B317A 02, B318A 02, B319A 02

- The DTC will be current for as long as the fault is present.
- The DTC will change from current to history when the fault is no longer present.
- A history DTC will clear after 100 consecutive ignition cycles if the condition for the malfunction is no longer present.

B316B 39

If the DTC is current, the driver window switch must be replaced before the DTC can be cleared.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Vehicle in Service Mode, command each window UP and DOWN by using each switch on the S79D window switch-driver and by using the S79P window switch-passenger, the S79LR window switch-left rear and the S79RR window switch-right rear. Each window should perform the UP and DOWN functions from each switch.

If the driver window does not perform as specified, refer to Driver Window Malfunction.

If the passenger window, left rear window or right rear window does not perform as specified, refer to Passenger/Rear Window Malfunction.

Circuit/System Testing

Driver Window Malfunction

1. Vehicle Off, disconnect the harness connector at the S79D window switch-driver.
2. Vehicle in Service Mode, verify that the scan tool Driver Window Main Control Down Switch parameter is Inactive.
If not the specified value, test the control circuit terminal 3 for a short to ground. If the circuit tests normal, test or replace the M74D window motor-driver.
3. Verify that the scan tool Driver Window Main Control Up Switch parameter is Inactive.
If not the specified value, test the control circuit terminal 6 for a short to ground. If the circuit tests normal, test or replace the M74D window motor-driver.
4. Verify that the scan tool Driver Window Main Control Express Switch parameter is Inactive.
If not the specified value, test the control circuit terminal 2 for a short to ground. If the circuit tests normal, test or replace the M74D window motor-driver.
5. If all circuits test normal, test or replace the S79D window switch-driver.

Passenger/Rear Window Malfunction

1. Vehicle in Service Mode, verify that the scan tool Front Passenger Main Control Down Switch, Front Passenger Main Control Express Switch, Front Passenger Main Control Up Switch, Left Rear Window Main Control Down Switch, Left Rear Window Main Control Express Switch, Left Rear Window Main Control Up Switch, Right Rear Window Main Control Down Switch, Right Rear Window Main Control Express Switch, and Right Rear Window Main Control Up Switch parameters are inactive.
If any of the parameters are always Active, replace the S79D window switch-driver.
2. Verify that the scan tool Passenger Window Switch at Door parameter is Inactive.
If not the specified value, replace the S79P window switch-passenger.
3. Verify that the scan tool Left Rear Window Switch at Door parameter is Inactive.
If not the specified value, replace the S79LR window switch-left rear.
4. Verify that the scan tool Right Rear Window Switch at Door parameter is Inactive.
If not the specified value, replace the S79RR window switch-right rear.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC B3205

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B3205 00: Driver Window Motor Circuit

DTC B3205 39: Driver Window Motor Circuit Internal Electronic Failure

DTC B3205 42: Driver Window Motor Circuit Calibration Data Set Not Programmed

DTC B3205 4B: Driver Window Motor Circuit Calibration Not Learned

Circuit/System Description

The body control module (BCM) monitors, receives and transmits serial data to each of the doors switches and window motors. When a window switch has been activated on the driver window switch, a signal is sent to the BCM which sends a signal to the appropriate window motor and the window motor will move in the direction commanded.

Conditions for Running the DTC

- The Vehicle in Service Mode.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B3205 00

The BCM has detected that the compatibility code stored in the driver window motor does not match the compatibility code stored in the BCM.

B3205 39

An internal malfunction has been detected by the BCM in the driver window motor while commanding the window UP or DOWN.

B3205 42

The BCM will automatically attempt to download the calibration program into the driver window motor (As will occur when the window motor has been replaced), if the first calibration program fails to load, the BCM will attempt to download the calibration program a second time. If this download fails, the BCM will set appropriate DTC.

B3205 4B

The BCM has detected that the driver window is not "normalised" and can set for the following reasons:

- When the battery has been disconnected
- When the battery has been replaced
- When the door wiring harness has been disconnected
- When the window motor has been disconnected.

Action Taken When the DTC Sets

The driver power window will malfunction.

Conditions for Clearing the DTC

B3205 00

Installing a compatible window motor for that specific make and model vehicle.

B3205 39

The driver window motor must be replaced before the DTC can be cleared.

B3205 42

The driver window motor must be replaced before the DTC can be cleared.

B3205 4B

The driver window motor must be normalised before the DTC can be cleared.

Description and Operation

[Power Windows Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

B3205 00, B3205 39, B3205 42

1. Vehicle in Service Mode, command the driver window UP and DOWN with a scan tool. The driver window should perform the UP and DOWN functions.

Note: If the window performs the UP and DOWN functions, clear the DTC

2. Replace the M74D window motor--driver with a M74D window motor--driver compatible for that specific make and model vehicle.

[Circuit/System Testing](#)

Note: The all doors must be completely closed prior to normalising the windows, a door that is open or ajar may cause the power window to function abnormally or it may become inoperative during the normalisation procedure. If this occurs, verify that the door is completely closed then repeat the normalisation procedure.

1. Vehicle in Service Mode, starting with the window completely UP, press and hold the driver power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is completely open.
2. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.
3. Command the window to express UP and express DOWN by pressing the window switch past the first detent and releasing and then pulling the window switch past the first detent and releasing. The window should perform the express UP and express DOWN functions.

If the M74D window motor--driver does not perform as specified and the DTC resets, verify the vehicle doors are closed and repeat the normalisation procedure.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Front Side Door Window Regulator Motor Replacement](#)
- [Control Module References](#) for BCM replacement, programming and setup

Symptoms - Fixed and Moveable Windows

Important Preliminary Checks Before Starting:

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the power window system operation or rear window demister system operation in order to familiarise yourself with the system functions. Refer to the following:
 - [Rear Window Demister Description and Operation](#)
 - [Power Windows Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the rear window demister. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Note:

- Inspect for proper installation of electrical components if an intermittent condition exists. Inspect for aftermarket theft deterrent devices, lights, and mobile phones. Ensure that no aftermarket equipment is connected to the class 2 circuit. If you can not locate an intermittent condition, a mobile phone signal may cause the condition. Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .
- The problem may or may not turn ON the SERVICE VEHICLE SOON indicator or store a DTC. Do not use the symptom tables to diagnose intermittent conditions. The malfunction must be present in order to locate the problem.

Poor electrical connections or wiring cause most intermittent conditions. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body
- An improperly formed or damaged terminal
- Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.
- Poor terminal to wire connection requires removing the terminal from the connector body in order to perform the check.

Use a scan tool in order to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. The snapshot feature can

capture and store data parameters within the scan tool when the malfunction occurs. This information can then be reviewed in order to see what caused the malfunction.

[Symptom List](#)

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Rear Window Demister Malfunction](#)
- [Power Windows Malfunction](#)

Rear Window Demister Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Outside Wing Mirror Heater Relay B+	2	2	--	--
Rear Demist Relay B+	1	1	--	--
Outside Wing Mirror Heater Relay Control	B0283 02	2	B0283 05	--
Rear Demist Relay Control	B0283 02	1	B0283 05	--

Lower Rear Window Demister Grid Ground	--	2	--	--
Upper Rear Window Demister Grid Ground	--	1	--	--
Outside Wing Mirror Heater Relay Ground	--	2	--	--
Rear Demist Relay Ground	--	1	--	--
1. Upper Rear Demister Grid Malfunction				
2. Lower Rear Demister Grid Malfunction				

[Circuit/System Description](#)

When the HVAC control module receives a rear window demist request from the HVAC control faceplate, the HVAC control module will supply voltage to the relay coil. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input to flow through the switch contacts and out the relay switched output to the rear window demister grid.

Diagnostic Aids

Rear window demister indicator will still function when the switch is pressed but any of the following conditions may cause the rear window demister not to function:

- Ambient temperature at the HVAC control module must be less than 10°C (50°F).
- System voltage is out of range.
- A DTC is set that disables rear window demister functionality.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle ON, observe the scan tool Rear Demister Switch parameter while pressing the heated rear window switch, the parameter should change from Inactive to Active.
If the value does not change, replace the A20 radio/HVAC control.
2. Command the Rear Demist Indicator ON and OFF with a scan tool. The indicator should turn ON or OFF while changing between the commanded states.
If the demister indicator is always ON or always OFF, replace the A20 radio/HVAC control.

3. Command the Rear Demist ON and OFF with a scan tool, the upper and lower rear window demister grids should turn ON and OFF when changing between the commanded states.

If a single rear window demister grid does not turn ON and OFF when changing between the commanded states, refer to Single Rear Window Demist Grid Malfunction.

If both rear window demister grids do not turn ON and OFF when changing between the commanded states, refer to Rear Window Demister Malfunction.

Circuit/System Testing

Single Rear Window Demist Grid Malfunction

1. Vehicle OFF, disconnect the harness connector at the appropriate E18 rear window demister grid.
2. Test for less than 10 Ω between the ground circuit terminal listed below and ground:
 - Terminal A E18B rear demister grid-lower.
 - Terminal 1 E18A rear demister grid-upper

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Disconnect the appropriate KR4B outside wing mirror relay or the KR5 rear demister relay.
4. Test for less than 10 Ω between the ground circuit terminal listed below and ground.
 - Terminal 40 KR5 rear demister relay.
 - Terminal 86 KR4B outside wing mirror heater relay.

If greater than the specified range, test the ground circuit for an open/high resistance.

5. Vehicle ON, connect a 40A fused jumper wire between the circuit terminals listed below, verify the rear demister grid is activated:
 - B+ terminal 43 and control terminal 42 KR5 rear demister relay.
 - B+ terminal 30 and control terminal 87 KR4B outside wing mirror heater relay.

If the rear demister grid does not activate and the circuit fuse is open, test the control circuit for a short to ground. If the circuit tests normal, test or replace the E18 rear window demister grid.

If the rear demister grid does not activate and the circuit fuse is good, test the control circuit for an open/high resistance. If the circuit tests normal, test or replace the E18 rear window demister grid.

6. If all circuits test normal, test or replace the relay.

Rear Window Demister Malfunction

1. Vehicle OFF, disconnect the KR5 rear window demister relay.
2. Vehicle OFF, disconnect the KR4B outside wing mirror heater relay.
3. Connect a test lamp between the control circuit terminal 85 and the ground circuit terminal 86 of the KR4B outside wing mirror heater relay.
4. Vehicle ON, command the Rear Demist ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K33 HVAC control module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K33 HVAC control module.

5. Vehicle OFF, connect the KR4B outside wing mirror heater relay.
6. Vehicle ON, command the Rear Defog ON with a scan tool, the E18B rear demister grid-lower should turn ON.
If the E18B rear demister grid-lower does not turn ON, test or replace the KR4B outside wing mirror heater relay.
7. If all circuits test normal, test or replace the KR5 rear window demister relay.

Component Testing

Rear Window Demister Grid Test

1. Vehicle ON, turn on the E18 rear window demister grid.
2. Verify that a test lamp illuminates between each E18 rear window demister grid line and ground. The test lamp should be off when testing at the ground side of the grid and get brighter as the test lamp moves closer to the voltage supply side of the grid. The test lamp should be dim when testing each grid line in the middle.
If the test lamp remains bright at the middle of the grid line, test for an open between the test point and the ground side of the grid.
If the test lamp remains off at the middle of the grid line, test for an open between the test point and the voltage supply side of the grid

Relay Test

1. Vehicle OFF, disconnect the appropriate relay.
2. Test for 60-180 Ω between terminals 1 and 2.
If the not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
 - 3 and 2
 - 3 and 5
 - 3 and 1
 - 1 and 5If not the specified value, replace the relay.
4. Install a 5 A fused jumper wire between relay terminal 2 and 12 V. Install a jumper wire between relay terminal 1 and ground. Test for less than 2 Ω between terminals 3 and 5.
If greater than the specified range, replace the relay.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Tailgate Lower Window Replacement](#)
- [Tailgate Upper Window Replacement](#)
- [Relay Replacement](#) : [Within an Electrical Centre](#) → [Attached to Wire Harness](#)
- [Control Module References](#) for HVAC control module and radio/HVAC control replacement, programming and setup

Power Windows Malfunction

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

1. Driver Window Malfunction

2. Passenger Window Malfunction

3. Left Rear Window Malfunction
4. Right Rear Window Malfunction

Circuit/System Description

The window motors are supplied with B+ voltage which is used to power the motor and also used as a reference voltage within the logic circuit. When the driver or passenger window switch is pressed, a switch is closed causing the reference voltage in the appropriate circuit in the window motor to drop, the window motor responds by moving the window in the direction commanded.

Diagnostic Aids

The loss of the express up and express down functions for the driver window may have occurred for the following reasons:

- The battery was disconnected
- The battery was replaced
- The door wiring harness was disconnected
- The window motor was disconnected

The driver window motor will need to be normalised in order to restore the express functions, refer to [Window Motor Programming - Express Function](#) for the proper procedure.

Description and Operation

[Power Windows Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)

- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, command the M74D window motor-driver UP, DOWN, express UP and express DOWN with a scan tool. The M74D window motor--driver should perform the UP, DOWN, express UP and express DOWN commands.
If the M74D window motor--driver does perform as specified, refer to Driver Window Motor Malfunction.
2. Command the M74D window motor--driver UP, DOWN, express UP and express DOWN by using the S79D window switch-driver. The M74D window motor--driver should perform the UP, DOWN, express UP and express DOWN commands.
If the M74D window motor-driver does perform as specified, refer to Driver Window Switch Malfunction.
3. Observe the scan tool Left Rear Main Control Down Switch, Left Rear Main Control Express Switch, Left Rear Main Control Up Switch, Right Rear Main Control Down Switch, Right Rear Main Control Express Switch, Right Rear Main Control Up Switch, Front Passenger Main Control Down Switch, Front Passenger Main Control Express Switch, and the Front Passenger Main Control Up Switch parameters while using the appropriate switches on the S79D window switch-driver. Each value should change from Inactive to Active as the switch is used.
If the values do not change or if the value is No Communication, refer to Driver Window Switch Malfunction.
4. Command the passenger and rear windows UP and DOWN by using their respective S79 window switch, each window should perform the UP and DOWN functions from each switch.
If a window does not perform as specified, refer to Passenger/Rear Window Malfunction.
5. Observe the scan tool Window Lockout Switch parameter while pressing the window lockout switch on the S79D window switch-driver, the value should change from Inactive to Active each time the switch is pressed.
If the value does not change, replace the S79D window switch-driver.

Circuit/System Testing

Driver Window Motor Malfunction

1. Vehicle OFF, disconnect the harness connector at the M74D window motor-driver.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Test for 5-10 V between the serial data circuit terminal 4 and ground.
If greater than the specified range, test the serial data circuit for a short to voltage.

If less than the specified range, test the serial data circuit for a short to ground or an open/high resistance.

5. If all circuits test normal, test or replace the M74D window motor-driver.

Driver Power Window Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S79D window switch-driver.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Verify that the scan tool Driver Window Main Control Down Switch parameter is Inactive.
If not the specified value, test the control circuit terminal 3 for a short to ground. If the circuit tests normal, test or replace the M74D window motor-driver.
5. Connect a 5 A fused jumper wire between the control circuit terminal 3 and ground, verify that the scan tool Driver Window Main Control Down Switch parameter is Active.
If not the specified value, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, test or replace the M74D window motor-driver.
6. Verify that the scan tool Driver Window Main Control Up Switch parameter is Inactive.
If not the specified value, test the control circuit terminal 6 for a short to ground. If the circuit tests normal, test or replace the M74D window motor-driver.
7. Connect a 5 A fused jumper wire between the control circuit terminal 6 and ground, verify that the scan tool Driver Window Main Control Up Switch parameter is Active.
If not the specified value, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, test or replace the M74D window motor-driver.
8. Verify that the scan tool Driver Window Main Control Express Switch parameter is Inactive.
If not the specified value, test the control circuit terminal 2 for a short to ground. If the circuit tests normal, test or replace the M74D window motor-driver.
9. Connect a 5 A fused jumper wire between the control circuit terminal 2 and ground, verify that the scan tool Driver Window Main Control Express Switch parameter is Active.
If not the specified value, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, test or replace the M74D window motor-driver.
10. If all circuits test normal, test or replace the S79D window switch-driver.

Passenger/Rear Window Malfunction

1. Vehicle OFF, disconnect the harness connector at the appropriate S79 window switch.
2. Test for less than 10 Ω between the ground circuit terminal listed below and ground.
 - S79P window switch-passenger ground circuit terminal 1
 - S79LR window switch-left rear ground circuit terminal 3
 - S79LR window switch-left rear ground circuit terminal 5
 - S79RR window switch-right rear ground circuit terminal 5If greater than the specified range, test the ground circuit for an open/high resistance.

3. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal listed below and ground.
 - S79P window switch-passenger B+ circuit terminal 4
 - S79LR window switch-left rear B+ circuit terminal 8
 - S79RR window switch-right rear B+ circuit terminal 8If the test lamp does not illuminate, test the ground circuit for a short to ground or an open/high resistance.
4. Test for 5-10 V between the serial data circuit terminal listed below and ground.
 - S79P window switch-passenger serial data circuit terminal 5
 - S79LR window switch-left rear serial data circuit terminal 1
 - S79RR window switch-right rear serial data circuit terminal 1If greater than the specified range, test the serial data circuit for a short to voltage.
If less than the specified range, test the serial data circuit for a short to ground or an open/high resistance.
5. Vehicle OFF, connect the harness connector at the S79 window switch and disconnect the harness connector at the appropriate M74 window motor.
6. Test for less than 15 Ω between the control circuit terminal A and ground.
If greater than the specified range, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the appropriate S79 window switch.
7. Test for less than 15 Ω between the control circuit terminal B and ground.
If greater than the specified range, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the appropriate S79 window switch.
8. Connect a test lamp between the control circuit terminal A and control circuit terminal B.
9. Vehicle in Service Mode, command the M74 window motor UP and DOWN by using the S79 window switch. The test lamp should briefly illuminate during the UP and DOWN commands.
If the test lamp does not illuminate during the UP or DOWN command, test either control circuit for a short to ground. If the circuits tests normal, replace the S79 window switch.
10. If all circuits test normal, test or replace the M74 window motor.

Component Testing

Passenger/Rear Window Motor

1. Vehicle OFF, disconnect the harness connector at the appropriate M74 window motor.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground.
Reverse the jumper wires at least two times, the M74 window motor should perform the UP and DOWN functions.
If it does not perform as specified, replace the M74 window motor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Front Side Door Window Switch Replacement](#)
- [Front Side Door Window and Multifunction Switch Replacement](#)
- [Rear Side Door Window Switch Replacement](#)
- [Front Side Door Window Regulator Motor Replacement](#)
- [Rear Side Door Window Regulator Motor Replacement](#)

Side Door Window Mechanical Diagnosis

Cause	Correction
DEFINITION: A mechanical condition that requires a correction for proper operation of the side door window.	
Refer to Symptoms - Fixed and Moveable Windows prior to beginning this table.	
Intermittent Operation	Check proper glass alignment/attachment and door seal installation.
	Check switch and switch bezel to see if sticking.
	Check wire harness for pinched/shorted wire.
	THIS STEP APPLIES TO ALL TWO PIN MOTOR CONNECTORS ONLY. Perform electrical diagnostics, by first applying 12 volt power supply to the regulator motor to verify motor function.
Glass Binds	Check proper glass alignment/attachment.
	Check for defective seal and/or proper seal installation.
	Check for debris in glass run channel.
	Check for glass run channel position.
Regulator/Glass Rattles	Check for loose fasteners and retorque if required.
	Check that the glass is in the channel and reinstall if not positioned correctly.
Noisy Operation	Check for other components in the glass path such as wire harness, impact foam, lock rods, or cables.
	Check for proper glass alignment/attachment and door seal installation.
Windnoise	Check seals, mirror patch, and glass alignment.
False glass reversal, the glass goes down unexpectedly.	Check seals, reinitialise the glass and/or realign the glass.
	Check for debris in the glass run channel.

Windscreen Replacement

Special Tools

- *BO-641* Suction Holder
- *BO-46974* Glass Removal System
- Use an adhesive that is approved by GM

For equivalent regional tools, refer to [Special Tools](#) .

Warning: Refer to [Cracked Window Warning](#) in the Preface section.

Warning: Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Open the bonnet.
2. Remove the windscreen wiper arms and blades. Refer to [Windscreen Wiper Arm Replacement](#) : [Passenger](#) → [Driver](#) .
3. Remove the air inlet grille panel. Refer to [Air Inlet Grille Panel Replacement](#) .
4. Remove the left and right side corner weatherstrip by the air inlet panel.
5. Remove the left and right windscreen side garnish moldings. Refer to [Windscreen Side Garnish Molding Replacement](#) .
6. Remove the rearview mirror. Refer to [Inside Rearview Mirror Replacement](#) .
7. Disconnect the rain sensor connector, if equipped.

Warning: If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.

8. Cover to protect the following parts from broken glass:
 - Upper dash pad
 - Demister outlets and A/C outlets
 - Seats and carpeting

9. Use *BO-46974* system .
10. Take the diagonal measurement of the windscreen.
11. Cut cutting wire into four times lengths.

Approx. **5200 mm (204.724 in)**, the circumference of the corresponding role of wire is approx. **1000 mm (39.369 in)**

12. Heat the awl with a suitable tool.

Note: Ensure that the windscreen is not damaged in the process, otherwise stress cracks in the windscreen may occur.

13. Stick the awl (1) with adhesive bed in the area of the front wall.

14. Pull the wire through.

14.1. Thread the cutting wire into the hole of the awl and bend the end over.

14.2. Pull the cutting wire with the awl to the middle of the steering wheel in the interior.

Note: The cutting wire (1) should be rolled in beneath the rubber window seal (2) at the windscreen.

15. Lay the wire under the windscreen all the way around.

16. Pull the second wire end through.
 - 16.1. Stick awl approx. **10 mm (0.393 in)**, overlapping the first entry place with adhesive bed.
 - 16.2. Thread the cutting wire into the hole of the awl and bend it over.
 - 16.3. Pull the rest of the wire into the interior using the awl.

Note: Ensure that the cutting wire is fitted correctly to the winch deflection roller.

17. Place the winch with two winding heads (2) on windscreen inside.
18. Position the winch in the right hand area of the windscreen inside.
19. Attach the cutting wire to the winch.

Note: In the area of the A-pillar/front wall, increased cutting effort is necessary. Arrow shows the path of cutting wire (1).

20. Cut out the windscreen.
 - 20.1. Use the plastic sheet in order to protect the instrument panel assembly.
 - 20.2. Insert transfer ratchet and apply tension to the cutting wire.
 - 20.3. Cut out the windscreen until the cutting wire is on the same level with the winch.

Note: Ensure that the cutting wire is fitted correctly to the winch deflection roller.

21. Place the winch with two winding heads (2) on the inside of the windscreen near to the interior rear view mirror.
22. Insert the transfer ratchet and apply tension to the cutting wire.

Note: In the area of the A-pillar/roof frame, increased cutting effort is necessary. Arrow shows the path of the cutting wire (1).

23. Cut out the windscreen.
 - 23.1. Use the hold-down positioner and the plastic sheet to protect the sunroof.
 - 23.2. Cut out the windscreen until the cutting wire is on the same level with the winch.

Note: Ensure that the cutting wire is fitted correctly to the winch deflection roller.

24. Place the winch with one winding head (2) on the inside the windscreen in the position of the A-pillar on the driver side.
25. Attach the cutting wire (1) to the winch.
26. Insert transfer ratchet and apply tension to the cutting wire.

Note: Use lubricant on the winch deflection roller. In the area of the A-pillar/bulkhead, increased cutting effort is necessary. Arrow shows the path of cutting wire (1).

27. Cut out the windscreen.
 - 27.1. Cut out the windscreen until the cutting wire is on the same level with the winch.
 - 27.2. Use the plastic sheet in order to protect the instrument panel assembly.

Note: Ensure that the cutting wire is fitted correctly to the winch deflection roller.

28. Place the winch with one winding head (1) on the inside of the windscreen in the area of the roof frame (1).
29. Insert the transfer ratchet and apply tension to the cutting wire.

Note: Use lubricant on the winch deflection roller. In the area of the A-pillar/roof frame, increased cutting effort is necessary. Arrow shows the path of cutting wire (2).

30. Cut out the windscreen.
 - 30.1. Cut out the windscreen until the cutting wire is on the same level with the winch.
 - 30.2. Use the plastic sheet in order to protect the headlining trim panel.

31. Position both cutting tools.
32. Shift the winch (1) with two winding heads downwards
33. Shift the winch with one winding head (2) in the headlining area so that the cutting wire (3) is crossed.
34. Insert the transfer ratchet and apply tension to the cutting wire.

Note: Arrow shows the path of cutting wire (3).

35. Cut out the windscreen.
 - 35.1. Cut out windscreen until the cutting wire has cut through the adhesive bed completely.
 - 35.2. Use the plastic sheet in order to protect the headlining trim panel.
36. Remove the glass removal system.
37. Install and lock the *BO-641* holder onto the windscreen.

Note: A second technician is required.

38. Remove the windscreen from the vehicle.

39. Cut the adhesive tape with the provided knife (1) within a depth of **1 mm (0.039 in)**.
40. Repair any paint damage, using a touch-up pen that matches the vehicle color.
41. Replace the windscreen rubber if damaged.
42. Cut the adhesive tape on the glass pane with the provided knife within a depth of **1 mm (0.039 in)**.

[Installation Procedure](#)

1. Remove all mounds or loose pieces of urethane adhesive from the pinch-weld area.
2. Inspect for any of the following conditions in order to help prevent future breakage of the window:
 - High weld
 - Solder spots
 - Hardened sealer
 - Any other obstruction or irregularity in the pinch-weld flange

3. After repairing the windscreen opening as indicated, remove all traces of broken glass from the outer cowl panel, seats, floor, and defroster ducts.

4. Apply an adhesive bead (1).

Cut into the tip of the cartridge so that a bead of adhesive with a thickness approx. of **13 mm (0.511 in)** is produced.

Note: A second technician is required.

5. Insert the windscreen.

5.1. Insert windscreen, using the *BO-641* holder .

5.2. Place the windscreen on the roof frames and lower it down.

6. Use fabric tape to secure the windscreen in position.

7. Remove any excessive urethane adhesive from the body, using a suitable cleaner.

Note: A second technician is required.

8. Use a soft spray of warm water in order for a immediate water leak test.
9. Inspect the windscreen for leaks.
10. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive to the leak point.
11. Repeat the water leak test.
12. Maintain the following conditions in order to assure a proper cure of the urethane adhesive:
 - 12.1. Lower a door window partially in order to prevent pressure buildups when closing the doors before the adhesive is cured.
 - 12.2. DO NOT drive the vehicle until the adhesive is cured. Refer to the above curing times.
 - 12.3. DO NOT use compressed air to dry the adhesive.
13. Install the air inlet grille panel. Refer to [Air Inlet Grille Panel Replacement](#) .
14. Install the windscreen wipers arms and blades. Refer to [Windscreen Wiper Arm Replacement](#) : [Passenger](#) → [Driver](#) .
15. Install the left and right windscreen garnish molding. Refer to [Windscreen Side Garnish Molding Replacement](#) .
16. Install the rearview mirror. Refer to [Inside Rearview Mirror Replacement](#) .
17. Connect the rain sensor connector, if equipped.
18. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.
19. Close the bonnet.

Front Side Door Window Adjustment

[Causes of Slow Moving Window](#)

Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.

Note: Owners may comment that the windows operate slowly when going up or down.

1. Listed below are conditions that may cause a slow moving window.
 - The window run channel outboard lip at the rearview mirror is rolled over or the window run channel outboard lip at the rear of door frame (2).
 - The window is not seated in the run channel.
 - The window is misaligned in the opening.
 - The regulator is misaligned causing misalignment of the window.
 - Inspect the power window motor for being loose.
2. After inspecting the conditions above, do the following:

Remove the front door trim panel.
3. Remove the water deflector.
4. Ensure that the window guide is fully seated and clipped.
5. Ensure that the window is fully seated into the window guide run channel.
6. Inspect the window for equal distance between the front and rear run channels.

Adjustment Procedure

1. Inspect for the following conditions before making adjustments.
 - Using a flat-bladed tool, straighten the run channel lip by pulling it out to its correct position.
 - Use a flat-bladed tool to push the run channel rearward to seat it in the door frame.
 - Inspect the window guide retainer to window for the proper alignment to the slots in the window.
 - Inspect the window to be straight up and down position.

- Loosen the fasteners that attach the window regulator (1) to the inner door panel, in the specified sequence (2, 3, 4).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Tighten the fasteners that attach the front side door window regulator (1) to the inner door panel in the specified sequence (2, 3, 4) to **11 N·m (97 lb in)**.
3. Inspect the window for proper operation.
4. Install the water deflector.
5. Install the front door trim panel.

Front Side Door Window Replacement

Callout

Component Name

Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.

Caution: Refer to [Paint Damage Caution](#) in the Preface section.

Preliminary Procedures

1. Remove the front side door window front channel. Refer to [Front Side Door Window Channel Replacement](#) .
2. Remove the front side door window garnish molding. Refer to [Front Side Door Window Garnish Molding Replacement](#) .

1	<p>Front Side Door Window Guide Retainer Nuts (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Apply masking tape to the outer applique and frame.2. Remove the door trim panel bracket.3. Remove the water deflector.4. Use masking tape to tape the window in the full up position to the door frame.5. Loosen the window guide retainer nuts through the access holes in the door.6. Lower the window regulator full down.7. Remove the masking tape from the window.8. Tilt the window downward in the front, pull up on the back of the window and pull it out from the frame. <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Front Side Door Window</p> <p>Tip Inspect the window for proper operation before installing the door trim panel.</p>

Rear Side Door Window Adjustment

[Causes of Slow Moving Window](#)

Note: Owners may comment that the windows operate slowly when going up or down.

1. Listed below are conditions that may cause a slow moving window:
 - The window run channel outboard lip at the rear of door frame.
 - The window is not seated in the run channel.
 - The window is misaligned in the opening.
 - The regulator is misaligned causing misalignment of the window.
2. After inspecting the conditions above, do the following:
 - 2.1. Remove the rear door trim panel.
 - 2.2. Remove the water deflector.
 - 2.3. Ensure that the window guide is fully seated and clipped.

Ensure that the window is fully seated in the window guide run channel.

- 2.4. Inspect the window for equal distance between the front and rear run channels.
- 2.5. Inspect the power window motor for being loose.
- 2.6. Inspect the window for alignment.

[Adjustment Procedure](#)

1. Remove the rear side door trim panel.

2. Inspect for the following conditions before making adjustments:
 - Using a flat-bladed tool, straighten the run channel lip by pulling it out to its correct position.
 - Use a flat-bladed tool to push the run channel rearward to seat it in the door frame.
 - Inspect the window guide channel to window fasteners to ensure that they are in the proper slots and the window is not tilted forward.
 - Inspect the window to be straight up and down position.
 - Loosen the fasteners that attach the window regulator (1) to the inner door panel, in the specified sequence (2, 3, 4).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Loosen the fasteners that attach the rear side door window regulator (1) to the inner door panel in the specified sequence (2, 3, 4).

Tighten the fasteners to **11 N·m (97 lb in)**.

4. Inspect the window for proper operation.
5. Install the water deflector.
6. Install the rear door trim panel.

Rear Side Door Window Replacement

Callout	Component Name
Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.	
Caution: Refer to Paint Damage Caution in the Preface section.	

Preliminary Procedures

1. Place the window in the full up position.
2. Remove the rear side door window rear channel. Refer to [Rear Side Door Window Rear Channel Replacement](#) .
3. Remove the rear side door window upper garnish molding. Refer to [Rear Side Door Window Garnish Molding Replacement](#) .

1	<p>Rear Side Door Window Guide Nuts (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Use masking tape to tape the window in the full up position to the door frame.2. Remove the door trim panel bracket.3. Remove the water deflector.4. Loosen the window guide retainer nuts through the access holes in the door.5. Lower the window regulator full down.6. Remove the masking tape from the window.7. Slide the window down in the door until the window is free from the rear window channel. <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Rear Side Door Window</p> <p>Tip Inspect the window for proper operation before install the door trim panel.</p>

Tailgate Upper Window Replacement

Special Tools

- *BO-641* Suction Holder
- *BO-46974* Glass Removal System
- Use an adhesive that is approved by GM

For equivalent regional tools, refer to [Special Tools](#) .

[Removal Procedure](#)

Warning: Refer to [Cracked Window Warning](#) in the Preface section.

Warning: Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

1. Position the vehicle on level ground and move the front wheels to the straight-ahead position.
2. Open the tailgate.
3. Remove the tailgate lower trim finish panel. Refer to [Tailgate Lower Trim Finish Panel Replacement](#) .
4. Disconnect the electrical connectors from the tailgate window demister bus bar.
5. Remove the rear end spoiler. Refer to [Rear End Spoiler Replacement](#) .

Warning: Refer to [Defroster Outlet Warning](#) in the Preface section.

6. Cover the following parts to protect from broken glass:
 - Upper dash pad
 - Seats and carpeting

7. Use *BO-46974* system .
8. Take the diagonal measurement (1) of the tailgate window.
9. Cut cutting wire into four times lengths.

Approx. **5200 mm (204.724 in)**, the circumference of the corresponding role of wire is approx. **1000 mm (39.369 in)**

10. Heat the awl with a suitable tool.

Note: Ensure that the tailgate window is not damaged in the process. Otherwise, stress cracks could form in the tailgate window. Mask off the area with fabric tape (1).

11. Stick the awl through the adhesive bed in the area of the lower C-pillar.

12. Pull the wire through.

12.1. Thread both ends of the cutting wire (3) in the bores of the piercing awl (2) and bend them over.

12.2. Use the piercing awl (2) to pull the cutting wire to the centre of the tailgate window.

Note: The cutting wire (1) should be rolled in beneath the rubber window seal (2) at the tailgate window.

13. Lay the wire under the tailgate window all the way around.
14. Pull the remaining wire into the interior.

Note: Ensure that the cutting wire (1) is fitted correctly to the winch deflection roller.

15. Place the winch (2) with two winding heads on the tailgate window inside.
16. Position the winch vertically at the same height as the C-pillar.
17. Attach the cutting wire (1) to the winch (2).
18. Insert transfer ratchet and apply tension to the cutting wire.

Note: Arrow shows the path of the cutting wire (1).

19. Cut out the tailgate window until the cutting wire (1) is on the same level with the winch.

Note: Ensure that the cutting wire (1) is fitted correctly to the winch deflection roller.

20. Place the winch (2) with two winding heads on the inside of the tailgate window, in the area of the roof frame.
21. Insert transfer ratchet and apply tension to the cutting wire.

Note: In the area of the tailgate window radius, increased cutting effort is necessary. Arrow shows the path of the cutting wire (1).

22. Cut out the tailgate window until the cutting wire is on the same level with the winch.

Note: Ensure that the cutting wire (1) is fitted correctly to the winch deflection roller.

23. Place the winch (2) with two winding heads on the inside of the tailgate window, in the centre area of the tailgate window.
24. Insert transfer ratchet and apply tension to the cutting wire.

Note: Arrow shows the path of the cutting wire (1).

25. Cut out the tailgate window until the cutting wire is on the same level with the winch.

Note: Ensure that the cutting wire (1) is fitted correctly to the winch deflection roller.

26. Place the winch (2) with one winding heads on the inside of the tailgate window, in the area of the lower C-pillar.
27. The winch (1) with 2 winding heads remains in the position.
28. Insert transfer ratchet and apply tension to the cutting wire.

Note: In the area of the tailgate window radius, increased cutting effort is necessary. Arrow shows the path of the cutting wire (1).

29. Cut out the tailgate window until the cutting wire is on the same level with the winch.

Note: Ensure that the cutting wire (2) is fitted correctly to the winch deflection roller.

30. Place the winch with one winding head on the inside of the tailgate window, in the area of the lower C-pillar.
31. The winch (1) with 2 winding heads remains in the position.
32. Insert transfer ratchet and apply tension to the cutting wire.

Note: In the area of the tailgate window radius, increased cutting effort is necessary. Arrow shows the path of the cutting wire (1).

33. Cut out the tailgate window until the cutting wire is on the same level with the winch.

Note: Ensure that the cutting wire (2) is fitted correctly to the winch deflection roller.

34. Place the winch (1) with one winding head on the inside of the tailgate window.
35. Position winch (1) with one winding head next to winch with two winding heads so that the cutting wire (2) crosses.
36. The winch (1) with 2 winding heads remains in the position.
37. Insert transfer ratchet and apply tension to the cutting wire.

Note: Arrow shows the path of the cutting wire (1).

38. Cut out the tailgate window until the cutting wire (2) has cut through the adhesive bead completely.
39. Remove the glass removal system.
40. Install and lock the *BO-641* holder onto the tailgate window.

Note: A second technician is required.

41. Remove the tailgate window from the vehicle.

42. Cut the adhesive tape with the provided knife (1) within a depth of **1 mm (0.039 in)**.
43. Repair any paint damage, using a touch-up pen that matches the vehicle color.
44. Replace the tailgate window rubber if damaged.
45. Cut the adhesive tape on the glass pane with the provided knife within a depth of **1 mm (0.039 in)**.

[Installation Procedure](#)

1. Remove all mounds or loose pieces of urethane adhesive from the pinch-weld area.
2. Inspect for any of the following conditions in order to help prevent future breakage of the window:
 - High weld
 - Solder spots
 - Hardened sealer
 - Any other obstruction or irregularity in the pinch-weld flange

3. After repairing the tailgate window opening as indicated, remove all traces of broken glass from the outer cowl panel, seats, and floor.

4. Apply an adhesive bead (1).

Cut into the tip of the cartridge so that a bead of adhesive with a thickness approx. of **13 mm (0.511 in)** is produced.

Note: A second technician is required.

5. Insert the tailgate window.

5.1. Insert tailgate window, using the *BO-641* holder .

5.2. Place the tailgate window on the roof frames and lower it down.

6. Use fabric tape to secure the tailgate window in position.

7. Remove any excessive urethane adhesive from the body, using a suitable cleaner.

Note: A second technician is required.

8. Use a soft spray of warm water in order for a immediate water leak test.
9. Inspect the tailgate window for leaks.
10. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive to the leak point.
11. Repeat the water leak test.
12. Maintain the following conditions in order to assure a proper cure of the urethane adhesive:
 - 12.1. Lower a door window partially in order to prevent pressure buildups when closing the doors before the adhesive is cured.
 - 12.2. DO NOT drive the vehicle until the adhesive is cured. Refer to the above curing times.
 - 12.3. DO NOT use compressed air to dry the adhesive.
13. Install the rear end spoiler. Refer to [Rear End Spoiler Replacement](#) .
14. Connect the tailgate window demister electrical connectors to the bus bar.
15. Install the rear window radio antenna connects.
16. Install the tailgate lower trim finish panel. Refer to [Tailgate Lower Trim Finish Panel Replacement](#) .
17. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.
18. Close the tailgate.

Tailgate Lower Window Replacement

Special Tools

- *BO-24402-A* Glass Sealant Remover (Cold Knife)
- *BO-39032* Stationary Glass Removal Tool
- Use an adhesive that is approved by GM

For equivalent regional tools, refer to [Special Tools](#)

[Removal Procedure](#)

Warning: Refer to [Cracked Window Warning](#) in the Preface section.

Note: Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and the interior trim.

1. Open the tailgate.
2. Remove the tailgate lower trim finish panel. Refer to [Tailgate Lower Trim Finish Panel Replacement](#) and [Tailgate Lower Trim Finish Panel Replacement](#) .
3. Remove the rear end spoiler. Refer to [Rear End Spoiler Replacement](#) .

Warning: Refer to [Defroster Outlet Warning](#) in the Preface section.

4. Cover the following parts to protect from broken glass:
 - Upper dash pad
 - Demister outlets and A/C outlets
 - Seats and carpeting

Warning: Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

Note: Keep the cutting edge of the tool against the window. Use care Not to damage the window corner retainers. If the window retainers get cut off when removing the window it will be necessary to tape the window in place until cured.

5. Remove the window from the urethane adhesive.
 - Leave a base of urethane approximately 2 mm (0.078 in) on the pinch-weld flange.
 - The only suitable lubrication is clear water.
 - *BO-24402-A* Glass Sealant Remover (Cold Knife)
 - *BO-39032* Stationary Glass Removal Tool
6. If necessary, use a long utility knife or similar tool to remove the bottom corners of the window from the urethane adhesive.

7. With an assistant, remove the window (1) from the vehicle, place the window on a clean soft surface.

[Installation Procedure](#)

1. Install the tailgate lower window into the opening using the appropriate urethane adhesive.
2. Install the rear end spoiler. Refer to [Rear End Spoiler Replacement](#) .
3. Install the tailgate lower trim finish panel. Refer to [Tailgate Lower Trim Finish Panel Replacement](#) and [Tailgate Lower Trim Finish Panel Replacement](#) .
4. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.
5. Close the tailgate.

Front Side Door Window Channel Replacement

Callout	Component Name
<p>Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.</p> <p>Preliminary Procedures</p>	

1. Position the window to the full up position.
2. Remove the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .

1	<p>Front Side Door Window Front Channel Bolts (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Reposition the water deflector.2. Pull the weatherstrip from the front channel. <p>Tighten 11 N·m (97 lb in)</p>
2	<p>Front Side Door Window Front Channel</p> <p>Tip Inspect the window for proper operation before installing the door trim panel.</p>

Rear Side Door Window Rear Channel Replacement

Callout

Component Name

Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.

Preliminary Procedures

1. Position the window to the full up position.
2. Remove the rear side door trim panel. Refer to [Rear Side Door Trim Replacement](#) .

1	<p>Rear Side Door Window Rear Channel Bolts (Qty :2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connectors.

Front Side Door Window Regulator Replacement

Callout	Component Name
<p>Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.</p> <p>Preliminary Procedures</p>	

1. Loosen the front side door window from the guide nuts. Do not remove the window from the door. Refer to [Front Side Door Window Replacement](#) .
2. Remove the front side door trim panel bracket.

1	<p>Front Side Door Window Regulator Bolts (Qty: 5)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove the water deflector.2. Do Not to remove the window guides nuts from the window regulator.3. After releasing the window from the guides tape the window to the upper door frame before removing the regulator bolts.4. Disconnect the electrical connector. <p>Tighten 11 N·m (97 lb in)</p>
2	<p>Front Side Door Window Regulator</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove the window regulator through the opening in the inner door panel.2. Transfer all parts as necessary. <p>Tip Inspect the window for proper operation before installing the door trim panel.</p>

Window Motor Programming - Express Function

[Window Motor Normalised Procedure](#)

A window motor that has not been normalised will no longer perform the express up and express down functions, this may occur during the following conditions:

- When a window motor has been disconnected
- When a door harness has been disconnected
- When the battery has been disconnected or replaced

Note: When DTC B3205 4B & 3210 4B are set, the following warnings will be displayed on the driver information centre:

Open, then Close Driver Window

Open, then Close Passenger Window

These warnings will clear once the windows have been "Normalised" and the respective DTC will clear.

To normalise the window motor, follow these steps:

Note: The doors must be completely closed prior to normalising the windows, a door that is open or ajar may cause the power window to function abnormally or to become inoperative while performing the normalising procedure. If this occurs, verify that the door is completely closed then repeat the normalising procedure.

1. Vehicle in Service Mode.
2. Starting with the window completely UP, press and hold the power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is completely open.
3. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.

The window should now be normalised and the window should perform the express up and express down functions.

[Window Motor Relearn Procedure](#)

A relearn procedure may need to be performed for any Local Interconnect Network (LIN) window motor for the following conditions:

- When the window glass is out of alignment
- When the window glass has been replaced

- When the door has been replaced
- When the window regulator has been replaced

Note: Prior to performing the relearn procedure the vehicle must have all 4 wheels properly inflated and mounted, the vehicle must be sitting on a level surface and all doors must be completely closed.

To relearn the window motor, follow these steps:

1. Vehicle in Service Mode.
2. With a scan tool, select Module Diagnosis, Body Control Module, Configuration/Reset Functions and then select the appropriate Clear Window Learn Values for the window motor requiring the relearn procedure.
3. After the learn procedure, exit the scan tool learn procedure completely, the power window cannot be normalised and will not function until you exit the program.
4. Starting with the window completely UP, press and hold the power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is completely open.
5. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.

The window is now reprogrammed.

Front Side Door Window Regulator Motor Replacement

Callout	Component Name
<p>Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.</p> <p>Preliminary Procedure</p>	

Remove the front side door window regulator. Refer to [Front Side Door Window Regulator Replacement](#) .

1	<p>Front Side Door Window Regulator Motor Screws (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 5 N·m (44 lb in)</p>
2	<p>Front Side Door Window Regulator Motor</p> <p>Tip Inspect the window for proper operation before installing the door trim panel.</p>

Rear Side Door Window Regulator Replacement

Callout	Component Name
<p>Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.</p> <p>Preliminary Procedure</p>	

Loosen the rear side door window from the guide nuts. Do not remove the window from the door. Refer to [Rear Side Door Window Replacement](#) .

1	<p>Rear Side Door Window Regulator Bolts (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Rear Side Door Window Outer Weatherstrip Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the upper rear side door belt reveal molding. Refer to [Rear Side Door Window Belt Reveal Molding Replacement](#) : [Lower](#) → [Upper](#) .
2. Remove the rear side door window. Refer to [Rear Side Door Window Replacement](#) .

1	Rear Side Door Window Upper Weatherstrip Screw Tip Reposition the door weatherstrip to access.
2	Rear Side Door Window Outer Weatherstrip Screw Tighten 2 N·m (22 lb in) Tip The screw is located under the outer weatherstrip, in the lower fame.
3	Rear Side Door Window Weatherstrip Lower Bolt (Qty: 2) Tighten 11 N·m (97 lb in)
4	Rear Side Door Window Weatherstrip Procedure Grasp the rear top corner of the outer window and weatherstrip, pull rearward and down releasing the assembly from the door frame. Tip Inspect the window for proper operation before installing the door trim panel.

Front Side Door Window Rear Channel Replacement

Callout	Component Name
<p>Warning: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.</p> <p>Preliminary Procedures</p>	

1. Position the window to the full up position.
2. Remove the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .

1	<p>Front Side Door Window Front Channel Bolts (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Reposition the water deflector.2. Pull the weatherstrip from the front channel. <p>Tighten 11 N·m (97 lb in)</p>
2	<p>Front Side Door Window Front Channel</p> <p>Tip Inspect the window for proper operation before installing the door trim panel.</p>

Power Windows Description and Operation

Power Windows System Components

The power window system consists of the following components:

- Driver window switch
- Passenger window switch
- Left rear window switch
- Right rear window switch
- Window motors in each of the doors
- F24U 30A Fuse
- F55U 7.5A Fuse
- F21UA 30A Fuse
- Body control module (BCM)

Driver Express Up and Express Down Power Window Motor

The driver door contains a window motor is smart motor that will detect excessive resistance while performing the express up function and automatically reverse direction to prevent injury to any occupants that may become trapped between the closing window and the door frame. The automatic reverse safety feature can be overridden by pulling and holding the window switch.

The logic circuit within the window motor monitors the up, down and express signal circuits which are normally equal to B+ voltage. When a switch is used on the driver window switch, the contacts close causing a voltage drop within the appropriate signal circuit. The driver window motor will detect the voltage drop and will command the window to move in the direction requested.

Passenger, Left Rear and Right Rear Express Down Window Motors

For the passenger, right rear and left rear doors, when their window switch is pressed in the down position, battery positive voltage is applied to their respective window motor control circuit and ground to the other window motor control circuit causing that window to open. When the individual window switch is pulled in the up position, voltage and ground is applied to the window motor in the opposite direction causing that window to close. The return path to ground is supplied through the inactive control circuit being normally grounded through the window switch.

Each passenger and rear window switch communicates to the BCM by a serial data circuit. When the driver wishes to control the passenger, left rear or right rear window, the

driver will use the appropriate switch on the driver window switch. When this switch is used, a serial data message is sent to the BCM requesting a window motor command, the BCM will then send a serial data message to the appropriate door window switch which will then command that window to move in the direction requested.

Lockout Switch Feature

The driver power window switch contains a window lockout switch, when the driver presses the window lockout switch, a serial data message is sent to the BCM which will send a disable command to the rear window switches, deactivating them. The rear windows will still function normally from the switches on the driver window switch.

Rear Window Demister Description and Operation

[Rear Window Demister System Components](#)

The rear window demister system consists of the following components:

- HVAC Control Module
- HVAC Control Head
- Rear Window Demister Relay
- Rear Demister Grid
- F28UA 40A Fuse

[Rear Window Demister Operation](#)

The rear demist control system utilises a single zone backlight design, driven with a single relay configuration. Additionally, up to two outside rear view mirrors can be heated if required. A switch for the customer to control the system is provided within the HVAC control head. Also included in the HVAC control head is an indicator to inform the customer with the current state of the system. The system is only operational when engine is running or during remote start.

Pressing the heated rear window switch on the HVAC control face plate causes the HVAC control head to send a serial data message to the HVAC control module requesting rear window demist operation. The HVAC control module upon receipt of the serial data message will provide voltage to the coil side of the rear window demister relay, this will energise the relay causing the relay switch contacts to close allowing B+ voltage to flow through the rear demister grid control circuit to the rear demister grid.

When the rear heated window switch is pressed and the engine is running, the rear demist control system will remain active for 10 minutes. After the initial cycle has lapsed, pressing the switch again will continue rear window demister operation, but the cycle will only last 5 minutes. The rear demist control system will function continuously if the vehicle speed is greater than 70 kilometres per hour (45 mph).

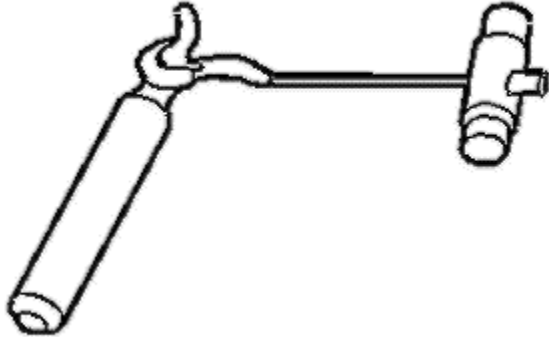

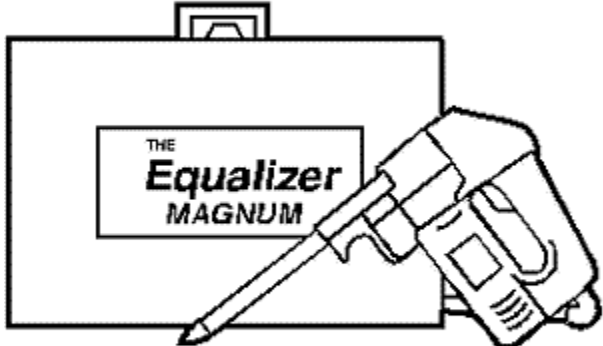

Stationary Window Description

Most stationary windows, specifically windscreens, are retained to the body with adhesive which adheres the window to the body, increasing structural integrity. The re-installation of the windows with adhesive requires complete replacement of the adhesive bead, and is known as the full cut method. All stationary windows must use adhesive systems which meet GM Specification GM 3651G

DTC B2750

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B2750 01: Horn Relay Coil Circuit Short to Battery

DTC B2750 02: Horn Relay Coil Circuit Short to Ground

DTC B2750 04: Horn Relay Coil Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Horn Relay Control	B2750 02	B2750 04	B2750 01	--
Horn Relay Ground	-	B2750 04	--	--

[Circuit/System Description](#)

The body control module (BCM) controls the horn relay by providing system voltage to the control circuit of the horn relay coil energising the relay. When the horn relay is energised, the horn relay contacts close applying voltage through the horn fuse and the horn control circuit to the horns.

[Conditions for Running the DTC](#)

The DTC can only set only when the output is actively being requested by the BCM.

[Conditions for Setting the DTC](#)

B2750 01

The BCM detects a short to voltage in the horn relay control circuit for approximately 125 milliseconds.

B2750 02

The BCM detects a short to ground in the horn relay control circuit for approximately 125 milliseconds.

B2750 04

The BCM detects an open/high resistance in the horn relay control circuit for approximately 125 milliseconds.

Action Taken When the DTC Sets

B2750 02

The horns will sound continuously until the horns are disconnected or when the horns overheat and becomes inoperative

B2750 01, B2750 04

The horns will be inoperative.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Vehicle in Service Mode, command the Horn Relay ON and OFF with the scan tool. The horns should turn ON and OFF when changing between the commanded states.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the KR3 horn relay.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground
If greater than the specified range, test the ground circuit for an open/high resistance
3. Connect a test lamp between the control circuit terminal 5 and the ground circuit terminal 6.
4. Vehicle in Service Mode, command the Horn Relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM
If the test lamp is always OFF, test the control circuit for a short circuit to voltage or open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. If all circuits test normal, test or replace the KR3 horn relay.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Relay Replacement](#) : [Within an Electrical Centre](#) → [Attached to Wire Harness](#)
- [Control Module References](#) for BCM replacement, programming and setup

Symptoms - Horns

Important: The following steps must be completed before using the symptom tables:

1. Perform [Diagnostic System Check - Vehicle](#) , before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set
 - The control modules can communicate via the serial data link
2. Review the system operation in order to familiarise yourself with the system functions. Refer to [Horns System Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the horn system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Perform the following if a horn buzzes or has a harsh tone.
 - Inspect for debris in the joint where the horn fastens to the vehicle.
 - Test the torque of the horn mounting hardware. The horn mounting hardware should be tightened to a torque of 10 N·m (7 lb ft).

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure [Horns Malfunction](#) in order to diagnose the symptom.

Horns Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Horn Relay B+	2	2	--	--
Horn Switch Signal	1	2	2	--
Predestrian Friendly Alert Switch Signal	3	3	3	--
Horn Relay Control	B2750 02	B2750 04	B2750 01	--
Horn Control	2	2	1	--
Horn Switch Ground	--	2	--	--
Horn Ground	--	2	--	--
Horn Relay Ground	-	B2750 04	--	--
1. Horn Always On				
2. Horn Inoperative				
3. Predestrian Friendly Alert Malfunction				

[Circuit/System Description](#)

Battery positive voltage is applied at all times to the horn relay coil and the horn relay switch. Pressing the horn switch provides system voltage to the switch contacts and the horn relay control circuit to the coil side of the relay, energising the relay. Battery voltage is then applied through the switch side of the relay, the horn fuse, and the horn control circuit to the horns. The body control module (BCM) may also apply system voltage to the horn relay control circuit as described above. The horns sound as long as ground is applied to the horn relay control circuit.

Diagnostic Aids

A short to ground in the HORN relay control circuit or a short to voltage in the horn control circuit will cause the horns to sound continuously until the horns overheat and become inoperative.

Rotate the steering wheel while pressing the horn pad to identify intermittent and poor connections within the steering column.

If diagnosing a Horn- Poor Tone condition, inspect the following:

- Debris or water in the horn assembly.
- Proper horn mounting hardware torque. Refer to [Fastener Tightening Specifications](#) .
- Debris in the joint where the horns attach to the vehicle.
- Debris in direct contact with the horn.
- Vehicle components vibrating while the horn is sounding.

Description and Operation

[Horns System Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Command the horns ON and OFF with the scan tool, the P12 horns should turn ON and OFF when changing between the commanded states.
If the P12 horns are always ON or always OFF, refer to Horns or Horn Command Malfunction.
If the sound emitted from the P12 horns are not clear and even, refer to Horn - Poor Tone.
2. Observe the scan tool Horn Switch parameter while pressing and releasing the horn pad. The parameter should change from Inactive to Active.
If the value does not change, refer to Horn Switch Malfunction.
3. Command the horns to sound the pedestrian friendly alert function by pressing and releasing the pedestrian friendly alert switch. The P12 horns should sound an 8 cycle horn chirp burst each time the switch is pressed.
If the P12 horns do not perform as specified, refer to Pedestrian Friendly Alert Switch Malfunction.

Circuit/System Testing

Horns or Horn Command Malfunction

1. Vehicle OFF, disconnect the KR3 horn relay.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp does not illuminate between the control circuit terminal 4 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage.
4. Verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the control circuit terminal 4 for a short to ground.
5. Vehicle OFF, disconnect the harness connector at the P12 horn.
6. Vehicle OFF, test for less than 10 Ω between the ground circuit terminal 1 and ground
If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the harness connector at the P12 horn.
8. Vehicle in Service Mode, connect a 15 A fused jumper wire between the B+ circuit terminal 2 and the control circuit terminal 4. Verify the P12 horn is activated.
If the P12 horn does not activate, test the control circuit for an open/high resistance. If the circuit tests normal, test or replace the P12 horn.
9. Connect a test lamp between the control circuit terminal 5 and the B+ circuit terminal 2.
10. Command the Horn Relay ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the K9 BCM.
If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
11. If all circuits test normal, test or replace the KR3 horn relay.

Horn - Poor Tone

1. Vehicle OFF, disconnect the harness connector at the appropriate P12 horn.

2. Test for less than 1 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for a high resistance.
3. Disconnect the KR3 horn relay.
4. Test for less than 1 Ω between the control circuit terminal 4 at the KR3 horn relay and the control circuit terminal 2 at the P12 horn.
If greater than the specified range, test the control circuit for high resistance.
5. If all circuits test normal, test or replace the P12 horn.

Horn Switch Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the S33 horn switch.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Disconnect the X1 harness connector at the S33 horn switch.
4. Vehicle in Service Mode, test for greater than 10 V between the signal circuit terminal 1 and ground.
If less than the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. If all circuits test normal, test or replace the S33 horn switch.

Predestrian Friendly Alert Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S78 indicator/multifunction switch.
2. Vehicle in Service Mode, test for greater than 10 V between the signal circuit terminal 3 and ground.
If less than the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
3. If all circuits test normal, test or replace the S78 indicator/multifunction switch.

Component Testing

Horn Test

1. Vehicle OFF, disconnect the harness connector at the appropriate P12 horn.
2. Install a 15 A fused jumper wire between the control terminal 2 and 12 V. Install a jumper wire between the ground terminal 1 and ground. Verify the horn emits a clear and even tone.
If the sound emitted is not clear and even, replace the P12 horn.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Relay Replacement](#) : [Within an Electrical Centre](#) → [Attached to Wire Harness](#)
- [Steering Wheel Horn Contact Replacement](#)

- [Horn Replacement](#)
- [Indicator Multifunction Switch Replacement](#)
- [Control Module References](#) for BCM replacement, programming and setup

Horn Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front wheelhouse front liner. Refer to Front Wheelhouse Front Liner Replacement .	
	Horn Nut

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Horn</p> <p>Tip Left side shown, right side similar.</p> <p>Procedure</p> <p>Disconnect the electrical connector.</p>

Steering Wheel Horn Contact Replacement

Callout	Component Name
Preliminary Procedure	Remove the steering wheel inflatable restraint module. Refer to Steering Wheel Airbag Coil Replacement .
	Steering Wheel Horn Contact Spring Retainer Bolt (Qty: 3)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 5.5 N·m(49 lb in)
2	Steering Wheel Horn Contact Assembly Procedure Disconnect the electrical connectors.

Horns System Description and Operation

System Description

The horn system consists of the following components:

- 15 A fuse
- Horn relay
- Horn switch
- Indicator multifunction switch
- Left and right horns
- Body control module (BCM)

System Operation

- The vehicle horn is activated whenever the horn switch is depressed.
- When the Pedestrian Friendly Alert System is activated by pressing a button on the end of the indicator/multifunction stalk.
- The BCM commands the horns ON under any of the following conditions:
 - When the content theft deterrent system detects a vehicle intrusion--For further information refer to [Theft Systems Description and Operation](#) .
 - When the keyless entry system is used to lock the vehicle, a horn chirp may sound to notify the driver that the vehicle has been locked. The notification feature may be enabled or disabled through personalisation. For further information refer to [Keyless Entry System Description and Operation](#) .
 - When the hybrid powertrain control module 2 begins charging the vehicle. For further information refer to [Plug-In Charging System Description and Operation](#) .
 - When the hybrid powertrain control module 2 detects that the vehicle charging has been interrupted for any reason before the vehicle is fully recharged. For further information refer to [Plug-In Charging System Description and Operation](#) .
 - When the hybrid powertrain control module 2 detects a disconnect of the charge cord while the vehicle is locked. Refer to the appropriate section of the owner's manual for further information.

Horn Operation

Normal Horn Operation

The BCM controls the horn operation, when the horn switch is pressed, it closes a switch pulling the horn signal circuit low. When the BCM detects the drop in voltage in the horn switch signal circuit, it energises the horn relay which provides B+ voltage to the horn control circuit, sounding the horn.

When the vehicle is in the Off Power Mode the BCM will attempt to detect a stuck or continuously activated horn switch. When enabled, activation of the horn will be limited to 10 seconds to protect the horn from excessive use.

Predestrian Friendly Alert System

Extended Range Electric Vehicles (EREV) present a situation for visually impaired pedestrians who cannot hear an approaching EREV. The Predestrian Friendly Alert System offers the driver the ability to warn a visually impaired pedestrian, in a non-startling manner, that the vehicle is approaching. When the driver presses the predestrian friendly alert switch located on the end of the indicator/multifunction stalk, the BCM will command an 8 cycle horn chirp burst lasting 217.5 ms.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Reverse Lamp to Rear Bumper Fascia Bolt/Screw	2.5 N·m	22 lb in
Reverse Lamp to Rear Energy Absorber Bolt/Screw	2.5 N·m	22 lb in

1. Interior Backlighting Malfunction

[Circuit/System Description](#)

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The body control module (BCM) provides a low reference, signal, and B+ voltage reference circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the light emitting diode (LED) dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B1395 03

- The BCM detects a short to ground in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to ground or an open/high resistance in the F10DL fuse B+ circuit.

DTC B1395 07

The BCM detects a short to voltage in the instrument panel dimmer switch B+ reference circuit.

Action Taken When the DTC Sets

The interior backlighting defaults to full bright.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

The instrument panel dimmer switch B+ reference circuit is a low current circuit that will not illuminate a test lamp.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the S16 Driver Information Centre Switch.
2. Vehicle in Service Mode, verify that a test lamp illuminates between B+ and the low reference circuit terminal 12.
If the test lamp does not illuminate, test the low reference circuit for a short to voltage or an open/high resistance.
3. Test for B+ between the B+ reference circuit terminal 11 and ground.
If less than the specified range, test the B+ reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
4. Verify that a test lamp does not illuminate between the B+ reference circuit terminal 11 and ground.
If the test lamp illuminates, test the B+ reference circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
5. Verify the scan tool LED Backlight Dimming Command parameter is greater than 40%.
If less than the specified range, test the signal circuit terminal 10 for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
6. Vehicle OFF, install a 3 A fused jumper wire between the B+ reference circuit terminal 11 and the signal circuit terminal 10.
7. Vehicle in Service Mode, verify the scan tool LED Backlight Dimming Command parameter is less than 40%.
If greater than the specified range, test the signal circuit terminal 10 for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.

8. If all circuits test normal, replace the S16 Driver Information Centre Switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC B1480

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B1480 02: Battery Rundown Protection Circuit Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F7DR (interior lamps) Fuse B+	B2545 01, B2545 04, B2615 02	B2545 01, B2545 04, B2615 02	--	--
Courtesy Lamp Control - Terminal 2 X7	B1480 02	1	1	--
Dome/Reading Lamps - Front Ground	--	1	--	--
Sun Visor - Left Ground	--	1	--	--
Sun Visor - Right Ground	--	1	--	--
1. Courtesy Lamps Malfunction				

[Circuit/System Description](#)

The body control module (BCM) supplies battery voltage to the dome/reading lamps - front and left and right sun visor lamps via the courtesy lamp control circuit. When a sun visor mirror is opened, the switch contact close allowing battery voltage to flow illuminating the respective lamps. The front reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16 V.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground in the courtesy lamp control circuit.

[Action Taken When the DTC Sets](#)

The BCM will disable the circuit and the sun visor lamps and front reading lamps will be inoperative.

[Conditions for Clearing the DTC](#)

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

[Diagnostic Aids](#)

When the F7DR (interior lamps) fuse is open, both dome lamps, sun visor lamps, reading lamps, and reverse lamps will be inoperative. DTC B2545 will also set for the reverse lamps when the vehicle is placed in the reverse gear.

Circuit/System Testing

Note: Each courtesy lamp component may need to be disconnected to isolate a short to voltage or a short to ground. Use the schematic to identify the following:

- Each components control and ground circuit terminals
- Courtesy lamp components the vehicle is equipped with
- Component locations on the courtesy lamp control circuit

1. Vehicle OFF, disconnect the harness connector at any component with inoperative courtesy lamps.
2. Connect a test lamp between the appropriate control circuit terminal listed below and ground:
 - E37F Dome/Reading Lamps - Front terminal 1
 - E31L Sun Visor Mirror Lamp - Left terminal A
 - E31R Sun Visor Mirror Lamp - Right terminal A
3. Vehicle in Service Mode, command the Inadvertent Load ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
4. If all circuits test normal, replace the inoperative courtesy lamp.

DTC B2545 01: Reverse Lamps Circuit Short to Battery

DTC B2545 02: Reverse Lamps Circuit Short to Ground

DTC B2545 04: Reverse Lamps Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F7DR (interior lamps) Fuse B+	B2545 01, B2545 04, B2615 02	B2545 01, B2545 04, B2615 02	--	--
Reverse Lamp Control	B2545 02	B2545 01, B2545 04	1	--
Reverse Lamp Ground	--	1	--	--
1. Reverse Lamps Malfunction				

[Circuit/System Description](#)

With the vehicle ON and the transmission in the REVERSE position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the REVERSE position. The BCM applies battery voltage to the reverse lamp control circuit illuminating the reverse lamps. Once the driver moves the gear selector out of the REVERSE position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the reverse lamps control circuit. The engine must be ON for the reverse lamps to operate.

[Conditions for Running the DTC](#)

- Vehicle ON.
- Transmission in REVERSE gear.

Conditions for Setting the DTC

DTC B2545 01 and B2545 04

- The BCM detects an open/high resistance in the reverse lamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F7DR fuse B+ circuit.

DTC B2545 02

The BCM detects a short to ground in the reverse lamp control circuit.

Action Taken When the DTC Sets

The reverse lamp will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Disconnect the harness connector at the E5 Reverse Lamp.
5. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal B and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between the control circuit terminal A and ground.
7. Vehicle in Service Mode, command the Reverse Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
8. If all circuits test normal, replace the E5 Reverse Lamp.

[DTC Descriptor](#)

DTC B257A 00: Headlamp Switch Input Signals Correlation Malfunction

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Indicator/Multifunction Switch Sidelights ON Signal	2	B257A 00	2	--
Indicator/Multifunction Switch Headlamps OFF Signal	B257A 00	1	1	--
Indicator/Multifunction Switch Headlamps ON Signal	B257A 00	1	1	--
Indicator/Multifunction Switch Ground	--	1	--	--
1. Headlamps Malfunction				
2. Sidelight, Number Plate, and/or Tail Lamps Malfunction				

[Circuit/System Description](#)

For headlamp operation, the body control module (BCM) monitors three signal circuits from the indicator/multifunction switch. When the indicator/multifunction switch is in the AUTO position, the three signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRL) ON and OFF. When the indicator/multifunction switch is placed in the OFF position, the indicator/multifunction switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the indicator/multifunction switch in the sidelights position, the indicator/multifunction switch sidelights ON signal circuit is grounded, indicating that the sidelights have been requested. When the indicator/multifunction switch is in the headlamp position, both the indicator/multifunction switch sidelights ON signal circuit and the indicator/multifunction switch headlamps ON signal circuit are grounded. The BCM responds by commanding the sidelights and headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16V.

Conditions for Setting the DTC

- The BCM detects an open/high resistance in the indicator/multifunction switch sidelights ON signal circuit.
- The BCM detects a short to ground in the indicator/multifunction switch headlamps ON signal circuit.
- The BCM detects a short to ground in the indicator/multifunction switch headlamps OFF signal circuit.

Action Taken When the DTC Sets

- When DTC B257A 00 is present on the indicator/multifunction switch headlamps OFF signal circuit, the dipped beam headlamps are always ON in the AUTO position. The indicator/multifunction switch operates in all positions other than AUTO. The AUTO headlamp defeat is inoperative.
- When DTC B257A 00 is present on the indicator/multifunction switch headlamps ON signal circuit, the dipped beam headlamps are always ON. The BCM disregards all indicator/multifunction switch inputs.
- When DTC B257A 00 is present on the indicator/multifunction switch sidelights ON signal circuit, the sidelights and dipped beam headlamps are inoperative in the SIDELIGHTS and headlamps positions. Headlamps and sidelights operate in AUTO position.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S78 Indicator/Multifunction Switch.
2. Vehicle OFF, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 9 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
4. Verify the scan tool Sidelights Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 7 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
5. Verify the scan tool Headlamps On Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
6. Install a 3 A fused jumper wire between the signal circuit terminal 9 and ground. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
7. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground. Verify the scan tool Sidelights Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
8. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground. Verify the scan tool Headlamps On Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
9. If all circuits test normal, replace the S78 Indicator/Multifunction Switch.

[DTC Descriptors](#)

DTC B2580 01: Main Beam Control Circuit Short to Battery

DTC B2580 02: Main Beam Control Circuit Short to Ground

DTC B2580 04: Main Beam Control Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Main Beam Relay Control	B2580 02, B2580 04	B2580 02, B2580 04	B2580 01	--
Headlamp Main Beam Control - Left	1	1	1	--
Headlamp Main Beam Control - Right	1	1	1	--
Headlamp Ground - Left	--	1	--	--
Headlamp Ground - Right	--	1	--	--
1. Headlamps Malfunction				

[Circuit/System Description](#)

When the dipped beam headlamps are on and the indicator/multifunction switch is placed in the main beam position, ground is applied to the body control module (BCM) through the main beam signal circuit. The BCM responds to the main beam request by applying ground to the main beam relay control circuit which energises the headlamp main beam relay. With the main beam relay energised, the switch contacts close allowing battery voltage to flow through the main beam fuses to the main beam control

circuits illuminating the main beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Main beam headlamps ON.

Conditions for Setting the DTC

DTC B2580 01

The BCM detects a short to voltage in the headlamp main beam relay control circuit.

DTC B2580 02 and B2580 04

The BCM detects a short to ground or an open/high resistance in the headlamp main beam control circuit.

Action Taken When the DTC Sets

- For an open/high resistance fault, the main beam headlamps and flash to pass function are inoperative. The main beam indicator on the instrument cluster operates normally.
- For a short to ground fault, the main beam headlamps and main beam indicator on the instrument cluster are always ON with the headlamp switch in the AUTO or headlamps positions.
- For a short to voltage fault, the main beam headlamps and flash to pass function are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B2585 01: Sidelights Control Circuit Short to Battery

DTC B2585 02: Sidelights Control Circuit Short to Ground

DTC B2585 04: Sidelights Control Circuit Open

DTC B3867 01: Right Sidelight Control Circuit Short to Battery

DTC B3867 02: Right Sidelight Control Circuit Short to Ground

DTC B3867 04: Right Sidelight Control Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Sidelights Control	B2585 02	B2585 04	B2585 01	-
Right Sidelight Control	B3867 02	B3867 04	B3867 01	--

[Circuit/System Description](#)

The body control module (BCM) energises the sidelights by applying voltage to the sidelight control circuit. When the sidelight control circuit is energised the sidelights are illuminated.

Conditions for Running the DTC

B2585 01

The sidelights are turned OFF.

B2585 02 or B2585 04

The sidelights are turned ON

B3867 01

- The vehicle is OFF.
- Headlamp switch in OFF or AUTO position.

B3867 02 or B3867 04

Headlamp switch in sidelight or dipped beam position.

Conditions for Setting the DTC

B2585 01 or B3867 01

The BCM detects a short to voltage on the control circuit.

B2585 02 or B3867 02

The BCM detects a short to ground on the control circuit.

B2585 04 or B3867 04

The BCM detects an open control circuit.

Action Taken When the DTC Sets

The sidelights are inoperative.

Conditions for Clearing the DTC

The condition for setting the DTC is not longer present.

[Circuit/System Verification](#)

Vehicle in Service Mode, perform the appropriate Tail Lamp test. The appropriate sidelight should be ON/OFF

[Circuit/System Testing](#)

DTC B2585

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
2. Verify that a test lamp illuminates between the B+ circuit terminal 3 X2 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.

3. Connect the harness connector at the K9 Body Control Module and disconnect the harness connector at the appropriate inoperative tail lamp.
4. Test for less than 5 Ω between the appropriate tail lamp ground circuit harness connector listed below and ground.
 - E4J Sidelight - Left Front harness connector terminal 1
 - E5AA Tail/Brake Lamp - Left harness connector terminal 3
 - E5E Tail Lamp - Left harness connector terminal 2If greater than the specified value, test the ground circuit for an open/high resistance.
5. Connect a test lamp between the appropriate tail lamp control circuit harness connector listed below and ground.
 - E4J Sidelight - Left Front harness connector terminal 2
 - E5AA Tail/Brake Lamp - Left harness connector terminal 2
 - E5E Tail Lamp - Left harness connector terminal 1
6. Command the appropriate Tail Lamp test ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the K9 Body Control Module.
7. If all the circuits test normal, replace the appropriate inoperative tail lamp.

DTC B3867

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
2. Verify that a test lamp illuminates between the B+ circuit terminal 4 X1 and ground.
 - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Connect the harness connector at the K9 Body Control Module and disconnect the harness connector at the appropriate inoperative tail lamp.
4. Test for less than 5 Ω between the appropriate tail lamp ground circuit harness connector listed below and ground.
 - E4K Sidelight - Right Front harness connector terminal 1
 - E5AB Tail/Brake Lamp - Right harness connector terminal 3
 - E5F Tail Lamp - Right harness connector terminal 2If greater than the specified value, test the ground circuit for an open/high resistance.
5. Connect a test lamp between the appropriate tail lamp control circuit harness connector listed below and ground.
 - E4K Sidelight - Right Front harness connector terminal 2
 - E5AB Tail/Brake Lamp - Right harness connector terminal 2
 - E5F Tail Lamp - Right harness connector terminal 1
6. Command the appropriate Tail Lamp test ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the K9 Body Control Module.
7. If all the circuits test normal, replace the appropriate inoperative tail lamp.

1. Headlamps Malfunction				
2. Daytime Running Lamps Malfunction				

[Circuit/System Description](#)

The ambient light sensor is used to monitor outside lighting conditions. The ambient light sensor provides a voltage signal that will vary between 0.2-4.9 V depending on outside lighting conditions. The body control module (BCM) provides a 5 V reference signal to the ambient light sensor which is permanently grounded. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lamps (DRL) or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions, the BCM will command the DRL ON by applying a pulse width modulated (PWM) voltage to the left and right DRL control circuits illuminating the DRL. Any function or condition that turns on the headlamps will cancel DRL operation.

[Conditions for Running the DTC](#)

- Battery voltage must be between 9-16 V.
- Headlamp switch in AUTO position.

[Conditions for Setting the DTC](#)

B2600 01

The BCM detects a short to voltage in the left DRL control circuit.

B2600 02

The BCM detects a short to ground in the left DRL control circuit.

B2600 04

The BCM detects an open in the left DRL control circuit.

B2605 01

The BCM detects a short to voltage in the left DRL control circuit.

B2605 02

The BCM detects a short to ground in the left DRL control circuit.

B2605 04

The BCM detects an open in the left DRL control circuit.

Action Taken When the DTC Sets

The BCM will disable the appropriate DRL control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free ignition cycles have occurred.

[DTC Descriptors](#)

DTC B2610 01: Passenger Compartment Dimming 1 Circuit Short to Battery

DTC B2610 02: Passenger Compartment Dimming 1 Circuit Short to Ground

DTC B2610 04: Passenger Compartment Dimming 1 Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
LED Backlight Dimming Control Terminal 8 X2	B2610 02	B2610 04, 1	B2610 01, 1	-
LED Backlight Dimming Control Terminal 9 X7	B2610 02	B2610 04, 1	B2610 01, 1	-
1. Interior Backlighting Malfunction				

[Circuit/System Description](#)

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference, signal, and B+ voltage reference circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the light emitting diode (LED) dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Sidelights ON.

Conditions for Setting the DTC

DTC B2610 01

The BCM detects a short to battery in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

DTC B2610 02

The BCM detects a short to ground in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

DTC B2610 04

The BCM detects an open/high resistance in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

Action Taken When the DTC Sets

The BCM will disable the LED backlight dimming control circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

Note: Each component supplied by the LED backlight dimming control circuits may need to be disconnected to isolate the short to ground. Use the schematics to identify the following:

- Each component control and ground circuit terminals
- Component locations on the LED backlight dimming control circuits

1. Vehicle OFF, disconnect the harness connector at any component with inoperative backlighting.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground:
 - A20 Radio/HVAC Controls - terminal 17
 - S16 Driver Information Centre Switch - terminal 4
 - E37F Dome/Reading Lamps - Front - terminal 6
 - S25 Garage Door Opener switch - terminal 3
 - S48B Multifunction Switch - Overhead Console amber LED - terminal 6
 - S70R Steering Wheel Controls Switch - Right - terminal 5
 - S70L Steering Wheel Controls Switch - Left - terminal 7
 - S91 Hand Brake Control Switch - terminal 8
 - S48B Multifunction Switch - Overhead Console - terminal 2
 - S52 Outside Wing Mirror Switch - terminal 11
 - S113 Charge Port Door Open Request Switch - terminal 4
 - S117 Refuel Request Switch - terminal 4

- S83 Vehicle On/Off Switch - terminal 4
- If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground:
 - A20 Radio/HVAC Controls - terminal 18
 - S16 Driver Information Centre Switch - terminal 3
 - E37F Dome/Reading Lamps - Front - terminal 3
 - S25 Garage Door Opener switch - terminal 2
 - S48B Multifunction Switch - Overhead Console amber LED - terminal 3
 - S70L Steering Wheel Controls Switch - Left - terminal 6
 - S70R Steering Wheel Controls Switch - Right - terminal 4
 - S91 Hand Brake Control Switch - terminal 6
 - S48B Multifunction Switch - Overhead Console - terminal 1
 - S52 Outside Wing Mirror Switch - terminal 1
 - S113 Charge Port Door Open Request Switch - terminal 5
 - S117 Refuel Request Switch - terminal 5
 - S83 Vehicle On/Off Switch - terminal 8
 4. Vehicle in Service Mode, command the LED Backlight Dimming ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 5. If all circuits test normal, replace the component with inoperative backlighting.

DTC B2615

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B2615 02: Passenger Compartment Dimming 2 Circuit Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F7DR Fuse B+	B2545 01, B2545 04, B2615 02	B2545 01, B2545 04, B2615 02	--	--
Interior Lamps Control	B2545 01, B2545 04, B2615 02	1	1	--
Dome Lamp - Front Ground	--	1	--	--
Dome Lamp - Middle Ground	--	1	--	--
1. Interior Lights Malfunction				

[Circuit/System Description](#)

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door open input. The BCM illuminates the dome lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps will remain illuminated approximately 3 s after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the dome lamps control circuit to prevent total battery discharge.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- The BCM detects a short to ground in the dome lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the F7DR (interior lamps) fuse B+ circuit.

Action Taken When the DTC Sets

The front and middle dome lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

When the F7DR (interior lamps) fuse is open, both dome lamps, sun visor lamps, reading lamps, and reverse lamps will be inoperative. DTC B2545 will also set for the reverse lamps when the vehicle is placed in the reverse gear.

[Circuit/System Testing](#)

Note: Each dome lamp may need to be disconnected to isolate the short to ground. Use the schematic to identify the following:

- Each dome lamps control and ground circuit terminals
- All dome lamps equipped on the vehicle
- Component locations on the dome lamps control circuits

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the F7DR (interior lamps) fuse B+ circuit terminal 4 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Disconnect the harness connector at the inoperative dome lamp.
5. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 min, then test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between the control circuit terminal 2 and ground.
7. Vehicle in Service Mode, command the Courtesy Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
8. If all circuits test normal, replace the appropriate dome lamp.

DTC B2625 02: Display Dimming Pulse Width Modulation Output Circuit Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Garage Door Opener Switch Amber LED Control	B2625 02	1	1	--
Garage Door Opener Switch Ground	--	1	--	--
1. Interior Backlighting Malfunction				

[Circuit/System Description](#)

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference, signal, and B+ voltage reference circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the garage door opener switch amber LED indicator control circuit illuminating the garage door opener switch amber LED to the requested level of brightness.

[Conditions for Running the DTC](#)

- Battery voltage must be between 9-16 V.
- Sidelights ON.

Conditions for Setting the DTC

The BCM detects a short to ground in the garage door opener switch amber LED control circuit.

Action Taken When the DTC Sets

The garage door opener switch amber LED is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Headlamp Ground - Left	--	1	--	--
Headlamp Ground - Right	--	1	--	--
1. Headlamps Malfunction				
2. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light sensor is used to monitor outside lighting conditions. The body control module (BCM) provides a low reference ground and 5V reference signal to the ambient light sensor. Depending on outside lighting conditions, the ambient light sensor provides a voltage signal to the BCM that will vary between 0.2-4.9 V. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lamps (DRL) or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions, the BCM will command the DRL ON by applying voltage to the left and right DRL control circuits illuminating the DRL. Any function or condition that turns on the headlamps will cancel DRL operation.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B2645 03

The BCM detects a short to ground in the ambient light sensor signal circuit.

DTC B2645 07

- The BCM detects a short to voltage or an open/high resistance in the ambient light sensor signal circuit.
- The BCM detects an open/high resistance in the ambient light sensor low reference circuit.

Action Taken When the DTC Sets

- The BCM defaults to low light status and commands the dipped beam headlamps ON.
- Daytime running lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Circuit/System Verification

Ignition ON, observe the scan tool Rear Fog Lamp Switch parameter. The reading should change between Active/Inactive when changing between pressed and released rear fog lamp switch button.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 and X3 harness connector at the K9 Body Control Module.

2. Ignition ON, test for less than 0.3 V at the K9 Body Control Module signal circuit harness connector X1 terminal 9 and ground.
If greater than the specified value, test the signal circuit for an short to voltage.
3. Test for less than 0.3 V at the K9 Body Control Module 12 V reference circuit harness connector X3 terminal 4 and ground.
If greater than the specified value, test the 12 V reference circuit for a short to voltage.
4. Ignition OFF, test for infinite resistance between the K9 Body Control Module signal circuit harness connector X1 terminal 9 and ground.
If lower than the specified value, test the signal circuit for a short to ground.
5. Test for infinite resistance between the K9 Body Control Module 12 V reference circuit harness connector X3 terminal 4 and ground.
If lower than the specified value, test the 12 V reference circuit for a short to ground.
6. Press and hold the front fog lamp switch button.
7. Test for 100-200 Ω between the K9 Body Control Module 12 V reference circuit harness connector X3 terminal 4 and the K9 Body Control Module signal circuit harness connector X1 terminal 9.
If not within the specified range, test the 12 V reference circuit and the signal circuit for an open/high resistance. If the circuits test normal replace the S30 Headlamp Switch
8. If all circuits test normal, replace the K9 Body Control Module.

Component Testing

Static Test

Ignition OFF, disconnect the harness connector at the S30 Headlamp Switch. Press and hold the rear fog lamp switch button, test for 100-200 Ω at the S30 Headlamp Switch terminal 1 and terminal 12.

If not within the specified range replace the S30 Headlamp Switch.

Instrument Panel Dimmer Switch Low Reference	1	1	1	--
Driver Information Centre Switch Ground	--	1	--	--
1. Interior Backlighting Malfunction				

[Circuit/System Description](#)

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference, signal, and B+ voltage reference circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The

BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the light emitting diode (LED) dimming control circuits illuminating the interior backlighting to the requested level of brightness.

[Conditions for Running the DTC](#)

- Battery voltage must be between 9-16 V.
- Sidelights ON.

[Conditions for Setting the DTC](#)

DTC B3600 03

- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch signal circuit.

DTC B3600 07

The BCM detects a short to voltage in the instrument panel dimmer switch signal circuit.

[Action Taken When the DTC Sets](#)

The interior backlighting defaults to full bright.

[Conditions for Clearing the DTC](#)

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

[Diagnostic Aids](#)

The instrument panel dimmer switch B+ reference circuit is a low current circuit that will not illuminate a test lamp.

[DTC Descriptor](#)

DTC B3650 08: Main Beam Request Signal Circuit Performance - Signal Invalid

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Indicator/Multifunction Switch Headlamps OFF Signal	B257A 00	1	1	--
Indicator/Multifunction Switch Headlamps ON Signal	B257A 00	1	1	--
Indicator/Multifunction Switch Sidelights ON Signal	2	B257A 00	2	--
Indicator/Multifunction Switch Flash To Pass Signal	3806 00	1	1	--
Indicator/Multifunction Switch Main Beam Signal	B3650 08	1	1	--
Indicator/Multifunction Switch Ground	--	1	--	--
1. Headlamps Malfunction				
2. Sidelight, Number Plate, and/or Tail Lamps Malfunction				

[Circuit/System Description](#)

For headlamp operation, the body control module (BCM) monitors three signal circuits from the indicator/multifunction switch. When the indicator/multifunction switch is in the AUTO position, the three signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRL) ON and OFF. When the indicator/multifunction switch is placed in the OFF position, the indicator/multifunction switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the indicator/multifunction switch in the SIDELIGHTS position, the indicator/multifunction switch sidelights ON signal circuit is

grounded, indicating that the sidelights have been requested. When the indicator/multifunction switch is in the HEADLAMP position, both the indicator/multifunction switch sidelights ON signal circuit and the indicator/multifunction switch headlamps ON signal circuit are grounded. The BCM responds by commanding the sidelights and headlamps ON.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16V.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground in the indicator/multifunction switch main beam signal circuit.

[Action Taken When the DTC Sets](#)

The main beam headlamps will not operate.

[Conditions for Clearing the DTC](#)

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B3806 00: Main Beam and Headlamp Flash Select Circuit Malfunction

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Indicator/Multifunction Switch Headlamps OFF Signal	B257A 00	1	1	--
Indicator/Multifunction Switch Headlamps ON Signal	B257A 00	1	1	--
Indicator/Multifunction Switch Sidelights ON Signal	2	B257A 00	2	--
Indicator/Multifunction Switch Flash To Pass Signal	3806 00	1	1	--
Indicator/Multifunction Switch Main Beam Signal	B3650 08	1	1	--
Indicator/Multifunction Switch Ground	--	1	--	--
1. Headlamps Malfunction				
2. Sidelight, Number Plate, and/or Tail Lamps Malfunction				

[Circuit/System Description](#)

When the indicator/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the body control module (BCM) through the flash to pass signal circuit. The BCM responds to the flash to pass request by applying ground to the high beam relay control circuit which energises the main beam relay. With the main beam relay energised, the switch contacts close allowing battery voltage to flow through the main beam fuses to the main beam control circuits illuminating the main beam headlamps. The main beam headlamps will only illuminate for as long as the flash to pass switch is activated.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16V.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground in the indicator/multifunction switch flash to pass signal circuit.

[Action Taken When the DTC Sets](#)

The main beam lamps and the main beam indicator on the instrument panel cluster are always ON.

[Conditions for Clearing the DTC](#)

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Centre High Mounted Brake lamp Control	B3884 02	B3884 04	B3884 01	--
Centre High Mounted Brake Lamp Ground	--	1	--	--
1. Brake Lamps Malfunction				

[Circuit/System Description](#)

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analogue voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right brake lamp control circuits as well as the centre high mounted brake lamp control circuit illuminating the left and right brake lamps and the centre high mounted brake lamp.

[Conditions for Running the DTC](#)

- Battery voltage must be between 9-16 V.
- Brakes applied.

Conditions for Setting the DTC

DTC B3884 01

The BCM detects a short to voltage in the Centre High Mounted Brake Lamp control circuit.

DTC B3884 02

The BCM detects a short to ground in the Centre High Mounted Brake Lamp control circuit.

DTC B3884 04

The BCM detects an open/high resistance in the Centre High Mounted Brake Lamp control circuit.

Action Taken When the DTC Sets

DTC B3884 01

Centre High Mounted Brake Lamp always ON.

DTC B3884 02 and B3884 04

Centre High Mounted Brake Lamp inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

[Control Module References](#) for scan tool information

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the E6 Centre High Mounted Brake Lamp.
2. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 1 and ground.
4. Vehicle in Service Mode, command the Centre Brake Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the E6 Centre High Mounted Brake Lamp.

Tail Lamp Ground - Right	--	1	--	--
1. Indicator Lamps and/or Indicators Malfunction				

[Circuit/System Description](#)

Ground is applied at all times to the indicator/multifunction switch. The indicator lamps may only be activated with the vehicle ON/OFF switch in the SERVICE MODE or ON positions. When the indicator/multifunction switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the body control module (BCM) through either the right turn or left indicator switch signal circuit. The BCM responds to the indicator switch input by applying a pulsating voltage to the front and rear indicator lamps through their respective control circuits. When a indicator request is received by the BCM, a serial data message is sent to the instrument panel cluster requesting the respective indicator indicator be pulsed ON and OFF.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16 V.

[Conditions for Setting the DTC](#)

DTC B3948 01 and B3948 04

- The BCM detects a short to ground or an open/high resistance in the F8DR fuse B+ circuit.
- The BCM detects an open/high resistance in the left front indicator control circuit.
- The BCM detects an open/high resistance in the left front indicator ground circuit.

DTC B3948 02

The BCM detects a short to ground in the left front indicator control circuit.

DTC B3949 01 and B3949 04

- The BCM detects a short to ground or an open/high resistance in the F6DR fuse B+ circuit.
- The BCM detects an open/high resistance in the right front indicator control circuit.
- The BCM detects an open/high resistance in the right front indicator ground circuit.

DTC B3949 02

The BCM detects a short to ground in the right front indicator control circuit.

Action Taken When the DTC Sets

DTC B3948

- The left front indicator is inoperative.
- The left indicator indicator on the instrument panel cluster flashes rapidly.

DTC B3949

- The right front indicator is inoperative.
- The right indicator indicator on the instrument panel cluster flashes rapidly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B3948

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 3 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Disconnect the harness connector at the E4N Sidelight/Indicator Lamp - Left front.
5. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between the control circuit terminal 3 and ground.
7. Vehicle in Service Mode, command the Left Front Indicator Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the K9 Body Control Module.
8. If all circuits test normal, replace the E4N Sidelight/Indicator Lamp - Left front.

DTC B3949

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 3 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Disconnect the harness connector at the E4P Sidelight/Indicator Lamp - Right front.
5. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between the control circuit terminal 3 and ground.
7. Vehicle in Service Mode, command the Right Front Indicator Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the K9 Body Control Module.

8. If all circuits test normal, replace the E4P Sidelight/Indicator Lamp - Right front.

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analogue voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right brake lamp control circuits as well as the centre high mounted brake lamp control circuit illuminating the left and right brake lamps and the centre high mounted brake lamp.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes applied.

Conditions for Setting the DTC

DTC C0277 06

- The BCM detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.
- The BCM detects a short to ground or an open/high resistance in the BPP sensor signal circuit.
- The BCM detects an open/high resistance in the BPP sensor low reference circuit.

DTC C0277 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.

DTC C0277 09

The BCM detects the BPP sensor signal is changing faster than possible under normal operating conditions.

DTC C0277 4B

The DTC will set when the BPP sensor home position is not learned.

DTC C0890 03

- The BCM detects a short to ground in the BPP sensor 5 V reference circuit.
- The BCM detects a short to ground or an open/high resistance in the F10DL fuse B+ circuit.

DTC C0890 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor low reference circuit.

Action Taken When the DTC Sets

DTC C0277 06 and C0890 03

- The vehicle will not start with a short to ground or an open/high resistance on the BPP sensor 5 V reference circuit or the BPP sensor signal circuit.
- The vehicle will start with an open/high resistance on the BPP sensor low reference circuit without applying the brake pedal.

DTC C0277 07 and C0890 07

The vehicle will not start with a short to voltage on the BPP sensor 5 V reference circuit or the BPP sensor signal circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- For DTC C0277 4B a successful brake pedal position sensor calibration has been performed.

- A history DTC will clear once 50 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.
- A DTC will not clear the current status until the next ignition cycle.

Circuit/System Testing

DTC C0277 06, C0277 07, C0890 03, and C0890 07

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor.
2. Vehicle in Service Mode, verify that a test lamp illuminates between B+ and the low reference circuit terminal C.
If the test lamp does not illuminate, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
3. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.

If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.

If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.

4. Verify the scan tool Brake Pedal Applied parameter is Inactive.

If not the specified value, test the signal circuit terminal B for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.

5. Vehicle OFF, install a 3 A fused jumper wire between the 5 V reference circuit terminal A and signal circuit terminal B.

6. Vehicle in Service Mode, verify the scan tool Brake Pedal Applied parameter is Active.

If not the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.

7. If all circuits test normal, replace the B22 Brake Pedal Position Sensor.

DTC C0277 4B

1. Verify that the DTC sets under the Conditions for Running and Setting.

2. Perform the brake pedal position sensor calibration procedure. Refer to [Brake Pedal Position Sensor Calibration](#)

3. Operate the vehicle within the Conditions for Running and Setting the DTC and verify the DTC does not reset.

If DTC C0277 4B resets as current, replace the B22 Brake Pedal Position Sensor.

DTC C0277 09

1. Replace the brake pedal position sensor.

2. Perform the brake pedal position sensor calibration procedure. Refer to [Brake Pedal Position Sensor Calibration](#)

3. Operate the vehicle within the Conditions for Running and Setting the DTC and verify the DTC does not reset.

If DTC C0277 09 resets as current, replace the K9 Body Control Module.

[DTC Descriptor](#)

DTC C0297 02: Brake Applied Output Circuit Short-circuit to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Applied Signal	C0297 02	C0297 02	1	--
1. Cruise Control Malfunction				

[Circuit/System Description](#)

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analogue voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the right and left brake lamp control circuits, engine control module (ECM), and centre high mounted brake lamp control circuit.

[Conditions for Running the DTC](#)

- Battery voltage must be between 9-16 V.
- Brakes applied.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground or an open/high resistance on the brake applied signal circuit.

Action Taken When the DTC Sets

The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

Verify that the brake pedal position sensor is properly calibrated.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Connect a test lamp between the signal circuit terminal 33 and ground.
3. Vehicle in Service Mode, observe the test lamp while pressing and releasing the brake pedal. The test lamp should turn ON and OFF as the brake pedal is pressed and released.
If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
4. If all circuits test normal, replace the K20 Engine Control Module.

Symptoms - Lighting

Note: The following steps must be completed before using a symptom table.

- Perform the [Diagnostic System Check - Vehicle](#) before using a symptom table in order to verify that all of the following conditions are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
- Review the system description and operation in order to familiarise yourself with the system functions. Refer to the following:
 - [Exterior Lighting Systems Description and Operation](#)
 - [Interior Lighting Systems Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the lighting system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Thoroughly inspect the wiring and connectors. An incomplete inspection of the wiring and connectors may result in misdiagnosis causing part replacement with the reappearance of the malfunction. If an intermittent malfunction exists, refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Reverse Lamps Malfunction](#)
- [Courtesy Lamps Malfunction](#)
- [Interior Lights Malfunction](#)
- [Hazard Lamps Malfunction](#)
- [Headlamps Malfunction](#)
- [Interior Backlighting Malfunction](#)
- [Sidelight, Number Plate, and/or Tail Lamps Malfunction](#)

- [Brake Lamps Malfunction](#)
- [Indicator Lamps and/or Indicators Malfunction](#)

Automatic Light Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ambient Light Sensor Signal	B2645 03	B2645 03	B2645 07	--
Ground	--	1	--	--
1. Daytime Running Light Malfunction				
DTC B2645 03 - Ambient Light Sensor Circuit Low Voltage				
DTC B2645 07 - Ambient Light Sensor Circuit High Voltage				

[Circuit/System Description](#)

The ambient light/sunload sensor is used to monitor outside lighting conditions. The ambient light/sunload sensor provides a voltage signal that will vary between 1.4-4.5 V depending on outside lighting conditions. The body control module (BCM) monitors the ambient light/sunload sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lights or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the daytime running lights ON. During low light conditions the BCM will command the dipped beam headlamps ON.

[Circuit/System Verification](#)

Vehicle in Service Mode, observe the scan tool Ambient Light Sensor parameter. The reading should be between 1.4-4.5 V and change with ambient light changes.

If the reading is out of specified range, verify that DTC B2645 is not set. If the DTC is set, refer to [DTC B2645](#) .

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the B10B Ambient Light/Sunload Sensor.
2. Test for less than 5 Ω between ground circuit harness connector terminal 6 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance.
3. Vehicle in Service Mode test for 4.8-5.2 V between B10B Ambient Light/Sunload Sensor signal circuit harness connector terminal 5 and ground.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
4. If all circuits test normal, replace the B10B Ambient Light/Sunload Sensor.

[Component Testing](#)

Static Test

1. Vehicle in Service Mode, observe the scan tool Ambient Light Sensor parameter. The reading should be between 1.4-4.5 V and change with ambient light changes.

2. Test the B10B Ambient Light/Sunload Sensor by varying the ambient light while monitoring the sensors voltage output.
3. Verify that the voltage output is within the range of the specification.
If not within the specified range, replace the B10B Ambient Light/Sunload Sensor.

Reverse Lamp Control	B2545 02	B2545 01, B2545 04	1	--
Reverse Lamp Ground	--	1	--	--
1. Reverse Lamps Malfunction				

[Circuit/System Description](#)

With the vehicle ON and the transmission in the REVERSE position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the REVERSE position. The BCM applies battery voltage to the reverse lamp control circuit illuminating the reverse lamps. Once the driver moves the gear selector out of the REVERSE position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the reverse lamps control circuit. The engine must be ON for the reverse lamps to operate.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F7DR (interior lamps) Fuse B+	B2545 01, B2545 04, B2615 02	B2545 01, B2545 04, B2615 02	--	--
Courtesy Lamp Control - Terminal 2 X7	B1480 02	1	1	--
Dome/Reading Lamps - Front Ground	--	1	--	--
Sun Visor Mirror Lamp - Left Ground	--	1	--	--
Sun Visor Mirror Lamp - Right Ground	--	1	--	--
1. Courtesy Lamps Malfunction				

[Circuit/System Description](#)

The body control module (BCM) supplies battery voltage to the dome/reading lamps - front and left and right sun visor lamps via the courtesy lamp control circuit. When a sun visor mirror is opened, the switch contact close allowing battery voltage to flow illuminating the respective lamps. The front reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

[Diagnostic Aids](#)

When the F7DR (interior lamps) fuse is open, both dome lamps, sun visor lamps, reading lamps, and reverse lamps will be inoperative. DTC B2545 will also set for the reverse lamps when the vehicle is placed in the reverse gear.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the inoperative courtesy lamp.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground:
 - E37F Dome/Reading Lamps - Front terminal 6
 - E31L Sun Visor Mirror Lamp - Left terminal B
 - E31R Sun Visor Mirror Lamp - Right terminal BIf greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground:
 - E37F Dome/Reading Lamps - Front terminal 1
 - E31L Sun Visor Mirror Lamp - Left terminal A
 - E31R Sun Visor Mirror Lamp - Right terminal A

4. Vehicle in Service Mode, command the Inadvertent Load ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.

If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.

5. If all circuits test normal, replace the inoperative courtesy lamp.

Dome Lamp Ground - Middle	--	1	--	--
1. Interior Lights Malfunction				
2. Dome Lamp Switch Malfunction				

[Circuit/System Description](#)

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door open input. The BCM illuminates the dome lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps will remain illuminated approximately 3 seconds after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more than 10 minutes with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the dome lamps control circuit to prevent total battery discharge.

[Circuit/System Verification](#)

1. Vehicle in Service Mode, observe the scan tool Door Ajar Switch parameter for each door while opening and closing each vehicle door. The parameter should change between Active and Inactive.
If the parameter does not change between the selected states, refer to [Door Ajar Indicator Malfunction](#)
2. Observe the scan tool Interior/Courtesy Lighting Master Switch parameter while placing the dome lamp switch in the Door, On, and Cancel positions. The parameter should change between Door, On, and Cancel.
If the parameter does not change between the selected states, refer to Dome Lamp Switch Malfunction.
3. Command the Courtesy Lamps ON and OFF with a scan tool. The front and middle dome lamp should turn ON and OFF when changing between the commanded states.
If one or both of the dome lamps do not turn ON and OFF when commanded, refer to Dome Lamps Malfunction.

[Circuit/System Testing](#)

Dome Lamp Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the E37F Dome/Reading Lamps - Front.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Door.
If the scan tool Interior/Courtesy Lighting Master Switch parameter is Cancel, test the signal circuit terminal 4 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
If the scan tool Interior/Courtesy Lighting Master Switch parameter is On, test the signal circuit terminal 5 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
4. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Cancel.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and ground. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is On.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
6. If all circuits test normal, replace the E37F Dome/Reading Lamps - Front.

Interior Lights Malfunction

1. Vehicle OFF, disconnect the harness connector at the inoperative dome lamp.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 2 and ground.
4. Vehicle in Service Mode, command the Courtesy Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the inoperative dome lamp.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Lamps Switch Signal	1	1	1	B3596 00
Hazard Lamps Switch Ground	--	1	--	--
1. Hazard Lamps Malfunction				

[Circuit/System Description](#)

The hazard flashers may be activated in any power mode. The hazard switch signal circuit is momentarily grounded when the hazard switch is pressed. The body control module (BCM) responds to the hazard switch signal input by supplying battery voltage to all four indicator lamps in an ON and OFF duty cycle. When the hazard switch is activated, the BCM sends a serial data message to the instrument panel cluster requesting both indicator indicators to be cycled ON and OFF.

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Hazard Lamps Switch parameter while turning the hazard lamp switch ON and OFF. The parameter should change between Active and Inactive.
If the parameter does not change between the commanded states, refer to Circuit/System Testing.
2. Observe the right and left indicator lamps while turning the hazard lamps switch ON and OFF. The right and left indicator lamps should flash ON and OFF while the hazard lamps switch is ON and remain OFF when the hazard lamps switch is OFF
If the indicator lamps do not cycle between the selected states, refer to [Indicator Lamps and/or Indicators Malfunction](#) .

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the A20 Radio/HVAC Controls.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 5 Ω between the ground circuit terminal 17 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Hazard Lamps Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 16 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
4. Install a 3 A fused jumper wire between the signal circuit terminal 16 and the ground circuit terminal 17. Verify the scan tool Hazard Lamps Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the A20 Radio/HVAC Controls.

1. Headlamps Malfunction - Dipped beam

2. Headlamps Malfunction - Main beam

3. Indicator/Multifunction Switch Malfunction

[Circuit/System Description](#)

For headlamp operation, the body control module (BCM) monitors three signal circuits from the indicator/multifunction switch. When the indicator/multifunction switch is in the AUTO position, the three signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRL) ON and OFF. When the indicator/multifunction switch is placed in the OFF position, the indicator/multifunction switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the indicator/multifunction switch in the PARK lamps position, the indicator/multifunction switch sidelights ON signal circuit is grounded, indicating that the sidelights have been requested. When the indicator/multifunction switch is in the HEADLAMP position, both the indicator/multifunction switch sidelights ON signal circuit and the indicator/multifunction switch headlamps ON signal circuit are grounded. The BCM responds by commanding the sidelights and headlamps ON.

The main beam and flash to pass functions are contained within the indicator/multifunction switch. The BCM provides the indicator/multifunction switch with two signal circuits, the main beam signal circuit and the flash to pass signal circuit. When the dipped beam headlamps are ON and the indicator/multifunction switch is placed in the main beam position, ground is applied to the BCM through the main beam signal circuit. The BCM responds to the main beam request by applying ground to the main beam relay control circuit which energises the main beam relay. With the main beam relay energised, the switch contacts close allowing battery voltage to flow through the main beam fuses to the main beam control circuits illuminating the main beam headlamps.

When the indicator/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the BCM through the flash to pass signal circuit. The BCM responds by applying ground to the main beam relay control circuit which energises the main beam relay illuminating the main beams for a brief moment or until the flash to pass switch is released.

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Headlamps On Switch parameter while turning the dipped beam headlamps ON and OFF with the indicator/multifunction switch. The parameter should change between Active and Inactive.
If the parameter does not change between the commanded states, refer to Indicator/Multifunction Switch Malfunction.
2. Observe the scan tool Automatic Headlamps Disable Switch parameter while applying and releasing the automatic lamp control disable switch. The parameter should change between Active and Inactive.
If the parameter does not change between the commanded states, refer to Indicator/Multifunction Switch Malfunction.
3. Observe the scan tool Main Beam Select Switch parameter while applying and releasing the main beam select switch. The parameter should change between Active and Inactive.
If the parameter does not change between the commanded states, refer to Indicator/Multifunction Switch Malfunction.
4. Observe the scan tool Headlamps Flash Switch parameter while applying and releasing the flash to pass switch. The parameter should change between Active and Inactive.
If the parameter does not change between the commanded states, refer to Indicator/Multifunction Switch Malfunction.
5. Command the Left Headlamp Dipped Beam ON and OFF with a scan tool. The left dipped beam headlamp should turn ON and OFF when commanded.
If the left dipped beam headlamp does not turn ON and OFF when commanded, refer to Headlamps Malfunction - Dipped Beam.
6. Command the Right Headlamp Dipped Beam ON and OFF with a scan tool. The right dipped beam headlamp should turn ON and OFF when commanded.
If the right dipped beam headlamp does not turn ON and OFF when commanded, refer to Headlamps Malfunction - Dipped Beam.
7. Dipped beam headlamps ON, command the Main Beams ON and OFF with a scan tool. The main beam headlamps should turn ON and OFF when commanded.
If the main beam headlamps do not turn ON and OFF when commanded, refer to Headlamps Malfunction - Main Beam.
8. Observe the main beam indicator while applying and releasing the main beam select switch. The main beam indicator should turn ON and OFF when changing between the commanded states.
If the main beam indicator does not illuminate or remains illuminated at all times, replace the P16 Instrument Cluster.

Circuit/System Testing

Indicator/Multifunction Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S78 Indicator/Multifunction Switch.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Headlamps On Switch parameter is Inactive.

- If not the specified value, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
4. Verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 9 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
 5. Verify the scan tool Main Beam Select Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 11 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
 6. Verify the scan tool Headlamps Flash Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 12 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
 7. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground. Verify the scan tool Headlamps On Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
 8. Install a 3 A fused jumper wire between the signal circuit terminal 9 and ground. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
 9. Install a 3 A fused jumper wire between the signal circuit terminal 11 and ground. Verify the scan tool Main Beam Select Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
 10. Install a 3 A fused jumper wire between the signal circuit terminal 12 and ground. Verify the scan tool Headlamps Flash Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
 11. If all circuits test normal, replace the S78 Indicator/Multifunction Switch.

Headlamps Malfunction - Dipped beam

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 2 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Verify that a test lamp illuminates between the B+ circuit terminal 3 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
5. Disconnect the harness connector at the inoperative headlamp.
6. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect a test lamp between the control circuit terminal 1 and ground.
8. Vehicle in Service Mode, command the appropriate Headlamp Dipped Beam ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the K9 Body Control Module.
9. If all circuits test normal, replace the inoperative headlamp.

Headlamps Malfunction - Main beam

1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Under-bonnet.
2. Connect a test lamp between the control circuit terminal 18 and B+.

3. Vehicle in Service Mode, command the Main Beams ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
4. Vehicle OFF, connect the X2 harness connector at the X50A Fuse Block - Under-bonnet.
5. Disconnect the harness connector at the inoperative headlamp.
6. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 4 and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect a test lamp between the control circuit terminal 3 and ground.
8. Vehicle in Service Mode, dipped beam headlamps ON, command the Main Beams ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the X50A Fuse Block - Under-bonnet.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the X50A Fuse Block - Under-bonnet.
9. If all circuits test normal, replace the inoperative headlamp.

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference, signal, and B+ voltage reference circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the light emitting diode (LED) dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Diagnostic Aids

The instrument panel dimmer switch B+ reference circuit is a low current circuit that will not illuminate a test lamp.

Circuit/System Verification

1. Vehicle in Service Mode, sidelights ON, observe the scan tool LED Backlight Dimming Command parameter while operating the dimmer switch from high to low. The reading should change from a high percentage to a low percentage as the switch is activated.
If the reading does not change, refer to Dimmer Switch Malfunction.
2. Observe the function of the backlighting components while commanding the LED Backlight Dimming ON and OFF with a scan tool. The backlighting components should turn ON and OFF while changing between the commanded states.
If the backlighting components do not turn ON and OFF, refer to Interior Backlighting Malfunction.
3. Observe the vehicle ON/OFF switch while adjusting the backlighting from low to high with the dimmer switch. The vehicle ON/OFF switch backlighting should change from low to high as the dimmer switch is operated.
If the vehicle ON/OFF switch backlighting does not change from low to high as the dimmer switch is operated or is always OFF, refer to Vehicle ON/OFF Switch Backlighting Malfunction.

Circuit/System Testing

Dimmer Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S16 Driver Information Centre Switch.
2. Vehicle in Service Mode, verify that a test lamp illuminates between B+ and the low reference circuit terminal 12.
If the test lamp does not illuminate, test the low reference circuit for a short to voltage or an open/high resistance.
3. Test for B+ between the B+ reference circuit terminal 11 and ground.
If less than the specified range, test the B+ reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
4. Verify that a test lamp does not illuminate between the B+ reference circuit terminal 11 and ground.
If the test lamp illuminates, test the B+ reference circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
5. Verify the scan tool LED Backlight Dimming Command parameter is greater than 40%.
If less than the specified range, test the signal circuit terminal 10 for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
6. Vehicle OFF, install a 3 A fused jumper wire between the B+ reference circuit terminal 11 and the signal circuit terminal 10.
7. Vehicle in Service Mode, verify the scan tool LED Backlight Dimming Command parameter is less than 40%.
If greater than the specified range, test the signal circuit terminal 10 for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
8. If all circuits test normal, replace the S16 Driver Information Centre Switch.

Interior Backlighting Malfunction

Note: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each components control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Vehicle OFF, disconnect the harness connector at any component with inoperative backlighting.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground:

- A20 Radio/HVAC Controls - terminal 17
- S16 Driver Information Centre Switch - terminal 4
- E37F Dome/Reading Lamps - Front - terminal 6
- S25 Garage Door Opener - terminal 3
- S48B Multifunction Switch - Overhead Console amber LED - terminal 6
- S70R Steering Wheel Controls Switch - Right - terminal 5
- S70L Steering Wheel Controls Switch - Left - terminal 7
- S91 Hand Brake Control Switch - terminal 8
- S48B Multifunction Switch - Overhead Console - terminal 2
- S52 Outside Wing Mirror Switch - terminal 11
- S113 Charge Port Door Open Request Switch - terminal 4
- S117 Refuel Request Switch - terminal 4

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Connect a test lamp between the appropriate control circuit terminal listed below and ground:

- A20 Radio/HVAC Controls - terminal 18
- S16 Driver Information Centre Switch - terminal 3
- E37F Dome/Reading Lamps - Front - terminal 3
- S25 Garage Door Opener - terminal 2
- S48B Multifunction Switch - Overhead Console amber LED - terminal 3
- S70L Steering Wheel Controls Switch - Left - terminal 6
- S70R Steering Wheel Controls Switch - Right - terminal 4
- S91 Hand Brake Control Switch - terminal 6
- S48B Multifunction Switch - Overhead Console - terminal 1

- S52 Outside Wing Mirror Switch - terminal 1
 - S113 Charge Port Door Open Request Switch - terminal 5
 - S117 Refuel Request Switch - terminal 5
4. Vehicle in Service Mode, command the LED Backlight Dimming ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 5. If all circuits test normal, replace the component with inoperative backlighting.

Vehicle ON/OFF Switch Backlighting Malfunction

1. Vehicle OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 8 and ground.
4. Vehicle in Service Mode, sidelights ON, activate the dimmer switch from low to high. The test lamp intensity should change from low to high as the dimmer switch is activated.
If the test lamp is always ON full intensity, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the S83 Vehicle On/Off Switch.

Repair Instructions

Lights On Indicator Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

With the indicator/multifunction switch in the HEADLAMP or SIDELIGHT position, the appropriate indicator/multifunction switch signal circuit is grounded through the headlight switch. The body control module (BCM) then sends a serial data message to the instrument cluster requesting the instrument cluster to illuminate the lights on indicator. With the indicator/multifunction switch in the MAIN BEAM or FLASH-TO-PASS position the appropriate indicator/multifunction switch signal circuit is grounded through the indicator/multifunction switch. The BCM then sends a serial data message to the instrument cluster requesting the instrument cluster to illuminate the main beam indicator. The BCM will also request the instrument cluster to turn on the LIGHTS ON INDICATOR located in the driver information centre anytime the headlamps are ON and the ignition is OFF or the driver door is opened.

[Diagnostic Aids](#)

This diagnostic procedure assumes that the headlamps operate as described in [Exterior Lighting Systems Description and Operation](#) .

[Circuit/System Testing](#)

Lights On Indicator Malfunction

Vehicle in Service Mode, command the All Indicators test ON and OFF with the scan tool, verify that the lights on indicator changes between turn ON and OFF.

If the lights on indicator does not illuminate during the test or remains illuminated at all times, replace the P16 Instrument Cluster.

If the lights on indicator illuminates during the test, replace the K9 Body Control Module.

Main Beam Indicator Malfunction

Vehicle in Service Mode, command the All Indicators test ON and OFF with the scan tool, verify that the main beam indicator changes between turn ON and OFF.

If the main beam indicator does not illuminate during the test or remains illuminated at all times, replace the P16 Instrument Cluster.

If the main beam indicator illuminates during the test, replace the K9 Body Control Module.

2. Sidelight Switch Malfunction				

Circuit/System Description

When the indicator/multifunction switch is placed in the HEADLAMP or SIDELIGHT position, ground is applied to the sidelights ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the sidelights, tail lamps, and number plate lamps control circuits illuminating the sidelight, tail, and number plate lamps.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Sidelights Switch parameter while turning the indicator/multifunction switch between the OFF and SIDELIGHT positions.

The parameter should change between Active and Inactive.

If the parameter does not change between the commanded states, refer to Sidelight Switch Malfunction.

2. Command the Left Front Sidelight ON and OFF with a scan tool. The left front sidelight should turn ON and OFF when changing between the commanded states.
If the left front sidelight does not turn ON and OFF when commanded, refer to Sidelights Malfunction.
3. Command the Left Rear Sidelight ON and OFF with a scan tool. The left rear sidelight should turn ON and OFF when changing between the commanded states.
If the left rear sidelight does not turn ON and OFF when commanded, refer to Sidelights Malfunction.
4. Command the Right Front Sidelight ON and OFF with a scan tool. The right front sidelight should turn ON and OFF when changing between the commanded states.
If the right front sidelight does not turn ON and OFF when commanded, refer to Sidelights Malfunction.
5. Command the Right Rear Sidelight ON and OFF with a scan tool. The right rear sidelight should turn ON and OFF when changing between the commanded states.
If the right rear sidelight does not turn ON and OFF when commanded, refer to Sidelights Malfunction.
6. Command the Number Plate Lamps ON and OFF with a scan tool. The number plate lamps should turn ON and OFF when changing between the commanded states.
If the number plate lamps do not turn ON and OFF when commanded, refer to Number Plate Lamps Malfunction.

Circuit/System Testing

Sidelight Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S78 Indicator/Multifunction Switch.
2. Vehicle OFF, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Sidelights Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 7 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
4. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground. Verify the scan tool Sidelights Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the S78 Indicator/Multifunction Switch.

Sidelights Malfunction

1. Vehicle OFF, disconnect the harness connector at the inoperative sidelight.
2. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the appropriate ground circuit terminal listed below and ground:
 - E4N Sidelight/Indicator Lamp - Left - terminal 1
 - E4P Sidelight/Indicator Lamp - Right - terminal 1
 - E42L Tail Lamp Assembly - Left - terminal 4
 - E42R Tail Lamp Assembly - Right - terminal 4If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground:
 - E4N Sidelight/Indicator Lamp - Left - terminal 2

- E4P Sidelight/Indicator Lamp - Right - terminal 2
 - E42L Tail Lamp Assembly - Left - terminal 2
 - E42R Tail Lamp Assembly - Right - terminal 2
4. Vehicle in Service Mode, command the appropriate Sidelight ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
 5. If all circuits test normal, replace the inoperative park lamp.

Number Plate Lamps Malfunction

1. Vehicle OFF, disconnect the harness connector at the E7L Number Plate Lamp - Left and E7R Number Plate Lamp - Right.
2. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between each ground circuit terminal 2 and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the E7L Number Plate Lamp - Left control circuit terminal 1 and ground.
4. Vehicle in Service Mode, command the Number Plate Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. Vehicle OFF, connect a test lamp between the E7R Number Plate Lamp - Right control circuit terminal 1 and ground.
6. Vehicle in Service Mode, command the Number Plate Lamps ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
7. If all circuits test normal, replace the inoperative number plate lamp bulb.

1. Brake Lamps Malfunction
2. Centre High Mounted Brake Lamp Malfunction

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analogue voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right brake lamp control circuits as well as the centre high mounted brake lamp control circuit illuminating the left and right brake lamps and the centre high mounted brake lamp.

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Brake Pedal Applied parameter while pressing and releasing the brake pedal. The parameter should change between Active and Inactive as the brake pedal is applied and released.
If the parameter does not change between the commanded states, refer to the Brake Pedal Position Sensor Malfunction.
2. Command the Left Rear Indicator/Brake Lamp ON and OFF with a scan tool. The left brake lamp should turn ON and OFF when changing between the commanded states.
If the left brake lamp does not turn ON and OFF when changing between the commanded states, refer to Brake Lamps Malfunction.
3. Command the Right Rear Indicator/Brake Lamp ON and OFF with a scan tool. The right brake lamp should turn ON and OFF when changing between the commanded states.
If the right brake lamp does not turn ON and OFF when changing between the commanded states, refer to Brake Lamps Malfunction.
4. Command the Centre Brake Lamp ON and OFF with a scan tool. The centre high mounted brake lamp should turn ON and OFF when changing between the commanded states.
If the centre high mount brake lamp does not turn ON and OFF when changing between the commanded states, refer to Centre High Mount Brake Lamp Malfunction.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor.
2. Vehicle in Service Mode, verify that a test lamp does not illuminate between the low reference circuit terminal C and ground.
If the test lamp illuminates, test the low reference circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
3. If all circuits test normal, replace the B22 Brake Pedal Position Sensor.

Brake Lamps Malfunction

1. Vehicle OFF, disconnect the harness connector at the inoperative tail lamp assembly.
2. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 4 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 1 and ground.
4. Vehicle in Service Mode, command the appropriate Rear Indicator/Brake Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the inoperative tail lamp assembly.

Centre High Mount Brake Lamp Malfunction

1. Vehicle OFF, disconnect the harness connector at the E6 Centre High Mounted Brake Lamp.
2. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.

3. Connect a test lamp between the control circuit terminal 1 and ground.
4. Vehicle in Service Mode, command the Centre Brake Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the E6 Centre High Mounted Brake Lamp.

Indicator/Multifunction Switch Ground	--	2	--	--

1. Indicator Lamps and/or Indicators Malfunction

2. Indicator/Multifunction Switch Malfunction

3. Tail Lamp Outage Detection Malfunction

[Circuit/System Description](#)

Ground is applied at all times to the indicator/multifunction switch. The indicator lamps may only be activated with the vehicle mode switch in the SERVICE MODE or ON positions. When the indicator/multifunction switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the body control module (BCM) through either the right turn or left indicator switch signal circuit. The BCM responds to the indicator switch input by applying a pulsating voltage to the front and rear indicator lamps through their respective control circuits. When an indicator request is received by the BCM, a serial data message is sent to the instrument panel cluster requesting the respective indicator be pulsed ON and OFF.

[Diagnostic Aids](#)

The tail lamp outage detection circuits are low current B+ circuits that will not illuminate a test lamp.

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Right Indicator Switch and Left Indicator Switch parameters while cycling the indicator/multifunction switch between the right and left positions. The readings should change between Active and Inactive.
If the parameters do not change between the selected states, refer to Indicator/Multifunction Switch Malfunction.
2. Command the Left Front Indicator Lamp ON and OFF with a scan tool. The left front indicator should turn ON and OFF when changing between the commanded states.
If the left front indicator does not turn ON and OFF when changing between the commanded states, refer to Indicator Lamps Malfunction.
3. Command the Right Front Indicator Lamp ON and OFF with a scan tool. The right front indicator should turn ON and OFF when changing between the commanded states.
If the right front indicator does not turn ON and OFF when changing between the commanded states, refer to Indicator Lamps Malfunction.
4. Command the Left Rear Indicator/Brake Lamp ON and OFF with a scan tool. The left rear indicator should turn ON and OFF when changing between the commanded states.
If the left rear indicator does not turn ON and OFF when changing between the commanded states, refer to Indicator Lamps Malfunction.
5. Command the Right Rear Indicator/Brake Lamp ON and OFF with a scan tool. The right rear indicator should turn ON and OFF when changing between the commanded states.
If the right rear indicator does not turn ON and OFF when changing between the commanded states, refer to Indicator Lamps Malfunction.
6. Observe the left and right indicator lamps and indicator indicators on the instrument panel cluster while activating the left and right indicators. The left and right indicator lamps and indicators should illuminate and flash at a normal rate when turned ON.
If the left and right indicator lamps and indicators illuminate but flash in a rapid manner, refer to Tail Lamp Outage Detection Malfunction.
7. Command the Instrument Cluster Gauge Sweep Test ON and OFF with a scan tool. The left and right indicator indicators should turn ON and OFF when changing between the commanded states.
If the left and right indicator indicators do not turn ON and OFF when commanded, refer to Indicator Indicators Malfunction.

Circuit/System Testing

Indicator/Multifunction Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S78 Indicator/Multifunction Switch.
2. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, and wait 2 minutes. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Left Indicator Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 4 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
4. Verify the scan tool Right Indicator Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 5 for a short to ground. If the circuit tests normal, replace the K9 Body Control Module.
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground. Verify the scan tool Left Indicator Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
6. Install a 3 A fused jumper wire between the signal circuit terminal 5 and ground. Verify the scan tool Right Indicator Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.

7. If all circuits test normal, replace the S78 Indicator/Multifunction Switch.

Indicator Lamps Malfunction

1. Vehicle OFF, disconnect the harness connector at the inoperative indicator lamp.
2. Vehicle OFF, exterior lamps OFF, test for less than 5 Ω between the appropriate ground circuit terminal listed below and ground:
 - E4N Sidelight/Indicator Lamp - Left - terminal 1
 - E4Y Indicator Repeater Lamp - Left - terminal C
 - E4P Sidelight/Indicator Lamp - Right - terminal 1
 - E4Z Indicator Repeater Lamp - Right - terminal C
 - E42L Tail Lamp Assembly - Left - terminal 4
 - E42R Tail Lamp Assembly - Right - terminal 4

If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground:
 - E4N Sidelight/Indicator Lamp - Left - terminal 3
 - E4Y Indicator Repeater Lamp - Left - terminal A
 - E4P Sidelight/Indicator Lamp - Right - terminal 3
 - E4Z Indicator Repeater Lamp - Right - terminal D
 - E42L Tail Lamp Assembly - Left - terminal 1
 - E42R Tail Lamp Assembly - Right - terminal 1
4. Vehicle in Service Mode, command the appropriate Indicator Lamp ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, replace the inoperative indicator lamp.

Tail Lamp Outage Detection Malfunction

1. Vehicle OFF, disconnect the harness connector at the inoperative tail lamp assembly.
2. Vehicle in Service Mode, test for B+ between the signal circuit terminal 3 and ground.
 - If less than the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
3. Verify that a test lamp does not illuminate between the signal circuit terminal 3 and ground.
 - If the test lamp illuminates, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
4. If all circuits test normal, replace the inoperative tail lamp assembly.

Indicator Indicators Malfunction

Vehicle in Service Mode, with a scan tool perform the Instrument Cluster Gauge Sweep Test and observe the left and right indicator indicators.

If the left and right indicator indicators illuminate during the test, replace the K9 Body Control Module.

If the left and right indicator indicators do not illuminate during the test or remain illuminated at all times, replace the P16 Instrument Cluster.

Brake Pedal Position Sensor Calibration

[Calibration Criteria](#)

Note: Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.

Brake pedal position sensor calibration must be performed after the brake pedal position sensor or body control module (BCM) have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

[Calibration Procedure](#)

1. Apply the handbrake.
2. Place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual gearbox.
3. Install a scan tool.
4. Clear all BCM DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.
6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

Brake Pedal Position Sensor Replacement

[Removal Procedure](#)

1. Disconnect the brake pedal position sensor electrical connector.

2. Remove the brake pedal position sensor bolt (1).

3. Remove the brake pedal position sensor (1) and spacer (2).

[Installation Procedure](#)

1. Align the locating pin on the brake pedal position sensor (1) to the hole on the spacer (2).
2. Align the locating pin on the brake pedal position sensor to the hole on the brake pedal assembly bracket.
3. Ensure the brake pedal position sensor fork is properly located on the brake pedal pin.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the brake pedal position sensor bolt (1) and tighten to **9 N·m (80 lb in)**.
5. Connect the brake pedal position sensor electrical connector.
6. Calibrate the brake pedal position sensor. Refer to [Brake Pedal Position Sensor Calibration](#) .

Reading Lamp Replacement

Headlamp Bulb Replacement

Callout	Component Name
1	Headlight Bulb Dust Cover
	Headlamp Bulb
	Warning: Refer to Halogen Bulb Warning in the Preface section.

2

Procedure

1. Disconnect the electrical connector from the headlamp bulb socket.
2. Rotate the bulb socket a quarter turn counterclockwise and remove the bulb socket from the headlamp housing.
3. Install the bulb socket in the correct position as shown in the graphic.

Headlamp Alignment

Directive 76/756 EEC and ECE-Regulation 48 cover checking and alignment of headlights on vehicle. Correct alignment of headlamps of vehicles should enable optimal road illumination by the low beam with minimal glare to oncoming traffic. For this purpose the inclination of the light beam in relation to the road surface and the angle of the beam to the vertical longitudinal plane running through the vehicle centre must comply with the requirements laid down in the ECE regulation and EEC directive.

Glaring of the dipped beam is considered eliminated if the intensity of the illumination at a distance of 25 m (82 ft) from each individual headlight on the plane perpendicular to the road and at the height of the headlight as well as above, is not greater than 1 lux. This requirement is generally satisfied if the headlight alignment is carried out according to these alignment guidelines.

Main headlamp housing or retainer displays typically reference a 1.0 percent downward inclination for dipped beam alignment according to EEC 76/756 or ECE-R48 requirements.

Example for a display on a headlight with a 1.3% downward inclination for dipped beam alignment:

Reference 1.0 percent corresponds to the adjustment dimension of the headlamp with reference to the inclination of the light beam. The inclination at a distance of 10 m (33 ft) from vehicle headlamp is therefore 10 cm (4 in). The inclination of the dipped beam headlamp is indicated by its light/dark boundary (cut-off line).

The alignment guideline is shown by the following three illustrations.

Abbreviations used:

A = Horizontal distance between headlamp centres

B = Central marking

C = Test surface

x = Kink of cut-off line for the left/right setting

y = Horizontal area of the cut-off line for up/down setting

1 = Halogen

2 = Xenon

3 = AFL+

C = Test surface

D = Road surface

E = Break point (kink of cut-off line)

e = Aiming dimension in cm, $e = H - h$ (aiming dimension, dipped beam headlamps usually at 1.0 percent, $e = 10$ cm (4 in), front fog lamps 2.0 percent, $e = 20$ cm (8 in), main beam headlamps (if separately amiable) at 0 percent, $e = 0$ cm (0 in)).

H = Height of centre of headlamp over road surface

h = Height of light/dark boundary line (cut-off line) of dipped beam above road surface

The headlight alignment is performed according to the specifications, as shown in the illustrations, using an adjuster. When using a headlight adjuster, set up the height and position of the adjuster according to the instructions in the operation manual. Ensure that the vehicle tyre surface that is in contact with the road and the surface for setting up the adjuster are at the same level and parallel with each other.

X = Centre of adjuster lens (see arrow mark on adjuster housing) must be aligned on the same level as the dipped beam headlight and must be parallel to the ground.

1 = Use marking of the control mirror (1) to align the adjuster system in the correct angle to the vehicle, based on the information shown in the owner operating instructions.

The distance between the adjuster lens and the headlight must be within 0.5 and 0.8 metres (refer to operation instructions of the adjuster system)

The surface on which the measuring instrument (adjuster system) and the vehicle stand must be flat. The level of the ground must not vary by more than $\pm 0.5 \text{ mm / m}$.

- I = $\pm 0.1 \text{ mm / m}$
- II = $\pm 0.5 \text{ mm / m}$

Vehicle tyres must have specified air pressure. Blackened bulbs must be replaced before adjusting.

The adjustment is performed at vehicle curb weight plus one person or 75 kg (165 lb) on the driver's seat. (Curb weight = weight of vehicle ready for use with completely filled

fuel tank plus the weight of all equipment carried during use, e.g. spare wheel, tools, jack, first aid kit, emergency warning triangle, etc.).

For vehicle with a manual headlight levelling system switch the ignition on and position the adjuster wheel of the manual headlight range control at the light switch centre to "0".

The intersection between the horizontal and the ascending parts of the cut-off line (break point) must lie on the perpendicular through the central marking.

For easier determination of the intersection point, headlamp halves can be alternately covered and uncovered.

The headlamp adjusting equipment used must comply with the existing guidelines and the manufacturer's operating instructions must be observed.

The headlamp adjuster must be regularly checked by manufacturer's maintenance service.

Example of a halogen dipped beam light pattern on a headlamp adjuster screen. Refer to the operating manual of the adjuster system.

The headlamp adjuster is set up according to manufacturer's guidelines and is adjusted to 1.0 percent downwards inclination for the dipped beam or 2.0 percent inclination for the fog lamp or 0% for the main beam (if separately aimable). If not advised differently on the headlight.

According to the directive 76/756/EEC the 15 degree line is no longer required for the dipped beam on the measurement screen. The adjustment direction can also be undertaken with headlight aiming equipment which shows the 15 degree line on the measurement screen (For all headlights).

Depending on the specific inner design of the headlamps, the movement of the light beam on the measurement screen is not exactly vertical or horizontal during the alignment on the alignment screws. This is caused by the technical solution of the suspension of the reflectors in the headlamp housing. After alignment of one axis the alignment of the other axis should be rechecked. For instance the vertical alignment could be changed a bit after the alignment of the horizontal axis. Therefore the vertical axis must be checked and if necessary aligned again after the alignment of the horizontal axis.

If a headlamp shows a significant deviation from the correct alignment for both horizontal and vertical direction the alignment operation must be performed step by step for the two directions. This means that in such a case the alignment of horizontal and vertical direction must be done alternately in small steps. Not more than one turn of an alignment screw shall be performed at once. After one turn change to the other alignment screw. Repeat this procedure until the headlamp is correctly aligned.

Example of a main beam light pattern on a headlamp adjuster screen. Refer to the operating manual of the adjuster system.

In headlights where the main and dipped beam can be aimed, the centre of the main beam must lie within the boundary corners around the central mark.

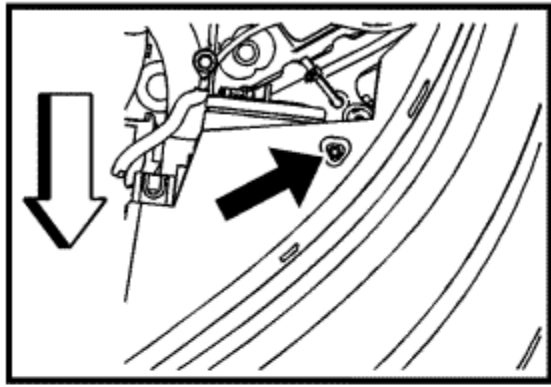

Only Vehicles with AFL+

Turn headlamp switch into position II (dipped beam)

A= Break point for the side setting in line V

B= Setting of the height by means of cut-off line in this area usually at 1 percent (e = 10 cm or 4 in) downward inclination.

e = Aiming dimension.

Note: The headlamps can not be adjusted horizontally.

1. Adjust the vertical alignment screw of the headlamps to the specifications required by the state and the local authorities.
2. Repeat the alignment procedure for the passenger side headlamp while blocking the light from projecting onto the screen from the driver side headlamp. Headlights must be alignment using a legally specified projection wall or with optical headlight adjuster.

For the vertical alignment (adjustment of height) the cut-off line on the left side of the adjustment cross must be parallel to the horizontal adjustment line.

Note: Carry out vertical alignment first, then lateral alignment. Check vertical alignment again after lateral alignment.

For the horizontal alignment (adjustment of the side) the cut-off line must be horizontal on the left side of the adjustment cross and rising upward on the right side of the adjustment cross. The downward inclination is typically 1.0 percent.

Note: This description is valid for right hand traffic. For left hand traffic the light pattern of left and right side is mirrored.

The reference run must be performed for each single headlamp after alignment. During the reference run check for enough clearance between the projector module and the reflector and that the module bezel is free from scratches. In case of a touch condition between the projector module and bezel during the reference run or visible scratches

on the bezel the headlamp alignment must be checked again. Conditions like these occur if the aiming differs extremely from the set position.

Note: DO NOT aim the headlamps when the headlamp switch is on position "AUTO" and the engine is running. In this case the headlights turn for 8° outward to go into the play street mode.

Front Indicator Lamp Replacement - Volt

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .2. Disconnect the forward lamp harness electrical connector from the front indicator lamp socket.3. Transfer the bulb and bulb socket as needed, rotate counter-clockwise in order to remove.	

1	Indicator Lamp Screw (Qty: 4) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Indicator Lamp Assembly Warning: Refer to Halogen Bulb Warning in the Preface section.

Rear Fog Lamp Replacement - Volt Ampera (T79)

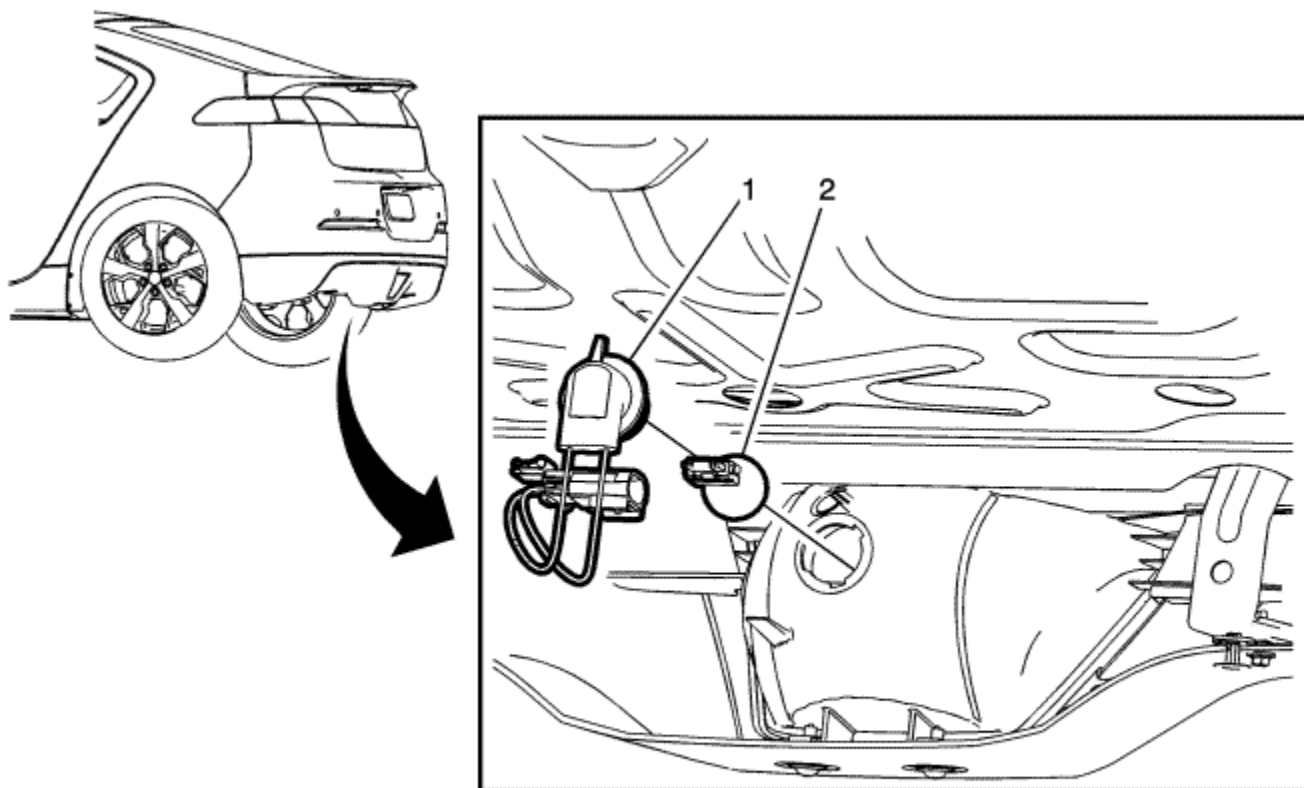

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the underbody rear air deflector. Refer to Underbody Rear Air Deflector Replacement .2. Disconnect the electrical connector from the tail lamp harness.3. Transfer the electrical connector jumper harness as needed.	

1	Rear Bumper Fascia Lower Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Rear Energy Absorber Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
3	Rear Fog Lamp

Rear Fog Lamp Bulb Replacement - Volt Ampera (T79)

Callout	Component Name
Preliminary Procedure	
Remove the underbody rear air deflector. Refer to Underbody Rear Air Deflector Replacement .	
	Rear Fog Lamp Bulb Socket

1	Procedure Rotate the bulb socket a quarter turn counter-clockwise and remove from the fog lamp housing.
2	Rear Fog Light Bulb Tip Do not touch the bulb with bare fingers, use a cotton shop towel to cover when replacing the bulb.

Rear Reflector Replacement - Volt

Callout	Component Name
Preliminary Procedure	
Remove the rear bumper fascia. Refer to Rear Bumper Fascia Removal and Installation : Volt → Ampera .	
	Rear Reflector Bolt

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Rear Reflector Retainer Procedure Compress the retainer tabs and press out from the fascia.
3	Rear Reflector

Front Indicator Lamp Bulb Replacement - Volt

Callout	Component Name
Preliminary	Remove the front wheelhouse front liner. Refer to Front Wheelhouse Front Liner Replacement .
	Front Indicator Bulb Socket

1	Procedure Rotate the bulb socket a quarter turn counter-clockwise and remove the front indicator lamp assembly.
2	Front Indicator Bulb Procedure Pull the indicator lamp bulb from the front indicator lamp bulb socket.

High Mount Brake lamp Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Open and support the tailgate assembly.2. Remove the tailgate lower trim finish panel. Refer to Tailgate Lower Trim Finish Panel Replacement .3. Disconnect the high mount brake lamp electrical connector from the main tailgate harness.	

1	High Mount Brake Lamp Access Hole Cover (Qty: 2)
2	High Mount Stop Lamp Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
3	High Mount Brake Lamp Procedure Remove the high mount brake lamp and harness connector from the rear end spoiler.

Cargo Centre Courtesy Lamp Bulb Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear compartment courtesy lamp. Refer to Rear Compartment Courtesy Lamp Replacement .	
1	Cargo Lamp Bulb

Reverse Lamp Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the underbody rear air deflector. Refer to Underbody Rear Air Deflector Replacement .2. Disconnect the electrical connector from the tail lamp harness.3. Transfer the electrical connector jumper harness as needed.	

1	Rear Bumper Fascia Lower Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
2	Rear Energy Absorber Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (22 lb in)
3	Reverse Lamp

Reverse Lamp Bulb Replacement

Callout	Component Name
Preliminary Procedure	
Remove the underbody rear air deflector. Refer to Underbody Rear Air Deflector Replacement .	
	Reverse Lamp Bulb Socket

1	Procedure Rotate the bulb socket a quarter turn counter-clockwise and remove from the lamp housing.
2	Reverse Lamp Bulb Tip Do not touch the bulb with bare fingers, use a cotton shop towel to cover when replacing the bulb.

Rear Number Plate Lamp Replacement

Callout	Component Name
1	Number Plate Lamp Procedure 1. Using a flat-bladed tool, insert the tool on the passenger side of the lamp and push inward and rotate downward to disengage the lamp from the rear bumper fascia opening. 2. Rotate the bulb socket anticlockwise to remove from the lamp housing.
2	Number Plate Lamp Bulb Socket
3	Number Plate Lamp Bulb

Rear Number Plate Lamp Bulb Replacement

Callout	Component Name
1	Number Plate Lamp Procedure Using a flat-bladed tool, insert the tool on the passenger side of the lamp and push inward and rotate downward to disengage the lamp from the rear bumper fascia opening.
2	Number Plate Lamp Bulb Socket Tip Rotate the lamp socket a quarter turn counter-clockwise in order to remove.
3	Number Plate Lamp Bulb Tip Pull the lamp bulb from the bulb socket.

Exterior Lighting Systems Description and Operation

[Exterior Lamps](#)

The exterior lighting system consist of the following lamps if equipped:

- Headlamps
- Front fog lamps
- Rear fog lamps:
- Sidelight, tail and number plate lamps
- Indicator lamps
- Hazard warning lamps
- Repeater lamps
- Brake lamps
- Reverse lamps

[Dipped Beam Headlamps](#)

The headlamps consist of one single bulb which provides dipped and main beam. The body control module (BCM) controls the headlamps based on the inputs of the headlamp switch. When a dipped beam request is received, the BCM supplies a B+ to the dipped beam headlamps, illuminating the dipped beam headlamps. When a main beam request is received, the BCM grounds the headlamp main beam relay control circuit.

[Flash to Pass](#)

When the dipped beam headlamps are on and the indicator/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the indicator/multifunction switch. The indicator/multifunction switch applies ground to the BCM through the flash to pass switch signal circuit. The BCM then applies ground to the main beam relay control circuit. This energises the main beam relay, closing the switch side contacts of the main beam relay, applying battery voltage to the left and right main beam fuses. Battery voltage is applied from the main beam fuses through the main beam voltage supply circuit to the main beam headlamp assemblies. This causes the main beam headlamps to illuminate at full brightness momentarily or until the flash to pass switch is released.

[Front Fog Lamps](#)

The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energises the front fog lamp relay by

applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energised, the relay switch contacts close and battery voltage is applied through the front fog lamp fuse to the front fog lamp supply voltage circuit which illuminates the front fog lamps.

Rear Fog Lamps RPO T79

The rear fog lamp switch signal circuit is grounded through a resistor momentarily by pressing the rear fog lamp switch. The body control module (BCM) energises the rear fog lamp supply voltage circuit which illuminates the rear fog lamp. With the rear fog lamp switch activated the BCM sends a message via serial data to the instrument cluster requesting the instrument cluster to illuminate the rear fog indicator.

Sidelight, Tail and Number Plate Lamps

The sidelights, tail lamps and number plate lights are turned ON when the headlamp switch is placed in the SIDELIGHT or DIPPED BEAM position or anytime the headlamps are requested. When the BCM receives a request from the headlamp switch to turn ON the sidelights the BCM sends out a PWM signal, which illuminates the sidelights, tail lamps and number plate lights.

Indicator Lamps

Ground is applied at all times to the indicator/multifunction switch. The indicator lamps may only be activated with the ignition switch in the ON or START position. When the indicator/multifunction switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the BCM through either the right or left indicator switch signal circuit. The BCM then applies a pulsating voltage to the front and rear indicator lamps through their respective voltage supply circuits. When an indicator request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective indicator indicator be pulsed ON and OFF.

Repeater Lamps

The repeater lamps are located in the front wing. The repeater lamps are used as additional indicator lamps, and operate as described in the Indicator/Hazard Flasher Lamps description.

Hazard Flasher Lamps

The hazard flashers may be activated in any power mode. The hazard switch is permanently grounded. When the hazard switch is placed in the ON position, ground is applied through the hazard switch signal circuit to the BCM. The BCM supplies battery voltage to all indicator lamps in an ON and OFF duty cycle. When the hazard switch is activated, the BCM sends a serial data message to the instrument cluster requesting both indicator indicators to be cycled ON and OFF.

Brake Lamps

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analogue voltage signal that will increase as the brake pedal is applied. The BCM provides a low reference signal and a 5 V reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the brake lamp control circuit and centre high mounted brake lamp control circuit. When the control circuit is energised the brake lamps are illuminated.

Reverse Lamps

When the transmission is placed in the reverse position, the engine control module (ECM) sends a serial data message to the BCM. The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the reverse lamps. The reverse lamps are permanently grounded. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the reverse lamp control circuit.

Battery Run Down Protection/Inadvertent Power

To provide battery run down protection, the exterior lamps will be deactivated automatically under certain conditions. The BCM monitors the state of the headlamp switch. If the sidelight or headlamp switch is ON when the ignition switch is placed in either the CRANK or RUN position and then placed in the OFF position, the BCM initiates a 10 min timer. At the end of the 10 min, the BCM will turn off the control power output to the sidelight and headlamp relay coils, deactivating the exterior lamps. This feature will be cancelled if any power mode other than OFF becomes active. The BCM will disable battery run down protection if any of the following conditions exist. The sidelight or headlamp switch is placed in the ON to OFF position, and back to the ON position during battery run down protection. The BCM determined that the park or headlamp switch was not active when the ignition was turned OFF.

Interior Lighting Systems Description and Operation

[Interior Lamps](#)

The interior lamps consist of 2 groups, those which can dim from the instrument panel cluster lamps dimmer switch and those that can not dim.

[Courtesy/Illuminated Entry Lamps](#)

The following lamps may be manually turned ON by placing the interior lamp switch in the ON position, or by opening a door while the switch is in the AUTO position.

- The interior light
- The tailgate lamps
- Courtesy lamps

The courtesy lamp supply voltage circuit of the body control module (BCM) supplies battery positive voltage to the interior light, the tailgate lamps and courtesy lamps. When any door is opened, the door jamb switch contacts close providing a door open input to the BCM. The BCM then provides a B+ to the interior lamps with the switch in the AUTO position. The interior lamps receive a ground when the switch is in the ON position.

Note: If the tailgate is opened after all the modules go to sleep, the dome light will not come on. The tailgate ajar switch input to the BCM will not wake up the BCM once it has gone to sleep, so the dome light will not come on. Once the BCM gets an input to wake it up, from remote keyless entry or a door handle, the dome light will turn on when the tailgate is opened.

If the driver inadvertently leaves any interior lamp ON, the BCM will turn it OFF after a 20 min time-out.

The courtesy lights will turn OFF immediately if the ignition switch is turned to the ON position or approximately 20 s after all doors are closed.

The courtesy lamps will normally turn OFF using the theater dimming feature.

[Keyless Entry Interior Illumination](#)

When the BCM receives a door unlock command from the remote keyless entry transmitter, the BCM will flash the indicator lamps several times, illuminate the courtesy and sidelights, and illuminate the dipped beam headlamps at low intensity. The lamps will remain on until the ignition key is turned from the OFF position, a keyless entry transmitter door lock command is received, or after an approximate 20 s delay through the theatre dimming feature.

[Interior Lamps Dimming](#)

This group includes lamps which may dim. This group may use a combination of vacuum fluorescent illumination, LEDs and incandescent lamps.

- HVAC control module, head assembly
- Rear HVAC control module, head assembly
- Radio
- Rear seat audio
- The instrument panel cluster
- The PRNDL lamp, with the exception of the current gear select position
- Power window switches
- Various switches

When the ignition switch is turned to the ON position, the vacuum fluorescent display, radio, turns ON at maximum brightness. When the park lamps are ON, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel cluster dimmer switch. At the same time all fluorescent display displays dim to match the indicated dimming level. When the headlamp switch is placed in the PARK position, the park lamp supply voltage circuit provides an input to the BCM. The BCM then supplies voltage to the instrument panel cluster dimmer switch through the dimming control circuit. The setting of the instrument panel cluster dimmer switch determines the amount of voltage that the instrument panel cluster dimmer switch supplies to the BCM through the instrument panel cluster dimming lamps low reference circuit. The BCM then sends a PWM voltage to all the interior lamps. All the fluorescent display and incandescent back lighting lamps are provided a specific voltage and are then grounded. When the headlamp switch is turned to the park lamp or headlamp position, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel cluster dimmer switch. When the instrument panel cluster dimmer switch is moved from minimum to maximum, all fluorescent display displays, as well as all incandescent back lighting respond from minimum intensity to maximum brightness in response to the instrument panel cluster dimmer switch.

Inadvertent Power

The BCM used in this vehicle controls the lighting system through circuits that enable the interior lamps. The BCM opens these enabling circuits shortly after the ignition switch is turned OFF with no lamp switch activity. If the ignition switch is turned to any position other than OFF, or if a lamp switch is activated during this period, the timer will reset itself.

Symptoms - Mirrors

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to the following system descriptions:
 - [Outside Mirror Description and Operation](#)
 - [Automatic Day-Night Mirror Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Heated Mirrors Malfunction](#)
- [Automatic Day-Night Mirrors Malfunction](#)
- [Power Mirror Folding Malfunction](#)
- [Power Mirror Malfunction](#)

Heated Mirrors Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Heated Mirror Element Control	1	1	2	--
Ground	--	1	--	--
1. Heated Mirror Inoperative				
2. Heated Mirror Always On				

[Circuit/System Description](#)

The rear demister relay supplies voltage to the outside wing mirror heater elements based on the current state of the rear window demister. The relay supplies B+ through the driver/passenger mirror heating element control circuit when a request is seen.

Scan Tool Reference

[Control Module References](#) for scan tool information.

[Circuit/System Verification](#)

1. Vehicle ON, press the rear window demister switch. Verify the rear window demister turns ON and the rear window becomes warm.
If the rear window demister does not turn on, refer to [Rear Window Demister Malfunction](#) .
2. Verify both the left and right outside mirror glass become warm.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the appropriate A9 outside wing mirror.
2. Wait 1 minute, test for less than 10 Ω between the appropriate ground circuit terminal and ground.
 - Driver outside wing mirror terminal D
 - Passenger outside wing mirror terminal EIf greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the heater element control circuit terminal F and ground.
4. Vehicle ON, operate the rear window demister ON and OFF with the rear demister switch. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance.
5. If all circuits test normal, test or replace the outside wing mirror glass.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	--	--
Reverse Lamp Control	1	1	1	--
Ground	--	1	--	--
1. Inside Electrochromic Mirror Malfunction				

[Circuit/System Description](#)

The inside rearview mirror uses 2 photocell sensors. One sensor is the rear light sensor, located on the face side of the mirror, facing the rear of the vehicle. The rear light sensor is used to determine light conditions present at the mirror face. The other sensor is the front light sensor, located on the backside of the mirror, facing the front of the vehicle. The front light sensor is used to determine the exterior light conditions at the front of the vehicle. With a low exterior light condition detected by the front light sensor and a high light condition from the rear light sensor, the inside rearview mirror will automatically darken the face of the inside rearview mirror.

With the gear selector lever in the REVERSE position, reverse lamp control voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, regardless of the rear light sensor status.

[Circuit/System Verification](#)

1. Vehicle in Service Mode, headlamps ON, vehicle in PARK, cover the front light sensor with a towel or other suitable item. Shine a torch at the rear light sensor while observing the inside rearview mirror face. The inside rearview mirror face should dim.
2. Vehicle ON, hand brake applied, place the transmission in REVERSE. The inside rearview mirror face should transition from dim to bright.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the A10 inside rearview mirror.
2. Wait 1 minute, test for less than 10 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 2 and ground.
If the test lamp does not illuminate test the ignition circuit for an open/high resistance or short to ground.
4. Vehicle ON, hand brake applied, vehicle in REVERSE, verify that a test lamp illuminates between the reverse lamp control circuit terminal 1 and ground.
If the test lamp does not illuminate test the control circuit for an open/high resistance or short to ground. If the circuit tests normal, refer to [Reverse Lamps Malfunction](#).
5. If all circuits test normal, test or replace the A10 inside rearview mirror.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left/Right Mirror Motor Horizontal Control	1	1	--	--
Left/Right Mirror Motor Vertical Control	1	1	--	--
Left/Right Mirror Motor Common Control	1	1	--	--
1. Power Mirror Malfunction				

[Circuit/System Description](#)

The outside wing mirror switch controls the outside wing mirrors based on the position of the mirror selector switch and which movement position is selected. The outside wing mirror switch has four positions: up, down, left, and right. B+ is applied to the switch from the power mirror fuse and when a movement position switch is selected, voltage is sent to the commanded mirror via a mirror control circuit. The opposite mirror control circuit acts as a ground circuit for the bi-directional mirror motor. Ground is the applied through the switch.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle in Service Mode, with the mirror selector switch in the DRIVER position, command the mirrors UP, DOWN, LEFT, and RIGHT using the mirror directional switch. The A9A driver outside wing mirror should move in the commanded direction.
2. With the mirror selector switch in the PASSENGER position, command the mirrors UP, DOWN, LEFT, and RIGHT using the mirror directional switch. The A9B passenger outside wing mirror should move in the commanded direction.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the S52 outside mirror switch.
2. Wait 1 minute, test for less than 10 Ω between the ground circuit terminal 11 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 12 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Vehicle OFF, connect the harness connector at the S52 outside mirror switch.
5. Disconnect the harness connector at the appropriate A9 outside rearview mirror.
6. Connect a test lamp between the control circuit terminal H and the control circuit terminal B.
7. Operate the vertical switch UP and DOWN. The test lamp should turn ON when commanding the UP and DOWN states.
If the test lamp remains OFF during either of the commands, test for a short to voltage, short to ground, or an open/high resistance on the control circuits. If the circuits test normal, replace the S52 outside mirror switch.
8. Connect a test lamp between the control circuit terminal H and the control circuit terminal G.
9. Operate the horizontal switch LEFT and RIGHT. The test lamp should turn ON when commanding the LEFT and RIGHT states.
If the test lamp remains OFF during either of the commands, test for a short to voltage, short to ground, or an open/high resistance on the control circuits. If the circuits test normal, replace the S52 outside mirror switch.

10. If all circuits test normal, test or replace the A9 outside wing mirror.

Outside Wing Mirror Applique Replacement

Callout	Component Name
1	<p data-bbox="252 1373 682 1419">Outside Wing Mirror Applique</p> <p data-bbox="252 1451 419 1497">Procedure</p> <p data-bbox="290 1529 2349 1575">1. It's necessary to remove the outside wing mirror, loosen the bolts to allow the mirror to move. Refer to Outside Rearview Mirror Replacement .</p>

2. Insert a plastic tool between the door frame and the edge of the mirror applique.
3. Push inward, turn clockwise releasing the retaining clips from the door frame.
4. It may be necessary to remove the old retaining clips from the door frame.
5. When reinstalling the applique, set the bottom of the applique in first then rotate the part into place clipping the top first then the bottom.

Outside Rearview Mirror Replacement

Callout	Component Name
Warning: Refer to Glass and Sheet Metal Handling Warning in the Preface section.	
Preliminary Procedure	
Remove the front side door trim panel. Refer to Front Side Door Trim Replacement .	

1	<p>Outside Wing Mirror Nuts (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the water deflector cover at the top of the door panel to expose the nuts. 2. Disconnect the electrical connector. <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Outside Wing Mirror Front Lower Base Retainer</p> <p>Procedure</p> <p>When pulling the mirror assembly off the vehicle it Must be pulled straight forward to prevent the retainer from falling in the door.</p> <p>Note: If the retainer stay in the door when removing the mirror, remove and reinstall to the mirror base.</p>
3	<p>Outside Rearview Mirror</p> <p>Tip Inspect the outside wing mirror for proper operation before installing the door trim.</p>

Outside Wing Mirror Housing Cover Replacement

Callout

Component Name

Warning: Refer to [Glass and Sheet Metal Handling Warning](#) in the Preface section.

Preliminary Procedure

Remove the outside wing mirror housing bezel. Refer to [Outside Wing Mirror Housing Bezel Replacement](#).

Outside Wing Mirror Housing Cover Retainers (Qty: 3)

Procedure

1

1. The housing cover has three molded retainers on the front edge that retains it to the housing.
2. Lift and slide the housing cover straight forward to release the retainers from the housing.

Note: The housing cover fits in the edge of the turning signal house and it must slid forward to release completely.

Outside Wing Mirror Housing Cover

Procedure

2

1. Reinstall the housing cover to the housing.
2. Inner actuator to housing, ensure proper operation.
3. Position the housing cover to the housing and indicator, push rearward until fully seated.
4. Place your hand on the back of the mirror housing. Using the flat part of your hand press inward until the mirror glass fully seats to the inner actuator retaining tabs.
5. Inspect the outside wing mirror for proper operation.

Outside Wing Mirror Housing Bezel Replacement

Callout	Component Name
Warning: Refer to Glass and Sheet Metal Handling Warning in the Preface section.	
Preliminary Procedure	
Remove the outside rearview mirror inner actuator. Refer to Outside Rearview Mirror Inner Actuator Replacement .	

Outside Wing Mirror Housing Bezel

1

Procedure

Inspect the outside wing mirror inner actuator for proper operation before installing the mirror glass.

Note: When removing the housing bezel it Must be pulled up and turn from the lower inside corner only to release.

Outside Remote Control Wing Mirror Switch Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the drivers side door accessory switch mount plate. Refer to Front Side Door Accessory Switch Mount Plate Replacement : Passenger Side Door → Drivers Side Door .</p>	
	<p>Outside Remote Control Wing Mirror Switch Assembly</p>

1

Procedure

Disconnect the electrical connector.

Outside Rearview Mirror Inner Actuator Replacement

Callout	Component Name
Warning: Refer to Glass and Sheet Metal Handling Warning in the Preface section.	
Preliminary Procedure	
Remove the outside rearview mirror glass. Refer to Outside Rearview Mirror Glass Replacement .	

1	<p>Outside Wing Mirror Inner Actuator Screws (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Disconnect the electrical connector.</p> <p>Tighten 3 N·m (27 lb in)</p>
2	<p>Outside Rearview Mirror Inner Actuator</p> <p>Procedure</p> <p>Inspect the outside wing mirror inner actuator for proper operation before installing the mirror glass.</p>

Inside Rearview Mirror Replacement

Callout	Component Name
	<p>Inside Rearview Mirror Set Screw</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p>

1	<ol style="list-style-type: none">1. Adjust the mirror to the full upward position.2. Loosen the set screw located at the base of the mirror.3. Slide the mirror upward off of the rearview mirror button. <p>Tighten 1.8 N·m (16 lb in)</p>
2	Inside Rearview Mirror

Inside Rearview Mirror Bracket Installation

Note: If the windscreen is equipped with a black out area where the inside rearview mirror is located this procedure does not apply. If the black out area is damaged, replace the windscreen.

1. Determine the location of the mirror mounting base by marking the outside of the windscreen with a marking pencil where the base was previously located. If it is not clear where the base was mounted, use the following steps to determine where the base should be installed:

- 1.1. Using a measuring tape, measure the distance between the windscreen pillars from the base of the shade line.
- 1.2. Using a marking pencil, halfway between the windscreen pillars, draw a centre line (1) on the windscreen from the roof panel to the windscreen base.
- 1.3. Draw a perpendicular line intersecting the centre line (2) at that location.

The top center of the mirror mounting base will be at the intersection of these lines.

2. Scrape the inside windscreen glass thoroughly with a safety razor or utility knife in order to remove all old adhesive.
3. If reinstalling the original mounting base, place the mirror mounting base in a suitable holding device, such as a vice.
4. Scrape the mirror mounting base thoroughly with a safety razor or utility knife in order to remove all old adhesive.
5. Clean the inside windscreen glass and the mounting surface of the mirror mounting base thoroughly with a clean cloth saturated with naphtha or a 50/50 mixture (by volume) of clean water and isopropyl alcohol.

6. Using the Inside Mirror Adhesive Kit, or equivalent to apply a small amount of activator to the mounting surface of the mirror mounting base. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended adhesive.
7. Apply a small amount of activator to the windscreen where the mounting base is to be installed.
8. Allow the activator to dry 5 minutes.

Note: Do not touch the mounting surface of the mirror mounting base or the glass.

9. Apply 1 drop of adhesive to the centre of the mirror mounting base.

10. Immediately apply the mounting base to the windscreen, ensuring that the mounting base aligns correctly to the marks made on the outside of the windscreen.
11. Hold the mounting base firmly in place for 1 minute.
12. Allow the adhesive to set for 15 minutes.
13. Install the mirror to the mirror mounting base and fasten, if necessary.
14. Connect the electrical connector and install the wire cover, if equipped.

Automatic Day-Night Mirror Description and Operation

[Inside Rearview Mirror with the Automatic Day-Night Feature System Operation](#)

The inside rearview mirror uses 2 photocell sensors. One sensor is the headlamp sensor, located on the face side of the mirror. The headlamp sensor is used to determine light conditions present at the mirror face. The other sensor is the ambient light sensor, located on the rear of the mirror or windshield side. The ambient light sensor is used to determine the exterior light conditions. With a low exterior light condition detected, and a high light condition from behind of the car, at the headlamp sensor, the inside rearview mirror will automatically darken the face of the mirror.

In the daytime, the mirror is in a normal state because of the high exterior light condition that is indicated by the ambient light sensor. With the gear selector lever in the REVERSE position, reverse lamp supply voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, even during the night.

Outside Mirror Description and Operation

[Power Mirror System Components](#)

The power mirror system consists of the following components:

- Outside rearview mirror switch
- Mirror selector switch
- Driver outside rearview mirror
- Passenger outside rearview mirror

Each of the outside rearview mirror contains two motors. The vertical motor operates the mirror in the up and down directions, and the horizontal motor operates the mirror in the left and right directions.

[Power Mirror System Controls](#)

The outside rearview mirror switch is a four position directional switch: Up, Down, Left and Right.

The mirror select switch is a three position switch: left, neutral/fold, and right.

[Power Mirror System Operation](#)

The outside wing mirror switch receives battery voltage from the under-bonnet fuse block. The power mirror switch also receives a constant ground.

The four positions of the direction switch have dual switch contacts. Each of the contacts are connected to opposing sides of the appropriate power mirror motors through the selector switch. The selector switch completes these circuits depending on the position of the selector switch, L or R.

If the selector switch is placed in the L position and the up switch is pressed, battery voltage will be supplied to the left outside wing mirror vertical motor through the left mirror motor vertical control circuit and ground through the left mirror motor common control circuit. If the down switch is pressed, battery voltage will be supplied to the left outside wing mirror vertical motor through the left mirror motor common control circuit and ground through the left mirror motor vertical control circuit.

The remainder of the mirror functions operate in the same manner as described above. Placing the power mirror switch in opposing positions, left/right or up/down, will reverse the polarity to the mirror motor, reversing the direction of movement.

[Heated Mirrors \(If Equipped\)](#)

The heated mirrors are controlled through the rear demist relay. Whenever the rear window demister is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

DTC B2500

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B2500 00: Driver Exterior Unlock Switch Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Door Key Switch Signal	B2500 00	1	1	--
Driver Door Latch Ground	--	1	--	--
1. Key Cylinder Switch Inoperative				

[Circuit/System Description](#)

The driver window switch monitors the voltage level of the key switch unlock signal circuit. When the key is inserted into the driver door key cylinder and turned to the Unlock position, a switch within the driver door latch closes causing the voltage to drop within the key switch unlock signal circuit. The driver window switch will detect the drop in voltage and will send a serial data message to the BCM commanding all the doors to unlock.

[Conditions for Running the DTC](#)

The system voltage is 9-16 V

[Conditions for Setting the DTC](#)

The BCM detects a short to ground on the driver door key switch signal circuit.

Action Taken When the DTC Sets

The BCM will ignore the unlock command from the key cylinder switch.

Conditions for Clearing the DTC

- This DTC will be current for as long as the fault is present
- When the fault is no longer present, the DTC will be a history DTC
- A history DTC will clear after 50 ignition cycles

Circuit/System Verification

Insert the key into the driver door lock cylinder, turn the key to the unlock position while observing the scan tool BCM Driver Door Key Unlock Switch parameter, the value

should change from Inactive to Active.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the A23D door latch assembly-driver.
2. Vehicle in Service Mode, verify the scan tool Driver Door Key Unlock Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 9 for a short to ground. If the circuits test normal, replace the S79D window switch - driver.
3. If all circuits tests normal, test or replace the A23D door latch assembly-driver.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the A23D door latch assembly-driver.
2. Test for infinite resistance between terminal 8 and terminal 9 with the switch in the open position.
If not the specified value, replace the A23D door latch assembly-driver.
3. Test for less than 2 Ω between terminal 8 and terminal 9 with the switch in the unlock position.
If greater than the specified range, replace the A23D door latch assembly-driver.

1. All Door Latches Inoperative

[Circuit/System Description](#)

The body control module (BCM) controls the door lock, passenger door unlock and driver door unlock circuits. Voltage is applied to the appropriate circuit when the BCM detects a door lock/unlock switch activation or a keyless entry lock or unlock command.

[Conditions for Running the DTC](#)

The system voltage is 9-16 V.

[Conditions for Setting the DTC](#)

B3125 02, B3130 02, B3135 02

The BCM detects a short to ground on a door latch control circuit.

B3125 04, B3130 04, B3135 04

The BCM detects an open/high resistance on a door latch control circuit

[Action Taken When the DTC Sets](#)

All the power door locks will be inoperative.

[Conditions for Clearing the DTC](#)

- This DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Command the door latches to LOCK and UNLOCK with a scan tool. Observe the operation of the door latches, each door should LOCK and UNLOCK when changing between the commanded states.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the X2 harness connector at the K9 BCM.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance
3. Vehicle OFF, disconnect the X6 harness connector at the K9 BCM.
4. Disconnect the X1 harness connector at the X50A fuse block-under-bonnet.
5. Test for infinite resistance between the control circuit listed below and ground:
 - Connector X1, terminal 11 at the X50A fuse block-under-bonnet
 - Connector X1, terminal 12 at the X50A fuse block-under-bonnet
 - Connector X6 terminal 1 at the K9 BCM
 - Connector X6 terminal 4 at the K9 BCMIf not the specified value, test the appropriate control circuit for a short to ground. If the circuit tests normal, test or replace the appropriate A23 door latch assembly.
6. Connect the X1 harness connector at the X50A fuse block-under-bonnet.
7. Test for infinite resistance between the control circuit terminal 2 X6 at the K9 BCM and ground.
If not the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the X50A fuse block-under-bonnet.
8. If all circuits test normal, replace the K9 BCM.

[Component Testing](#)

1. Vehicle OFF, disconnect the harness connector at the appropriate A23 door latch assembly.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the A23 door latch assembly should perform the LOCK and UNLOCK functions.
If it does not perform as specified, replace the A23 door latch assembly.

DTC B3140 or B3150

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3140 00: Driver Door Unlock Switch Circuit

DTC B3150 00: Left Front Door Lock Switch Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Door Lock Switch Lock Signal	B3150 00	1	1	--
Driver Door Lock Switch Unlock Signal	B3140 00	2	2	--
Driver Door Lock Switch Ground	--	3	--	--

1. Door Lock Switch Lock Function Inoperative
2. Door Lock Switch Unlock Function Inoperative
3. Door Lock Switch Lock and Unlock Functions Inoperative

[Circuit/System Description](#)

The body control module (BCM) monitors the voltage level of the door lock and door unlock signal circuits. When the central door lock switch is in the open position, the voltage level in the signal circuit will be near 12 V. When the central door lock switch is pressed to the lock or unlock position, the voltage level in the appropriate signal circuit will drop to 0 V and the BCM will detect the voltage drop and command the door latches to perform the requested lock or unlock command.

[Conditions for Running the DTC](#)

The system voltage is 9-16 V.

[Conditions for Setting the DTC](#)

B3140 00

The BCM detects short to ground in the unlock signal circuit for greater than 60 seconds.

B3150 00

The BCM detects a short to ground in the lock signal circuit for greater than 60 seconds.

[Action Taken When the DTC Sets](#)

B3140 00

The BCM will ignore the unlock signal and the doors will not unlock when using the central door lock switch.

B3150 00

The BCM will ignore the lock signal and the doors will not lock when using the central door lock switch.

[Conditions for Clearing the DTC](#)

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool BCM Central Door Lock Switch on Console parameter. The reading should be Inactive and change to Lock and Unlock when pushing the appropriate switch on the central door lock switch.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the A20 radio/HVAC control.
2. Test for less than 10 Ω between the ground circuit terminal 17 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Central Door Lock Switch on Centre Console parameter is Inactive.
If the value is Lock , test the signal circuit terminal 12 for a short to ground. If the circuit tests normal, replace the K9 BCM.
If the value is Unlock , test the signal circuit terminal 13 for a short to ground. If the circuit tests normal, replace the K9 BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 12 and ground. Verify the scan tool Central Door Lock Switch on Center Console parameter is Lock.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. Install a 3 A fused jumper wire between the signal circuit terminal 13 and ground. Verify the scan tool Central Door Lock Switch on Centre Console parameter is Unlock.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
6. If all circuits test normal, test or replace the A20 radio/HVAC control.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the A20 radio/HVAC control.
2. Test for infinite resistance between the signal terminal 13 and the ground terminal 17 with the switch in the open position.

If not the specified value, replace the A20 radio/HVAC control.

3. Test for infinite resistance between the signal terminal 12 and the ground terminal 17 with the switch in the open position.

If not the specified value, replace the A20 radio/HVAC control.

4. Test for less than 2 Ω between the signal terminal 12 and the ground terminal 17 with the switch in the lock position.

If greater than the specified range, replace the A20 radio/HVAC control.

5. Test for less than 2 Ω between the signal terminal 13 and the ground terminal 17 with the switch in the unlock position.

If greater than the specified range, replace the A20 radio/HVAC control.

Repair Instructions

- [Control Module References](#) for BCM replacement, programming and setup

DTC B3265

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B3265 02: Boot Lid Unlatch Output Circuit Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Tailboard Latch Relay Control	B3265 02	1	1	--
Tailgate Release Relay Ground	--	1	--	--
1. Rear Hatch Release Malfunction				

[Circuit/System Description](#)

The body control module (BCM) applies battery positive voltage to the tailgate release relay control circuit, which energises the coil side of the tailgate release relay. The switch side of the tailgate release relay then closes, supplying battery positive voltage through the relay and the relay controlled output circuit to the rear closure latch. The rear closure latch then releases the rear hatch so that it may be manually raised to an open position.

[Conditions for Running the DTC](#)

When the rear closure latch is actively being requested by the BCM.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground in the tailgate release relay control circuit.

Action Taken When the DTC Sets

The rear closure latch will malfunction.

Conditions for Clearing the DTC

- This DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

Vehicle in Service Mode, command the rear closure latch to UNLATCH with a scan tool. The rear closure latch should release the rear hatch.

Circuit/System Testing

1. Vehicle OFF, disconnect the KR95A tailgate release relay.
2. Test for less than 10 Ω between the ground circuit terminal 48 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 44 and the ground circuit terminal 48.
4. Vehicle in Service Mode, command the rear closure latch to UNLATCH with a scan tool, the test lamp should turn ON while commanding the UNLATCH state.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. If all circuits test normal, test or replace the KR95A tailgate release relay.

Component Testing

1. Vehicle OFF, disconnect the KR95A tailgate release relay.
2. Test for 60-200 Ω between terminals 85 and 86.
If not within the specified range, replace the KR95A tailgate release relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87If less than the specified value, replace the KR95A tailgate release relay.
4. Install a 3A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
If greater than the specified range, replace the KR95A tailgate release relay.

DTC B3618

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B3618 00: Exterior Tailgate Unlatch Switch Circuit Malfunction

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Closure Handle Switch Open Signal	B3618 00	1	1	--
Ground	--	1	--	--
1. Tailgate Release Switch Inoperative				

[Circuit/System Description](#)

When the vehicle is in service mode, the body control module (BCM) supplies a signal to the tailgate handle switch through the rear closure handle switch open signal circuit. When the tailgate handle switch is pressed, the voltage within the signal circuit is pulled low and in response, the BCM will energise the tailgate release relay.

[Conditions for Running the DTC](#)

The system voltage is 9-16 V.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground in the rear closure handle switch open signal circuit for greater than 60 seconds

Action Taken When the DTC Sets

The rear hatch will not open when the tailgate handle switch is pressed.

Conditions for Clearing the DTC

- This DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool Boot Lid/Tailgate Window Exterior Unlatch Switch parameter while pressing and releasing the S46 tailgate handle switch. The parameter should change between Active and Inactive each time the switch is pressed and released.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S46 tailgate handle switch.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Boot Lid/Tailgate Window Exterior Unlatch Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the K9 BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 2. Verify the scan tool Boot Lid/Tailgate Window Exterior Unlatch Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. If all circuits test normal, test or replace the S46 tailgate handle switch.

Component Testing

Boot Release Switch

1. Vehicle OFF, disconnect the harness connector at the S46 tailgate handle switch.
2. Test for infinite resistance between the signal terminal 1 and the ground terminal 2 with the switch in the open position.
If not the specified value, replace the S46 tailgate handle switch.
3. Test for less than 2 Ω between the signal terminal 1 and the ground terminal 2 with the switch in the closed position.
If greater than the specified range, replace the S46 tailgate handle switch.

DTC B3930

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B3930 02: Child Security Lock Motors Circuit Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Door Lock Security Relay Control	B3930 02	1	1	--
Under-bonnet Fuse Block Ground	--	1	--	--
1. Child Security Door Lock Malfunction				

[Circuit/System Description](#)

The child door lockout switch is on the driver door lock/window switch and controls the child locks on the rear doors as well as the rear window switches. When the BCM receives a command from the window lockout switch, it will apply voltage to the door lock security relay coil, this will energise the relay and the contact within the relay will then direct the voltage to lock the left rear and right rear child locks and then isolate them from the normal door lock system to prevent the rear doors from being opened by using the interior rear door handles.

[Conditions for Running the DTC](#)

Battery voltage must be between 9-16 V.

[Conditions for Setting the DTC](#)

The BCM detects a short to ground in the child security lock relay circuit.

Action Taken When the DTC Sets

The interior rear door handles will continue to function when commanded to lockout.

Conditions for Clearing the DTC

- This DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

Vehicle in Service Mode, with all the doors locked, command the child security lockout by pressing the window lockout switch on the S79D window switch-driver, the interior rear door handles should not open the doors when used.

Circuit/System Testing

1. Vehicle OFF, disconnect the X3 harness connector at the X50A fuse block-under-bonnet.
2. Test for less than 10 Ω between the ground circuit terminal 48 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle OFF, connect the X3 harness connector and disconnect the X1 harness connector at the X50A fuse block-under-bonnet.
4. Connect a test lamp between the control circuit terminal 36 and ground.
5. Vehicle in Service Mode, command the child security lockout by pressing the window lockout switch on the S79D window switch-driver. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM.
6. If all circuits test normal, replace the X50A fuse block-under-bonnet.

Repair Instructions

DTC P0CC6

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0CC6 00: Charge Port Door Open Request Switch Wake-Up Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Port Door Release Switch B+	P0CC6 00	P0CC6 00	--	--
Charge Port Door Open Request Switch Wake-Up Signal	P0CC6 00	P0CC6 00	--	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors the voltage values of the charge port wake-up signal circuit and the charge port request signal circuit. When the charge port door release switch is pressed, the two switch contacts close and provides B+ voltage to the two signal circuits. This provides B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2, The hybrid powertrain control module 2 detects the voltage on the signal circuits and provides a 12 V pulse to the charge port relay, the relay briefly becomes energised which then allows B+ voltage to the charge port door latch which activates and releases the charge port door.

[Conditions for Running the DTC](#)

Hybrid Powertrain Control Module 2 is awake

[Conditions for Setting the DTC](#)

The hybrid powertrain control module 2 detects that the Charge Port Door Open Request Switch Wake-Up Circuit value does not match the expected corresponding value for the Charge Port Door Open Request resistor ladder switch input.

Action Taken When the DTC Sets

The charge port door will not open if the hybrid powertrain control module 2 is asleep

Conditions for Clearing the DTC

DTC P0CC6 is a type B DTC

Circuit/System Verification

Vehicle is Service Mode, command the charge port door OPEN by pressing the S113 charge port door open request switch. The M80 charge port door unlatch actuator

should unlatch and the charge port door should open

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S113 charge port door open request switch.
2. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Connect the harness connector at the S113 charge port door open request switch.
4. Disconnect the X2 harness connector at the K114B hybrid powertrain control module 2.
5. Connect a test lamp between the signal circuit terminal 29 and ground.
6. Observe the function of the test lamp while pressing and releasing the S113 charge port door open request switch. The test lamp should turn ON each time the switch is pressed.
If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, test or replace the S113 charge port door open request switch.
If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the S113 charge port door open request switch.
7. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the S113 charge port door open request switch.
2. Test for infinite resistance between the signal terminal 2 and the B+ terminal 1 with the switch in the open position.
If not the specified value, replace the S113 charge port door open request switch.
3. Test for less than 2 Ω between the signal terminal 2 and the B+ terminal 1 with the switch in the closed position.
If greater than the specified range, replace the S113 charge port door open request switch.

Charge Port Door Request Signal	P0CC9 00	P0CC9 00	P0CC7 00	P0CCA 00	-
Charge Port Release Switch Low Reference	-	P0CC9 00	P0CC7 00	P0CCA 00	-
1. Charge Port Door Switch Malfunction					

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors the voltage values of the charge port wake-up signal circuit and the charge port request signal circuit. When the charge port door release switch is pressed, the switch contact closes and provides B+ voltage to the wake-up signal circuit. The hybrid powertrain control module 2 detects the voltage on the signal circuits and provides a 12 V pulse to the charge port relay, the relay briefly becomes energised which then allows B+ voltage to the charge port door latch which activates and releases the charge port door.

[Conditions for Running the DTC](#)

Hybrid Powertrain Control Module 2 is awake

Conditions for Setting the DTC

P0CC7 00

The hybrid powertrain control module 2 detects high resistance or an invalid high or invalid low voltage in the in the charge port door open request switch circuit.

P0CC9 00

The hybrid powertrain control module 2 detects a short to ground or an open/high resistance in the charge port door open request switch circuit.

P0CCA 00

The hybrid powertrain control module 2 detects a short to voltage in the charge port door open request switch circuit.

Action Taken When the DTC Sets

The charge port door will malfunction and the charge port door may not be able to be opened.

Conditions for Clearing the DTC

DTC P0CC7 00, P0CC9 00 and P0CCA 00 are type B DTCs

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0CCC 00: Charge Port Door Position Sensor Circuit

DTC P0CCE 00: Charge Port Door Position Sensor Circuit Low Voltage

DTC P0CCF 00: Charge Port Door Position Sensor Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open	High Resistance	Short to Voltage	Signal Performance
Charge Port Door Position Sensor Signal	P0CCE 00	P0CCE 00	P0CCC 00	P0CCF 00	-
Charge Port Door Position Sensor Ground	-	P0CCE 00	P0CCC 00	--	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 provides a 5V signal through a pull-up resistor to the Charge Port Door Position Sensor Circuit. The other end of the Charge Port Door Position Sensor Circuit is connected to the Charge Port Door Position Switch. The hybrid powertrain control module 2 monitors the voltage on the Charge Port Door Position Sensor Circuit. In normal operation, the hybrid powertrain control module 2 sends a serial data message to the driver information centre in the instrument panel cluster to display the Charge Door Open message.

[Conditions for Running the DTC](#)

Hybrid Powertrain Control Module 2 must be awake.

Conditions for Setting the DTC

P0CCC 00

The hybrid powertrain control module 2 detects the charge port door position sensor signal circuit voltage is mid range between expected high and low voltage values

P0CCE 00

The hybrid powertrain control module 2 detects a short to ground in the charge port position sensor circuit.

P0CCF 00

The hybrid powertrain control module 2 detects a short to voltage or an open/high resistance in the charge port position sensor circuit.

Action Taken When the DTC Sets

The Charge Door Open message will not illuminate when the charge port door is open or ajar.

Conditions for Clearing the DTC

DTC P0CCC 00, P0CCE 00 and P0CCF 00 are type B DTCs

[Circuit/System Verification](#)

Vehicle in Service Mode, observe the scan tool Charge Port Door parameter while opening and closing the charge port door, the value should change between Open and Closed.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the B197 charge port door position switch.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, test for 4.75-5.25 V between the signal circuit terminal A and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. If all circuits test normal, test or replace the B197 charge port door position switch.

[Component Testing](#)

1. Vehicle OFF, disconnect the harness connector at the B197 charge port door position switch.
2. Test for 180 Ω --190 Ω between the signal terminal A and the ground terminal C with the switch in the open position.
If not within the specified range, replace the B197 charge port door position switch.
3. Test for 2040 Ω --2065 Ω between the signal terminal A and the ground terminal C with the switch in the closed position.
If not within the specified range, replace the B197 charge port door position switch.

[DTC Descriptor](#)

DTC P0CD1 00: Charge Port Door Unlock Control Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Port Relay Control	P0CD1 00	P0CD1 00	1	--
Ground	--	P0CD1 00	--	--
1. Charge Port Door Latch Malfunction				

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors the voltage values of the charge port wake-up signal circuit and the charge port request signal circuit. When the charge port door release switch is pressed, the two switch contacts closes. The hybrid powertrain control module 2 detects the voltage on the signal circuits and provides a 12 V pulse to the charge port relay, the relay briefly becomes energised which then allows B+ voltage to the charge port door latch which activates and releases the charge port door.

[Conditions for Running the DTC](#)

The hybrid powertrain control module 2 is awake

[Conditions for Setting the DTC](#)

- The hybrid powertrain control module 2 detects a short to ground or an open/high resistance in the charge port door relay control circuit.

- The hybrid powertrain control module 2 detects an open/high resistance in the charge port door relay ground circuit

Action Taken When the DTC Sets

The charge port door latch will malfunction and the charge port door may not be able to be opened.

Conditions for Clearing the DTC

DTC P0CD1 00 is a type B DTC

Circuit/System Verification

Vehicle in Service Mode, command the charge port door to OPEN with the scan tool, the M80 charge port door actuator should release the charge port door allowing it to open.

Circuit/System Testing

1. Vehicle OFF, disconnect the KR119 charge port door relay.
2. Test for less than 1 Ω between the ground circuit terminal 85 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the control circuit terminal 86 and ground.
4. Vehicle in Service Mode, command the charge port door to OPEN with a scan tool. The test lamp should turn ON during the OPEN command.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
5. If all circuits test normal, test or replace the KR119 charge port door relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR119 charge port door relay.
2. Test for 60-180 Ω between terminals 85 and 86.
If not within the specified range, replace the KR119 charge port door relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87If not the specified value, replace the KR119 charge port door relay.
4. Install a 5 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
If greater than the specified range, replace the KR119 charge port door relay.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P0CD2

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0CD2 00: Charge Port Door Unlock Control Performance

[Circuit/System Description](#)

When the vehicle is in the Service Mode, the hybrid powertrain control module 2 supplies a 5V signal to the charge door position sensor through the charge port door position sensor signal circuit. The charge port door ajar switch contains a resistor ladder interface for switch position between two resistors for sensing used by the hybrid powertrain control module 2 to determine if the charge port door is in the open position or the closed position.

[Conditions for Running the DTC](#)

The charge port door does not open when commanded.

[Conditions for Setting the DTC](#)

- The charge port door has been commanded to open twice but the hybrid powertrain control module 2 has detected that the charge port door is still in the closed position
- The charge port door has been commanded to open but the hybrid powertrain control module 2 has detected that the charge port door is still in the closed position after 5 seconds.

[Action Taken When the DTC Sets](#)

The malfunction indicator lamp will be illuminated.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will become a history DTC.
- A history DTC will clear after 50 ignition cycles

Diagnostic Aids

This DTC will set if the charge port door is stuck closed as may occur when ice and/or snow has accumulated around the charge port door or if any moisture on the charge port door weatherstrip freezes to the charge port door. Placing the vehicle in a warm environment and allowing all the snow or ice to melt, the charge port door should function normally and the DTC will become history.

DTC Descriptor

DTC P04B6 00: Fuel Fill Door Stuck Closed

Circuit/System Description

The hybrid powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provide B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2. The hybrid powertrain control module 2 detects the voltage on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information centre to display the Wait to Refuel message. The hybrid powertrain control module 2 then energises the fuel door lock/unlock actuator to unlock the fuel door.

Conditions for Running the DTC

- The hybrid powertrain control module 2 is awake
- The fuel tank is being filled.

Conditions for Setting the DTC

The hybrid powertrain control module 2 has detected that the fuel level in the fuel tank has increased but detects that the fuel filler door was always in the closed position.

Action Taken When the DTC Sets

The driver information centre will display the Service Refuel System message.

Conditions for Clearing the DTC

DTC P04B6 is a type B DTC.

DTC P04B8-P04BA or P04DC

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P04B8 00: Fuel Fill Door Position Sensor Circuit

DTC P04B9 00: Fuel Fill Door Position Sensor Circuit Low Voltage

DTC P04BA 00: Fuel Fill Door Position Sensor Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open	High Resistance	Short to Voltage	Signal Performance
Fuel Door Open Signal	P04B9 00	P04B9 00	P04B8 00	P04BA 00	--
Ground	--	P04B9 00	P04B8 00	--	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 provides a 5V signal through a pull-up resistor to the Fuel Door Position Sensor Circuit. The other end of the Fuel Door Position Sensor Circuit is connected to the Fuel Door Position Sensor in the Fuel Door Status Switch Assembly. The hybrid powertrain control module 2 monitors the voltage on the Fuel Door Position Sensor Circuit. In normal operation, when the Fuel Door moves to the open position, the switch in the Fuel Door Lock Position closes and lowers the voltage on the Fuel Door Lock Position Sensor Circuit.

[Conditions for Running the DTC](#)

Hybrid Powertrain Control Module 2 is awake.

Conditions for Setting the DTC

P04B8 00

The hybrid powertrain control module 2 detects the fuel door position signal circuit voltage is mid range between expected high and low voltage values

P04B9 00

The hybrid powertrain control module 2 detects a short to ground in the fuel door open signal circuit.

P04BA 00

The hybrid powertrain control module 2 detects a short to voltage or an open or high resistance in the fuel door open signal circuit.

Action Taken When the DTC Sets

The driver information centre will continuously display the Wait To Refuel message after the refuel request switch is pressed.

Conditions for Clearing the DTC

DTC P04B8 00, P04B9 00 and P04BA 00 are type B DTCs

[DTC Descriptors](#)

DTC P04BB 00: Fuel Fill Door Lock Control Circuit

DTC P04BC 00: Fuel Fill Door Lock Performance

DTC P04C0 00: Fuel Fill Door Unlock Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Door Lock Actuator Lock Control	P04BB 00	P04BB 00	P04BB 00	P04BC 00
Fuel Door Lock Actuator Unlock Control	P04BB 00	P04BB 00	P04BB 00	P04C0 00

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provide B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2. The hybrid powertrain control module 2 detects the voltage on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information centre to display the Wait to Refuel message. The hybrid powertrain control module 2 then energises the fuel door lock/unlock actuator to unlock the fuel door.

[Conditions for Running the DTC](#)

Hybrid Powertrain Control Module 2 is awake

Conditions for Setting the DTC

P04BB 00

The hybrid powertrain control module 2 has detected a short to ground, short to voltage or an open/high resistance on either of the lock actuator control circuits

P04BC 00

The hybrid powertrain control module 2 provided a lock command with no corresponding lock status indication on the fuel door lock actuator input circuit

P04C0 00

The hybrid powertrain control module 2 provided an unlock command with no corresponding unlock status indication on the fuel door lock actuator input circuit

Action Taken When the DTC Sets

- The fuel door latch will malfunction and the fuel filler door may not be able to be opened.
- The Wait to Refuel message always be displayed on the driver information centre.

Conditions for Clearing the DTC

DTC P04BB 00, P04BC 00 and P04C0 00 are type B DTCs

Circuit/System Verification

Vehicle in Service Mode command the fuel door to LOCK and UNLOCK with a scan tool, the M97 fuel door lock actuator should perform the LOCK and UNLOCK functions.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the M97 fuel door lock actuator.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the control circuit terminal 1 and ground.
If the test lamp is OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
3. Verify that a test lamp illuminates between the control circuit terminal 2 and ground.
If the test lamp is OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. Connect a test lamp between the control circuit terminal 1 and the control circuit terminal 2
5. Vehicle in Service Mode, command the fuel door to LOCK and UNLOCK with a scan tool. The test lamp should briefly illuminate while changing between the commanded states.
If the test lamp is always OFF, test both control circuits for a short to voltage. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. If all circuits test normal, test or replace the M97 fuel door lock actuator.

Component Testing

Fuel Door Lock Actuator

1. Vehicle OFF, disconnect the harness connector at the M97 fuel door lock actuator.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground.
Reverse the jumper wires at least two times, the M97 fuel door lock actuator should perform the LOCK and UNLOCK functions.
If it does not perform as specified, replace the M97 fuel door lock actuator.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Vehicle in Service Mode, command the fuel filler door to UNLATCH by pressing the S117 refuel request switch. The M97 fuel door lock actuator should unlatch allowing the fuel filler door to open

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S117 refuel request switch.
2. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Connect the harness connector at the S117 refuel request switch.
4. Disconnect the X2 harness connector at the K114B hybrid powertrain control module 2.
5. Connect a test lamp between the signal circuit terminal 7 and ground.
6. Observe the function of the test lamp while pressing and releasing the S117 refuel request switch. The test lamp should turn ON each time the switch is pressed.
If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, test or replace the S117 refuel request switch.
If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the S117 refuel request switch.
7. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the S117 refuel request switch.
2. Test for infinite resistance between the signal terminal 1 and the B+ terminal 2 with the switch in the open position.
If not the specified value, replace the S117 refuel request switch.
3. Test for less than 2 Ω between the signal terminal 1 and the B+ terminal 2 with the switch in the closed position.
If greater than the specified range, replace the S117 refuel request switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Fuel Tank Filler Door Lock Release Switch Replacement](#)
- [Control Module References](#) for the hybrid powertrain control module 2 replacement, programming and setup

Symptoms - Vehicle Access

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set
 - The control modules can communicate via the serial data link
2. Review the system operation in order to familiarise yourself with the system functions. Refer to the following systems description:
 - [Door Ajar Indicator Description and Operation](#)
 - [Rear Hatch/Gate Description and Operation](#)
 - [Power Door Locks Description and Operation](#)
 - [Tailgate Ajar Indicator Description and Operation](#)
 - [Fuel Fill Door Description and Operation](#)
 - [Charge Port Door Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Power Door Lock Key Cylinder Switches Malfunction](#)
- [Door Ajar Indicator Malfunction](#)
- [Exterior Door Handle Switch Malfunction - DTC B1474, B1534, B1535, or B3849](#)
- [Power Door Locks Malfunction](#)

- [Power Door Child Lock Malfunction](#)
- [Hatch Release Malfunction](#)
- [Rear Hatch/Gate Ajar Indicator Malfunction](#)
- [Fuel Filler Door Release Malfunction](#)
- [Fuel Filler Door Ajar Indicator Malfunction](#)
- [Charger Door Release Malfunction](#)
- [Charger Door Ajar Indicator Malfunction](#)

Charger Door Ajar Indicator Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Port Door Sensor Signal	P0CCC 00	P0CCE 00	P0CCF 00	--
Ground	--	P0CCE 00	--	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 provides a 5V signal through a pull-up resistor to the Charge Port Door Position Sensor Circuit. The other end of the Charge Port Door Position Sensor Circuit is connected to the Charge Port Door Position Switch. The hybrid powertrain control module 2 monitors the voltage on the Charge Port Door Position Sensor Circuit. In normal operation, the hybrid powertrain control module 2 sends a serial data message to the driver information centre in the instrument panel cluster to display the Charge Door Open message.

[Circuit/System Verification](#)

Vehicle in Service Mode, observe the scan tool Charge Port Door parameter while opening and closing the charge port door, the value should change between Open and Closed.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the B197 charge port door position switch.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, test for 4.75-5.25 V between the signal circuit terminal A and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. If all circuits test normal, test or replace the B197 charge port door position switch.

[Component Testing](#)

1. Vehicle OFF, disconnect the harness connector at the B197 charge port door position switch.
2. Test for 180 Ω --190 Ω between the signal terminal A and the ground terminal C with the switch in the open position.
If not within the specified range, replace the B197 charge port door position switch.
3. Test for 2040 Ω --2065 Ω between the signal terminal A and the ground terminal C with the switch in the closed position.
If not within the specified range, replace the B197 charge port door position switch.

Charge Port Door Release Actuator Ground	--	2	--	--
Charge Port Relay Ground	--	2	--	--
1. Charge Port Door Switch Malfunction				
2. Charge Port Door Latch Malfunction				

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors the voltage values of the charge port wake-up signal circuit and the charge port request signal circuit. When the charge port door release switch is pressed, the two switch contacts close and provides B+ voltage to the two signal circuits. This provides B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2. The hybrid powertrain control module 2 detects the voltage on the signal circuits and provides a 12V pulse to the charge port relay, the relay briefly becomes energised which then allows B+ voltage to the charge port door latch which activates and releases the charge port door.

[Circuit/System Verification](#)

1. Vehicle in Service Mode, command the M80 charge port door actuator to UNLATCH with the scan tool, the M80 charge port door actuator should unlatch and the charge port door should open.
If the M80 charge port door actuator does not perform as specified, refer to Charge Port Door Actuator Malfunction.
2. Command the M80 charge port door actuator to UNLATCH by pressing the S113 charge port door open request switch, the M80 charge port door actuator should unlatch and the charge port door should open.
If charge port door does not open, refer to Charge Port Door Switch Malfunction.

[Circuit/System Testing](#)

Charge Port Door Actuator Malfunction

1. Vehicle OFF, disconnect the KR119 charge port door relay.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp does not illuminate between the control circuit terminal 30 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage.
4. Verify that a test lamp illuminates between the B+ circuit terminal 87 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the control circuit terminal 30 for a short to ground.
5. Vehicle OFF, disconnect the harness connector at the M80 charge port door actuator.
6. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the harness connector at the M80 charge port door actuator.
8. Vehicle in Service Mode, connect a 10 A fused jumper wire between the B+ circuit terminal 87 and the control circuit terminal 30. Verify the M80 charge port door actuator is activated.
If the M80 charge port door actuator does not activate, test the control circuit for an open/high resistance. If the circuit tests normal, test or replace the M80 charge port door actuator.
9. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
10. Command the Activate Charge Port Solenoid with a scan tool. The test lamp should turn ON while commanding the solenoid.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
11. If all circuits test normal, test or replace the KR119 charge port door relay.

Charge Port Door Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S113 charge port door open request switch.
2. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Connect the harness connector at the S113 charge port door open request switch.
4. Disconnect the X2 harness connector at the K114B hybrid powertrain control module 2.
5. Connect a test lamp between the signal circuit terminal 29 and ground.
6. Observe the function of the test lamp while pressing and releasing the S113 charge port door open request switch. The test lamp should turn ON each time the switch is pressed.
If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, test or replace the S113 charge port door open request switch.
If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the S113 charge port door open request switch.
7. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Component Testing

Charge Port Door Release Actuator

1. Vehicle OFF, disconnect the harness connector at the M80 charge port door actuator.
2. Install a 20 A fused jumper wire between the control terminal 2 and 12 V. Briefly install a jumper wire between the ground terminal 1 and ground. Verify the M80 charge port door actuator activates.

If the actuator does not perform as specified, replace the M80 charge port door actuator.

Charge Port Door Release Switch

1. Vehicle OFF, disconnect the harness connector at the S113 charge port door open request switch.
2. Test for infinite resistance between the B+ terminal 1 and the signal terminal 2 with the switch in the open position.
If not the specified value, replace the S113 charge port door open request switch.
3. Test for less than 2 Ω between the B+ terminal 1 and the signal terminal 2 while pressing the S113 charge port door open request switch.
If greater than the specified range, replace the S113 charge port door open request switch.

Relay Test

1. Vehicle OFF, disconnect the KR119 charge port door relay.
2. Test for 60-180 Ω between terminals 85 and 86.
If not within the specified range, replace the KR119 charge port door relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87
If not the specified value, replace the KR119 charge port door relay.
4. Install a 5 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
If greater than the specified range, replace the KR119 charge port door relay.

Exterior Door Handle Switch Malfunction - DTC B1474, B1534, B1535, or B3849

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B1474 02: Passenger Exterior Door Handle Switch Circuit Short to Ground

DTC B1534 02: Left Rear Door Handle Switch Circuit Short to Ground

DTC B1535 02: Right Rear Door Handle Switch Circuit Short to Ground

DTC B3849 02: Driver Exterior Door Handle Switch Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Door Handle Switch Signal	B3849 02	1	1	--
Passenger Door Handle Switch Signal	B1474 02	2	2	--
Left Rear Door Handle Switch Signal	B1534 02	3	3	--
Right Rear Door Handle Switch Signal	B1535 02	4	4	-
Driver Door Handle Switch Ground	--	1	--	--
Passenger Door Handle Switch Ground	--	2	--	--
Left Rear Door Handle Switch Ground	--	3	--	--
Right Rear Door Handle Switch Ground	--	4	--	--

1. Driver Door Handle Switch Malfunction

2. Passenger Door Handle Switch Malfunction
3. Left Rear Door Handle Switch Malfunction
4. Right Rear Door Handle Switch Malfunction

[Circuit/System Description](#)

The exterior door handle switch signal circuits provide inputs to the keyless entry control module when the exterior door handle switches are activated. These inputs allow the keyless entry control module to detect a door unlock request. The keyless entry control module provides a 12 V signal to each exterior door handle switch via the door handle switch signal circuits. When a door handle switch is pressed, the switch closes and the voltage signals from the keyless entry control module are pulled to ground.

[Conditions for Running the DTC](#)

Battery voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

B1474 02

The keyless entry control module detects the passenger exterior door handle switch signal circuit is shorted to ground or closed for greater than 180 s

B1534 02

The keyless entry control module detects the left rear exterior door handle switch signal circuit is short-circuited to ground or closed for more than 180 s.

B1535 02

The keyless entry control module detects the right rear exterior door handle switch signal circuit is short-circuited to ground or closed for more than 180 s.

B3849 02

The keyless entry control module detects the driver exterior door handle switch signal circuit is short-circuited to ground or closed for more than 180 s.

[Action Taken When the DTC Sets](#)

The keyless entry control module will ignore input from the affected door switch and the door will not unlock when the door handle switch is pressed.

[Conditions for Clearing the DTC](#)

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 40 ignition cycles.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool keyless entry control module Exterior Driver Door Handle Switch, Exterior Passenger Door Handle Switch, Exterior Left Rear Door Handle Switch and Exterior Right Rear Door Handle Switch parameters while pressing and releasing each exterior door handle switch. The parameter for each should change between Active and Inactive

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate exterior A24 door handle assembly.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Vehicle in Service Mode, verify the appropriate scan tool Exterior Door Handle Switch parameter is Inactive.

If not the specified value, test the signal circuit terminal 3 for a short to ground. If the circuit tests normal, replace the K84 keyless entry control module.

4. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 4. Verify the scan tool Exterior Door Handle Switch parameter is Active.

If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K84 keyless entry control module

5. If all circuits test normal, test or replace the A24 door handle assembly.

Component Testing

Exterior Door Handle Switch Test

1. Vehicle OFF, disconnect the harness connector at the appropriate exterior A24 door handle assembly.
2. With the switch in the open position, test for infinite resistance between the signal terminal 3 and the ground terminal 4.
If not the specified value, replace the exterior A24 door handle assembly.
3. With the switch in the closed position, test for less than 5 Ω between the signal terminal 3 and the ground terminal 4.
If greater than the specified range, replace the exterior A24 door handle assembly.

Refuel Request Switch Low Reference	-	P04CA 00	--	--
Fuel Fill Door Position Sensor Ground	-	P04C5 00	--	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors the voltage values of the fuel fill door open request wake-up signal circuit and the fuel door request signal circuit. When the refuel request switch is pressed, the two switch contacts close. This provide B+ to the Wake-up Circuit input of the hybrid powertrain control module 2 and lowers the voltage on the fuel door request signal circuit input to the hybrid powertrain control module 2. The hybrid powertrain control module 2 detects the voltage on the signal circuits and commands the fuel system to vent and sends a serial data message to the driver information centre to display the Wait to Refuel message. The hybrid powertrain control module 2 then energises the fuel door lock/unlock actuator to unlock the fuel door.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Command the fuel filler door to LOCK and UNLOCK with the scan tool, the M97 fuel door lock actuator should LOCK and UNLOCK while changing between the commanded states.
If the fuel filler door does not perform as specified, refer to Fuel Filler Door Lock Malfunction.
2. Command the fuel filler door to UNLOCK by pressing the S117 refuel request switch, the M97 fuel door lock actuator should UNLOCK allowing the fuel filler door to open.
If the fuel filler door does not perform as specified, refer to Refuel Request Switch Malfunction.
3. With the fuel filler door locked, verify that the scan tool Fuel Door Lock parameter is Locked.
If not the specified value, refer to Fuel Door Lock Position Sensor Malfunction.
4. With the fuel filler door unlocked, verify that the scan tool Fuel Door Lock parameter is Unlocked.
If not the specified value, refer to Fuel Door Lock Position Sensor Malfunction.

Circuit/System Testing

Fuel Filler Door Lock Malfunction

1. Vehicle OFF, disconnect the harness connector at the M97 fuel door lock actuator.

2. Vehicle in Service Mode, verify that a test lamp illuminates between the control circuit terminal 1 and ground.
If the test lamp is OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
3. Verify that a test lamp illuminates between the control circuit terminal 2 and ground.
If the test lamp is OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. Connect a test lamp between the control circuit terminal 1 and the control circuit terminal 2
5. Vehicle in Service Mode, command the fuel door to LOCK and UNLOCK with a scan tool. The test lamp should briefly illuminate while changing between the commanded states.
If the test lamp is always OFF, test both control circuits for a short to voltage. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. If all circuits test normal, test or replace the M97 fuel door lock actuator.

Refuel Request Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the S117 refuel request switch.
2. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Connect the harness connector at the S117 refuel request switch.
4. Disconnect the X2 harness connector at the K114B hybrid powertrain control module 2.
5. Connect a test lamp between the signal circuit terminal 7 and ground.
6. Observe the function of the test lamp while pressing and releasing the S117 refuel request switch. The test lamp should turn ON each time the switch is pressed.
If the test lamp is always ON, test the signal circuit for a short to voltage. If the circuit tests normal, test or replace the S117 refuel request switch.
If the test lamp is always OFF, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the S117 refuel request switch.
7. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Fuel Door Lock Position Sensor Malfunction

1. Vehicle OFF, disconnect the harness connector at the B208 fuel door status switch assembly.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, test for 4.75 -- 5.25 V between the signal circuit terminal 3 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. If all circuits test normal, test or replace the B208 fuel door status switch assembly.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the M97 fuel door lock actuator
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M97 fuel door lock actuator should perform the LOCK and UNLOCK functions.
If it does not perform as specified, replace the M97 fuel door lock actuator

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Tailgate Release Relay Ground	--	2	2	--
1. Rear Compartment Lid Release Switch Malfunction				
2. Rear Compartment Lid Release Malfunction				

[Circuit/System Description](#)

The BCM supplies a reference voltage to the tailgate handle switch through the rear closure handle switch open signal circuit. When the tailgate handle switch is operated, the rear closure handle switch open signal circuit is grounded through the tailgate handle switch ground circuit and the reference voltage is pulled low within the BCM. In response, the BCM applies battery positive voltage to the tailgate release relay control circuit, which energises the coil side of the tailgate release relay. The switch side of the tailgate release relay then closes, supplying battery positive voltage through the relay and the tailgate latch control circuit activating the latch so that the rear hatch may be manually raised to an open position.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Boot Lid/Liftglass Exterior Unlatch Switch parameter while pressing and releasing the S46 tailgate handle switch. The parameter should change between Active and Inactive.
If the value does not change, refer to Tailgate Handle Switch Inoperative.
2. Command the rear hatch to release with a scan tool, the A23C tailgate latch assembly should release the rear hatch.
If the A23C tailgate latch assembly does not release the rear hatch, refer to Release Actuator Inoperative.

Circuit/System Testing

Tailgate Handle Switch Inoperative

1. Vehicle OFF, disconnect the harness connector at the S46 tailgate handle switch.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Boot Lid/Liftglass Exterior Unlatch Switch parameter is Inactive.

If not the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the K9 BCM.

4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground. Verify the scan tool Boot Lid/Liftglass Exterior Unlatch Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. If all circuits test normal, test or replace the S46 tailgate handle switch.

Release Actuator Inoperative

1. Vehicle OFF, disconnect the KR95A tailgate release relay.
2. Test for less than 10 Ω between the ground circuit terminal 48 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp does not illuminate between the control circuit terminal 45 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage.
4. Verify that a test lamp illuminates between the B+ circuit terminal 46 and ground.
If the test lamp does not illuminate, test the B+ circuit for an open/high resistance.
5. Vehicle OFF, disconnect the harness connector at the A23C tailgate latch assembly.
6. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
7. Connect the harness connector at the A23C tailgate latch assembly.
8. Vehicle in Service Mode, connect a 10 A fused jumper wire between the B+ circuit terminal 46 and the control circuit terminal 45. Verify the A23C tailgate latch assembly is activated.
If the A23C tailgate latch assembly does not activate and the circuit fuse is good, test the control circuit for an open/high resistance. If the circuit tests normal, test or replace the A23C tailgate latch assembly.
If the A23C tailgate latch assembly does not activate and the circuit fuse is open, test the control circuit for a short to ground. If the circuit tests normal, test or replace the A23C tailgate latch assembly.
9. Connect a test lamp between the control circuit terminal 44 and the ground circuit terminal 48.
10. Command the Boot Lid Unlatch to UNLATCH with a scan tool. The test lamp should turn ON during the UNLATCH command.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
11. If all circuits test normal, test or replace the KR95A tailgate release relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR95A tailgate release relay.
2. Test for 60-200 Ω between terminals 85 and 86.
If not within the specified range, replace the KR95A tailgate release relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86

- 30 and 87
- 30 and 85
- 85 and 87

If less than the specified value, replace the KR95A tailgate release relay.

4. Install a 3A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

If greater than the specified range, replace the KR95A tailgate release relay.

Rear Compartment Lid Latch

1. Vehicle OFF, disconnect the harness connector at the A23C tailgate latch assembly.
2. Install a 10 A fused jumper wire between the control terminal 3 and 12 V. Briefly install a jumper wire between the ground terminal 1 and ground. Verify the A23C tailgate latch assembly activates.

If the latch does not perform as specified, replace the A23C tailgate latch assembly.

Tailgate Handle Switch

1. Vehicle OFF, disconnect the harness connector at the S46 tailgate handle switch.
2. Test for infinite resistance between the signal terminal 1 and the ground terminal 2 with the switch in the open position.
If not the specified value, replace the S46 tailgate handle switch.
3. Test for less than 2 Ω between the signal terminal 1 and the ground terminal 2 with the switch in the closed position.

If greater than the specified range, replace the S46 tailgate handle switch.

Passenger Door Latch Ground	--	2	--	--
Left Rear Door Latch Ground	--	2	--	--
Right Rear Door Latch Ground	--	2	--	--
1. Ajar Indicator Always Illuminated				
2. Ajar Indicator Inoperative				

[Circuit/System Description](#)

The driver window motor, the passenger window switch, left rear and right rear window switch each supplies a 12V signal to each of their respective door ajar switches. The door ajar switches are integral to each door latch assembly. When a door is opened, the normally open door ajar switch closes. With the door ajar switch closed, ground is provided to the door ajar switch signal circuit. The window motor and/or window switch interprets this and communicates door status via serial data to the BCM.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Driver Door Ajar Switch parameter while opening and closing the driver door. The parameter should change between Active and Inactive.
If the value does not change, refer to Driver Door Ajar Switch Malfunction.
2. Observe the scan tool Passenger Door Ajar Switch parameter while opening and closing the front passenger door. The parameter should change between Active and Inactive.
If the value does not change, refer to Passenger Door Ajar Switch Malfunction.
3. Observe the scan tool Left Rear Door Ajar Switch and Right Rear Door Ajar Switch parameters while opening and closing the left and right rear doors. The value should change between Inactive and Active.
If a value does not change, refer to Rear Door Ajar Switch Malfunction.

Circuit/System Testing

Driver Door Ajar Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the A23D door latch assembly - driver.

2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Driver Door Ajar Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 6 for a short to ground. If the circuit tests normal, replace the M74D window motor - driver.
4. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground. Verify the scan tool Driver Door Ajar Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the M74D window motor - driver.
5. If all circuits test normal, test or replace the A23D door latch assembly - driver.

Passenger Door Ajar Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the A23P door latch assembly - passenger.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Passenger Door Ajar Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the S79P Window Switch - Passenger.
4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground. Verify the scan tool Passenger Door Ajar Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the S79P Window Switch - Passenger.
5. If all circuits test normal, test or replace the A23P door latch assembly - passenger.

Rear Door Ajar Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the appropriate rear A23 door latch.
2. Test for less than 10 Ω between the ground circuit terminal listed below and ground:
 - Left rear door latch ground circuit terminal 8
 - Right rear door latch ground circuit terminal 3If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the appropriate scan tool Rear Door Ajar Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal listed below for a short to ground. If the circuit tests normal, replace the rear S79 window switch.
 - Left rear door ajar switch signal circuit terminal 6
 - Right rear door ajar switch signal circuit terminal 1
4. Install a 3 A fused jumper wire between the signal circuit terminal listed below and ground. Verify the scan tool Rear Door Ajar Switch parameter is Active.
 - Left rear door ajar switch signal circuit terminal 6
 - Right rear door ajar switch signal circuit terminal 1If not the specified value, test the signal circuit terminal listed below for an open/high resistance. If the circuit tests normal, replace the rear S79 window switch.
5. If all circuits tests normal, test or replace the rear A23 door latch.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the appropriate A23 door latch.
2. With the switch in the open position, test for infinite resistance between the signal and the ground terminals listed below:
 - Driver door latch signal terminal 6 and ground terminal 8
 - Left rear door latch signal terminal 6 and ground terminal 8
 - Right rear door latch signal terminal 1 and ground terminal 3
 - Passenger door latch signal terminal 1 and ground terminal 3If not the specified value, replace the A23 door latch.
3. With the switch in the closed position, test for less than 5 Ω between the signal and the ground terminals listed below:
 - Driver door latch signal terminal 6 and ground terminal 8
 - Left rear door latch signal terminal 6 and ground terminal 8
 - Right rear door latch signal terminal 1 and ground terminal 3
 - Passenger door latch signal terminal 1 and ground terminal 3If greater than the specified range, replace the A23 door latch.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Door Lock Security Relay Control	B3930 02	1	1	--
Left Rear Door Latch Control	B3125 02, B3130 02, B3135 02	1	1	--
Right Rear Door Latch Control	B3125 02, B3130 02, B3135 02	1	1	--
Under-bonnet Fuse Block Ground	--	1	--	--
1. Child Door Lockout Malfunction				

[Circuit/System Description](#)

The child door lockout switch is on the driver door lock/window switch and controls the child locks on the rear doors as well as the rear window switches. When the BCM receives a command from the window lockout switch, it will apply voltage to the door lock security relay coil, this will energise the relay and the contact within the relay will then direct the voltage to lock the left rear and right rear child locks and then isolate them from the normal door lock system to prevent the rear doors from being opened by using the interior rear door handles.

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle in Service Mode, observe the scan tool Window Lockout Switch parameter while pressing the window lockout switch on the S79D window switch-driver. The value should change from Inactive to Active each time the switch is pressed.
If the value is always Inactive or always Active, replace the S79D window switch-driver.
2. Command the doors to LOCK and UNLOCK with the scan tool, all doors should LOCK and UNLOCK while changing between the commanded states.
If either rear door does not LOCK or UNLOCK, refer to [Power Door Locks Malfunction](#) .
3. With all the doors locked, command the child security lockout by pressing the window lockout switch on the S79D window switch-driver, the interior rear door handles should not open the doors when used.
If both interior rear door handles continue to function, refer to Child Security Door Lockout Inoperative.
If the left or right interior rear door handles continue to function, refer to Child Security Door Lockout Malfunction.

[Circuit/System Testing](#)

Child Security Door Lockout Inoperative

1. Vehicle OFF, disconnect the X3 harness connector at the X50A fuse block-under-bonnet.
2. Test for less than 10 Ω between the ground circuit terminal 48 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle OFF, connect the X3 harness connector and disconnect the X1 harness connector at the X50A fuse block-under-bonnet
4. Connect a test lamp between the control circuit terminal 36 and ground.
5. Vehicle in Service Mode, command the child security lockout by pressing the window lockout switch on the S79D window switch-driver. The test lamp should turn ON

and OFF when changing between the commanded states.

If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.

If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM.

6. If all circuits test normal, replace the X50A fuse block-under-bonnet.

Child Security Door Lockout Malfunction

1. Vehicle OFF, disconnect the harness connector at the appropriate A23 door latch assembly-rear.

2. Test for less than 10 Ω between the ground circuit terminal listed below and ground:

- A23LR door latch assembly-left rear terminal 8
- A23RR door latch assembly-right rear terminal 3

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Vehicle in Service Mode, test for greater than 10V between the signal circuit terminal listed below and ground:

- A23LR door latch assembly-left rear terminal 9
- A23RR door latch assembly-right rear terminal 4

If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.

4. Connect a test lamp between the control circuit terminals listed below:

- A23LR door latch assembly-left rear terminal 7 and terminal 4
- A23RR door latch assembly-right rear terminal 2 and terminal 9

5. Command the child security lockout by pressing the window lockout switch on the S79D window switch-driver, the test lamp should briefly illuminate while changing between the commanded states.

If the test lamp is always OFF, test either control circuit for an open/high resistance between the connector and the circuit splice.

6. If all circuits test normal, test or replace the A23 door latch assembly-rear.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate A23 door latch assembly-rear.

2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground.

Reverse the jumper wires at least two times, the A23 door latch assembly-rear should perform the LOCK and UNLOCK functions.

If it does not perform as specified, replace the A23 door latch assembly-rear.

[Circuit/System Description](#)

The body control module (BCM) powers the reversible door latch assemblies by providing battery positive voltage and ground to the appropriate lock and unlock control circuits of the door latch assemblies. The lock and unlock control circuits of the rear doors and passenger door latch assemblies are all connected together. When the door latch assemblies are not active, all actuator lock and unlock control circuits are at ground potential within the BCM. Transitioning of the lock actuators to the lock or unlocked position depends upon which control circuits receive voltage and which control circuits receive ground.

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool BCM Central Door Lock Switch on Console parameter. The reading should be Inactive and change to Lock and Unlock when pushing the appropriate switch on the A20 radio/HVAC controls.
If the value does not change between commanded states, refer to Central Door Lock Switch Malfunction.
2. Command the doors to LOCK and UNLOCK with a scan tool, all doors should LOCK and UNLOCK while changing between the commanded states.
If a door does not LOCK or UNLOCK, refer to Door Lock Malfunction.
If all doors do not LOCK or UNLOCK, refer to All Door Locks inoperative.

Circuit/System Testing

Central Door Lock Switch Malfunction

1. Vehicle OFF, disconnect the harness connector at the A20 radio/HVAC controls.
2. Test for less than 10 Ω between the ground circuit terminal 17 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Central Door Lock Switch on Centre Console parameter is Inactive.
If the value is Lock , test the signal circuit terminal 12 for a short to ground. If the circuit tests normal, replace the K9 BCM.
If the value is Unlock , test the signal circuit terminal 13 for a short to ground. If the circuit tests normal, replace the K9 BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 12 and ground. Verify the scan tool Central Door Lock Switch on Centre Console parameter is Lock.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. Install a 3 A fused jumper wire between the signal circuit terminal 13 and ground. Verify the scan tool Central Door Lock Switch on Centre Console parameter is Unlock.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
6. If all circuits test normal, replace the A20 radio/HVAC controls.

Door Lock Malfunction

1. Vehicle OFF, disconnect the harness connector at the appropriate A23 door latch assembly.
2. Connect a test lamp between the control circuit terminals listed below:
 - A23D door latch assembly-driver terminal 2 and terminal 3
 - A23P door latch assembly-passenger terminal 7 and terminal 8
 - A23LR door latch assembly-left rear terminal 2 and terminal 3
 - A23RR door latch assembly-right rear terminal 7 and terminal 8
3. Vehicle in Service Mode, command the door to LOCK and UNLOCK by using the central door lock switch. The test lamp should briefly illuminate when commanding the LOCK and UNLOCK states.
If the test lamp is always OFF for either the LOCK or UNLOCK command, test the control circuit for an open/high resistance between the connector and the circuit splice.
4. If all circuits test normal, test or replace the A23 door latch assembly.

All Door Locks inoperative

1. Vehicle OFF, disconnect the X2 harness connector at the K9 BCM.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance
3. Vehicle OFF, disconnect the X6 harness connector at the K9 BCM.
4. Disconnect the X1 harness connector at the X50A fuse block-under-bonnet.
5. Test for infinite resistance between the control circuit listed below and ground:
 - Connector X1, terminal 11 at the X50A fuse block-under-bonnet
 - Connector X1, terminal 12 at the X50A fuse block-under-bonnet
 - Connector X6 terminal 1 at the K9 BCM

- Connector X6 terminal 4 at the K9 BCM

If not the specified value, test the appropriate control circuit for a short to ground. If the circuit tests normal, test or replace the appropriate A23 door latch assembly.

6. Connect the X1 harness connector at the X50A fuse block-under-bonnet.

7. Test for infinite resistance between the control circuit terminal 2 X6 at the K9 BCM and ground.

If not the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the X50A fuse block-under-bonnet.

8. If all circuits test normal, replace the K9 BCM.

Component Testing

Door Catch

1. Vehicle OFF, disconnect the harness connector at the appropriate A23 door latch assembly.

2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground.

Reverse the jumper wires at least two times, the door latch should perform the LOCK and UNLOCK functions.

If it does not perform as specified, replace the A23 door latch assembly.

Central Door Lock Switch

1. Vehicle OFF, disconnect the harness connector at the A20 radio/HVAC controls.

2. Test for infinite resistance between the signal terminal 12 and the ground terminal 17 with the switch in the open position.

If not the specified value, replace the A20 radio/HVAC controls.

3. Test for infinite resistance between the signal terminal 13 and the ground terminal 17 with the switch in the open position.

If not the specified value, replace the S48C multifunction switch 1-instrument panel.

4. Test for less than 2 Ω between the signal terminal 12 and the ground terminal 17 with the switch in the lock position.

If greater than the specified range, replace the A20 radio/HVAC controls.

5. Test for less than 2 Ω between the signal terminal 13 and the ground terminal 17 with the switch in the unlock position.

If greater than the specified range, replace the A20 radio/HVAC controls.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Rear Hatch/Gate Ajar Indicator Malfunction

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Compartment Lid Ajar Switch Signal	1	2	2	--
Tailgate Latch Ground	--	3	--	--
1. Hatch Ajar Message Always Illuminated 2. Hatch Ajar Message Inoperative 3. Hatch Release Inoperative				

Circuit/System Description

The body control module (BCM) supplies a 12V signal to the rear compartment lid ajar switch signal circuit. When the tailgate latch releases the rear hatch, the rear compartment lid ajar switch, which is internal to the tailgate latch, is supplied with ground which causes the rear hatch/gate ajar switch signal circuit to be pulled low. The BCM interprets this and communicates via serial data to the driver information center which will display the Hatch Open message.

Description and Operation

[Tailgate Ajar Indicator Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Vehicle in Service Mode, observe the scan tool Rear Closure Ajar Switch parameter while opening and closing the rear hatch. The parameter should change between Inactive and Active.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the A23C tailgate latch assembly.
2. Vehicle in Service Mode, verify the scan tool Rear Closure Ajar Switch parameter is Inactive.
If not the specified value, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K9 BCM.
3. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground. Verify the scan tool Rear Closure Ajar Switch parameter is Active.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
4. If all circuits test normal, test or replace the A23C tailgate latch assembly.

[Component Testing](#)

Static Test

1. Vehicle OFF, disconnect the harness connector at the A23C tailgate latch assembly.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 1 with the switch in the open position.
If not the specified value, replace the A23C tailgate latch assembly.
3. Test for less than 2 Ω between the signal terminal 2 and the ground terminal 1 with the switch in the closed position.

If greater than the specified range, replace the A23C tailgate latch assembly.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Tailgate Latch Replacement](#)

Fuel Tank Filler Door Lock Actuator Replacement

Callout

Component Name

Preliminary Procedure

1. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
2. Remove the fuel tank filler pipe housing. Refer to [Fuel Tank Filler Pipe Housing Replacement](#) .

Fuel Tank Filler Door Lock Actuator

Procedure

1

1. Disconnect the actuator electrical harness from the fuel tank filler pipe housing.
2. Remove the actuator rod from the actuator shaft, with light pressure, pressing sideways on the rod at the shafts end, and rotating the rod outward from the housing.
3. Release the 3 retainers while using light upward pressure on the actuator.

Front Side Door Inside Handle Cable Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the front side door lock. Refer to Front Side Door Lock Replacement .
	Front Side Door Inside Handle Lock Cable Cover

1	<p>Procedure</p> <ol style="list-style-type: none">1. Release the cable retainer from the inner door panel.2. Open the front side door inside handle cable cover to access and release cable end.
2	<p>Front Side Door Inside Handle Cable</p> <p>Procedure</p> <p>Ensure that the lock cable cover is closed before installing the lock.</p> <p>Tip</p> <p>Inspect the door lock system for proper operation before installing the door trim panel.</p>

Rear Side Door Inside Handle Cable Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the rear side door lock. Refer to Rear Side Door Lock Replacement .
	Rear Side Door Inside Handle Lock Cable Cover

1	<p>Procedure</p> <ol style="list-style-type: none">1. Release the cable retainer from the inner door panel.2. Open the rear side door inside handle cable cover to access and release the cable end
2	<p>Rear Side Door Inside Handle Cable</p> <p>Procedure</p> <p>Ensure that the lock cable cover is closed before installing the lock.</p> <p>Tip</p> <p>Inspect the door lock system for proper operation before installing the door trim panel.</p>

Front Side Door Lock Cylinder Replacement

Callout	Component Name
1	<p>Front Side Door Lock Cylinder Screw Cover</p> <p>Procedure</p> <p>1. Do Not remove the inside door trim.</p>

2. Use a flat-bladed tool to remove the cylinder opening access cover.

Front Side Door Lock Cylinder Screw

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

2

1. Do Not remove the lock cylinder screw completely from the housing. Unscrew the screw to a hard stop, remove the lock cylinder.
2. It is not necessary to remove the outside door handle or housing to replace the lock cylinder.

Tighten

5 N·m (44 lb in)

Front Side Door Lock Cylinder

Procedure

3

1. Pull the lock cylinder from the housing.
2. Remove the lock cylinder bezel from the cylinder.
3. Use a suitable tool to release the lock cylinder bezel.

Note: Pull the outside handle to release the door lock cylinder.

Opening the Tailgate Without Electrical Power

Callout	Component Name
1	Tailgate Access Cover
2	Tailgate Latch Procedure

1. Insert a flat-bladed tool into the hole, rotate slightly counterclockwise.
2. Push open the tailgate from the inside.
3. Install the access cover.

Front Side Door Outside Handle Replacement - Base

[Removal Procedure](#)

1. Remove the cover cap that conceals the screw (1) from the inside edge of the door.

Using a small flat-bladed tool, release the cover cap from the door.

Note: The door outside handle (2) must now be secured in the pulled position.

2. Remove the door handle from the door.
 - 2.1. Pull the door handle (2) outwards and hold.
 - 2.2. Turn the fastener (1) counterclockwise (left) to the mechanical hard stop.

2.3. Remove the bezel with cylinder / cover with blank cylinder (1) from the door.

3. Remove the door handle (1) from the door as follows:
 - 3.1. Slide the door handle rearward releasing it from the door handle bracket.
 - 3.2. Open the door handle fully.
 - 3.3. Remove the door handle from the door.

[Installation Procedure](#)

1. Install the door handle (1) to the door (2) as follows:
 - 1.1. Insert the door handle into the door handle pocket.

1.2. Slide the door handle forward securing it into the door handle bracket.

Note: The door handle will snap back to a flush condition, continue to turn the fastener in a clockwise (right) direction to the mechanical hard stop.

2. Install the bezel with cylinder / cover with blank cylinder (1) in the door.

Hold the bezel or cover flush to the door sheet and turn the cylinder clamp screw (2) to a mechanical hard stop.

3. Install the cover cap that conceals the screw (1) to the inside edge of the door.
4. Ensure that the door lock system operates properly.

Front Side Door Outside Handle Replacement - Pass Key Entry ATH

[Removal Procedure](#)

1. Remove the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .
2. Remove the door water deflector.
3. Move the window to the full up position.
4. Disconnect the electrical connector from the door handle for the pass key entry (ATH).

5. Remove the cover cap that conceals the screw (1) from the inside edge of the door.

Using a small flat-bladed tool, release the cover cap from the door.

Note: The door outside handle (2) must now be secured in the pulled position.

6. Remove the outside door handle from the door.

6.1. Pull the outside door handle (2) outwards and hold.

6.2. Turn the fastener (1) counterclockwise (left) to the mechanical hard stop.

7. Remove the bezel with cylinder / cover with blank cylinder (1) from the door.

8. Remove the door handle (1) from the door as follows:
 - 8.1. Slide the door handle rearward releasing it from the door handle bracket.
 - 8.2. Open the door handle fully.
 - 8.3. Remove the door handle from the door.

[Installation Procedure](#)

1. Install the door handle (1) to the door (2) as follows:
 - 1.1. Insert the door handle into the door handle pocket.

1.2. Slide the door handle forward securing it into the door handle bracket.

Note: The door handle will snap back to a flush condition, continue to turn the fastener in a clockwise (right) direction to the mechanical stop.

2. Install the bezel with cylinder / cover with blank cylinder (1) in the door.

Hold the bezel or cover flush to the door sheet and turn the cylinder clamp screw (2) to a mechanical hard stop.

3. Connect the electrical connector to the door handle for the pass key entry (ATH).

4. Install the cover cap that conceals the screw (1) to the inside edge of the door.
5. Vehicle with passive entry / passive start do the following:
 - 5.1. Close all doors on the vehicle.
 - 5.2. With the key fob, lock all the doors.
 - 5.3. Put key fob in pocket.
 - 5.4. Walk up to every door and open (Note: Each door should open, if door does not open then further diagnostic needs to be completed).
6. Install the door water deflector.
7. Install the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .

Front Side Door Outside Handle Bracket Replacement

Callout

Component Name

Preliminary Procedures

1. Place the window in the full up position.
2. Remove the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .
3. Remove the front outside door handle. Refer to [Front Side Door Outside Handle Replacement : Pass Key Entry ATH](#) → [Base](#) .

1	<p>Front Side Door Outside Handle Bracket Screw</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove arm rest support.2. Remove the water deflector.3. Remove the 2 rear front side door window outer weatherstrip bolts and reposition the weatherstrip. Refer to Front Side Door Window Outer Weatherstrip Replacement .4. Use a suitable to unclip the outside handle rod from the front side door lock.5. If servicing the driver side, unclip the lock cylinder rod from the handle bracket. <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Front Side Door Outside Handle Bracket</p> <p>Procedure</p> <ol style="list-style-type: none">1. In order to prevent outside handle lever pre-load, latch, outside handle, handle bracket and cover/cap shall be fully secured to the door prior to securing integral latch clip to outside handle rod. Integral latch clip shall be in the full up position while securing to outside handle rod. Refer to Front Side Door Outside Handle Rod Adjustment .2. Inspect the door lock system for proper operation before installing the door trim panel.

Rear Side Door Outside Handle Bracket Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the outside door handle. Refer to [Rear Side Door Outside Handle Replacement](#) .
2. Remove the rear side door rear channel. Refer to [Rear Side Door Window Rear Channel Replacement](#) .

1	<p>Rear Side Door Outside Handle Bracket Screw</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Rear Side Door Lock Screws (Qty: 3)</p> <p>Procedure</p> <p>Unclip the outside handle rod from the lock.</p> <p>Tighten 10 N·m (89 lb in)</p>
3	<p>Rear Side Door Outside Handle Bracket</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. In order to prevent outside handle lever pre-load, latch, outside handle, handle bracket and cover/cap shall be fully secured to the door prior to securing integral latch clip to outside handle rod. Integral latch clip shall be in the full up position while securing to outside handle rod. Refer to Rear Side Door Outside Handle Rod Adjustment . 2. Inspect the door lock system for proper operation before installing the door trim panel.

Tailgate Latch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the tailgate lower trim panel. Refer to Tailgate Lower Trim Finish Panel Replacement .	
	Tailgate Latch Screw (Qty: 2)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Tailgate Latch Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connector.2. Adjust the tailgate if needed. Refer to Tailgate Adjustment .

Rear Side Door Outside Handle Replacement

[Removal Procedure](#)

1. Place the window to the full up position.
2. Remove the rear side door trim panel. Refer to [Rear Side Door Trim Replacement](#) .
3. Remove the rear side door trim panel bracket.
4. Remove the water deflector.

5. Remove screw cover (1) from the inside edge of the side door.

Using a suitable tool, release the screw plug from the door.

6. Loosen the door blank cylinder clamp screw (1) to the left, Do Not remove the screw completely from blank cylinder clamp, just until the mechanical hard stop is reached.

7. Remove the blank lock cylinder and cover (1).
8. Retighten the blank lock cylinder clamp screw to the right until the mechanical hard stop is reached.

Note: The follow step doesn't require the door handle rod or lock cylinder rod to be removed from the handle housing.

9. Reach inside the inner door panel, pull downward on the outside handle bracket cam and rod releasing the outside door handle from the handle bracket and cam. Refer to [Rear Side Door Outside Handle Rod Replacement](#) for reference only.

1

10. Pull the outside door handle (1) to the rear of the door releasing it from the pocket.

Installation Procedure

1. Ensure that the blank cylinder gasket is in place when install the cylinder to the handle.
2. Position the door handle to the door.
3. Guide the outside door handle into the outside door handle pocket open.

Note: The follow step doesn't require the door handle rod or lock cylinder rod to be removed from the handle housing.

4. Reach inside the inner door panel, pull downward on the outside handle bracket cam allowing the handle to be install to the housing. Refer to [Rear Side Door Outside Handle Rod Replacement](#) for reference only.
5. Loosen the door blank cylinder clamp screw to the left until the mechanical hard stop is reached.

6. Install the door blank cylinder and cover (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

7. Install door blank cylinder clamp screw to the right until the mechanical hard stop is reached. Tighten to **5 N·m (44 lb in)**.

8. Install the screw plug (1) to the side door.
9. Inspect the door lock system for proper operation before installing the door trim panel.
10. Install the water deflector.
11. Install the rear side door trim panel bracket.
12. Install the rear side door trim panel. Refer to [Rear Side Door Trim Replacement](#) .

Front Side Door Lock Cylinder Opening Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door lock cylinder. Refer to Front Side Door Lock Cylinder Replacement .	
1	Front Side Door Lock Cylinder Opening Cover Retainer Procedure Use a suitable tool to release the front side door lock cylinder cover.
2	Front Side Door Lock Cylinder Opening Cover Tip Inspect the door lock system for proper operation before installing the door trim panel.

Rear Side Door Lock Cylinder Opening Cover Replacement

Callout	Component Name
1	Rear Side Door Lock Cylinder Clamp Access Plug
	Tip Use a suitable tool to remove the cover.
	Rear Side Door Lock Cylinder Clamp Screw

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

2 Do Not remove the cylinder clamp screw completely from the housing, unscrew the screw to a hard stop, releasing the blank cylinder from the housing.

Tip

It is not necessary to remove the outside door handle or housing to replace the cylinder.

Tighten

5 N·m (44 lb in)

3 Rear Side Door Lock Cylinder Cover

Rear Side Door Lock Cylinder

4 **Procedure**

1. Ensure that the lock cylinder gasket is in place when installing the lock cylinder to the handle.
2. Inspect the door lock system for proper operation before installing the door trim panel.

Front Side Door Lock Replacement

Callout

Component Name

Preliminary Procedures

1. Release tension on the window by lowering the window slightly.
2. Reposition the rear half of the front side door window regulator. Refer to [Front Side Door Window Regulator Replacement](#) .
3. Reposition the front side door rear channel of the front side door window outer weatherstrip. Refer to [Front Side Door Window Outer Weatherstrip Replacement](#) .

1	<p>Front Side Door Lock Screws (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Disconnect the door lock electrical connector.</p> <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Front Side Door Lock</p> <p>Procedure</p> <ol style="list-style-type: none">1. Unclip the outside handle rod from the door lock.2. Turn the lock assembly releasing the lock cylinder rod from the lock.3. Transfer components as necessary.4. In order to prevent outside handle lever pre-load, latch, outside handle, handle bracket and cover/cap shall be fully secured to the door prior to securing integral latch clip to outside handle rod. Integral latch clip shall be in the full up position while securing to outside handle rod. Refer to Front Side Door Outside Handle Rod Adjustment . <p>Tip Inspect the door lock system for proper operation before installing the door trim panel.</p>

Rear Side Door Lock Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the rear side door rear channel. Refer to [Rear Side Door Window Rear Channel Replacement](#) .
2. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Rear Side Door Lock Screws (Qty: 3)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

1

1. Disconnect the door lock electrical connector.
2. Unclip the outside handle rod from the lock.

Tighten

10 N·m (89 lb in)

Rear Side Door Lock

Procedure

2

1. Transfer components as necessary.
2. In order to prevent outside handle lever pre-load, latch, outside handle, handle bracket and cover/cap shall be fully secured to the door prior to securing integral latch clip to outside handle rod. Integral latch clip shall be in the full up position while securing to outside handle rod. Refer to [Rear Side Door Outside Handle Rod Adjustment](#) .
3. Inspect the door lock system for proper operation before installing the door trim panel.

Front Side Door Locking Rod Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the front side door lock. Refer to Front Side Door Lock Replacement .</p>	
<p>1</p>	<p>Front Side Door Locking Rod</p> <p>Procedure</p> <p>Unhook the lock rod from the lock assembly.</p> <p>Tip</p> <p>Inspect the door lock system for proper operation before installing the door trim panel.</p>

Front Side Door Lock Cylinder Rod Replacement

Callout	Component Name
Preliminary Procedure Remove the front side door lock. Refer to Front Side Door Lock Replacement .	
	Front Side Door Lock Cylinder Rod

1

Procedure

Unhook the rod from the door lock.

Tip

Inspect the door lock system for proper operation before installing the door trim panel.

Front Side Door Outside Handle Rod Adjustment

Callout

Component Name

Preliminary Procedures

1. Place the window in the full up position.
2. Remove the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .

Front Side Door Outside Handle Rod Clip

Procedure

1. Remove arm rest support.
2. Remove the water deflector.
3. Remove the 2 rear front side door window outer weatherstrip bolts and reposition the weatherstrip. Refer to [Front Side Door Window Outer Weatherstrip Replacement](#) .

Tip

Use a suitable tool to open the clip from the threaded rod connecting the lock to the outside handle.

Front Side Door Outside Handle Rod

Procedure

- 2 In order to prevent outside handle lever pre-load, latch, outside handle, handle bracket and cover/cap shall be fully secured to the door prior to securing integral latch clip to outside handle rod. Integral latch clip shall be in the full up position while securing to outside handle rod.

Tip

Inspect the door lock system for proper operation before installing the door trim panel.

Front Side Door Outside Handle Rod Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door outside handle bracket. Refer to Front Side Door Outside Handle Bracket Replacement .	
	Front Side Door Outside Handle Rod

1

Procedure

Unhook the rod from the handle bracket.

Tip

Inspect the door lock system for proper operation before installing the door trim panel.

Rear Side Door Locking Rod Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door lock. Refer to Rear Side Door Lock Replacement .	
1	<p>Rear Side Door Locking Rod</p> <p>Procedure</p> <p>Unhook the locking rod from the lock.</p> <p>Tip</p> <p>Inspect the door lock system for proper operation before installing the door trim panel.</p>

Rear Side Door Outside Handle Rod Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the rear side door outside handle bracket. Refer to Rear Side Door Outside Handle Bracket Replacement .</p>	
	<p>Rear Side Door Outside Handle Rod</p>

1

Procedure

Unclip the rod from the outside handle bracket.

Tip

Inspect the door lock system for proper operation before installing the door trim panel.

Front Side Door Lock Striker Adjustment

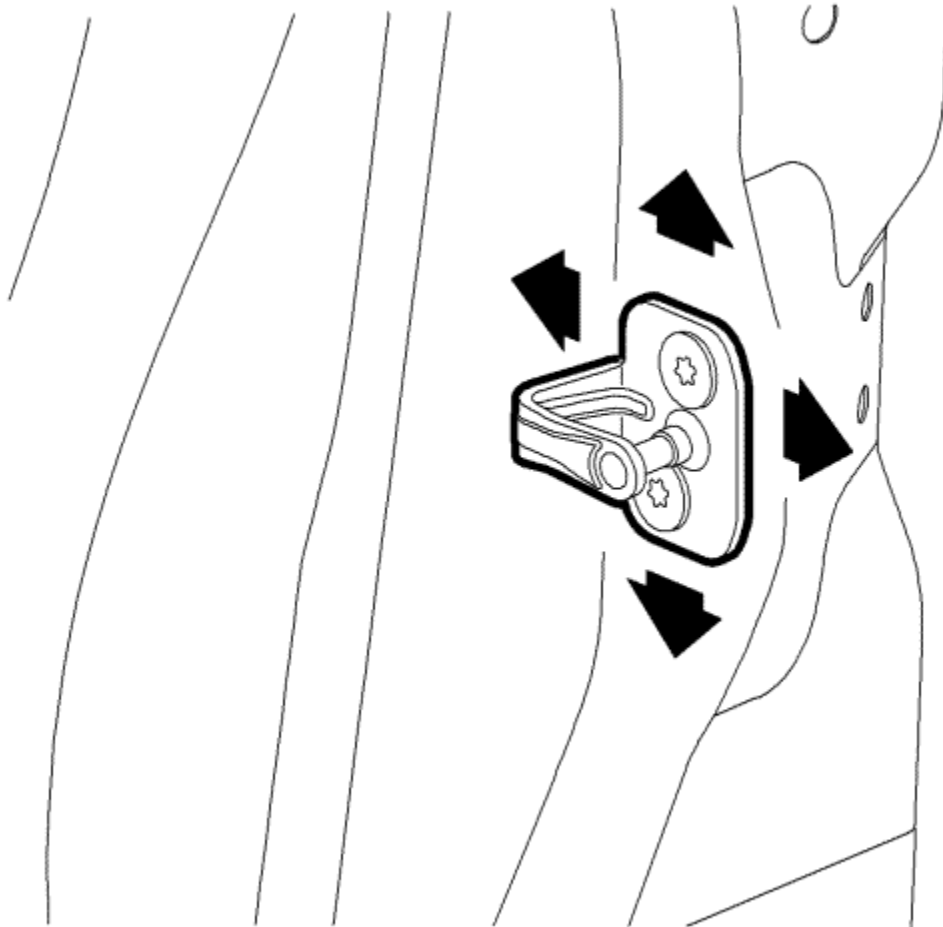

Note: To determine if the striker adjustment is required, proceed as follows.

1. Ensure that the door is properly aligned with the door opening before proceeding with the striker adjustment.
2. Open and close the door on the striker (2). Note if the door drags on the striker causing the door to move upward or downward upon contact with the striker. Also note the closing effort to fully engage the latch.

3. The striker plate weld nuts (1) are welded in place. Using a soft marker, mark around the striker (2) for reference of the original position. Loosen the striker screws just enough to allow the movement of the door striker and shims if equipped.

4. Adjust the door striker up or down and inboard or outboard as required.
5. Move the striker to eliminate drag on the striker and door latch and to achieve proper door position within door opening. Start with up/down position, then position the striker to achieve proper alignment to the door opening. Set the in/out adjustment for proper door seal engagement ensuring that the door closing efforts are correct.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Tighten

22 N·m (16 lb ft).

6. Adjust the striker and add spacers as required.
7. Inspect the door for proper operation.
8. Close the door.

Rear Compartment Lid and Fuel Filler Door Release Switch Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the fuel tank filler door lock actuator. Refer to Fuel Tank Filler Door Lock Actuator Replacement .
	Rear Compartment Lid and Fuel Filler Door Release Switch

1

Procedure

1. Disconnect the release switch electrical harness from the fuel tank filler pipe.
2. Remove the release switch from the housing by lifting up and out.

Opening the Fuel Tank Filler Door when the Door Lock Malfunctions

1. Remove the right rear wheelhouse panel liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .
2. Reach in behind the fuel filler pipe housing and manually slide the actuator rod forward, using light pressure, to override the actuator to release the fuel tank filler door.

Fuel Tank Filler Door Lock Release Switch Replacement

Callout	Component Name
	Preliminary Procedure Remove the driver door trim panel. Refer to Front Side Door Trim Replacement
	Fuel Tank Filler Door Lock Release Switch

1

Procedure

1. Push in on the integral tabs from the inside of the door trim panel. Push outward to release the switch from the door trim panel.
2. Disconnect the electrical connector.

Charger Door Release Switch Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the driver door trim panel. Refer to Front Side Door Trim Replacement
	Charger Door Release Switch

1

Procedure

1. Push in on the integral tabs from the inside of the door trim panel. Push outward to release the switch from the door trim panel.
2. Disconnect the electrical connector.

Tailgate Release Switch Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the tailgate lower trim finish panel. Refer to Tailgate Lower Trim Finish Panel Replacement .
	Tailgate Release Switch Screw

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Open the screw cover caps.</p> <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Tailgate Release Switch</p> <p>Procedure</p> <p>Disconnect the electrical connector.</p>

Charge Port Door Description and Operation

[Charge Port System Components](#)

The charge port system consists of the following components:

- Charge port door release switch
- Charge port door position sensor
- Charge port door motor
- Charge port door relay
- Hybrid powertrain control module 2

[Charge System Overview](#)

This alternative propulsion vehicle has the ability to store electrical energy from an electrical outlet, using a high voltage onboard charger, in a Rechargeable Energy Storage System (RESS). An RESS has a larger capacity than other alternative propulsion vehicle's Energy Storage System (ESS) allowing this vehicle to have fuel economy gains over their ESS equipped counterparts. Fuel economy gains are only realized when the customer uses the plug-in charging function; however, the customer is not required to use this feature for the vehicle to function. It continues to operate as an Extended Range Electric Vehicle if this functionality is not exercised.

The purpose of the plug in charging function is to provide the operator a means to charge their vehicle's RESS. This function is designed to safely transfer energy from the electrical power grid in order to complete a charge process in a time period not to exceed 12 hours.

[Charge Port System Operation](#)

High Voltage Battery Charging is initiated when the operator has completed all of the following steps:

- Transmission Shift Lever Position is in PARK
- Ignition Switch (Key) is in OFF position
- Pressing the charge port door release switch
- Opening the charge port door
- Charging cord has been plugged into a powered wall outlet
- Charging cord has been connected to the vehicle

The hybrid powertrain control module 2 monitors the voltage values of the charge port wake-up signal circuit and the charge port request signal circuit. When the charge port

door release switch is pressed, the switch contact closes and provides B+ voltage to the two signal circuits. The hybrid powertrain control module 2 detects the voltage on the signal circuits and provides a 12 V pulse to the charge port relay, the relay briefly becomes energised which then allows B+ voltage to the charge port door latch which activates and releases the charge port door.

Charge Port Ajar Message

When the ignition is ON, the hybrid powertrain control module 2 supplies a 5V signal to the charge port door position switch through the charge port door sensor signal circuit. The charge port door position switch contains a resistor ladder interface for switch position between two resistors for sensing used by the hybrid powertrain control module 2 to determine if the charge port door is in the open position or the closed position. The hybrid powertrain control module 2 sends a serial data message to the driver information centre in the instrument panel cluster to display the Charge Door Open message.

Door Ajar Indicator Description and Operation

[Door Ajar Indicator System Components](#)

The door ajar indicator system consists of the following components:

- Body control module (BCM)
- Instrument cluster
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch
- Driver window motor
- Passenger window switch
- Left rear window switch
- Right rear window switch

[Driver Door Ajar](#)

The driver window motor supplies a 12 volt signal to the door ajar switch within the door latch, when the driver door is open the door ajar switch closes pulling the 12 volts signal low. When the driver window motor detects the drop in the 12 volt signal circuit, it will then communicate this status to the BCM via local interconnect network (LIN) bus. The BCM communicates with the instrument cluster via serial data message. The instrument panel cluster, upon receipt of this serial data message, will illuminate the driver door ajar indicator and also send a serial data message to the radio to activate the door ajar audible warning when the vehicle speed is greater than 8 km/h (5 MPH).

[All Passenger Doors Ajar](#)

The passenger window motor, the left rear window switch and right rear window switches each supplies a 12 volt signal to their respective door ajar switch within the door latch, when the a door is open the door ajar switch closes pulling the 12 volts signal low. When the passenger window motor, the left rear window switch or right rear window detects the drop in the 12 volt signal circuit, it will then communicate this status to the BCM via local interconnect network (LIN) bus. The BCM communicates with the instrument cluster via serial data message. The instrument panel cluster, upon receipt of this serial data message, will illuminate the appropriate door ajar indicator and also send a serial data message to the radio to activate the door ajar audible warning when the vehicle speed is greater than 8 km/h (5 MPH).

Fuel Fill Door Description and Operation

[Refuelling System Components](#)

The refuelling system consists of the following components:

- Refuel request switch
- Fuel door position sensor
- Fuel door latch
- Hybrid powertrain control module 2

[Refuelling System Overview](#)

To effectively manage evaporative fuel emissions, hybrid vehicles with extended electrical range capability must be equipped with a "pressurised" fuel system that can be sealed from atmosphere when the internal combustion engine is not operating.

When the fuel system is sealed, the internal pressure will vary with changes in temperature, such as the natural variation in ambient temperature that occurs throughout the day. To maintain evaporative emissions compliance, vehicle refuelling can only be permitted once the fuel system has been adequately vented to atmosphere through the carbon canister. The Refuelling Management feature described in this document provides the necessary means to regulate customer access to the fuel cap and manage venting of the fuel system in order to facilitate vehicle refuelling without compromising evaporative emissions compliance.

[Refuelling System Operation](#)

When the refuel request switch is pressed, a 5 V signal is sent to the hybrid powertrain control module 2 which will then command the fuel system to vent and will send a serial data message to the driver information centre to display the Wait To Refuel message.

After the system has been vented, the hybrid powertrain control module 2 will send a command to unlock the fuel filler door and will send a serial data message to the driver information centre to display the Ready To Refuel message. After the vehicle has been refueled, the hybrid powertrain control module 2 will send a serial data message to the driver information centre to display the Close Fuel Door message until the fuel filler door is closed. The hybrid powertrain control module 2 will then command the fuel filler door to lock 5 seconds after the fuel filler door is closed or the vehicle speed exceeds 40 km/h (25 mph).

Tailgate Ajar Indicator Description and Operation

[Hatch Open Indicator](#)

The body control module (BCM) monitors the voltage level of the rear hatch ajar signal circuit which is normally at the system voltage when the hatch is closed. When the hatch is ajar or open, a switch within the rear hatch latch closes providing a path to ground for the hatch ajar signal circuit. The voltage within the signal circuit will then drop to 0 volts, the BCM will then detect the voltage drop and will send a serial data message to the instrument panel cluster (IPC). The IPC will then display an icon of the vehicle with the hatch open.

Power Door Locks Description and Operation

[Door Lock System Components](#)

The power door lock system consists of the following components:

- Central door lock switch (located with the radio/HVAC controls)
- Rear window/door lockout switch (located on the driver window switch)
- Body control module (BCM)
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch
- Door lock security PCB relay

[Door Lock and Unlock Operation](#)

When a door lock switch is activated in the lock or unlock position the BCM will receive a ground signal on either the door lock switch lock or unlock signal circuits.

The BCM, upon receipt of a lock switch lock or unlock signal, will supply battery voltage to the door lock actuator lock or unlock control circuits. Since the opposite side of the lock actuator is connected to ground through the other lock actuator control circuit, the doors will then lock or unlock as commanded.

The following three circuits are used to operate the lock:

- Driver door unlock
- Passenger door unlock
- All door lock

The driver door lock actuator is isolated so it can be unlocked by itself using the keyless entry transmitter.

[Child Door Lockout Operation](#)

The operator has the option to disable the interior rear door handles to prevent the unauthorised opening of the rear door doors while still retaining normal driver and passenger door handle functions. The driver door window switch has a lockout switch that will disable the interior rear door handles and the rear window switches. The rear

door latches contain switches that are open when the rear doors are unlocked and closed when the rear doors are locked. The operator will first lock all the doors by pressing the central door lock switch. When the lockout switch is pressed, the BCM will confirm that the rear doors have been locked, if the rear doors are locked the BCM will then command the child lockout latches. The driver and passenger doors will still function normally by pressing the central door lock switch which will unlock the doors but the child lockout latches will continue to disable the interior rear door handles. Pressing the lockout switch again will signal a command to the BCM to unlatch the rear doors, restore normal interior rear door handle functions and restore normal function of the rear window switches. If the lockout indicator flashes while trying to lockout the rear door handles means one or both rear door latches are not locked and the child lockout system will not function.

Rear Hatch/Gate Description and Operation

Rear Hatch Release System Components

- Tailgate Latch
- Tailgate Release Switch
- Tailgate Relay
- Body Control Module
- 15 A Fuse

Rear Hatch Release Operation

The rear hatch can be released by placing the transaxle in park, unlocking all the doors and then pressing the touchpad located at the rear of the vehicle above the number plate.

Pressing the touchpad closes a contact providing a ground for the rear closure handle switch open signal circuit. The body control module (BCM) will detect the voltage drop and will pulse 12 V to one side of the relay coil and provide a ground for the other side of the relay coil, this will briefly energise the tailgate relay closing the switch contacts and provide B+ voltage to the tailgate latch. When the doors are locked, the BCM will disable the rear hatch release system by ignoring the tailgate release switch input command and not providing 12 V for the tailgate relay.

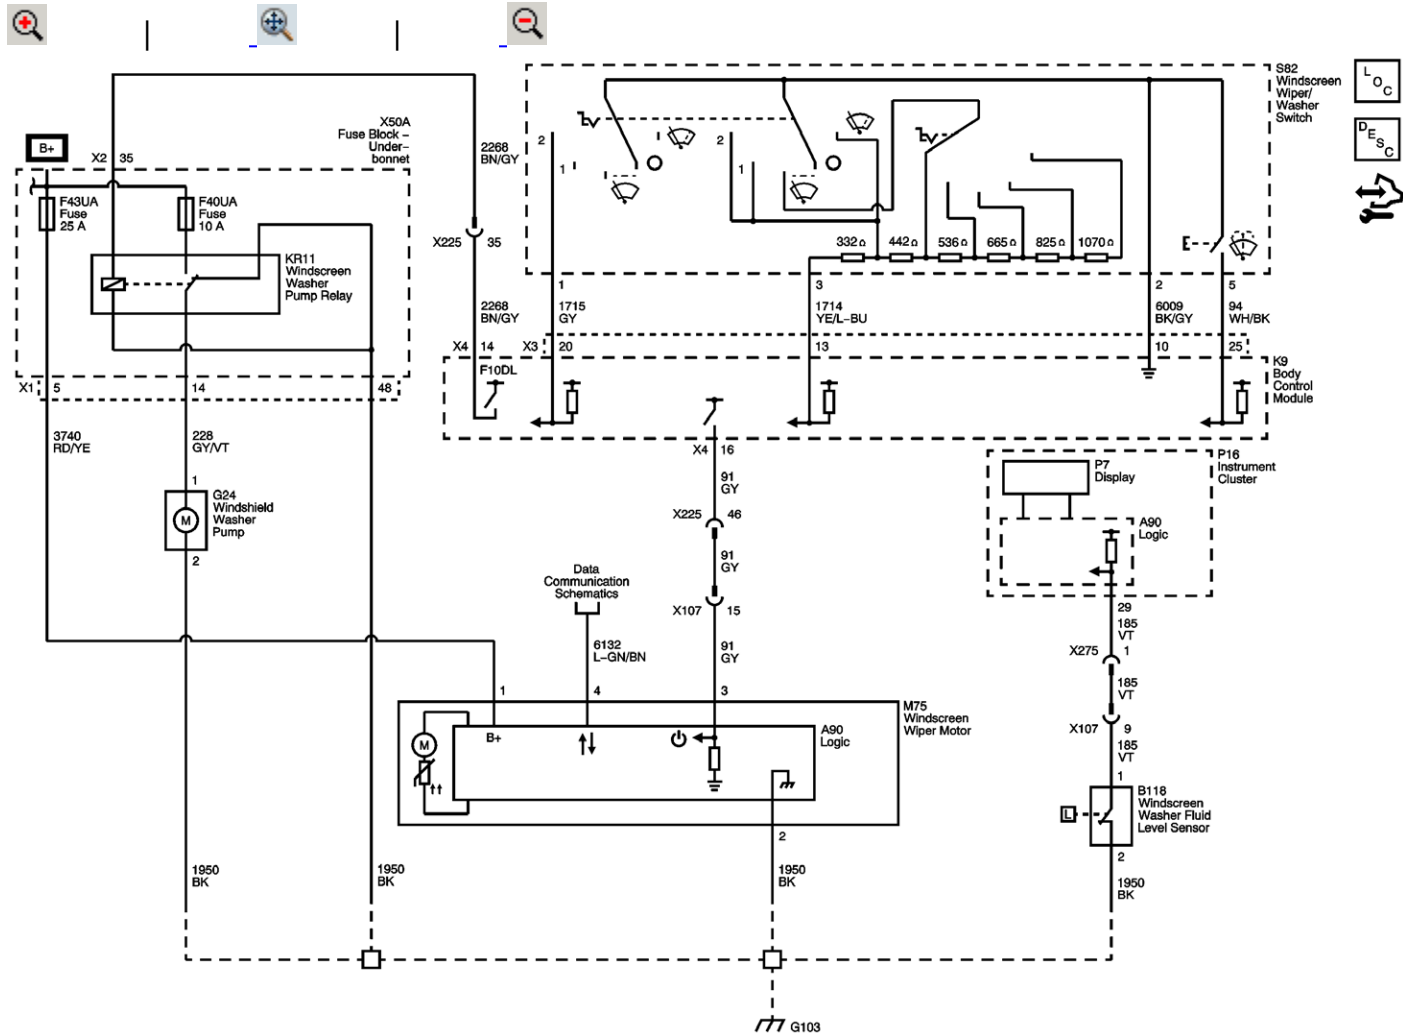

Fastener Tightening Specifications

Application	Specification

DTC B371A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B371A 39: Windscreen Wiper Motor Internal Malfunction

[Circuit/System Description](#)

B+ voltage and ground are supplied to the windscreen wiper motor. Whenever the ignition is ON or in accessory position, the body control module (BCM) sends the wiper/washer switch status through the LIN communication bus. If a fault occurs at any time in the windscreen wiper motor, the BCM will set the DTC.

[Conditions for Running the DTC](#)

The module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

[Conditions for Setting the DTC](#)

The BCM receives an invalid signal from the windscreen wiper motor.

[Action Taken When the DTC Sets](#)

The module refuses all additional inputs.

[Conditions for Clearing the DTC](#)

A current DTC clears when the diagnostic runs and passes.

[Diagnostic Aids](#)

Diagnose any communication DTCs (U-Codes) before attempting any diagnosis.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3873 01: Front Washer Relay Circuit Short to Battery

DTC B3873 02: Front Washer Relay Circuit Short to Ground

DTC B3873 04: Front Washer Relay Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Windscreen Washer Switch Signal	2	1	1	--
Windscreen Washer Fluid Pump Control	1	1	2	--
Windscreen Washer Relay Control	B3873 02	1	2	-
Windscreen Washer Fluid Pump Ground	--	1	1	--
1. Front Washer Inoperative				
2. Front Washer Always ON				

[Circuit/System Description](#)

The body control module (BCM) controls the windscreen washer fluid pump based on an input from the indicator/multifunction switch. The BCM monitors the washer switch through the windscreen washer switch signal circuit. When the wash switch is closed, ground is supplied to the front washer switch signal circuit. When this is the case, the BCM will command the windscreen washer fluid pump and the low speed wipers on.

Conditions for Running the DTC

- Vehicle in Service Mode
- The system voltage is between 9–16 V.

Conditions for Setting the DTC

- A short to ground or an open/high resistance is detected in the windscreen washer relay control circuit.
- A short to voltage is detected in the windscreen washer relay control circuit.

Action Taken When the DTC Sets

Washer operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Circuit/System Testing

1. Vehicle OFF, Retained Accessory Power OFF, disconnect the harness connector X4 at the K9 Body Control Module.
2. Test for 120-160 Ω between control terminal 14 and ground.
If less than the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the X50A under-bonnet fuse block.
If greater than the specified value, test the control circuit for an open/high resistance or a short to voltage. If the circuit tests normal, replace the X50A under-bonnet fuse block.
3. If all circuits test normal, test or replace the K9 Body Control Module.

Symptoms - Wiper/Washer Systems

Note: The following steps must be completed before using the symptom tables:

1. Perform [Diagnostic System Check - Vehicle](#) , in order to verify that all of the following conditions are true:
 - No DTCs are set.
 - The control modules can communicate via the serial data link.
2. Refer to [Wiper/Washer System Description and Operation](#) in order to familiarise yourself with the system functions.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the windscreen wiper/washer system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Inspect the washer fluid reservoir for the proper fluid level.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Windscreen Wiper System Malfunction](#)
- [Washer Malfunction](#)

Windscreen Wiper System Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

1. Wiper Motor Inoperative				
2. Wipers Always ON				

[Circuit/System Description](#)

The Body Control Module (BCM) controls the wiper motor based on input from the windscreen wiper/washer switch. The BCM monitors the wiper/washer switch through two separate signal circuits and a ground circuit. The windscreen wiper switch high signal circuit is used to determine high speed wiper operation, the windscreen wiper switch low signal is used to determine low speed, intermittent, and mist operation through the use of a resistor ladder, and the windscreen washer switch signal circuit is used to determine washer operation. The BCM controls the windscreen wiper motor low, high, and intermittent operations through a serial data Local Interconnect Network 1 (LIN) Bus control circuit.

Circuit/System Verification

1. Vehicle in Service Mode, S82 Windscreen Wiper/Washer Switch in the OFF position, verify the scan tool Windscreen Washer Switch parameter is INACTIVE.
If not the specified value, refer to [Washer Malfunction](#) .
2. S82 Windscreen Wiper/Washer Switch in the OFF position, verify the scan tool Windscreen Wiper Switch parameter is OFF.
If not the specified value, refer to Windscreen Wiper/Washer Switch Circuit Test.
3. S82 Windscreen Wiper/Washer Switch in the OFF position, verify the scan tool Windscreen Wiper High Speed Switch parameter is INACTIVE.
If not the specified value, refer to Windscreen Wiper/Washer Switch Circuit Test.
4. S82 Windscreen Wiper/Washer Switch in the LOW position, verify the scan tool Windscreen Wiper Switch parameter is LOW.
If not the specified value, refer to Windscreen Wiper/Washer Switch Circuit Test.
5. S82 Windscreen Wiper/Washer Switch in the HIGH position, verify the scan tool Windscreen Wiper High Speed Switch parameter is ACTIVE.
If not the specified value, refer to Windscreen Wiper/Washer Switch Circuit Test.
6. S82 Windscreen Wiper/Washer Switch in the INT position, cycling the delay adjustment switch from long delay to short delay, observe the scan tool Windscreen Wiper Switch parameter while cycling the delay adjustment switch from long delay to short delay. The parameter should cycle between Delay 1 through Delay 5 as each delay position is selected.
If not the specified value, refer to Windscreen Wiper/Washer Switch Circuit Test.

Circuit/System Testing

Windscreen Wiper/Washer Switch Circuit Test

1. Vehicle OFF, Retained Accessory Power OFF, disconnect the X1 harness connector at the S82 Windscreen Wiper/Washer Switch.
2. Verify a test lamp illuminates between terminal 2 and B+.
If the test lamp does not illuminate, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K9 BCM.
3. Vehicle in Service Mode, test for 9-11 V between the signal circuit terminal 3 and ground.
If less than the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
If greater than the specified value, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM.
4. Test for B+ between the signal circuit terminal 1 and ground.
If less than the specified value, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. Disconnect the X3 harness connector at the K9 BCM.
6. Test for less than 1 V between terminal 20 and ground.
If greater than the specified value, test for a short to voltage.
7. Vehicle OFF, disconnect the harness connector at the S70R steering wheel control switch - right.
8. Vehicle in Service Mode, test for B+ between the voltage reference circuit terminal 1 and ground.
If less than the specified value, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
9. If all circuits test normal, test or replace the S82 Windscreen Wiper/Washer Switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Windscreen Washer Fluid Pump Ground	--	1	--	--

1. Front Washer Inoperative.
2. Front Washer Always ON.
3. Washer Fluid Level Indicator Inoperative.
4. Washer Fluid Level Indicator Always ON.

[Circuit/System Description](#)

The body control module (BCM) controls the windscreen washer fluid pump based on an input from the wiper/washer switch. The BCM monitors the washer switch through the windscreen washer switch signal circuit. When the wash switch is closed, ground is supplied to the windscreen washer switch signal circuit. When this is the case, the BCM will command the windscreen washer fluid pump and the low speed wipers on.

On some vehicles, warning information (wash fluid low) will be conveyed via the GMLAN to the controls and displays subsystem (responsible for display). This subsystem will provide visual feedback to the customer while in the RUN power mode.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Windscreen Washer Switch parameter while pressing and releasing the S82 Windscreen Wiper/Washer Switch. The parameter should change between INACTIVE and ACTIVE.
If the reading does not change between INACTIVE and ACTIVE, refer to Windscreen Washer Switch Circuit Test.
2. Command the Windscreen Washer Relay Command ON and OFF with a scan tool. The windscreen washers should turn ON and OFF when changing between the commanded states.
If the windscreen washers do not turn ON and OFF, refer to Washer Pump Circuit Test
3. Verify the washer fluid level is above the minimum level.
If not above the minimum level, fill the reservoir and inspect for leaks. If the low washer fluid indicator is still ON, refer to Low Washer Fluid Indicator Test.

Circuit/System Testing

Note: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

Windscreen Washer Switch Circuit Test

1. Vehicle OFF, disconnect the harness connector at the S82 Windscreen Wiper/Washer Switch.
2. Verify that a test lamp illuminates between low reference circuit terminal 2 and B+.
If the test lamp does not illuminate, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K9 BCM.
3. Vehicle in Service Mode, verify the scan tool Windscreen Washer Switch parameter is INACTIVE.
If not the specified value, test the signal circuit terminal 5 for a short to ground. If the circuit tests normal, replace the K9 BCM.
4. Install a 3 A fused jumper wire between the signal circuit terminal 5 and ground. Verify the scan tool Windscreen Washer Switch parameter is ACTIVE.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 BCM.
5. If all circuits test normal, test or replace the S82 windscreen wiper/washer switch.

Washer Pump Circuit Test

1. Vehicle OFF, disconnect the X1 harness connector at the X50A under-bonnet fuse block.
2. Connect a test lamp between the control circuit terminal 35 and ground.
3. Vehicle in Service Mode, command the Windscreen Washer Relay Command ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 BCM.
If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the K9 BCM.
4. Vehicle OFF, connect the X1 harness at the X50A under-bonnet fuse block and disconnect the harness connector at the G24 Windscreen Washer Pump.
5. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
6. Connect a test lamp between control circuit terminal 1 and ground.
7. Vehicle in Service Mode, command the Windscreen Washer Relay Command On and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the X50A underbonnet fuse block.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the X50A underbonnet fuse block.
8. If all circuits test normal, test or replace the G24 Windscreen Washer Pump.

Low Washer Fluid Indicator Malfunction

1. Vehicle OFF, disconnect the harness connector at the B118B windscreen washer fluid level sensor.
2. Test for less than 5 Ω between the ground terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Washer Fluid Level Switch parameter is OFF.
If not the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the P16 instrument cluster.

4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground. Verify the scan tool Washer Fluid Level Switch parameter is ON.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the P16 instrument cluster.
5. If all circuits test normal, test or replace the B118B windscreen washer fluid level sensor.

Component Testing

Washer Switch Test

1. Vehicle OFF, disconnect the harness connector at the S82 Windscreen Wiper/Washer Switch.
2. Test for less than 5 Ω between the switch terminals 2 and 5 while activating the washer function.
If not the specified value, replace the S82 Windscreen Wiper/Washer Switch.

Washer Pump Test

1. Vehicle OFF, disconnect the harness connector at the G24 Windscreen Washer Pump.
2. Install a 10A fused jumper wire between the control terminal 1 and 12V. Install a jumper wire between the ground terminal 2 and ground.
3. Verify the G24 Windscreen Washer Pump is activated.
If the G24 Windscreen Washer Pump does not activate, replace the G24 Windscreen Washer Pump.

Relay Test

1. Vehicle OFF, Retained Accessory Power OFF, disconnect the harness connector X4 at the K9 Body Control Module.
2. Test for 120-160 Ω between the control circuit terminal 14 and ground.
If less than the specified value, test the control circuit for a short to ground.
If greater than the specified value, test the control circuit for an open/high resistance or a short to voltage.
3. If all circuits test normal, test or replace the K9 Body Control Module.

Low Washer Fluid Switch Test

1. Vehicle OFF, remove the B118B Windscreen Washer Fluid Level Switch.
2. B118B Windscreen Washer Fluid Level Switch open, test for infinite resistance between the signal circuit terminal 1 and the ground terminal 2.
If not the specified value, replace the B118B Windscreen Washer Fluid Level Switch.
3. B118B Windscreen Washer Fluid Level Switch closed, test for less than 5 Ω between the signal circuit terminal 1 and the ground terminal 2.
If not the specified range, replace the B118B Windshield Washer Fluid Level Switch.

Repair Instructions

Wiper Blade Element Check

1. Remove the wiper blade from the wiper arm. Refer to [Windscreen Wiper Blade Replacement : Passenger → Driver](#) .
2. Look down the entire length of the blade element.
3. The rubber part of the element (2) that contacts the window must be on the centre line of the blade plus or minus 15 degrees (1).
4. Replace the blade element (2) if the element exceeds 15 degrees from the centre line of the blade, or if the element is cracked or torn. Refer to [Windscreen Wiper Blade Replacement : Passenger → Driver](#)
5. Install the wiper blade onto the windscreen wiper arm.

Windscreen Wiper and Washer Switch Replacement

Callout	Component Name
Preliminary Procedure	Remove the upper trim cover and the lower trim cover from the steering column. Refer to Steering Column Lower Trim Cover Replacement .
	Windscreen Wiper and Washer Switch

1

Procedure

1. Disconnect any electrical connectors as necessary.
2. Release the plastic retaining tabs and remove the windscreen wiper and washer switch from the indicator switch bracket.

Windscreen Washer Nozzle Replacement

Callout

Component Name

Preliminary Procedures

1. Open and suitably support the bonnet assembly.
2. Remove the bonnet insulator. Refer to [Bonnet Insulator Replacement](#) : [Volt](#) → [Ampera](#) .
3. Disconnect the windscreen washer pump hose from the washer nozzle being serviced.

Windscreen Washer Nozzle

1

Procedure

1. Pinch the windscreen washer nozzle tabs and push the nozzle upward and outward from the bonnet assembly.
2. Remove the windscreen washer nozzle.

Windscreen Washer Pump Hose Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front wheelhouse front liner. Refer to Front Wheelhouse Front Liner Replacement .2. Place a suitable clean container under the windscreen washer container before disconnecting the washer pump hose from the washer pump spout.3. Disengage the washer hose from the front side of the windscreen washer solvent container.	

4. Remove the bonnet insulator. Refer to [Bonnet Insulator Replacement](#) : [Volt](#) → [Ampera](#) .

5. Remove the left side front compartment side sight shield. Refer to [Front Compartment Side Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .

Windscreen Washer Pump Hose

Procedure

1

1. Disconnect two washer hose retainers from the front wheelhouse panel inner front brace.
2. Disconnect the washer hose retainer from the bonnet hinge.
3. Disconnect the two washer hose retainers from the bonnet inner panel.
4. Disconnect the washer hose from both windscreen washer nozzles.
5. Carefully pull and remove the washer hose from the engine compartment.

Windscreen Washer Solvent Container Filler Tube Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Open and suitably support the bonnet assembly.2. Remove the front compartment sight shield. Refer to Front Compartment Front Sight Shield Replacement : Volt → Ampera .	

Windscreen Washer Solvent Container Filler Tube

1

Procedure

Pull upward on the filler tube in order to disconnect the filler tube from the windscreen washer solvent container grommet.

Windscreen Washer Solvent Container Grommet Replacement

Callout	Component Name
<p>Preliminary Procedures</p> <ol style="list-style-type: none"> 1. Open and suitably support the bonnet. 2. Remove the front compartment front sight shield. Refer to Front Compartment Front Sight Shield Replacement : Volt → Ampera . 3. Remove the windscreen washer solvent container filler tube. Refer to Windscreen Washer Solvent Container Filler Tube Replacement . 	
<p>1</p>	<p>Windscreen Washer Solvent Container Grommet</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Carefully squeeze the grommet while using a flat-bladed tool to pry upward under the edge of the grommet. 2. When installing a new grommet, use full strength windscreen washer fluid as a lubricant on the grommet. 3. Place the grommet to the windscreen washer solvent container. 4. Use the palm of the hand to seat the grommet into the windscreen washer solvent container.

Preliminary Procedures

1. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Remove the windscreen washer container filler tube. Refer to [Windscreen Washer Solvent Container Filler Tube Replacement](#) .
3. Disconnect the electrical connectors to the washer pump and level sensor.

1	<p>Windscreen Washer Solvent Container Nut (Qty: 4)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Electronic Control Module Bracket</p> <p>Tip Reposition the electronic control module (ECM) bracket in order to remove the windscreen washer solvent container from the mounting studs. Refer to Engine Control Module Bracket Replacement .</p>
3	<p>Windscreen Washer Pump Hose</p> <p>Procedure</p> <p>Disconnect the windscreen washer pump hose from the washer pump spout and disengage the washer hose from the side of the windscreen washer solvent container.</p>
4	<p>Windscreen Washer Solvent Container</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the container and drain into a suitable clean container. 2. Transfer the windscreen washer pump. 3. Transfer the level sensor. 4. Re-fill the washer container with clean washer solvent once the installation has been completed.

Windscreen Washer Pump Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Place a clean suitable drain pan under the windscreen washer solvent container to contain any lost windscreen washer solvent.

Windscreen Washer Pump

Procedure

- 1
1. Disconnect the electrical connector for the windscreen washer pump.
2. Disconnect the windscreen washer pump hose.
3. Using two flat-bladed tools underneath the washer pump grommet, turn the flat-blades in opposite directions to disengage the washer pump from the washer pump grommet.
4. Remove the washer pump grommet and discard.

Windscreen Washer Solvent Level Sensor Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the left front wheelhouse front liner. Refer to [Front Wheelhouse Front Liner Replacement](#) .
2. Disconnect the electrical connector from the windscreen washer level sensor.
3. Place a clean suitable drain pan under the windscreen washer solvent container to secure the windscreen washer solvent when the level sensor and seal are removed.

Windscreen Washer Solvent Level Sensor

1

Procedure

1. Using two flat-bladed tool, place the ends of the flat-blades under each side of the windscreen washer solvent level sensor seal.
2. Twisting in opposite directions, pry outward, the level sensor from the washer solvent container.
3. Remove and discard the windscreen washer level sensor grommet.

Plenum Upper Panel Insulator Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the front suspension strut housing support. Refer to Front Suspension Strut Housing Brace Replacement .
	Plenum Upper Panel Insulator Cover

1

Procedure

Remove the plenum upper panel insulator cover from the plenum lower flange.

Plenum Drain Tube Replacement

Callout

Component Name

Preliminary Procedure

1. Open and suitably support the bonnet assembly.
2. Remove the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

4. Remove the heater coolant heater. Refer to [Heater Coolant Heater Replacement](#) .

1	<p>Plenum Drain Tube Nut</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Remove the nut from the master wiring electrical harness to the plenum drain tube tab and remove the tab from the auxiliary heater stud.</p>
2	<p>Plenum Drain Tube</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the plenum drain tube from under the dash outer panel insulator.2. Remove the plenum drain tube from the bottom front side of the dash panel outer insulator.3. Pull the plenum drain tube upward and outward from the engine compartment side.

Air Inlet Grille Panel Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the windscreen wiper arms. Refer to Windscreen Wiper Arm Replacement : Passenger → Driver .2. Remove the air inlet grille panel extensions. Refer to Air Inlet Grille Panel Extension Replacement .3. Remove the bonnet rear weatherstrip. Refer to Bonnet Rear Weatherstrip Replacement : Volt → Ampera .	

1	Air Inlet Grille Panel Push-In Retainer (Qty: 6)
2	<p>Air Inlet Grille Panel</p> <p>Procedure</p> <ol style="list-style-type: none">1. Lift the forward edge grille panel high enough to clear the windscreen wiper transmission pivot shafts.2. Use an appropriate plastic flat-bladed tool to release and remove the panel perpendicular from the lower retainers below the windscreen.3. Remove the grille panel forward and out from the vehicle.

Air Inlet Grille Panel Extension Replacement

Callout	Component Name
1	<p data-bbox="290 1052 728 1084">Air Inlet Grille Panel Extension</p> <p data-bbox="290 1133 451 1166">Procedure</p> <p data-bbox="290 1214 1911 1247">Grasp the extension and disengage the tabs from the rear edge of the bumper and rear edge of the air inlet panel.</p>

Windscreen Wiper Arm Replacement - Driver

Callout	Component Name
Preliminary Procedure	
Open and suitably support the bonnet assembly.	
1	Windscreen Wiper Arm Finish Cap

	Tip Use a small flat-bladed tool in order to remove the cap from the wiper arm.
2	Windscreen Wiper Arm Nut Caution: Refer to Fastener Caution in the Preface section. Tighten 42 N·m (31 lb ft)
3	Windscreen Wiper Arm Assembly Procedure <ol style="list-style-type: none">1. When the wiper arm is removed from the pivot shaft, clean the pivot shaft knurls with a soft wire brush.2. Grasp the rear of the wiper arm, place the arm over the pivot shaft.3. Align the tip of the wiper blade to the small transparent circle in the lower centre windscreen blackout area.4. Hold the wiper arm in that position.5. Install the windscreen wiper arm nut.6. Hold the windscreen wiper arm in position and torque the wiper arm nut as specified above.7. Cycle the wiper arm with a spray of solvent, PARK the wiper arms and re-check the alignment of the wiper blade tip to the windscreen transparent circle.

Windscreen Wiper Arm Replacement - Passenger

Callout	Component Name
Preliminary Procedure	
Open and suitably support the bonnet assembly.	
1	Windscreen Wiper Arm Finish Cap

	Tip Use a small flat-bladed tool in order to remove the cap from the wiper arm.
2	Windscreen Wiper Arm Nut Caution: Refer to Fastener Caution in the Preface section. Tighten 42 N·m (31 lb ft)
3	Windscreen Wiper Arm Assembly Procedure <ol style="list-style-type: none">1. When the wiper arm is removed from the pivot shaft, clean the pivot shaft knurls with a soft wire brush.2. Grasp the rear of the wiper arm, place the arm over the pivot shaft.3. Align the tip of the wiper blade to the small transparent circle in the lower centre windscreen blackout area.4. Hold the wiper arm in that position.5. Install the windscreen wiper arm nut.6. Hold the windscreen wiper arm in position and torque the wiper arm nut as specified above.7. Cycle the wiper arm with a spray of solvent, PARK the wiper arms and re-check the alignment of the wiper blade tip to the windscreen transparent circle.

Windscreen Wiper Blade Replacement - Driver

Callout	Component Name
1	<p>Windscreen Wiper Blade</p> <p>Procedure</p> <ol style="list-style-type: none">1. Lift the windscreen wiper arm from the windscreen.2. Depress the small square tab on the topside of the wiper arm.3. Rotate the blade downward and slide the wiper blade from the wiper arm.

Windscreen Wiper Blade Replacement - Passenger

Callout	Component Name
1	<p>Windshield Wiper Blade</p> <p>Procedure</p> <ol style="list-style-type: none">1. Lift the windscreen wiper arm from the windscreen.2. Depress the small square tab on the topside of the wiper arm.3. Rotate the blade downward and slide the wiper blade from the wiper arm.

Windscreen Wiper Motor Replacement

Callout	Component Name
Preliminary Procedure	
Remove the windscreen wiper transmission. Refer to Windscreen Wiper Motor Replacement .	
1	Crank Arm Nut Procedure Separate the windscreen wiper motor crank arm from the wiper motor pivot shaft.
2	Windscreen Wiper Motor Bolt (Qty: 3) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)

Windscreen Wiper Motor Replacement

Callout

Component Name

Preliminary Procedures

1. Open and suitably support the bonnet assembly.
2. Remove the air inlet grille panel. Refer to [Air Inlet Grille Panel Replacement](#) .
3. Remove the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .

1	<p>Windscreen Wiper Module Bolt (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Windscreen Wiper Transmission Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Lift the front edge of the assembly and pull slightly forward in order to disengage the centre support from the backside of the plenum.2. Disconnect the electrical connection from the windscreen wiper motor.3. Remove the transmission assembly from the plenum.4. Remove the windscreen wiper motor. Refer to Windscreen Wiper Motor Replacement .

Windscreen Glass Cleaning

Clean the windscreen with windscreen cleaner. Refer to the electronic parts catalog or use equivalent cleaner. The cleaner should not harm the paint finish or scratch the glass. The glass is clean when the water no longer beads, but sheets across the entire glass surface.

Wiper Blade Element Cleaning

Lift each blade assembly off of the windscreen and clean the element with a cloth saturated with full strength washer solvent. Hold the blade in one hand and wipe the element with the saturated cloth until the black residue disappears. Then rinse the blade assembly elements with clean drinkable water.

Wiper Chatter Repair

Some vehicles may exhibit a condition where the windscreen wipers chatter and/or wipe unevenly. Several items may contribute to this condition. To completely repair this condition, ALL of the items listed should be inspected and corrected as necessary.

1. Inspect the wiper blade element set. Refer to [Wiper Blade Element Check](#)
2. Clean the wiper blade elements. Refer to [Wiper Blade Element Cleaning](#)
3. Clean the windscreen. Refer to [Windscreen Glass Cleaning](#)

Wiper/Washer System Description and Operation

Wiper/Washer System Components

The wiper/washer system consists of the following electrical components:

- Windscreen Washer Pump Relay
- Windscreen Washer Fluid Pump
- Windscreen Wiper Motor
- Window Wiper/Washer Switch
- Windscreen Wiper Motor Fuse
- Windscreen Washer Fluid Pump Fuse
- Body Control Module (BCM)
- Windscreen Washer Fluid Level Switch

Windscreen Wiper System

On Wiper System Smart equipped vehicles, the body control module (BCM) will command front wiper operations via local interconnect network (LIN) serial data communications instead of via ON/OFF and HIGH/LOW Wiper Motor Relay Drive Outputs. In front wiper systems using the Wiper System Smart - Single configuration, the Driver's side and Passenger's side Wiper Arm are connected by a mechanical linkage with a single integrated Front Wiper Motor/Controller operating them. The Front Wiper Motor/Controller contains the necessary electronics, motor, and position sensors to execute front wiper commands from the Body Control Module. These internal electronics are integrated into the cover of the wiper motor gear housing and are not considered a serviceable item. The Front Wiper Motor/Controller wipes the front windscreen by controlling the up and down wiper arm movement by the use of a reversing motor and an internal position sensor. The sensor keeps track of the gear wheel position and when the Controller determines that the wiper arms are at a position to reverse direction, it reverses the motor supply voltage by use of its internal motor control circuitry. The interface between the BCM and the Front Wiper Motor/Controller utilises a Master/Slave configuration using a LIN serial data system for communication. The BCM is designated as the master, and the Front Wiper Motor/Controller is configured as the slave. As the System Master, the BCM uses the LIN communication bus to command Front Wiper operation, and communicate vehicle information to the Wiper Motor controller. The Front Wiper Motor/Controller provides system status and diagnostic information to the BCM for diagnostic reporting and operational purposes. The Body Control Module (BCM) also provides a hardwired redundant output that switches Battery power to the Wiper Motor upon activation of its low assertion High Speed Wiper Switch input. The BCM will do this, even if the module has lost all microprocessor control. The Front Wiper Motor/Controller gives priority to its LIN input over this Redundant Control Input, however, in the event that LIN communications are lost between the BCM and the Front Wiper Motor/Controller this redundant signal is used to command the required fail-soft wiper actions including Power Mode. While under Redundant Input control the Front Wiper Motor/Controller shall provide Continuous Low Speed Wiper operation when the input is Active, and will park the Wipers and go to Low Power Mode when the Redundant Input is Inactive.

While the Front Wiper Switch is either held in the MIST position (momentary contact switch) or is in its LOW position (latching switch), the BCM provides continuous Low Speed Wiper operation by commanding uninterrupted Low Speed Wiper operation by setting the transmitted LIN signal to Low Speed Wipe.

The BCM shall command the Wiper System Smart to perform Intermittent Wipes as follows:

1. Perform one immediate wipe by issuing a LIN signal set to Low Wipes. The Front Wiper Motor/Controller shall initiate Low Speed Wiper Operation and send a LIN signal back set to Low Wiping.
2. Upon the wipers leaving their PARKED position, the Front Wiper Motor/Controller shall send a LIN signal indicating the wipers are no longer in park.
3. Upon receipt of the Wiper out of Park LIN signal, the BCM shall transition the Front Wiper Command LIN signal to Park. While the wiper system smart is in the process of moving the wipers to their parked position, it shall set the value of its Wiper Front Status LIN signal to Parking.
4. The current wipe cycle will be completed and the wipers parked. Upon parking the wipers, the wiper system smart sends the Wiper Front Status LIN signal set to Parked.
5. Upon the transition of the LIN signal from Parking to Parked, the BCM pauses the Wipers in their Park Position for the time duration associated with the current intermittent delay interval switch setting and repeats the process

As called out above, the wipe delay interval is a function of the INTERMITTENT Delay Interval Switch setting. When enabled, the Intermittent with Speed feature affects each of the 5 normal Intermittent Delay Intervals as a function of vehicle Speed. The Delay Intervals shall be biased to a shorter delay period with faster vehicle speeds and to a longer delay period with a slower vehicle speed.

Windscreen Washer System

The BCM controls the windscreen wash operation and windscreen wash activated wiper operation. When the BCM detects the activation of the momentary windscreen wash control switch, it activates its washer pump relay drive output which supplies battery power to the coil of the washer pump relay. This energises the relay, which switches battery power to the pump motor. The BCM will also activate continuous low speed windscreen wipes as described above. Upon deactivation of the windscreen wash control switch, the wiper control module (BCM) shall deactivate the wash motor and will also park the wiper motor as described above unless the drip wipe feature is enabled. On some vehicles the drip wipe feature will be enabled and cause the system to provide additional wiping of the windscreen after the switch has been released and fluid is no longer being applied. The front wash feature may attempt to detect a stuck switch. When enabled, activation of the wash feature shall be limited to 10 seconds.

On vehicles with the Rear Wash feature a single reversing wash motor may be utilised for both the front and rear wash operation. In this system the wash motor is operated in one direction to spray fluid on the front windscreen and then operated in the reverse direction to spray fluid on the rear window. The BCM Controls the reversing wash motor through two High Side Drive outputs. One controls the Front Wiper Motor Relay and one controls the Rear Wiper Relay.

Component	Condition			DTC Symptom Bytes
Wheel Speed Sensor	<ul style="list-style-type: none">• Physical damage• Debris on the wheel speed sensor or the tone ring• Loose or worn wheel bearing• Loose or improperly mounted sensor• Air gap between the wheel speed sensor and the tone ring too large• Water intrusion in the wiring harness			26, 27, 1F

Circuit/System Description

The wheel speed sensor receives ignition voltage from the electronic brake control module and provides a DC square wave signal back to the module. As the wheel spins, the

electronic brake control module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

- Vehicle On or Vehicle in Service Mode
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C0035 04 - C0050 04 or C1232 00 - C1235 00

- An open or a high resistance is detected on a wheel speed sensor ignition circuit.
- A short to ground or an open/high resistance is detected on a wheel speed sensor signal circuit.

C0035 0E - C0050 0E or C1207 00 - C1210 00

- A short to ground is detected on a wheel speed sensor ignition circuit.
- A short to voltage is detected on a wheel speed sensor signal circuit.

C0035 26 - C0050 26, C0035 27 - C0050 27, C0035 1F - C0050 1F, C1221 00 - C1224 00, or C1225 00 - C1228 00

- Incorrectly mounted wheel speed sensor
- Water intrusion in the wiring harness
- Debris on the wheel speed sensor or the tone ring
- Missing tooth or teeth on the wheel speed sensor tone ring
- The tone ring may be demagnetised
- Air gap between the wheel speed sensor and the tone ring too large
- Electrical magnetic interference with the wheel speed sensor harness

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the tone ring.
- Inspect the wheel hub bearing tone ring for rust or corrosion.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

1. Test drive the vehicle in a straight line at a speed greater than 20 km/h (13 mph).

2. Verify all scan tool Wheel Speed Sensor parameters are within 1.6 km/h (1 mph) of each other.

If any parameter is not within 1.6 km/h (1 mph) of each other

Refer to Circuit/System Testing.

If each parameter is within 1.6 km/h (1 mph) of each other

3. All OK.

Circuit/System Testing

Note: If any of the symptom codes 26, 27, or 1F are set, refer to the Diagnostic Fault Information table for possible mechanical faults or conditions.

1. Vehicle OFF, disconnect the harness connector at the appropriate B5 wheel speed sensor, vehicle in service mode.
2. Test for greater than 11 V between the ignition circuit terminal 1 and ground.

If 11 V or less

- 2.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 2.2. Test for infinite resistance between the ignition circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 2.3. Test for less than 2 Ω in the ignition circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 11 V

3. Install a 3 A fused jumper wire at the ignition circuit terminal 1, vehicle in service mode.
4. Verify the scan tool Wheel Speed Sensor parameter changes while rapidly tapping the fused jumper wire to the signal circuit terminal 2.

If the parameter does not change

- 4.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.
- 4.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V
- 4.3. Vehicle OFF.
- 4.4. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 4.5. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K17 electronic brake control module.

If the parameter changes

5. Replace the B5 wheel speed sensor.

DTC Descriptor

DTC C005A 00: Simultaneous Malfunction of Both Wheel Speed Sensors on One Axle Malfunction

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder ring consists of permanent magnets. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. As the wheel spins, the module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

- Vehicle in Service Mode or Vehicle ON
- Ignition voltage is greater than 10 V.
- Two wheel speeds are greater than 5 km/h (3 MPH).

Conditions for Setting the DTC

Simultaneous dropout of both wheel speed sensors on the same axle.

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.

- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	C0110 00	C0110 00	--	C0110 61, C12E8 00, C12E9 00
Ground	--	C0110 00	--	--
Component		Condition		DTCs
Pump Motor		<ul style="list-style-type: none"> • Wear • Damage • Lock 		C0110 61

[Circuit/System Description](#)

The pump motor is a bi-directional motor and is an internal part of the brake pressure modulator. There are three solid state relays in the electronic brake control module that operate the pump. The pump motor runs every few brake stops in order to fill the high pressure accumulator with brake fluid.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- Ignition voltage is greater than 10 V.
- The system enable relay is ON.
- The pump motor has been commanded ON, OFF and ON again.

Conditions for Setting the DTC

- Brake system hydraulic leak.
- Excessive brake pedal applies.
- Improper hydraulic brake system bleed.
- The electronic brake control module detects a short to ground or an open/high resistance on the B+ circuit.
- The electronic brake control module detects an open/high resistance on the ground circuit.
- The electronic brake control module detects the pump motor runs continuously.
- The electronic brake control module detects the pump motor is binding or stalled.
- The brake pressure accumulator is not charging.
- If in the Vehicle in Service Mode for an unspecified length of time, the high pressure accumulator may relieve brake pressure enough to set this DTC.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Check for hydraulic leaks, air in the brake system or incorrect brake bleed.

- DTC C0110 may set if the vehicle has been in the Service Mode for an extended period of time.
- Find out from the customer the conditions under which the DTC was set. This information may help duplicate the concern like the specific number of brake pedal applies in a row prior to the fault set.

Circuit/System Verification

Note: DTC C0110 may set if the vehicle has been in the Service Mode for an extended period of time.

1. Vehicle in Service Mode.
2. Verify that DTC C029C is not set.

If the DTC is set

If the DTC is set, refer [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If the DTC is not set

3. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

4. Refer to Circuit/System Testing.

Circuit/System Testing

Note: DTC C0110 may set if the vehicle has been in the Service Mode for an extended period of time.

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 electronic brake control module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 13 and ground:
If 10 Ω or greater
 - 2.1. Vehicle OFF.
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.***If less than 10 Ω***
 3. Vehicle in Service Mode.
 4. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate and the circuit fuse is good
 - 4.1. Vehicle OFF.
 - 4.2. Test for less than 2 Ω in the B+ circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
If the test lamp does not illuminate and the circuit fuse is open
 - 4.1. Vehicle OFF.
 - 4.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the Q5 brake pressure modulator.***If the test illuminates***
 5. Replace the Q5 brake pressure modulator.

DTC C128B 00: ABS Master Cylinder Pressure Sensor Offset Error

DTC C012A 0F: Brake Master Cylinder Pressure Sensor Signal Erratic

DTC C12B4 00: ABS Master Cylinder Pressure Sensor Performance

Circuit/System Description

The electronic brake control module uses input from the master cylinder pressure sensor for more accurate control during a vehicle stability enhancement system event. The

master cylinder pressure sensor is internal to the brake pressure modulator.

Conditions for Running the DTC

- The brake pedal is not applied.
- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

C012A 00, C128E 00 or C128B 00

- The Electronic Brake Control Module Learn was not successful.
- The master cylinder pressure sensor raw offset is out of specified range.
- An internal electronic or mechanical fault is detected in the master cylinder pressure sensor.

C012A 01 or C12B3 00

A short to battery is detected on the sensor signal circuit.

C012A 06 or C12B2 00

A short to ground or open is detected on the sensor signal circuit.

C012A 11

Improper learn procedure performed.

C012A 0F or C12B4 00

The signal is erratic and changes to fast.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.

- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C012B 0F: High Pressure Accumulator Pressure Sensor Signal Erratic

DTC C12B8 00: ABS High Pressure Accumulator Pressure Sensor Erratic

Circuit/System Description

The high pressure accumulator is attached to the brake pressure modulator and provides up to 18,000 kPa (2,600 psi) for use when applying the brakes. The electronic brake control module uses input from the high pressure accumulator sensor for more accurate control during braking and vehicle stability enhancement system event.

Conditions for Running the DTC

- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

C012B 01 or C12B7 00

A short to battery is detected on the sensor signal circuit.

C012B 06 or C12B6 00

A short to ground or open is detected on signal circuit.

C012B 0F or C12B8 00

The signal is erratic and changes to fast.

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC Descriptors

DTC C012E 00: Hydraulic Brake Boost Pressure Loss Malfunction

DTC C12FE 00: ABS Pump Pressure Loss

DTC C012E 12: Hydraulic Brake Boost Pressure Loss Low Input

Circuit/System Description

The boost pressure valve is internal to the brake pressure modulator. The electronic brake control module monitors the boost pressure. The boost valve controls the amount of hydraulic boost required during braking or a vehicle stability event.

When a boost fault condition is detected, the boost control will continue applying as much pressure as possible until boost pressure is no longer available.

Conditions for Running the DTC

- Ignition voltage is greater than 10 V.
- Brake pedal was applied.

Conditions for Setting the DTC

- A boost valve fault.
- Brake system hydraulic leak.

- Excessive brake pedal applies.
- Improper brake hydraulic system bleed.
- Master cylinder pressure is greater than boost pressure.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

Excessive brake pedal applies (10 or more applies in 30 seconds) may cause the DTC to set.

Circuit/System Verification

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal.
5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V.
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any of the parameters are not within the specified range

Refer to [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If all of the parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:

- Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)
- Brake Pressure Sensor - Less than 100 kPa (15 psi)
- High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all of the parameters are less than the specified range

10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the K17 electronic brake control module

If the DTC does not set

13. All OK.

Repair Instructions

DTC C012F 00: Brake Boost Solenoid Valve Circuit Malfunction

DTC C12A7 00: ABS Brake Boost Solenoid Valve Circuit Performance

DTC C12DC 00: ABS Brake Boost Solenoid Valve Circuit Malfunction

[Circuit/System Description](#)

The brake boost solenoid valve is used to control the amount of brake fluid flow from the high pressure accumulator, which provides brake assist and an improved brake pedal feel. The brake boost solenoid valve is an internal part of the brake pressure modulator.

[Conditions for Running the DTC](#)

- Ignition voltage is greater than 10 V.
- The Vehicle ON or Vehicle in Service Mode.

[Conditions for Setting the DTC](#)

Solenoid feedback current is greater than 25% of commanded current.

[Action Taken When the DTC Sets](#)

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Verification

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal,
5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V.
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any parameter is not within the specified range

Refer to Circuit/System Testing.

If all parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)
 - Brake Pressure Sensor - Less than 100 kPa (15 psi)
 - High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range

10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

K17 electronic brake control module.

If the DTC does not set

13. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)
- [Control Module References](#) for electronic brake control module replacement, programming and setup

DTC C0161

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0161 04: Antilock Braking System Brake Pedal Position Sensor Circuit Open

DTC C0161 0E: Antilock Braking System Brake Pedal Position Sensor Circuit Low Resistance

Circuit/System Description

The body control module monitors the brake pedal position sensor and sends a serial data message to the electronic brake control module when the brake pedal is applied. The electronic brake control module compares the correlation between the brake pedal positions and the brake control brake pedal position sensor to sense the driver's application of the brake pedal.

Conditions for Running the DTC

C0161 04

- Vehicle ON
- The brake pedal is applied.
- The ignition voltage is greater than 10 V.

C0161 0E

- Vehicle ON
- The ignition voltage is greater than 10 V.

- The vehicle speed is greater than 15 km/h (9 mph).
- The accelerator pedal position is greater than 20 percent.

Conditions for Setting the DTC

C0161 04

The brake pedal position sensor signal is not applied while the brake control brake pedal position sensor indicates the brake pedal is applied.

C0161 0E

The brake control brake pedal position sensor signal is showing the brakes applied while the vehicle speed is greater than 15 km/h (9 mph).

Action Taken When the DTC Sets

A driver information centre message and/or a warning indicator will not be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

The DTC C0161 may set if the brake pedal is applied while accelerating.

Circuit/System Verification

Note: Diagnose all other brake lamp DTCs or Symptoms prior to performing this diagnostic procedure.

1. Vehicle ON.
2. Verify that DTC C0277 or C0890 is not set.
If either DTC is set
Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
If either DTC is not set
3. Verify the brake pedal position sensor or the brake pedal is not binding causing residual brake pressure to be detected.
If a condition is found
Repair or replace the applicable component.
If a condition is not found
4. Verify the scan tool electronic brake control module Brake Pedal Position Sensor Signal parameter changes between Applied and Released when applying and releasing the brake pedal.
If the parameter does not change
Refer to [Symptoms - Lighting](#) .
If the parameter changes
5. Replace the K17 electronic brake control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for electronic brake control module replacement, programming and setup

DTC C0186, C0196, or C0287

Diagnostic Instructions

DTC C0196 11: Yaw Rate Signal High Input

DTC C0196 18: Yaw Rate Circuit Signal Low Signal Amplitude

DTC C0287 00: Longitudinal Acceleration Sensor Circuit Malfunction

DTC C0287 09: Longitudinal Acceleration Sensor Circuit Too Fast Transitions

DTC C0287 11: Longitudinal Acceleration Sensor High Input

DTC C0287 18: Longitudinal Acceleration Sensor Circuit Low Signal Amplitude

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	U0125	U0125	--	--
Ground	--	U0125	--	--

[Circuit/System Description](#)

The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, external to the electronic brake control module. The electronic brake control module supplies ignition voltage to the multi-axis acceleration sensor. The multi-axis acceleration sensor communicates with the electronic brake control module via serial data. The electronic brake control module activates the stability control function depending on multi-axis acceleration sensor input.

[Conditions for Running the DTC](#)

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

[Conditions for Setting the DTC](#)

C0186 00, C0186 11, C0186 18, C0196 0A, C0287 00, C0287 09, C0287 11 or C0287 18

The multi-axis acceleration sensor fails an internal self test.

C0196 00, C0196 11, or C0196 18

The yaw sensor is out of specified range.

C0186 09, C0196 09, C0287 00, C0287 09 or C0287 11

The multi-axis acceleration sensor is not mounted properly.

[Action Taken When the DTC Sets](#)

- The stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information centre.

- The electronic brake control module disables the electronic stability system for the duration of the ignition cycle.

Conditions for Clearing the DTC

- In order for the DTC to clear the electronic stability control system must be initialised. Perform the steps listed below to initialise the system:
 1. Vehicle OFF, open the driver door and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
 2. Close the driver door and let the vehicle sit for 3 minutes.
 3. Vehicle ON, leave the vehicle in Park for greater than 10 seconds.
 4. Drive the vehicle in a straight line at a speed greater than 32 km/h (20 mph) for 30 seconds.
- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

DTC C0196 may have been improperly set due to the vehicle being transported on a flat bed truck, car hauler, or by train without it being completely shut down. The electronic stability control system may need to be initialised before the DTC will clear. Refer to Conditions for Clearing the DTC above.

Circuit/System Verification

Note: DTC C0196 may have been improperly set due to the vehicle being transported on a flat bed truck, car hauler, or by train without it being completely shut down. The electronic stability control system may need to be initialised before the DTC will clear. Refer to Conditions for Clearing the DTC.

1. Vehicle in Service Mode.
2. Verify that DTC U0125 is not set.

If the DTC is set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If the DTC is not set

3. Verify the B119 multi-axis acceleration sensor is installed correctly.

If loose or incorrect installation

Correct the installation of the component.

If installed correctly

4. Perform the [Vehicle Yaw Sensor Learn](#) .
5. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Refer to Circuit/System Testing.

If the DTC does not set

6. All OK.

Circuit/System Testing

Note: DTC C0196 may have been improperly set due to the vehicle being transported on a flat bed truck, car hauler, or by train without it being completely shut down. The electronic stability control system may need to be initialised before the DTC will clear. Refer to Conditions for Clearing the DTC.

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B119 multi-axis acceleration sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.

If 10 Ω or greater

2.1. Vehicle OFF.

2.2. Test for less than 2 Ω in the ground circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
If the test lamp does not illuminate
 - 4.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
 - 4.2. Test for infinite resistance between the ignition circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 4.3. Test for less than 2 Ω in the ignition circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K17 electronic brake control module.
If the test lamp illuminates
5. Replace the B119 multi-axis acceleration sensor.
6. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.
If the DTC sets
Replace the K17 electronic brake control module.
If the DTC does not set
7. All OK.

Ground Terminal 13	-	C056D 00, C12DA 00, C12D7 00	--	--
Ground Terminal 38	-	U0129 00, U1833 00	--	--

[Circuit/System Description](#)

Battery positive voltage is supplied to the electronic brake control module at all times through a 40 A fuse located in the under-bonnet fuse block. The electronic brake control module uses this voltage to power the pump motor. The pump motor is an integral part of the brake pressure modulator, while the pump motor relay is integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When the antilock brake system or traction control system operation is required the electronic brake control module activates the pump motor relay and turns the pump motor ON.

Conditions for Running the DTC

C0201 04 or C120D 00

- Ignition voltage is greater than 10 V.
- The solenoid relay is commanded ON.

C0201 0E or C120E 00

- Ignition voltage is greater than 10 V.
- The solenoid relay is commanded OFF.

Conditions for Setting the DTC

C0201 04 or C120D 00

- The electronic brake control module detects an open in the B+ circuit.
- The engine control module detects the traction control power switch circuit is open.

C0201 0E or C120E 00

- The electronic brake control module detects an internal power switch shorted.
- The engine control module detects the traction control power switch circuit is shorted.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information centre.
- The electronic brake control module disables the traction control and the electronic stability control for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Testing

1. Vehicle OFF all vehicle systems OFF, disconnect the harness connector at the K17 electronic brake control module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground:
 - Terminal 13
 - Terminal 38

If 10 Ω or greater

 - 2.1. Vehicle OFF.
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω
3. Vehicle in Service Mode, verify a test lamp illuminates between the B+ circuit terminal 25 and ground.

If the test lamp does not illuminate and the circuit fuse is good

3.1. Vehicle OFF.

3.2. Test for less than 2 Ω in the B+ circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp does not illuminate and the circuit fuse is open

3.3. Vehicle OFF.

3.4. Test for infinite resistance between the B+ circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K17 electronic brake control module.

If the test lamp illuminates

4. Replace the K17 electronic brake control module.

5. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the Q5 brake pressure modulator.

If the DTC does not set

6. All OK.

Repair Instructions

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0242 00: Powertrain Control Module Indicated Traction Control Malfunction

DTC P0856: Engine Control Module (ECM) Traction Control Torque Request Circuit

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the traction control. The electronic brake control module sends a serial data message to the engine control module requesting torque reduction. When certain engine control module DTCs are set, the engine control module will not be able to perform the torque reduction for traction control. A serial data message is sent to the electronic brake control module indicating that traction control is not allowed.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The engine control module diagnoses a condition preventing the engine control portion of the traction control function and sends a serial data message to the electronic brake control module indicating that torque reduction is not allowed.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C0245, C122E

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0245 00: Wheel Speed Sensor Frequency Error

DTC C122E: Tyre Size Mismatch

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. As the wheel spins, the module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

- Vehicle On or Vehicle in Service Mode.
- Ignition voltage is greater than 10 V.
- Vehicle must be moving at a speed less than 14.5 km/h (9 mph).
- No wheel speed sensor faults are set.
- Brake is not applied.
- Vehicle is not cornering.
- No wheel spinning is detected.

Conditions for Setting the DTC

- Missing tooth or teeth on the wheel speed sensor tone ring.
- The wheel speed differences between one wheel and the others is greater than 25 percent.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- A faulty wheel speed sensor will not set this DTC.
- A vehicle using a space saver spare will not set this DTC.

1. Verify that all tyres have the proper air pressure.

If not the proper air pressure

Adjust the air pressure in all tyres to the stated cold air pressure as identified on the tyre placard or specification.

If the proper air pressure

2. Verify that all tyres are of uniform size and matching brand.

If not of uniform size or matching brand

2.1. Replace the mis-sized or non-matching brand tyre.

2.2. Vehicle in Service Mode.

2.3. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC is set, replace the K17 electronic brake control module.

If the DTC does not set

2.4. All OK.

If all tyres are of uniform size or matching brand

3. All OK.

DTC C0252

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0252 00: Vehicle Stability Control Module Sensors Correlation Malfunction

Circuit/System Description

The electronic brake control module controls the vehicle stability control system by monitoring the inputs from the multi-axis acceleration sensor, wheel speed sensors, and the steering wheel angle sensor. All of the sensors need to correlate to the vehicle dynamics during the initial drive off in order to enable vehicle stability control. Normally this takes place within 100 metres (110 yards).

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- Ignition voltage is greater than 10 V.
- The steer wheel angle sensor has been centered.
- The vehicle stability control system has not been initialised.
- The direction (understeer or oversteer) of the yaw rate error has not changed.
- Vehicle is moving.

Conditions for Setting the DTC

- Vehicle is driven in a straight line without centering or initialisation the stability control system.
- The yaw rate has not changed and the lateral acceleration is less than 0.5 g.

Action Taken When the DTC Sets

- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information centre.
- The electronic brake control module disables the electronic stability control for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- The DTC C0252 can be set if the vehicle has been driven above 8 km (5 mph) on a winding road prior to the vehicle stability control system initialisation with the brake pedal applied and while accelerating.
- Driving off with constant steering wheel input or brake switch activation.
- An improperly mounted or loose combination multi-axis acceleration sensor.
- Stuck brake pedal position sensor.
- Improper steering wheel alignment or tyre pull.
- An internal multi-axis acceleration sensor failure.
- An electronic brake control module internal failure.

Ground Terminal 38	-	U0129 00, U1833 00	--	--

[Circuit/System Description](#)

Battery positive voltage is supplied to the electronic brake control module at all times through a 60 A fuse located in the under-bonnet fuse block. The electronic brake control module uses this voltage to power the pump motor. The pump motor is an integral part of the brake pressure modulator, while the pump motor relay is integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When the antilock brake system or traction control system operation is required the electronic brake control module activates the pump motor relay and turns the pump motor ON.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C0256 04 or C12E6 00

- The electronic brake control module detects an open in the B+ circuit.
- The engine control module detects the antilock brake system switch circuit is open.

C0256 0E or C12E7 00

- The electronic brake control module detects an internal power switch shorted.
- The engine control module detects the antilock brake system switch circuit is shorted.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 electronic brake control module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal listed below and ground:
 - Terminal 13
 - Terminal 38

If 10 Ω or greater

- 2.1. Vehicle OFF.
- 2.2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - If the test lamp does not illuminate and the circuit fuse is good***
 - 4.1. Vehicle OFF.
 - 4.2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp does not illuminate and the circuit fuse is open

4.1. Vehicle OFF.

4.2. Test for infinite resistance between the B+ circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the Q5 brake pressure modulator.

If the test lamp illuminates

5. Replace the K17 electronic brake control module.

6. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the Q5 brake pressure modulator.

If the DTC does not set

7. All OK.

Circuit/System Description

The electronic brake control module uses input from the brake control brake pedal position sensor and the brake pedal position sensor to determine when the brake pedal is being applied and with how much force. These inputs are used to determine the driver's braking intent which is used to control the amount of pressure applied to the wheels.

Conditions for Running the DTC

- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

- The electronic brake control module detects an open in the low reference circuit.
- The electronic brake control module detects that the two signal circuits do not match each other.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability control for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal,
5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V.
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

•

If any parameter is not within the specified range

Refer to Circuit/System Testing.

If all parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)
 - Brake Pressure Sensor - Less than 100 kPa (15 psi)
 - High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range

10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

K17 electronic brake control module.

If the DTC does not set

13. All OK.

Circuit/System Testing

1. Perform the brake hydraulic check, refer to [Brake Hydraulic and Assist System Diagnosis](#) .
2. Vehicle OFF, disconnect the harness connector at the B201 brake control brake pedal position sensor.
3. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

If 5 Ω or greater

- 3.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 3.2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K17 electronic brake control module.

If less than 5 Ω

4. Vehicle in Service Mode.
5. Test for 4.8-5.2 V between the 5 V reference circuit terminal 5 and ground.

If less than 4.8 V

5.1. Ignition OFF, disconnect the harness connector at the K17 electronic brake control module.

5.2. Test for infinite resistance between the 5 V reference circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

5.3. Test for less than 2 Ω in the 5 V reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 5.2 V

5.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.

5.2. Test for less than 1 V between the 5 V reference circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K17 electronic brake control module.

If between 4.8-5.2 V

6. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 1 parameter is less than 1 V.

If 1 V or greater

6.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.

6.2. Test for less than 1 V between the signal circuit terminal 4 and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K17 electronic brake control module.

If less than 1 V

7. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 5.

8. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 1 parameter is greater than 4.5 V.

If 4.5 V or less

8.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.

8.2. Test for infinite resistance between the signal circuit terminal 4 and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

8.3. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 4.5 V

9. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 2 parameter is greater than 80%.

If 80% or less

9.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.

9.2. Test for infinite resistance between the signal circuit terminal 6 and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K17 electronic brake control module.

If greater than 80%

10. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the low reference circuit terminal 1.

11. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 2 is less than 10%.

If 10% or greater

11.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.

11.2. Test for less than 1 V between the signal circuit terminal 6 and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V

11.3. Vehicle OFF.

11.4. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K17 electronic brake control module.

If less than 10%

12. Replace the B201 brake control brake pedal position sensor.

DTC Descriptors

DTC C0299 00: Brake Booster Performance Malfunction

DTC C12FF 00: Electronic Brake Control Module Non-Volatile RAM Malfunction

DTC C0299 31: Brake Booster Performance Internal Checksum Error

Circuit/System Description

The electronic brake control module uses inputs from the brake master cylinder piston position sensor and the brake pedal position sensor to determine when the brake pedal is being applied and with how much force. These inputs determine the driver's braking intent which is used to control the amount of pressure applied to the wheels.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

- The brake pedal is sensed as applied for 6 minutes.
- The vehicle speed is greater than 21 km/h (13 mph).

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability control for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Verification

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode.
2. Place the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn.

3. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

4. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

5. Vehicle OFF, without applying the brake pedal, remove the remote keyless entry transmitter and close all of the vehicle doors.
6. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down. Vehicle ON, brakes not applied
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V.
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any parameter is not within the specified range

Refer to [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If all parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)
 - Brake Pressure Sensor - Less than 100 kPa (15 psi)
 - High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range

10. Perform a brake hydraulic check, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If all parameters are less than the specified range

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the K17 electronic brake control module.

If the DTC does not set

13. All OK.

Circuit/System Description

The electronic brake control module uses inputs from the electronic brake control brake pedal position sensor to determine when the brake is applied and how much force is used. The electronic brake control module monitors when the drivers foot is on the brake and locks the offset. The offset is locked when 3 out of the 4 inputs indicate the brake pedal is applied. The 4 inputs are brake pedal travel 1, brake pedal travel 2, master cylinder pressure sensor, and the brake pedal position sensor. These inputs are used to determine the driver's braking intent which is used to the control amount of pressure applied to the wheels.

Conditions for Running the DTC

- Vehicle in Service Mode.
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C029C 00

- The electronic brake control module detects improper offset learn.
- Foot on brake pedal during the electronic brake control module learn procedure.
- The brake pedal position sensor voltage is out of range.

C029C 03, C129A 00, or C129D 00

The electronic brake control module detects voltage below threshold on signal circuit.

C029C 07, C129B 00, or C129E 00

The electronic brake control module detects voltage above threshold on signal circuit.

C029C 1A, C129C 00, or C129F 00

The electronic brake control pedal position sensor learn procedure has not been performed.

C029C 5A, C12B1 00, C12F8 00, or C120C 00

- The electronic brake control module detects the brake pressure is high when the electronic brake control pedal position sensor is reading low travel.
- The electronic brake control module detects the brake pressure is low when the electronic brake control pedal position sensor is reading high travel.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Verification

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal.
5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:

- Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V.
- Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
- Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any parameter is not within the specified range

Refer to Circuit/System Testing.

If all parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)
 - Brake Pressure Sensor - Less than 100 kPa (15 psi)
 - High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range

10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the K17 electronic brake control module.

If the DTC does not set

13. All OK.

Circuit/System Testing

1. Perform the brake hydraulic check, refer to [Brake Hydraulic and Assist System Diagnosis](#) .
2. Vehicle OFF, disconnect the harness connector at the B201 brake control brake pedal position sensor.
3. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

If 5 Ω or greater

- 3.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 3.2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K17 electronic brake control module.

If less than 5 Ω

4. Vehicle in Service Mode.

5. Test for 4.8-5.2 V between the 5 V reference circuit terminal 5 and ground.

If less than 4.8 V

- 5.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 5.2. Test for infinite resistance between the 5 V reference circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 5.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 5.2 V

- 5.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.
- 5.2. Test for less than 1 V between the 5 V reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K17 electronic brake control module.

If between 4.8-5.2 V

6. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 1 parameter is less than 1 V.

If 1 V or greater

- 6.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.
- 6.2. Test for less than 1 V between the signal circuit terminal 4 and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K17 electronic brake control module.

If less than 1 V

7. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 5.
8. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 1 parameter is greater than 4.5 V.

If 4.5 V or less

- 8.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 8.2. Test for infinite resistance between the signal circuit terminal 4 and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 8.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 4.5 V

9. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 2 parameter is greater than 80%.

If 80% or less

- 9.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 9.2. Test for infinite resistance between the signal circuit terminal 6 and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K17 electronic brake control module.

If greater than 80%

10. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the low reference circuit terminal 1.
11. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 2 is less than 10%.

If 10% or greater

11.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.

11.2. Test for less than 1 V between the signal circuit terminal 6 and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V

11.3. Vehicle OFF.

11.4. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K17 electronic brake control module.

If less than 10%

12. Replace the B201 brake control brake pedal position sensor.

Repair Instructions

DTC C0552

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

DTC Descriptor

DTC C0552 00: Improper Shutdown Malfunction

Circuit/System Description

The electronic brake control module monitors the number of Vehicle in Service Mode and Vehicle OFF cycles. When it detects that a Vehicle OFF cycle was incomplete or nonexistent this fault will set. This means the fault reports a problem that occurred at the end of the previous ignition cycle. If this occurs during an electronic brake control module service operation, any calibrations or offsets learned during that service operation may not be properly stored in memory.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.
- The electronic brake control module is initialising.

Conditions for Setting the DTC

A Vehicle OFF cycle was interrupted before completion. Or power was removed from the module; with the Vehicle ON, the vehicle moving, and the brake applied.

Action Taken When the DTC Sets

- The electronic brake control module disables the antilock brake system, traction control and the vehicle stability enhancement system for the duration of the drive cycle.
- A driver information centre message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The electronic brake control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.

Diagnostic Aids

This DTC can set if battery voltage drops below 8 V with the Vehicle ON or Vehicle in Service Mode.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminals listed below and ground:

- Terminal 13
- Terminal 38

If 10 Ω or greater

2.1. Vehicle OFF.

2.2. Test for less than 2 Ω in the ground circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

3. Vehicle in Service Mode.

4. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.

If the test lamp does not illuminate and the circuit fuse is good

4.1. Vehicle OFF.

4.2. Test for less than 2 Ω in the B+ circuit end to end.

If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.

If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp illuminates

5. Cycle the Vehicle OFF then to Vehicle in Service Mode.

6. Verify DTC C0552 or C121D is not set.

If the DTC sets

Replace the K17 Electronic Brake Control Module.

If the DTC does not set

7. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for electronic brake control module replacement, programming and setup

DTC C0561

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0561 4B: System Disabled Information Stored Calibration Not Learned

DTC C0561 54: System Disabled Information Stored High Temperature

Circuit/System Description

The electronic brake control module receives data from other modules; engine control module, body control module, 14 V accessory power module, hybrid powertrain control module 1, and hybrid powertrain control module 2. The multi-axis acceleration sensor and the steering wheel angle sensor are needed to perform brake control functions. The module must ensure that all serial data and sensor inputs are properly received and learned.

Conditions for Running the DTC

- Ignition voltage is greater than 10 V.
- Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

DTC C0561 4B

- Air in the hydraulic brake system or incorrect brake bleed.
- This diagnostics detects if one or more of the module learning steps was not performed or failed during a new component replacement or with a reprogrammed module.

DTC C0561 54

This diagnostics detects an over temperature condition with one of the twelve solenoids due to an extended antilock brake system, traction control and the vehicle stability enhancement system event lasting more than 45 seconds.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- It may take two Vehicle ON cycles to clear this DTC.
- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

DTC C0561 4B

- This DTC may set during a battery disconnect.
- Check for hydraulic leaks, air in the brake system or incorrect brake bleed.
- The module set up was not performed after a programming event or the electronic brake control module learn failed.

DTC C0561 54

Excessive traction control event for greater than 45 seconds.

Circuit/System Verification

DTC C0561 4B

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn procedure.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal.

5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any parameter is not within the specified range
Refer to [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If all parameters are within the specified range
8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)
 - Brake Pressure Sensor - Less than 100 kPa (15 psi)
 - High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range
Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range
10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass
Repair as necessary.

If the brake hydraulic system tests normal
11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets
Replace the K17 electronic brake control module.

If the DTC does not set
13. All OK.

DTC C0561 54

Note: This diagnostic detects an over temperature condition with 1 of the 12 solenoids due to an extended anti lock, traction control and the vehicle stability enhancement system event lasting more than 45 seconds. This does not indicate a failure with the electronic brake control module.

1. Verify DTC C0561 54 does not set while operating the vehicle under normal driving conditions.

If the DTC sets
Replace the K17 electronic brake control module.

If the DTC does not set

2. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

B+ Terminal 1	C0256 04, C12E5 00	C0256 04, C12E5 00	--	--
B+ Terminal 25	C0201 04	C0201 04	--	--
Ground Terminal 13	-	C056D 00, C12DA 00, C12D7 00	--	--
Ground Terminal 38	-	U0129 00, U1833 00	--	--

Circuit/System Description

The electronic brake control module detects an internal malfunction.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- Ignition voltage is between 8-16 V.

Conditions for Setting the DTC

- An open electronic brake control module ground circuit.
- The electronic brake control module detects an internal malfunction.

Action Taken When the DTC Sets

- A driver information centre message and/or a warning indicator may be displayed.
- The electronic brake control module disables the antilock brake system, traction control and the vehicle stability enhancement system for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The electronic brake control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminals listed below and ground:
 - Terminal 13
 - Terminal 38

If 10 Ω or greater

- 2.1. Vehicle OFF.
- 2.2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the B+ circuit terminals listed below and ground.
 - Terminal 1
 - Terminal 25

If the test lamp does not illuminate and the circuit fuse is good

- 4.1. Vehicle OFF.
- 4.2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp illuminates

Replace the K17 Electronic Brake Control Module.

Repair Instructions

DTC Descriptors

DTC C0574 08: Printed Circuit Board Temperature Sensor Performance - Signal Invalid

DTC C0574 11: Printed Circuit Board Temperature Sensor High Input

Circuit/System Description

The electronic brake control module monitors the internal temperature sensor.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

C0574 08

The electronic brake control module detects an internal temperature sensor failure.

C0574 11

The temperature sensor value is greater than 284° F for greater than 1 second.

Action Taken When the DTC Sets

No indicators or warning messages are displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C0710

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0710 00: Steering Position Signal Malfunction

DTC C0710 09: Steering Position Signal Too Fast Transitions

DTC C0710 0A: Steering Position Signal Too Slow Transitions

DTC C0710 11: Steering Position Signal High Input

DTC C0710 18: Steering Position Signal Low Signal Amplitude

DTC C0710 19: Steering Position Signal High Signal Amplitude

DTC C0710 4B: Steering Position Signal Calibration Not Learned

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	U0125, U0126	U0125, U0126	--	--
Ground	--	U0126	--	--

Circuit/System Description

The steering wheel angle sensor receives ignition voltage from the electronic brake control module. The electronic brake control module receives serial data message inputs from the steering wheel angle sensor identifying the position and direction of the steering wheel rotation. The electronic brake control module utilises this signal to calculate the driver intended driving direction.

Conditions for Running the DTC

- Vehicle ON.
- Vehicle speed is greater than 15 km/h (10 MPH).

Conditions for Setting the DTC

C0710 00 or C0710 11

- The steering wheel angle sensor fails internally.
- The steering wheel alignment may be out of the specified range.
- The steering wheel angle sensor may not be properly mounted.

C0710 09

The steering wheel angle sensor detects an error of 30° or more.

C0710 0A

The steering wheel angle sensor signal does not vary.

C0710 18

The steering wheel angle sensor signal has a low amplitude signal.

C0710 19

The steering wheel angle sensor signal has a high amplitude signal or greater value than physically possible.

C0710 4B

The steering wheel angle sensor is not calibrated or learned.

Action Taken When the DTC Sets

- The traction control/stability control-active indicator turns ON.
- The electronic brake control module disables the traction control and the vehicle stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- In order for the DTC to clear the electronic stability control system must be initialised. Perform the steps listed below to initialise the system:
 1. Vehicle OFF, open the driver door and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
 2. Close the driver door and let the vehicle sit for 3 minutes.
 3. Vehicle ON, leave the vehicle in Park for greater than 10 seconds.
 4. Drive the vehicle in a straight line at a speed greater than 32 km/h (20 mph) for 30 seconds.
- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- Confirm that all tyres are of the proper size and that all are matching brands. Check and adjust all tyres to the stated cold air pressure as identified on the tyre placard. If a mis-sized or non-matching brand tyre is present, inform the customer that in order for the vehicle stability enhanced system to function normally, tyres need to be a uniform size and rolling diameter.
- The car should not pull in either direction causing the steering wheel to be off centre while driving in a straight line on a level surface.
- Improperly mounted or loose sensor.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify none of the DTCs listed below are set:
 - DTC U0125
 - DTC U0126
 - DTC C0035
 - DTC C0040
 - DTC C0045
 - DTC C0050

If any of the DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If none of the DTCs are set

3. Verify that DTC C0186, C0196, or C0287 is not set.

If any of the DTCs are set

Refer to [DTC C0186, C0196, or C0287](#) .

If none of the DTCs are set

4. Verify that DTC C0710 4B is not set.

If DTC C0710 4B is set

Perform the [Steering Angle Sensor Centring](#) procedure.

If DTC C0710 4B is not set

5. Verify the B99 steering wheel angle sensor is installed correctly.

If loose or incorrect installation

Correct the installation of the component.

If installed correctly

6. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B99 steering wheel angle sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF.
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.**If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.
If the test lamp does not illuminate
 - 4.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
 - 4.2. Test for infinite resistance between the ignition circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 4.3. Test for less than 2 Ω in the ignition circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K17 electronic brake control module.**If the test lamp illuminates**
5. Replace the B99 steering wheel angle sensor.
6. Verify that DTC C0710 does not set while operating the vehicle under the Conditions for Running the DTC.
If the DTC sets

Replace the K17 electronic brake control module.

If the DTC does not set
7. All OK.

[Circuit/System Description](#)

The electronic brake control module supplies a 5 V reference to the brake control brake pedal position sensor.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

- A short to ground or a short to voltage on the 5 V reference circuit to the brake control brake pedal position sensor.
- A short to voltage on the sensor 1 signal circuit to the brake control brake pedal position sensor.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Testing

1. Vehicle in Service Mode.
2. Verify that DTC C029C is not set.

If the DTC is set

Refer to [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If the DTC is not set

3. Vehicle OFF, disconnect the harness connector at the B201 brake control brake pedal position sensor.
4. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

If 5 Ω or greater

- 4.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 4.2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K17 electronic brake control module.

If less than 5 Ω

5. Vehicle in Service Mode.
6. Test for 4.8-5.2 V between the 5 V reference circuit terminal 5 and ground.

If less than 4.8 V

- 6.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 6.2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 6.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 5.2 V

- 6.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.
- 6.2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K17 electronic brake control module.

If between 4.8-5.2 V

7. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 1 parameter is less than 1 V.
 - If 1 V or greater***
 - 7.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.
 - 7.2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K17 electronic brake control module.

If less than 1 V

8. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 5.
9. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 1 parameter is greater than 4.5 V.

If 4.5 V or less

- 9.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
- 9.2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 9.3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K17 electronic brake control module.

If greater than 4.5 V

10. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 2 parameter is greater than 80%.
 - If 80% or less***
 - 10.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
 - 10.2. Test for infinite resistance between the signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K17 electronic brake control module.

If greater than 80%

11. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the low reference circuit terminal 1.
12. Verify the scan tool Brake Controls Brake Pedal Position Sensor Circuit 2 is less than 10%.
 - If 10% or greater***
 - 12.1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module, vehicle in service mode.
 - 12.2. Test for less than 1 V between the signal circuit terminal 6 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V

12.3. Vehicle OFF.

12.4. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K17 electronic brake control module.

If less than 10%

13. Replace the B201 brake control brake pedal position sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Electronic Brake Control Position Sensor Replacement](#)
- [Control Module References](#) for electronic brake control module replacement, programming and setup

DTC C0898

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C0898 00: Control Module Power and Ground Circuits Malfunction

DTC C0898 03: Control Module Power and Ground Circuits Low Voltage

Circuit/System Description

The electronic brake control module monitors two different blocks of memory to determine its capability to control the system shutdown process.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

- Keep alive voltage regulator not functional.
- Processor loses complete power (Ignition and Battery).
- Battery voltage is under 9 V and the vehicle is not moving.

Action Taken When the DTC Sets

- The electronic brake control module disables the antilock brake system/traction control system/vehicle stability enhancement system for the duration of the drive cycle.
- A driver information centre message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The electronic brake control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.

Circuit/System Verification

Check to ensure battery shunt is not opened.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminals listed below and ground:

- Terminal 13
- Terminal 38

If 10 Ω or greater

2.1. Vehicle OFF.

2.2. Test for less than 2 Ω in the ground circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

3. Vehicle in Service Mode.

4. Verify that a test lamp illuminates between the B+ circuit terminals listed below and ground.

- Terminal 1
- Terminal 25

If the test lamp does not illuminate and the circuit fuse is good

4.1. Vehicle OFF.

4.2. Test for less than 2 Ω in the B+ circuit end to end.

If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.

If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp illuminates

5. Vehicle in Service Mode.

6. Verify that a test lamp illuminates between the ignition circuit terminal 14 and ground.

If the test lamp does not illuminate and the circuit fuse is good

6.1. Vehicle OFF.

6.2. Test for less than 2 Ω in the ignition circuit end to end.

If 2 Ω or greater, repair the open/high resistance or the short to ground in the circuit.

If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp illuminates

7. Replace the K17 Electronic Brake Control Module.

DTC C1120 or C1121

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C1120 00: ABS Left Front Hydraulic Circuit Blocked

DTC C1121 00: ABS Left Front Hydraulic Circuit Leak Detected

Circuit/System Description

The electronic brake control module activates the valve relay to supply voltage to the valve solenoids. This voltage is referred to as the system voltage. The electronic brake control module activates individual valve solenoids by grounding the valve solenoid control circuits. This verification is used to perform hydraulic checks at the normally open base brake valve, the front hydraulic circuit and the block.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- Accumulator pressure is less than 9,000 kPa (1,305 psi).
- The ignition voltage is greater than 10 V.
- The electronic brake control module performs a hydraulic system check every third drive cycle.
- Brake pedal was depressed.

Conditions for Setting the DTC

C1120 00

This diagnostic detects if the left front circuit is blocked by actively applying pressure and monitoring the accumulator pressure change. The pressure change of the accumulator indicates the value of fluid used which is then compared to expected fluid used during a brake apply. Too little fluid usage indicates a blocked circuit.

C1121 00

This diagnostic detects if the left front circuit is leaking by actively applying pressure and monitoring the accumulator pressure change. The pressure change of the accumulator indicates the volume of fluid used which is then compared to expected fluid used during a brake apply. Too much fluid usage indicated a leaking circuit.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Verification

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn procedure.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal.
5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any parameter is not within the specified range

Refer to [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If all parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)

- Brake Pressure Sensor - Less than 100 kPa (15 psi)
- High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range

10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the K17 electronic brake control module.

If the DTC does not set

13. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)
- [Control Module References](#) for electronic brake control module replacement, programming and setup

DTC C1122 or C1123

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC C1122 00: ABS Right Front Hydraulic Circuit Blocked

DTC C1123 00: ABS Right Front Hydraulic Circuit Leak Detected

Circuit/System Description

The electronic brake control module activates the valve relay to supply voltage to the valve solenoids. This voltage is referred to as the system voltage. The electronic brake control module activates individual valve solenoids by grounding the valve solenoid control circuits. This verification is used to perform hydraulic checks at the normally open base brake valve, the front hydraulic circuit and the block.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode
- Accumulator pressure is less than 9,000 kPa (1,305 psi).
- The ignition voltage is greater than 10 V.
- The electronic brake control module performs a hydraulic system check every third drive cycle.
- Brake pedal was depressed.

Conditions for Setting the DTC

C1122 00

This diagnostic detects if the left front circuit is blocked by actively applying pressure and monitoring the accumulator pressure change. The pressure change of the accumulator indicates the value of fluid used which is then compared to expected fluid used during a brake apply. Too little fluid usage indicates a blocked circuit.

C1123 00

This diagnostic detects if the left front circuit is leaking by actively applying pressure and monitoring the accumulator pressure change. The pressure change of the accumulator indicates the volume of fluid used which is then compared to expected fluid used during a brake apply. Too much fluid usage indicated a leaking circuit.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information centre.
- The electronic brake control module disables the antilock brake system, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Circuit/System Verification

Note: The 12 V battery must be able to maintain a charge during this brake sensor performance procedure. It is recommended that a charger/maintainer or equivalent be used to maintain proper battery voltage during this procedure.

1. Vehicle in Service Mode with the transmission in PARK.

Note: Do not depress the brake pedal during the Electronic Brake Control Module Learn procedure.

2. Perform the Electronic Brake Control Module Learn procedure with a scan tool.

Note: To ensure the complete brake modulator and high pressure accumulator pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.

3. Vehicle ON, apply and release the brake pedal.

Note: Vehicle OFF, without applying the brake pedal ensure the brake modulator and high pressure accumulator pressure relief occurs. This process will take approximately 1-3 minutes.

4. Vehicle OFF, without applying the brake pedal.
5. Remove the remote keyless entry transmitter and close all of the vehicle doors. Wait approximately 1-3 minutes until the brake modulator and the high pressure accumulator pressure relief is complete and the vehicle powers down.
6. Vehicle ON, brakes not applied.
7. Verify the scan tool parameters listed below are within the specified range:
 - Brake Controls Brake Pedal Position Sensor 5 V Supply Voltage - Between 4.75-5.25 V
 - Brake Controls Brake Pedal Position Sensor Circuit 1 - Between 1.4-1.7 V
 - Brake Controls Brake Pedal Position Sensor Circuit 2 - Between 58-78%

If any parameter is not within the specified range

Refer to [DTC C029C, C120C, C129A-C129F, C12B1, or C12F8](#) .

If all parameters are within the specified range

8. Vehicle ON, brakes not applied.
9. Verify the scan tool parameters listed below are less the specified range:
 - Brake Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi)

- Brake Pressure Sensor - Less than 100 kPa (15 psi)
- High Pressure Accumulator Sensor - Less than 800 kPa (116 psi)

If any parameter is greater than the specified range

Replace the Q5 brake pressure modulator.

If all parameters are less than the specified range

10. Perform a brake hydraulic system test, refer to [Brake Hydraulic and Assist System Diagnosis](#) .

If the brake hydraulic system test does not pass

Repair as necessary.

If the brake hydraulic system tests normal

11. Replace the Q5 brake pressure modulator.
12. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

If the DTC sets

Replace the K17 electronic brake control module.

If the DTC does not set

13. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)
- [Control Module References](#) for electronic brake control module replacement, programming and setup

Symptoms - Antilock Brake System

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to [ABS Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the ABS. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions that could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [ABS Indicator Malfunction](#)
- [Traction Control/Stability Control Indicator Malfunction](#)
- [Brake Warning Indicator Malfunction](#)

ABS Indicator Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The instrument cluster turns ON the ABS indicator for 5 seconds after Vehicle in Service Mode or when the electronic brake control module detects a fault and sends a serial data message to the instrument cluster commanding the indicator ON.

- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that no DTCs are set.
If any DTCs are set
Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
If no DTCs are set
3. Verify the instrument cluster ABS indicator turns ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
If ABS indicator does not turn ON and OFF
Replace the P16 instrument cluster.
If the ABS indicator turns ON and OFF
4. Verify the ABS indicator turns OFF 5 seconds after the ignition is turned ON.
If the ABS indicator does not turn OFF
Replace the K17 electronic brake control module.
If the ABS indicator turns OFF
5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for electronic brake control module or instrument cluster replacement, programming and setup

Traction Control/Stability Control Indicator Malfunction

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit Description

The instrument cluster illuminates the Stabilitrak indicator during the instrument cluster bulb check or when the electronic brake control module detects a fault and sends a serial data message to the instrument cluster commanding the indicator ON.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

When the ignition is turned ON, the stabilitrak indicator lamp should illuminate, then after 5 seconds it should turn OFF.

1. Vehicle in Service Mode.
2. Verify the instrument cluster traction control/stability control-active indicator turns ON and OFF when commanding the All Indicators ON and OFF with a scan tool.

If the indicator does not turn ON and OFF

Replace the P16 instrument cluster.

If the indicator turns ON and OFF

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for instrument cluster replacement, programming and setup

Antilock Brake System Automated Bleed

Special Tools

- CH-29532-A Brake Pressure Bleeder
- CH-35589-A Brake Bleeder Adapter

For equivalent regional tools, refer to [Special Tools](#) .

Warning: At times during this brake bleed procedure brake fluid will be under higher pressures than during typical brake bleed procedures. Ensure the bleeder hose attached to the bleeder valve is securely maintained in position whenever the bleeder valve is opened. Failure to maintain the bleeder hose securely to the valve when opened, may allow the hose to blow off and brake fluid to spray out of the bleeder valve, possibly resulting in personal injury.

Caution: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Note:

- Do not pressurise the brake pressure bleeder CH-29532-A Brake Pressure Bleeder and thereby the master cylinder reservoir until instructed to do so by the scan tool. Portions of the automated bleed process require the master cylinder reservoir not be pressurised through the CH-29532-A Brake Pressure Bleeder .
- Do not apply the brake pedal until instructed to do so by the scan tool. Applying the brake pedal before instructed by the scan tool may result in setting a DTC and may require the sensor and boost valve calibration and electronic brake control module (EBCM) learn procedures to be repeated manually.

Note: The transmission must be in the PARK position, the power button in the OFF position, and the brakes not applied to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1 to 3 minutes.

1. Place the transmission in PARK.
2. Place the power button in the OFF position.
3. Wait approximately 3 minutes for the HPA pressure relief to occur.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

5. Remove the tyre and wheel assemblies. Refer to [Tyre and Wheel Removal and Installation](#) .
6. Inspect the brake system for leaks and visual damage. Refer to [Symptoms - Hydraulic Brakes](#) . Repair or replace components as necessary.
7. Lower the vehicle to allow for entry and exit while bleeding the brake corners and other components.
8. Connect a battery charger with 20 amp output to the 12V battery. The battery charger must remain connected and maintain 12V 20 amp for the entire automated bleed procedure. Refer to [Battery Charging](#) .
9. Install a scan tool to the vehicle.

Note: The power button must remain ON during this entire procedure.

10. Place the power button in the ON position.

Note: Do not pressurise the pressure bleeder *CH-29532-A Brake Pressure Bleeder* , and thereby the master cylinder reservoir, until instructed to do so by the scan tool.

11. Using the scan tool, perform the following steps:

- 11.1. Select Diagnostics
- 11.2. Select the appropriate vehicle information
- 11.3. Select Chassis
- 11.4. Select Electronic Brake Control Module (EBCM)
- 11.5. Select Special Functions
- 11.6. Select Automated Bleed

12. Press Start to begin the automated bleed procedure. Ensure the *CH-29532-A Brake Pressure Bleeder* has not yet been installed to the vehicle.

The travel and pressure sensors are being calibrated and learned by the EBCM during this step.

13. Press Start to continue.

Note: Approximately 2.5-3.0 L (2.6-3.2 qt) of brake fluid will be used throughout this procedure. Ensure there is an adequate supply of brake fluid in the *CH-29532-A Brake Pressure Bleeder* .

14. Inspect the fluid level in the *CH-29532-A Brake Pressure Bleeder* . Clean the outside of the *CH-29532-A Brake Pressure Bleeder* and add GM approved or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container, as necessary.
15. Clean the outside of the master cylinder reservoir on and around the reservoir cap prior to removing the cap and diaphragm.

Note: Do not pressurise the *CH-29532-A Brake Pressure Bleeder* and thereby the master cylinder reservoir until instructed to do so by the scan tool.

16. Install the *CH-35589-A Brake Bleeder Adapter* and the *CH-29532-A Brake Pressure Bleeder* to the vehicle.

Note: Ensure a MINIMUM of 200 kPa (30 psi) of pressure is MAINTAINED in the *CH-29532-A Brake Pressure Bleeder* throughout this procedure, except as instructed.

17. Set the pressure regulator of the *CH-29532-A Brake Pressure Bleeder* to 207 to 414 kPa (30 to 60 psi).
18. Open the *CH-29532-A Brake Pressure Bleeder* fluid tank valve to allow pressurised brake fluid to enter the brake system.
19. Wait approximately 30 seconds, then inspect the entire hydraulic brake system to ensure there are no existing external brake fluid leaks.

20. Secure bleeder hoses to all 4 brake calliper bleeder valves.
21. Bleed each of the 4 brake corners using the *CH-29532-A* Brake Pressure Bleeder in the following sequence. Ensure the brake fluid is clear and free of air bubbles at each corner.
 - 21.1. Left front
 - 21.2. Right front
 - 21.3. Left rear
 - 21.4. Right rear
22. Ensure each of the 4 brake calliper bleeder valves are tightened securely.
23. Press Start to begin the system automated bleed steps.

Follow all instructions on the scan tool. Only apply the brake pedal when instructed to do so by the scan tool.

24. When instructed, firmly apply and release the brake pedal using smooth, consistent full brake pedal strokes.

The brake pedal will go fully to the floor with some pedal feedback felt. The master cylinder reservoir supply circuit is being flushed through these steps.

25. Continue the brake applications until instructed by the scan tool.

The scan tool will instruct to perform 10 brake applies.

26. When instructed by the scan tool, stop performing the brake applications and press Enter.
27. When instructed by the scan tool, press Start to continue.

Note: The hydraulic brake system will be under high pressure during the next bleed sequence. Ensure the bleeder hose is maintained securely to the bleeder valve, and open the bleeder valve slowly.

28. Following the instructions on the scan tool, open the right rear (RR) brake calliper bleeder valve.
29. With the bleeder valve open and the bleeder hose maintained firmly in place, press Start to begin the bleeding process.

This process will run in a 30-second cycle. The pump and HPA circuits are being flushed during these steps.

30. Press Enter when instructed to repeat the bleeding process 3 more times on the scan tool.
31. Press Enter when instructed at the end of the 4th bleeding process.
32. Ensure the RR brake calliper bleeder valve is tightened securely.
33. Following the instructions on the scan tool, open the left rear (LR) brake calliper bleeder valve.
34. With the bleeder valve open and the bleeder hose maintained firmly in place, press Start to begin the bleeding process.
35. Press Enter when instructed to repeat the bleeding process 3 more times on the scan tool.
36. Press Enter when instructed at the end of the 4th bleeding process.
37. Ensure the LR brake calliper bleeder valve is tightened securely.
38. Reduce the charge in the air tank of the *CH-29532-A* Brake Pressure Bleeder to 0 kPa (0 psi).
39. Press Start to continue.

This sequence will run in a 20-second cycle. The brake pedal simulator circuit is being flushed through this step.

40. Press Enter when instructed to repeat the bleeding process 5 more times on the scan tool.
41. Set the pressure regulator of the *CH-29532-A* Brake Pressure Bleeder to 207 to 414 kPa (30 to 60 psi).
42. Press Enter to continue.

This sequence will run in a 120-second cycle. The boost side of the secondary master cylinder is being flushed through this step.

43. Open the right rear (RR) brake calliper bleeder valve.
44. Press Enter when instructed to repeat the bleeding process 1 more time on the scan tool.
45. Press Enter to continue.
46. Following the instructions on the scan tool, press Start to begin the next bleed sequence.
47. Open the right rear (RR) brake calliper bleeder valve.

Ensure the RR bleeder valve is fully bled and securely tightened before the 60-second cycle is completed. Do not leave the bleeder valve open for longer than 60-seconds.

48. If the RR bleeder valve was not fully bled within the 60-second cycle time, press Start to repeat Step 46 until the brake fluid is clear of any air.
49. Press Enter to continue.
50. Following the instructions on the scan tool, press Start to begin the next bleed sequence.
51. Open the left rear (LR) brake calliper bleeder valve.

Ensure the LR bleeder valve is fully bled and securely tightened before the 60-second cycle is completed. Do not leave the bleeder valve open for longer than 60-seconds.

52. If the RR bleeder valve was not fully bled within the 60-second cycle time, press Start to repeat Step 50 until the brake fluid is clear of any air.
53. Press Enter to continue.
54. Secure bleeder hoses to all 4 brake calliper bleeder valves.
55. Bleed each of the 4 brake corners using the *CH-29532-A* Brake Pressure Bleeder , in the following sequence. Ensure the brake fluid is clear and free of air bubbles at each corner.
 - 55.1. Left front
 - 55.2. Right front
 - 55.3. Left rear
 - 55.4. Right rear
56. Ensure each of the 4 brake calliper bleeder valves are tightened securely.
57. Press Enter to continue.
58. Remove the *CH-35589-A* Brake Bleeder Adapter and the *CH-29532-A* Brake Pressure Bleeder from the vehicle.

Note: The system is active and pressurised, therefore the brake fluid level in the master cylinder reservoir cannot be allowed to be higher than the MAX mark of the operating range.

59. Ensure the master cylinder reservoir is filled no higher than the MAX operating range line. Add or remove brake fluid as necessary. Refer to [Master Cylinder Reservoir](#)

[Filling](#) .

60. Start the engine.
61. Press Start to continue the final sequence.

The pump and the HPA circuits are being flushed, and the boost valve is being calibrated and learned by the EBCM through this step.

62. Continue to follow the instructions on the scan tool.
63. Allow the engine to idle for 1 minute to allow the system to recalibrate.
64. Place the power button in the OFF position, then place the power button in the ON position.
65. Clear any DTCs from the EBCM.
66. The brake control modulator is an OBDII compliant module. As such, brake related DTCs may be stored in the powertrain control modules. After addressing any other stored DTCs, clear any brake related DTCs stored in the powertrain control modules.
67. Place the power button in the OFF position, without applying the brake pedal.
68. Allow the vehicle to remain OFF for at least 1 minute before applying the brake pedal or performing a test drive.

This waiting period is essential to complete the sensor and boost valve calibration and EBCM learn processes, and to allow the HPA to depressurise to allow for a deactivated system pedal feel check.

69. Remove the scan tool from the vehicle.
70. Before activating the power button, firmly apply the brake pedal several times.

Observe the brake pedal feel.

71. If the brake pedal feels spongy, perform the following:
 - 71.1. Repeat the base hydraulic brake system bleeding procedure. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .
 - 71.2. If the brake pedal feel is now firm, repeat the automated bleeding procedure.
 - 71.3. If the brake pedal stills feels spongy after repeating the base hydraulic brake system bleeding procedure, inspect the brake system for external leaks. Refer to [Brake System External Leak Inspection](#) .
72. If the brake pedal stills feels spongy, an if no external brake fluid leaks are found, inspect the brake system for internal leaks and inspect the brake pedal travel. Refer to [Brake System Internal Leak Test](#) and [Brake Pedal Travel Measurement and Inspection](#) .
73. If internal leaks are found, replace the master cylinder. Refer to [Master Cylinder Replacement](#) .
74. If the brake pedal travel exceeds specification and there is no damage to the pedal system or pushrod, replace the master cylinder. Refer to [Master Cylinder Replacement](#) .
75. Place the power button in the ON position.

Observe if the brake system warning lamp remains illuminated.

76. If the brake system warning lamp remains illuminated, DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired. Refer to [Symptoms - Hydraulic Brakes](#) .
77. Firmly apply the brake pedal several times.

Observe the brake pedal feel.

78. If the brake pedal feels spongy, repeat the automated bleeding procedure until a firm brake pedal is obtained.
79. Drive the vehicle to a speed above 13 km/h (8 mph) to allow ABS initialisation to occur.

Observe the brake pedal feel.

80. If the brake pedal feels spongy, repeat the automated bleeding procedure until a firm brake pedal is obtained.

Steering Angle Sensor Centring

The external column mounted steering angle sensor does not require centring often. Centring of the steering wheel angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Electronic brake control module replacement
- Steering column replacement
- Steering gear replacement
- Steering wheel angle sensor replacement
- Steering linkage inner tie rod replacement
- Steering linkage outer tie rod replacement
- Collision or other physical damage

The external column mounted steering angle sensor centring procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align the front wheels forward.
2. Apply the hand brake, or set the transmission in the P position.
3. Install the scan tool to the data link connector.
4. Vehicle in Service Mode, engine OFF.
5. Select Steering Wheel Angle Sensor Reset in the Steering Wheel Angle Sensor Module Configuration/Reset Functions list.
6. Follow the scan tool directions to complete the Reset procedure.
7. Select Steering Wheel Angle Sensor Learn in the Steering Wheel Angle Sensor Module Configuration/Reset Functions list.
8. Follow the scan tool directions to complete the Learn procedure.
9. Clear any DTCs that may be set.
10. Select Power Steering Softstops Reset in the Electric Power Steering Control Module Configuration/Reset Functions list.
11. Follow the scan tool directions to complete the Reset procedure.
12. Select Power Steering Softstops Learn in the Electric Power Steering Control Module Configuration/Reset Functions list.
13. Follow the scan tool directions to complete the Learn procedure.
14. Clear any DTCs that may be set.

Electronic Brake Control Module Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Caution: Always connect or disconnect the wiring harness connector from the EBCM/EBTCM with the ignition switch in the OFF position. Failure to observe this precaution could result in damage to the EBCM/EBTCM.

Note: The transmission must be in the PARK position, the power button in the OFF position, and the brakes not applied to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1 to 3 minutes.

1. Place the transmission in PARK.
2. Place the power button in the OFF position.
3. Remove the remote keyless entry (RKE) transmitter and close all of the vehicle doors.
4. Wait approximately 3 minutes for the HPA pressure relief to occur.
5. Remove the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
6. Disconnect the electronic brake control module (EBCM) electrical connector.

7. Remove the brake pressure modulator valve (BPMV) bracket bolt (1).
8. Without disconnecting the connectors, remove the fasteners and position the drive motor generator power inverter module aside. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
9. Remove the bolt and position aside the engine wiring junction block.

10. Disconnect the BPMV return hose quick connect (1).
11. Cap the BPMV outlet port and plug the return hose to prevent brake fluid loss and contamination.

12. Disconnect the BPMV supply hose quick connect (1).
13. Cap the BPMV inlet port and plug the supply hose to prevent brake fluid loss and contamination.

Note: Mark the location of the brake pipe fittings at the BPMV to ensure correct installation.

14. Disconnect the right rear (1) and left rear (2) brake pipe fittings from the BPMV.
15. Cap the brake pipe fittings and the BPMV outlet ports to prevent brake fluid loss and contamination.

Note: Mark the location of the brake pipe fittings at the BPMV to ensure correct installation.

16. Disconnect the left front (1) and right front (2) secondary brake pipe fittings from the BPMV.
17. Cap the brake pipe fittings and the BPMV outlet ports to prevent brake fluid loss and contamination.

18. Disconnect the master cylinder primary brake pipe fitting (1).
19. Cap the brake pipe fitting and the BPMV inlet port to prevent brake fluid loss and contamination.

20. Remove the BPMV bracket nut (1).

21. Remove the BPMV bracket bolt (1).
22. Remove the brake master cylinder. Refer to [Master Cylinder Replacement](#) .
23. Carefully move the front brake pipes and remove the hydraulic control unit and bracket assembly.

24. Remove the EBCM bolts (1).

Note: Do not pry the EBCM from the BPMV. The EBCM must be pulled back evenly.

25. Carefully separate the EBCM (1) and seal (2) from the BPMV. Do not pry or force the components apart.

Installation Procedure

1. Clean the sealing surfaces of the EBCM and the BPMV with denatured alcohol or equivalent and allow to dry.

2. Install the EBCM (1) and seal (2) to the BPMV.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the EBCM bolts (1) and tighten to **3 N·m (27 lb in)**.
4. Carefully move the front brake pipes and install the hydraulic control unit and bracket assembly.

5. Install the BPMV bracket bolt (1) and tighten to **22 N·m (16 lb ft)**.

6. Install the BPMV bracket nut (1) and tighten to **22 N·m (16 lb ft)**.
7. Install the brake master cylinder. Refer to [Master Cylinder Replacement](#) .

8. Install the master cylinder primary brake pipe and tighten the fitting (1) to **23 N·m (17 lb ft)**.

9. Install the left front (1) and right front (2) secondary brake pipes and tighten the fittings to **19 N·m (14 lb ft)**.

10. Install the right rear (1) and left rear (2) brake pipes and tighten the fittings to **23 N·m (17 lb ft)**.

11. Connect the BPMV supply hose quick connect (1).
12. Ensure the supply hose quick connect is fully engaged by attempting to pull the supply hose from the inlet fitting.

13. Connect the BPMV return hose quick connect (1).
14. Ensure the return hose quick connect is fully engaged by attempting to pull the return hose from the outlet fitting.
15. Install the engine wiring junction block and bolt.
16. Install the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .

17. Install the BPMV bracket bolt (1) and tighten to **22 N·m (16 lb ft)**.
18. Connect the EBCM electrical connector.
19. Install the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
20. If installing a new EBCM, the EBCM must be programmed. Refer to [Control Module References](#) .
21. Perform the [Antilock Brake System Automated Bleed](#) . Follow the procedure completely to ensure the sensor and boost valve calibration and EBCM learn processes have been completed.

Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement

[Removal Procedure](#)

1. Remove the electronic brake control module (EBCM). Refer to [Electronic Brake Control Module Replacement](#) .

2. Remove the 2 brake pressure modulator valve (BPMV) bolts (1).

3. Remove the BPMV (1) from the bracket (2).

[Installation Procedure](#)

1. Install the BPMV assembly (1) to the bracket (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 2 BPMV bolts (1) and tighten to **8 N·m (71 lb in)**.
3. Install the EBCM. Refer to [Electronic Brake Control Module Replacement](#) .

Brake Control Brake Pedal Position Sensor Replacement

[Removal Procedure](#)

1. Disconnect the brake control brake pedal position sensor electrical connector.

2. Remove the brake control brake pedal position sensor bolt (1).

3. Remove the brake control brake pedal position sensor (1).

[Installation Procedure](#)

1. Align the locating pin on the brake control brake pedal position sensor (1) to the hole on the brake pedal assembly bracket.
2. Ensure the brake control brake pedal position sensor fork is properly located on the brake pedal pin.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the brake control brake pedal position sensor bolt (1) and tighten to **9 N·m (80 lb in)**.
4. Connect the brake control brake pedal position sensor electrical connector.
5. Perform the [Diagnostic System Check - Vehicle](#) .

Electronic Brake Control Position Sensor Replacement

[Removal Procedure](#)

1. Remove the driver side inflatable restraint lower module. Refer to [Inflatable Restraint Instrument Panel Lower Module Replacement - Driver Side](#) .
2. Disconnect the electronic brake control position sensor electrical connector.

3. Remove the 2 electronic brake control position sensor bolts (1).

4. Remove the electronic brake control position sensor (1).

[Installation Procedure](#)

Note: Ensure the electronic brake control position sensor arm is properly located on the pin of the brake pedal.

1. Install the electronic brake control position sensor (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 2 electronic brake control position sensor bolts (1) and tighten to **9 N·m (80 lb in)**.
3. Connect the electronic brake control position sensor electrical connector.
4. Install the driver side inflatable restraint lower module. Refer to [Inflatable Restraint Instrument Panel Lower Module Replacement - Driver Side](#) .
5. Inspect the battery state of charge. Refer to [Battery Inspection/Test](#) .
6. If necessary, connect a battery charger to the 12V battery. Refer to [Battery Charging](#) .
7. Install a scan tool to the vehicle.

Note: The power button must remain in the ON position during this procedure.

8. Place the power button in the ON position.
9. Using the scan tool, perform the following steps:
 - 9.1. Select Diagnostics
 - 9.2. Select the appropriate vehicle information
 - 9.3. Select Chassis
 - 9.4. Select Electronic Brake Control Module (EBCM)
 - 9.5. Select Module Setup
 - 9.6. Select Electronic Brake Control Position Relearn and follow the instructions on the scan tool

Brake Pressure Modulator Valve Pressure Sensor Calibration

The brake pressure sensor does not require calibration often. Calibration of the brake pressure sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Electronic brake control module (EBCM) replacement.
- Brake pressure modulator valve assembly replacement

The Brake Pressure Sensor Calibration procedure can be completed with a scan tool using the following steps:

1. Place the power button in the ON/RUN position.
2. Place the transmission in PARK
3. Release the brake pedal.
4. Install the scan tool to the data link connector.
5. Select Brake Pressure Sensor Calibration in the EBCM Configuration/Reset Functions list.
6. Follow the scan tool directions to complete the calibration procedure.
7. Clear any DTCs that may be set.

Brake Pressure Modulator Valve Bracket Replacement

[Removal Procedure](#)

1. Without separating the brake pressure modulator valve (BPMV) from the electronic brake control module (EBCM), remove the EBCM. Refer to [Electronic Brake Control Module Replacement](#).

2. Remove the 2 BPMV bolts (1).

3. Remove the bracket (1) from the BPMV/EBCM assembly.

[Installation Procedure](#)

1. Install the bracket (1) to the BPMV/EBCM assembly.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 2 BPMV bolts (1) and tighten to **8 N·m (71 lb in)**.
3. Install the BPMV/EBCM assembly. Refer to [Electronic Brake Control Module Replacement](#) .

Front Wheel Speed Sensor Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Remove the 11 lower fasteners securing the front wheelhouse liner front liner to the frame. Refer to [Front Wheelhouse Front Liner Replacement](#) .
4. Pull the front wheelhouse liner away from the frame to access the wheel speed sensor electrical connector.

5. Disconnect the wheel speed sensor electrical connector (1) and release the connector from the frame.
6. Release the harness clip (2) from the frame.
7. Release the harness clips (3) from the lower control arm.

8. Clean the wheel speed sensor mounting area on the steering knuckle of any accumulated dirt and debris.
9. Remove the wheel speed sensor bolt (1).

10. Remove the wheel speed sensor (1) from the steering knuckle.
11. Release the harness clip (2) from the steering knuckle and remove the wheel speed sensor.

[Installation Procedure](#)

1. Install the wheel speed sensor (1) to the steering knuckle.
2. Install the harness clip (2) to the steering knuckle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the wheel speed sensor bolt (1) and tighten to **10 N·m (89 lb in)**.

4. Connect the wheel speed sensor electrical connector (1) and secure the connector to the frame.
5. Install the harness clip (2) to the frame.
6. Install the harness clips (3) to the lower control arm.
7. Install the 11 lower fasteners securing the front wheelhouse liner front liner to the frame. Refer to [Front Wheelhouse Front Liner Replacement](#) .
8. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
9. Perform the [Diagnostic System Check - Vehicle](#) .

Rear Wheel Speed Sensor Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Clean the wheel speed sensor mounting area on the suspension knuckle of any accumulated dirt and debris.

4. Remove the wheel speed sensor bolt (1).

5. Remove the wheel speed sensor (1) from the suspension knuckle.

6. Release the wheel speed sensor harness from the rear brake hose retainers (1) and the brake hose bracket (2).

7. Remove the lower forward wheelhouse liner pushpin, lift the wheelhouse liner away from the body slightly and disconnect the wheel speed sensor electrical connector (1).
8. Release the wheel speed sensor harness retainer (2) from the frame rail and remove the wheel speed sensor.

[Installation Procedure](#)

1. Install the wheel speed sensor (1) to the suspension knuckle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the wheel speed sensor bolt (1) and tighten to **9 N·m (80 lb in)**.

3. Install the wheel speed sensor harness to the rear brake hose retainers (1) and the brake hose bracket (2).

4. Lift the wheelhouse liner away from the body slightly and connect the wheel speed sensor electrical connector (1).
5. Install the forward lower wheelhouse liner pushpin.
6. Install the wheel speed sensor harness retainer (2) to the frame rail.
7. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
8. Perform the [Diagnostic System Check - Vehicle](#) .

Vehicle Yaw Sensor Learn

The yaw sensor does not require calibration often. Calibration of the yaw rate sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Electronic brake control module (EBCM) replacement
- Yaw rate sensor replacement

The Yaw Rate Sensor Learn procedure can be completed with a scan tool using the following steps:

1. Place vehicle on a level surface
2. Apply the hand brake, or set the transmission in the P position.
3. Install the scan tool to the data link connector.
4. Vehicle in Service Mode, engine OFF
5. Select Yaw Rate Sensor Reset in the Multi-axis Acceleration Sensor Module Configuration/Reset Functions list.
6. Follow the scan tool directions to complete the calibration procedure.
7. Select Yaw Rate Sensor Learn in the Multi-axis Acceleration Sensor Module Configuration/Reset Functions list.
8. Follow the scan tool directions to complete the calibration procedure.
9. Select Yaw Rate Sensor Learn in the EBCM Configuration/Reset Functions list.
10. Follow the scan tool directions to complete the calibration procedure.
11. Clear any DTCs that may be set.

Vehicle Yaw Sensor with Vehicle Lateral and Longitudinal Accelerometer Replacement

Callout	Component Name
Preliminary Procedures 1. Turn the ignition OFF. 2. Remove the front floor console. Refer to Front Floor Console Replacement .	

1	<p>Yaw Sensor Nut</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Vehicle Yaw Sensor with Vehicle Lateral and Longitudinal Accelerometer</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connector.2. After the installation is complete, perform the Vehicle Yaw Sensor Learn

ABS Description and Operation

This vehicle is equipped with a TRW ABS/SCB/TC/VSC module.

This module provides the following vehicle performance enhancement systems:

- Antilock Brake System (ABS)
- Slip Control Boost (SCB)
- Master Cylinder Assembly
- Electronic Brake Distribution
- Traction Control (TC)
- Vehicle Stability Control (VSC)

The following components are involved in the operation of the above systems:

- Electronic brake control module (EBCM)--The EBCM controls the system functions and detects failures.
The EBCM contains the following components:
 - System relay--The system relay is internal to the EBCM. The system relay is energised when the power button is placed in ON/RUN or a remote function actuation (RFA) commands remote START. The system relay supplies battery positive voltage to the valve solenoids and to the ABS pump motor. This voltage is referred to as system voltage.
 - Solenoids--The solenoids are commanded ON and OFF by the EBCM to operate the appropriate valves in the brake pressure modulator valve.
- Brake pressure modulator valve--The brake pressure modulator valve uses a 4-circuit configuration to control hydraulic pressure to each wheel independently.
The brake pressure modulator valve contains the following components:
 - ABS pump motor and pump
 - Isolation valves
 - Dump valves
 - High pressure accumulator
 - Electronic hydraulic control unit
- Steering angle sensor - The EBCM receives serial data message inputs from the steering angle sensor. The steering angle sensor signal is used to calculate the desired yaw rate.
- Traction control switch - Traction control and stability control are manually disabled or enabled by pressing the traction control switch.
- Multi-axis acceleration sensor--The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, external to

the EBCM. The EBCM receives serial data message inputs from the yaw rate, lateral acceleration and longitudinal acceleration sensor and activates stability control depending on multi-axis acceleration sensor input.

- Wheel speed sensors--The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder ring consists of permanent magnets. Each wheel speed sensor receives ignition voltage from the electronic brake control module (EBCM) and provides a DC square wave signal back to the module. As the wheel spins, the EBCM uses the frequency of the square wave signal to calculate the wheel speed.

Slip Control Boost Overview

The slip control boost system is a hydraulic braking system which is capable of supplying boosted braking, slip control functions, and regenerative brake blending.

The system is made up of two major assemblies, the master cylinder assemble (no vacuum booster is used), and the electro-hydraulic control unit. Also included are various internal and external sensors used for system control and fault isolation.

The master cylinder assembly is made up of a reservoir and a master cylinder with primary and secondary pistons.

The electro-hydraulic control unit is used to electronically control pressure at the wheels. A pump and accumulator supply hydraulic brake fluid pressure to perform braking applications. A proportional supply valve controls the flow and pressure of fluid from the accumulator to the brakes. Standard digital slip control valves and, in some cases, proportional versions of them, are used to control pressures at the brakes independently for slip control. The regenerative axle isolation valves along with the proportional relief valve are used in regenerative brake blending situations. A simulator, consisting of a plunger, spring, orifice, and check valve provide the force and travel feedback to the driver through the master cylinder. There are four internal pressure transducers, master cylinder pressure, high pressure accumulator, boost pressure, and regenerative axle circuit pressure sensors.

General Operation

The driver applies the pedal and thereby builds pressure in the primary chamber of the master cylinder with the primary piston. The fluid from the primary chamber is transmitted from the master cylinder by the brake tube to the electro-hydraulic control unit through the orifice and check valve and into the simulator chamber. With the slip control boost system active and working normally, the fluid from the primary master cylinder chamber does not get applied to the wheel brakes but to the simulator. The pedal simulator spring, the orifice, and the check valve combine to affect a force/travel characteristic that feels smooth, normal, and controllable to the driver. A pressure transducer on the primary master cylinder chamber/pedal simulator (Master Cylinder Pressure), a pedal travel sensor on the input piston assembly, and the brake switch are inputs into the electronic control unit. These inputs are used to determine the driver's braking intent which is used to control the torque applied to the wheels.

Base Brakes (Friction Braking)

The braking torque applied to the wheels in proportion to the driver's braking intent is achieved with a combination of regenerative braking from the powertrain and hydraulically applied friction braking controlled by the electro-hydraulic control unit. The friction braking is achieved by the electro-hydraulic control unit controlling a combination of valves in a way that allows accumulator pressure to be used to actuate the wheel brakes. The accumulator is maintained at pressure during normal operation by the pump and motor, independent of the brake being applied. The pressure built in the braking circuits by the electro-hydraulic control unit by means of the boost valve is applied directly to the rear brakes. The front circuit pressure, however, are applied to the master cylinder secondary pistons, and they in turn apply pressure to the front while brakes. The slip control boost system is designed and used with its electro-hydraulic control unit and master cylinder primary and secondary pistons configured as they are for fail-safe purposes.

Fail-Safe System Operation (Four or Two Wheel Push Through)

With the system active, and working normally, the normally open and normally closed valves become active when the driver steps on the pedal, and friction braking is desired. This opens up the simulator to the fluid input from the master cylinder, and allows the boost valve to build pressure in the boost circuit that will actuate the wheel brakes. If the brake is applied with no power, or if the system detects a critical failure, these valves are not energised, resulting in a fail-safe system operation (push through) that allows the driver to push primary chamber fluid directly into the braking/boost circuits of all four wheels (four wheel push through). If a hydraulic failure occurs in the boost circuit a further pedal input will result in the primary piston of the master cylinder directly contracting the secondary pistons and applying pressure to the front hydraulic circuits (two wheel push through). Slip control functions are done by controlling the four isolation valves and the four dump valves in a manner common to how slip control functions are done in standard systems and is not described here.

Regenerative Brake Blending

Regenerative brake blending is done by using the driver braking intent information to request a powertrain braking torque, by receiving feedback about how much powertrain torque is applied, and controlling wheel brake pressures to fulfill the braking desired along with the powertrain regenerative pressure applied. To maximise the regenerative powertrain energy recovery during braking (while still maintaining suitable brake balance), the rear brake pressures may be reduced as compared proportionally to the front brakes. This pressure reduction is achieved by controlling the rear isolation valves in conjunction with the pressure reducing valve, which both controlled proportionally. Feedback from a pressure transducer (regenerative axle pressure) is used for this control. The boost valve itself controls the pressure applied to the front wheel brakes during regenerative brake blending.

Accumulator and Pump Motor Operations

The accumulator is charged independently of the brakes being applied, meaning that the motor may run at any time when the vehicle is powered. The pressure transducer (High Pressure Accumulator) is used by the EBCM to determine when the accumulator pressure is low. The EBCM controls the motor such that it runs from the time when the accumulator pressure is seen to be low until the high pressure accumulator is fully charged. A dual pump arrangement is used and is driven by an electronically commutator motor.

EBCM Controls

The EBCM controls the current to the boost valve so that pressure can be applied to the wheel brakes. The boost valve is a spool type valve which is referenced to the controlled pressure so that for a given current applied, a specific pressure is expected. The boost valve controls the pressure apply from the accumulator through the rear isolation valves directly to the rear wheel brakes, and through the front isolation valves, to the individual front pressure chambers behind the secondary pistons in the master cylinder, which in turn apply pressure to the front wheel brakes.

Base Brake Valves (Normal Open)

The normally open base brake valve is used to keep boost pressure from feeding back to the master cylinder which would increase the force back to the pedal. It closes off a passage which is used to apply pressure to the wheel brakes from the master cylinder in the case of a system failure. In this case the system failure referred to is one which results in a control mode known as push through. In normal operation the normally open base brake valve is on (closed) during a boost pressure apply event, and is left off (open) during failed system operation.

Base Brake Valves (Normal Closed)

The normally closed base brake valve is used to close off a passage which allows fluid from the back side (spring side) of the simulator and from the tank port of the boost valve to exit to the reservoir. In normal braking, turning this valve on (opening) allows the simulator to compress the spring and function normally. During failed system operation (push-through) the valve is left off (closed) keeping fluid from exiting the back side of the simulator, which in turn keeps master cylinder fluid from entering the front side of the simulator. In this way, fluid from the master cylinder during failed system, and push through operation is applied only to the wheel brakes, and not lost in the simulator. In normal operation the valve is turned on (opened).

Vehicle Stability Control

Stability control provides added stability during aggressive manoeuvres. Yaw rate is the rate of rotation about the vehicle's vertical axis. The stability control is activated when the EBCM determines that the desired yaw rate does not match the actual yaw rate as measured by the yaw rate sensor.

The desired yaw rate is calculated by the EBCM using the following inputs:

- Steering wheel position
- Vehicle speed
- Lateral acceleration

The difference between the desired yaw rate and the actual yaw rate is the yaw rate error, which is a measurement of oversteer or understeer. When a yaw rate error is detected, the EBCM attempts to correct the vehicle's yaw motion by applying brake pressure to one or more of the wheels. The amount of applied brake pressure varies, depending on the correction required.

Power-up Self-Test

The electronic brake control module (EBCM) is able to detect many malfunctions whenever the ignition is ON. However, certain failures cannot be detected unless active diagnostic tests are performed on the components. Shorted solenoid coil or motor windings, for example, cannot be detected until the components are commanded ON by the EBCM. Therefore, a power-up self-test is required at the beginning of each ignition cycle to verify correct operation of components before the various control systems can be enabled. The EBCM performs the power-up self-test when the ignition is first turned ON. The system relay, solenoids and the antilock brake system (ABS) pump motor are commanded ON and OFF to verify proper operation and the EBCM verifies the ability to return the system to base braking in the event of a failure. The power-up self-test may be heard by the driver, depending on how soon the engine is cranked and started after turning ON the ignition.

United Nations Economic Commission for Europe Regulation Number 13 (ECE 13) Response

The electronic brake control module (EBCM) illuminates the antilock brake system (ABS) indicator when a malfunction which disables ABS is detected. Usually, the ABS indicator is turned OFF during the following ignition cycle unless the fault is detected during that ignition cycle. However, the setting of a wheel speed sensor related DTC may cause the ABS indicator to remain illuminated during the following ignition cycle until the vehicle is operated at a speed greater than 13 km/h (8 mph) or, occasionally, 64 km/h (40 mph), depending on which DTC sets. This allows the EBCM to verify that no malfunction exists, before turning OFF the ABS indicator. It is important to verify that United Nations Economic Commission for Europe regulation number 13 (ECE 13) is not the cause of an ABS indicator which is illuminated when no DTCs are set, before attempting to diagnose other possible causes.

Driver Information Indicators

The following indicators are used to inform the driver of several different factors.

Brake Warning Indicator

The instrument panel cluster illuminates the brake warning indicator when the following occurs.

- The body control module (BCM) detects that the hand brake is engaged. The instrument panel cluster receives a serial data message from the BCM requesting illumination. The brake warning indicator flashes at a rate of approximately twice per second when the hand brake is engaged.
- The body control module (BCM) detects a low brake fluid condition or a base brake pressure differential and sends a serial data message to the instrument panel cluster requesting illumination.
- The instrument panel cluster performs the bulb check.
- The EBCM detects an antilock brake system (ABS)-disabling malfunction which also disables electronic brake distribution and sends a serial data message to the instrument panel cluster requesting illumination.

ABS Indicator

The instrument panel cluster illuminates the ABS indicator when the following occurs:

- The electronic brake control module (EBCM) detects an ABS-disabling malfunction and sends a serial data message to the instrument panel cluster requesting illumination.
- The instrument panel cluster performs the bulb check.
- The instrument panel cluster detects a loss of serial data communication with the EBCM.
- A DTC is set during the previous ignition cycle which requires a United Nations Economic Commission for Europe regulation number 13 (ECE 13) response at the beginning of the current ignition cycle. The EBCM sends a serial data message to the instrument panel cluster requesting illumination.

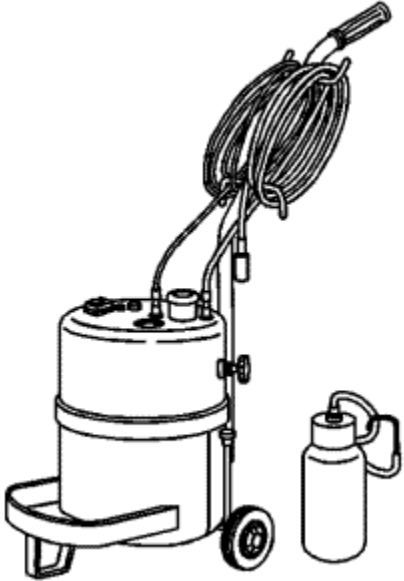

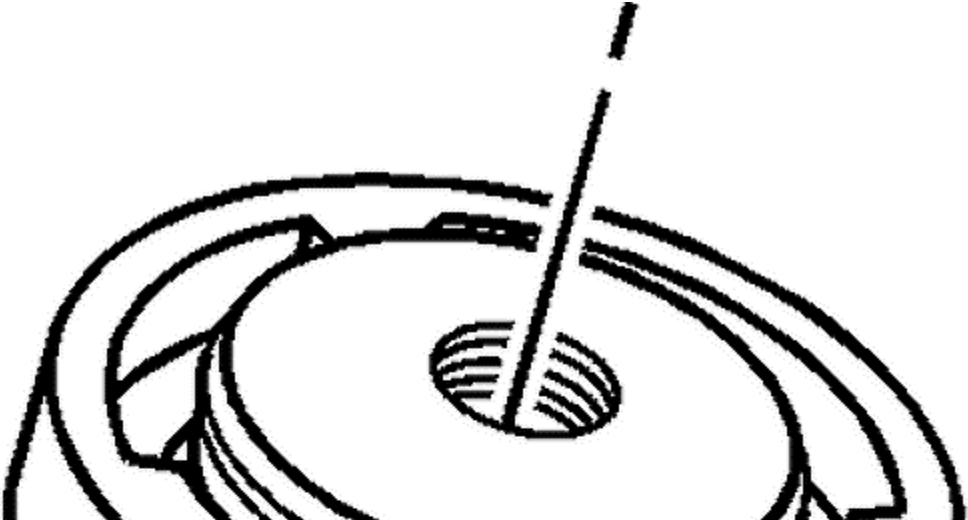

Traction Control/Stability Control Indicator

The instrument cluster turns the traction control/stability control indicator ON when the following occurs:

- The electronic brake control module (EBCM) detects an ABS-disabling malfunction and sends a serial data message to the instrument panel cluster requesting illumination.
- The instrument panel cluster performs the bulb check.
- The instrument panel cluster detects a loss of serial data communication with the EBCM.
- A DTC is set during the previous ignition cycle which requires a United Nations Economic Commission for Europe regulation number 13 (ECE 13) response at the beginning of the current ignition cycle. The EBCM sends a serial data message to the instrument panel cluster requesting illumination.

Special Tools

Brake Disc Thickness Measurement

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. If the inboard friction surface of the brake disc is not accessible, reposition and support the calliper with the brake pads. Refer to [Front Disc Brake Pads Replacement](#) and/or [Rear Disc Brake Pads Replacement](#).
2. Clean the friction surfaces of the brake disc with methylated spirit, or an equivalent approved brake cleaner.

3. Using a micrometer calibrated in thousandths-of-a-millimetre, or ten-thousandths-of-an-inch, measure and record the thickness of the brake disc at four or more points, evenly spaced around the disc.

Ensure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the disc, about 13 mm ($\frac{1}{2}$ in), for each measurement.

4. Compare the lowest thickness measurement recorded specifications. Refer to [Disc Brake Component Specifications](#).
5. If the lowest thickness measurement of the brake disc is above the minimum allowable thickness after refinishing specification, the disc may be able to be refinished,

depending upon surface and wear conditions which may be present.

6. If the lowest thickness measurement of the brake disc is at or below the minimum allowable thickness after refinishing specification, the disc may not be refinished.
7. If the lowest thickness measurement of the brake disc is at or below the discard thickness specification, the disc requires replacement.

Brake Disc Thickness Variation Measurement

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Note: Any disc brake disc that exhibits thickness variation exceeding the maximum acceptable level must be refinished or replaced. Thickness variation exceeding the maximum acceptable level can cause brake pulsation.

1. If the inboard friction surface of the brake disc is not accessible, reposition and support the calliper with the brake pads. Refer to [Front Disc Brake Pads Replacement](#) and/or [Rear Disc Brake Pads Replacement](#).
2. Clean the friction surfaces of the brake disc with methylated spirit, or an equivalent approved brake cleaner.

3. Using a micrometer calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the thickness of the brake disc at 4 or more points, evenly spaced around the disc.

Ensure that the measurements are only taken within the friction surfaces and that the micrometer is positioned the same distance from the outer edge of the disc, about 13 mm ($\frac{1}{2}$ in), for each measurement.

4. Calculate the difference between the highest and lowest thickness measurements recorded to obtain the amount of thickness variation.
5. Compare the thickness variation measurement to the following specification:

Specification

Brake disc maximum allowable thickness variation: 0.025 mm (0.001 in)

Note: Whenever a brake disc is refinished or replaced, the assembled lateral runout (LRO) of the disc must be measured to ensure optimum performance of the disc brakes.

6. If the brake disc thickness variation measurement exceeds the specification, the disc requires refinishing or replacement.

Brake Disc Surface and Wear Inspection

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. If the inboard friction surface of the brake disc is not accessible, reposition and support the calliper with the brake pads. Refer to [Front Disc Brake Pads Replacement](#) and/or [Rear Disc Brake Pads Replacement](#).
2. Clean the friction surfaces of the brake disc with methylated spirit, or an equivalent approved brake cleaner.
3. Inspect the friction surfaces of the brake disc for the following Braking Surface Conditions:
 - Heavy rust and/or pitting
Light surface rust can be removed with an abrasive disc. Heavy surface rust and/or pitting must be removed by refinishing the disc.
 - Cracks and/or heat spots
 - Excessive blueing discolouration
4. If the friction surfaces of the brake disc exhibit one or more of the Braking Surface Conditions, the disc requires refinishing or replacement.

5. Using a micrometer calibrated in thousandths-of-a-millimeter, or ten-thousandths-of-an-inch, measure and record the scoring depth of any grooves present on the disc friction surfaces.
6. Compare the groove scoring depth recorded to the following specification:

Specification

Brake disc maximum allowable scoring: 1.50 mm (0.059 in)

7. If the brake disc scoring depth exceeds the specification, or if an excessive amount of scoring is present, the disc requires refinishing or replacement.

Brake Disc Assembled Lateral Runout Measurement

Special Tools

- CH-41013 Disc Resurfacing Kit
- CH-42450-A Wheel Hub Resurfacing Kit
- CH-45101 Hub and Wheel Runout Gauge
- CH-45101-100 Conical Brake Disc Washers

For equivalent regional tools, refer to [Special Tools](#) .

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Note:

- Brake disc assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 4,800-11,300 km (3,000-7,000 mi).
- Brake disc thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Disc Thickness Variation Measurement](#) .

1. Matchmark the position of the brake disc to the wheel studs if this has not been done already.

Note: Whenever the brake disc has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake disc mating surfaces. Failure to do this may result in excessive assembled lateral runout (LRO) of the brake disc, which could lead to brake pulsation.

2. Inspect the mating surface of the hub/axle flange and the brake disc to ensure that there are no foreign particles, corrosion, rust, or debris remaining. If the wheel hub/axle flange and/or if the brake disc mating surfaces exhibit these conditions, perform the following steps:
 - 2.1. Remove the brake disc from the vehicle. Refer to [Front Brake Disc Replacement](#) and/or [Rear Brake Disc Replacement](#) .
 - 2.2. Using the CH-42450-A wheel hub resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
 - 2.3. Using the CH-41013 disc resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the brake disc.
 - 2.4. Clean the friction surfaces of the brake disc with methylated spirit, or an equivalent approved brake cleaner.
3. Install the disc to the hub/axle flange using the matchmark made prior to removal.

4. Hold the disc firmly in place against the hub/axle flange and install one of th *CH-45101-100* conical brake disc washers (1), and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the disc secure and tighten the wheel nut firmly by hand.

6. Install the remaining *CH-45101-100* conical brake disc washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
7. Tighten the lug nuts in a star-pattern to specification. Refer to [Tyre and Wheel Removal and Installation](#) .
8. If the brake disc has been REFINISHED or REPLACED with a new disc, proceed to step 14.
9. If the brake disc meets the following criteria, proceed to step 10.
 - The disc is within specifications and is being REUSED.
 - The disc has NOT been refinished.
 - The disc does NOT exhibit thickness variation exceeding the maximum allowable level.

10. Mount a dial indicator, *CH-45101* hub and wheel runout gauge, or equivalent, to the steering knuckle and position the indicator button so it contacts the brake disc friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the disc.
11. Measure and record the assembled LRO of the brake disc.
 - 11.1. Rotate the disc until the lowest reading is displayed on the indicator dial, then set the dial to zero.
 - 11.2. Rotate the disc until the highest reading is displayed on the dial.
 - 11.3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
 - 11.4. Measure and record the amount of LRO.
12. Compare the brake disc assembled LRO to the following specification:

Specification

- Front brake disc maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
 - Rear brake disc maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
13. If the brake disc assembled LRO is within specifications, proceed to step 18.

If the brake disc assembled LRO exceeds the specification, refinish the disc to ensure true parallelism. Refer to [Brake Disc Refinishing](#) . After refinishing the disc, proceed to step 14.

14. Mount a dial indicator, *CH-45101* hub and wheel runout gauge, or equivalent, to the steering knuckle and position the indicator button so it contacts the brake disc friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the disc.
15. Measure and record the assembled LRO of the brake disc.
 - 15.1. Rotate the disc until the lowest reading is displayed on the indicator dial, then set the dial to zero.
 - 15.2. Rotate the disc until the highest reading is displayed on the dial.
 - 15.3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
 - 15.4. Measure and record the amount of LRO.
16. Compare the brake disc assembled LRO to the following specification:

Specification

- Front brake disc maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
 - Rear brake disc maximum allowable assembled lateral runout: 0.05 mm (0.002 in)
17. If the brake disc assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to [Brake Disc Assembled Lateral Runout Correction](#) .
 18. If the brake disc assembled LRO measurement is within specification, install the brake calliper and depress the brake pedal several times to secure the disc in place before removing the *CH-45101-100* conical brake disc washers and the lug nuts.

Brake Pad Inspection

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. Inspect the disc brake pads at regular intervals, or whenever the tyre and wheel assemblies are removed from the vehicle.
2. If replacement is necessary, always replace disc brake pads in axle sets.
3. Inspect both edges of the disc brake pad friction surfaces (3). The highest rate of wear normally occurs at the trailing edge of the disc brake pads.
4. Inspect the thickness of the disc brake pads (3) in order to ensure that they have not worn prematurely. The disc brake pad wear should be approximately even per axle set.

5. Both front and rear disc brake pads have integral, audible wear sensors (1). When the disc brake pad wear reaches the minimum allowable thickness, the wear sensor contacts the disc brake disc (2). The wear indicator will then produce an audible, high-pitched warning noise during wheel rotation.
6. Replace the disc brake pads when the friction surface (3) is worn to within 0.76 mm (0.030 in) of the mounting plates.
7. Remove the brake callipers and inspect the friction surfaces of the inner and outer disc brake pads to ensure that they are level. Place the disc brake pad friction surfaces together and measure the gap between the surfaces. If more than 0.13 mm (0.005 in) gap exists midway between the length of the disc brake pads, replace the disc brake pads.
8. Verify that any disc brake pad shims that may be required are in place and not damaged or excessively corroded. Replace any missing or damaged shims in order to preserve proper disc brake performance.
9. Replace the disc brake pads if any have separated from the mounting plates.
10. Inspect the disc brake pads friction surfaces for cracks, fractures, or damage which may cause noise or otherwise impair disc brake performance.

Brake Calliper Inspection

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. Inspect the brake calliper housing (1) for cracks, excess wear, and/or damage. If any of these conditions are present, the brake calliper requires replacement.
2. Inspect the calliper piston dust boot seal (2) for cracks, tears, cuts, deterioration and/or improper seating in the calliper body. If any of these conditions are present, the brake calliper requires overhaul or replacement.
3. Inspect for brake fluid leakage around the calliper piston dust boot seal (2) and on the disc brake pads. If there is any evidence of brake fluid leakage, the brake calliper requires overhaul or replacement.

4. Inspect for smooth and complete travel of the calliper pistons into the calliper bores:

The movement of the calliper pistons into the calliper bores should be smooth and even. If the calliper piston is seized or difficult to bottom, the calliper requires overhaul or replacement.

- For single piston calliper applications, insert a discarded inner brake pad (2) or block of wood in front of the piston. Using a large C-clamp (1) installed over the body of the calliper (3) and against the brake pad or block of wood, slowly bottom the piston in the bore.
- For dual piston calliper applications, insert a discarded inner brake pad (2) or block of wood in front of the pistons. Using 2 large C-clamps (1) installed over the body of the calliper (3) and against the brake pad or block of wood, slowly bottom the pistons evenly into the bores.

Front Disc Brake Mounting and Hardware Inspection

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level then no brake fluid needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level then remove brake fluid to the midway point before proceeding.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer [Lifting and Jacking the Vehicle](#) .
5. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

6. Grasp the brake calliper housing and try to move the brake calliper housing up/down and forward/reverse in relation to the brake calliper mounting bracket. If excessive looseness is observed the brake calliper bracket bushes and/or the brake calliper mounting bolts may need to be replaced.
7. Compress the front calliper pistons.
 - Install a large C-clamp over the top of the calliper housing and against the back of the outboard pad.
 - Slowly tighten the C-clamp until the pistons are pushed completely into the calliper bores.
 - Remove the C-clamp from the calliper.
8. With the pistons compressed into the calliper bores, grasp the brake calliper housing and slide it back and forth on the brake calliper mounting bolts. Check for smooth operation. If the brake calliper housing slide force is high or the brake calliper housing does not slide smoothly, inspect the brake calliper mounting bolts and/or the brake calliper mounting bracket bushes for wear or damage. If wear or damage conditions are found, replacement of the brake calliper mounting bolts and/or the brake calliper mounting bracket bushes is necessary.
9. Remove the brake calliper mounting bolts from the brake calliper mounting bracket and support the brake calliper using heavy mechanics wire. Do Not remove the hydraulic brake hose from the calliper. Refer to [Front Brake Calliper Replacement](#) .
10. Remove the disc brake pads from the brake calliper mounting bracket.
11. Inspect the disc brake pad mounting hardware for the following:
 - Missing mounting hardware

- Excessive corrosion
- Bent mounting tabs
- Looseness at the brake calliper mounting bracket
- Looseness at the disc brake pads
- Excessive contaminants in the brake calliper mounting bracket surface and threads.

12. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.

13. Ensure the disc brake pads are held firmly in place on the brake calliper mounting bracket, yet slide easily on the mounting hardware without binding.

14. Inspect the calliper bolts (1) for the following:

- Binding
- Seizing
- Looseness in the brake calliper mounting bracket (3)
- Bent or damaged brake calliper mounting bolts
- Cracked or torn boots (4)
- Missing boots
- Bent or damaged brake calliper mounting bracket (3)

15. If any of the conditions listed are found then the brake calliper mounting hardware requires replacement.

16. Install the disc brake pads to the brake calliper mounting bracket.
17. Install the disc brake calliper to the brake calliper mounting bracket. Refer to [Front Brake Calliper Replacement](#) .

Rear Disc Brake Mounting and Hardware Inspection

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. Remove the disc brake calliper from the calliper mounting bracket.
2. Remove the disc brake pads from the calliper mounting bracket.
3. Inspect the disc brake pad mounting hardware for the following:
 - Missing mounting hardware
 - Excessive corrosion

- Bent mounting tabs
 - Looseness at the calliper mounting bracket
 - Looseness at the disc brake pads
4. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
 5. Ensure the disc brake pads are held firmly in place on the calliper mounting bracket, yet slide easily on the mounting hardware without binding.
 6. Install the disc brake pads to the calliper mounting bracket.
 7. Install the disc brake calliper to the mounting bracket.

Front Disc Brake Pads Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
6. Place a large C-clamp over the brake calliper body and against the outer brake pad.
7. Using the C-clamp, compress the brake calliper piston fully into the brake calliper bore.

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

8. Using a backup wrench to hold the brake calliper guide pin stationary, remove the lower brake calliper guide pin bolt (1).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

9. Rotate the brake calliper upward and support with heavy mechanics wire or equivalent.

Note: Note the location of the brake pad wear sensor for correct installation.

10. Remove the inner brake pad (1).
11. Remove the outer brake pad (2).

12. Remove the upper and lower brake pad springs (1).
13. If installing new brake pads, discard the brake pad springs.

Installation Procedure

1. Thoroughly clean the contact surfaces of the brake calliper bracket of any corrosion or debris.

Note: If installing new brake pads, install new brake pad springs.

2. Install the upper and lower brake pad springs (1).

Note: Note the location of the brake pad wear sensor for correct installation.

3. Install the inner brake pad (1).
4. Install the outer brake pad (2).
5. Position the brake calliper over the brake pads and to the calliper bracket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

6. Using a backup wrench to hold the brake calliper guide pin stationary, install the lower brake calliper guide pin bolt (1) and tighten to **28 N·m (21 lb ft)**.
7. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
8. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
9. Slowly release the brake pedal.
10. Wait 15 seconds, then repeat steps 8-9 until a firm brake pedal is obtained. This will properly seat the brake calliper piston and brake pads.
11. Fill the master cylinder reservoir. Refer to [Master Cylinder Reservoir Filling](#) .

Rear Disc Brake Pads Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

6. Using a backup wrench to hold the brake calliper guide pin stationary, remove the lower brake calliper guide pin bolt (1).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

7. Rotate the brake calliper upward and support with heavy mechanics wire or equivalent.

Note: Note the location of the brake pad wear sensor for correct installation.

8. Remove the outer brake pad (1).
9. Remove the inner brake pad (2).

10. Remove the upper and lower brake pad springs (1).
11. If installing new brake pads, discard the brake pad springs.

Installation Procedure

1. Using a brake calliper piston spanner tool, rotate the brake calliper piston clockwise while applying pressure to the face of the calliper piston to compress the piston into the calliper bore.
2. Thoroughly clean the contact surfaces of the brake calliper bracket of any corrosion or debris.

Note: If installing new brake pads, install new brake pad springs.

3. Install the upper and lower brake pad springs (1).

Note: Note the location of the brake pad wear sensor for correct installation.

4. Install the outer brake pad (1).
5. Install the inner brake pad (2).
6. Position the brake calliper over the brake pads and to the calliper bracket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

7. Using a backup wrench to hold the brake calliper guide pin stationary, Install the lower brake calliper guide pin bolt (1) and tighten to **28 N·m (21 lb ft)**.
8. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
9. With the engine OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
10. Slowly release the brake pedal.
11. Wait 15 seconds, then repeat steps 9-10 until a firm brake pedal is obtained. This will properly seat the brake calliper piston and brake pads.
12. Fill the master cylinder reservoir. Refer to [Master Cylinder Reservoir Filling](#) .

Front Brake Calliper Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

3. Remove the brake hose fitting bolt (1).

Note: Do not reuse the brake hose fitting gaskets.

4. Remove and discard the brake hose fitting gaskets (2) from the brake hose fitting (3).

5. Cap the brake hose fitting to prevent brake fluid loss and contamination.

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

6. Using a backup wrench to hold the brake calliper guide pin stationary, remove the brake calliper guide pin bolts (1).
7. Remove the brake calliper.

[Installation Procedure](#)

1. Position the brake calliper over the brake pads and to the calliper bracket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Using a backup wrench to hold the brake calliper guide pin stationary, install the brake calliper guide pin bolts (1) and tighten to **28 N·m (21 lb ft)**.

Note: Install new brake hose fitting gaskets.

3. Assemble the brake hose fitting bolt (1) and the 2 new brake hose fitting gaskets (2) to the brake hose fitting (3).
4. Install the brake hose assembly and tighten the brake hose fitting bolt to **40 N·m (30 lb ft)**.
5. Bleed the hydraulic brake system. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .
6. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Rear Brake Calliper Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Disable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Disabling](#) .

4. Disconnect the hand brake cable (1) from the actuator lever.
5. Compress the hand brake cable conduit retainers (2).
6. Remove the hand brake cable from the cable bracket and position the hand brake cable aside.

7. Remove the brake hose fitting bolt (1).

Note: Do not reuse the brake hose fitting gaskets.

8. Remove and discard the brake hose fitting gaskets (2) from the brake hose (3).

9. Plug the brake hose fitting to prevent brake fluid loss and contamination.

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

10. Using a backup wrench to hold the brake calliper guide pin (1) stationary, remove the brake calliper guide pin bolts (2).

11. Remove the brake calliper.

Installation Procedure

1. Position the brake calliper over the brake pads and to the calliper bracket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Using a backup wrench to hold the brake calliper guide pin (1) stationary, install the brake calliper guide pin bolts (2) and tighten to **28 N·m (21 lb ft)**.

3. Assemble the brake hose fitting bolt (1) and the 2 new brake hose fitting gaskets (2) to the brake hose (3).

4. Install the brake hose assembly to the brake calliper and tighten the fitting bolt to **40 N·m (30 lb ft)**.

5. Insert the hand brake cable through the hand brake cable bracket on the brake calliper.
6. Connect the hand brake cable (1) to the actuator lever and engage the hand brake cable conduit retainers (2) to the cable bracket.
7. Enable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Enabling](#) .
8. Bleed the hydraulic brake system. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .
9. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Front Brake Calliper Overhaul

[Disassembly Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Warning: Do not place fingers in front of the calliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.

Caution: Use clean cloths to pad interior of calliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.

1. Remove the brake calliper from the vehicle. Refer to [Front Brake Calliper Replacement](#) .

2. Remove the brake calliper piston from the calliper bore by directing low pressure compressed air into the calliper (1) through the fluid inlet hole.

3. Remove the piston dust boot seal (1) from the seal counterbore in the calliper (4). Discard the boot seal.
4. Using a small wooden or plastic tool, remove the piston seal (3) from the calliper bore. Discard the piston seal.
5. Remove the bleeder valve cap (6).
6. Remove the bleeder valve (5).

Note: Do not use abrasives to clean the brake calliper piston.

7. If cracks, scoring, pitting, excessive rust, and/or excessive corrosion are present in the calliper bore, replace the calliper assembly.
8. If light rust or light corrosion are present in the calliper bore, attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the calliper assembly.
9. Clean the brake calliper piston bore and seal counterbore, and the calliper piston with methylated spirit, or equivalent.
10. Dry the calliper piston bore and counterbore, and the piston with non-lubricated, filtered, compressed air.
11. Inspect the calliper piston for cracks, scoring, and/or damage to the plating. Replace the calliper piston if any of these conditions exist.
12. Inspect the calliper mounting holes for cracks, scoring, pitting, rust and/or excessive corrosion. Replace the calliper assembly if any of these conditions exist.

[Assembly Procedure](#)

1. Lubricate the new piston seal (3) with brake fluid from a clean, sealed brake fluid container. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended brake fluid.
2. Install the lubricated, new piston seal (3) into the calliper bore.
3. Apply a thin coat of brake fluid from a clean, sealed brake fluid container. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended brake fluid.

4. Install the bottom half of the calliper piston (2) into the calliper bore.
5. Install the new piston dust boot seal (1) over the calliper piston (2).
6. Compress the calliper piston (2) to the bottom of the calliper bore.
7. Fully seat the piston dust boot seal (1) into calliper counterbore.

Caution: Refer to [Fastener Caution](#) in the Preface section.

8. Install the bleeder valve (5) to the calliper and tighten the valve to **17 N·m (13 lb ft)**.
9. Install the bleeder valve cap (6).
10. Install the brake calliper to the vehicle. Refer to [Front Brake Calliper Replacement](#) .

Rear Brake Calliper Overhaul

Disassembly

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

1. Remove the rear brake calliper from vehicle. Refer to [Rear Brake Calliper Replacement](#) .
2. Drain the brake fluid from the calliper assembly.

Note: If the brake calliper was leaking brake fluid from the REAR of the calliper past the integral hand brake actuator shaft seal, replace the brake calliper assembly. The hand brake integral mechanism contains a non-serviceable seal which may be allowing brake fluid to leak past it and into the non-serviceable integral hand brake mechanism.

3. Firmly clamp the calliper assembly (1) in a soft-jawed vice.
4. Using a small wooden or plastic tool, carefully remove the brake calliper piston dust boot seal retaining ring from the groove in the calliper seal counterbore.
5. Carefully rotate the calliper piston (2) counter-clockwise and remove the calliper piston from the brake calliper housing.
6. Remove the brake calliper piston dust boot seal (3) from the brake calliper housing.
7. Using a small wooden or plastic tool, remove the piston seal from the calliper bore and discard the piston seal.
8. Inspect the operation of the integral hand brake mechanism: Rotate the hand brake lever back and forth while observing the movement of the hand brake mechanism actuator assembly in the calliper bore.

Note: The hand brake lever, lever return spring and actuator shaft seal are not serviceable components of the integral hand brake mechanism. Do not disassemble the integral hand brake mechanism.

9. If the integral hand brake mechanism was not operating properly, binding or seized, replace the brake calliper assembly.

Note: Do not use abrasives to clean the brake calliper piston.

10. If cracks, scoring, pitting, and/or excessive corrosion are present in the calliper bore, replace the calliper assembly.
11. If light corrosion is present in the calliper bore, attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the calliper assembly.
12. Clean the brake calliper piston bore and seal counterbore, the calliper piston, and the calliper sleeves with denatured alcohol, or equivalent.
13. Dry the calliper piston bore and counterbore, the piston, and the sleeves with non-lubricated, filtered compressed air.
14. Inspect the calliper piston for cracks, scoring, damage to the plating, and/or damage to the integral adjusting mechanism. Replace the calliper piston if any of these

conditions exist.

15. Inspect the calliper mounting holes for cracks, scoring, pitting, and/or excessive corrosion. Replace the calliper assembly if any of these conditions exist.

Assembly

1. Lubricate the new piston seal with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .
2. Install the new piston seal into the calliper bore.
3. Ensure the piston seal is seated squarely into the groove in the calliper bore and is not twisted.

4. Install the new dust boot seal (1) onto the calliper piston (2).

5. With the calliper housing (1) firmly secured in a soft-jawed vise, insert the calliper piston (2) into the calliper housing.
6. Using a spanner type wrench, rotate the piston clockwise while pushing the piston into the calliper housing bore.
7. When the calliper piston is fully seated into the calliper housing, align the notches in the calliper piston face to the pins on the inboard brake pad.
8. Fully seat the piston dust boot seal (3) in the calliper counterbore.
9. Install the piston dust boot seal retaining ring to the groove in the calliper counterbore.
10. Install the brake calliper to the vehicle. Refer to [Rear Brake Calliper Replacement](#) .

Inspect the brake calliper for brake fluid leaks while performing the hydraulic brake system bleeding procedure after the calliper has been installed to the vehicle. If the brake calliper leaks brake fluid from the FRONT of the calliper past the piston dust boot seal, replace the calliper piston assembly. The piston integral adjustment mechanism contains a non-serviceable seal which may be allowing brake fluid to leak past it through a bleed hole near the end of the calliper piston.

Front Brake Calliper Hardware Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

3. Hold the brake calliper guide pin stationary and remove the brake calliper guide pin bolts (1).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake calliper and support with heavy mechanics wire or equivalent.

Note: The upper brake calliper guide pin is equipped with a bushing and must be installed in the same location.

5. Remove the upper brake calliper guide pin (1).
6. Remove the lower brake calliper guide pin (2).
7. Remove the 2 brake calliper guide pin seals.

[Installation Procedure](#)

1. Apply a light coat of high temperature silicone brake lubricant to the brake calliper guide pins.

2. Install the 2 brake calliper guide pin seals.
3. Ensure the brake calliper guide pin seal is fully seated in the groove of the brake calliper bracket.

Note: The upper brake calliper guide pin is equipped with a bushing and must be installed in the same location.

4. Install the upper brake calliper guide pin (1).
5. Install the lower brake calliper guide pin (2).
6. Ensure the brake calliper guide pin seal is fully seated in the groove of the brake calliper guide pins.
7. Position the brake calliper over the brake pads and to the calliper bracket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

8. Using a backup wrench to hold the brake calliper guide pin stationary, install the brake calliper guide pin bolts (1) and tighten to **28 N·m (21 lb ft)**.
9. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Rear Brake Calliper Hardware Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

3. Using a backup wrench to hold the brake calliper guide pin (1) stationary, remove the brake calliper guide pin bolts (2).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake calliper and support with heavy mechanics wire or equivalent.

5. Remove the upper brake calliper guide pin (1).

Note: The lower brake calliper guide pin is equipped with a bushing, and must be installed in the same location in the calliper bracket.

6. Remove the lower brake calliper guide pin (2).

7. Remove the brake calliper guide pin seals (1).

[Installation Procedure](#)

1. Install the brake calliper guide pin seals (1).
2. Ensure the brake calliper guide pin seals are fully seated in the groove of the brake calliper bracket.

3. Install the upper brake calliper guide pin (1).

Note: The lower brake calliper guide pin is equipped with a bushing, and must be installed in the same location in the calliper bracket.

4. Install the lower brake calliper guide pin (2).

5. Ensure the brake calliper guide pin seals are fully seated in the groove of the brake calliper guide pins.

6. Position the brake calliper over the brake pads and to the calliper bracket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

7. Using a backup wrench to hold the brake calliper guide pin (1) stationary, install the brake calliper guide pin bolts (2) and tighten to **28 N·m (21 lb ft)**.

8. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Front Brake Calliper Bracket Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY.
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

3. Hold the brake calliper guide pin stationary and remove the brake calliper guide pin bolts (1).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake calliper and support with heavy mechanics wire or equivalent.

Note: Note the location of the wear sensor for correct installation.

5. Remove the inner brake pad (1).
6. Remove the outer brake pad (2).

7. Remove the brake pad springs (1).

Note: The upper brake calliper guide pin is equipped with a bushing and must be installed in the same location.

8. Remove the upper brake calliper guide pin (1).
9. Remove the lower brake calliper guide pin (2).
10. Remove the 2 brake calliper guide pin seals.

Note: Do not reuse the brake calliper bracket bolts.

11. Remove and discard the brake calliper bracket bolts (1).

12. Remove the brake calliper bracket (1).

[Installation Procedure](#)

1. Install the brake calliper bracket (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install 2 new brake calliper bracket bolts (1).
 - 2.1. Tighten the bolts a first pass to **100 N·m (74 lb ft)**.
 - 2.2. Tighten the bolts a second pass an additional **60 degrees**.
 - 2.3. Tighten the bolts a final pass an additional **15 degrees**.

3. Install the brake pad springs (1).

4. Install the 2 brake calliper guide pin seals.
5. Ensure the brake calliper guide pin seals are fully seated in the groove of the brake calliper bracket.

Note: The upper brake calliper guide pin is equipped with a bushing and must be installed in the same location.

6. Install the upper brake calliper guide pin (1).
7. Install the lower brake calliper guide pin (2).
8. Ensure the brake calliper guide pin seals are fully seated in the groove of the brake calliper guide pins.

Note: Note the location of the wear sensor for correct installation.

9. Install the inner brake pad (1).
10. Install the outer brake pad (2).
11. Position the brake calliper over the brake pads and to the calliper bracket.

12. Using a backup wrench to hold the brake calliper guide pin stationary, install the brake calliper guide pin bolts (1) and tighten to **28 N·m (21 lb ft)**.
13. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Rear Brake Calliper Bracket Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note:

- DO NOT use any air tools to remove or install the guide pin bolts. Use hand tools ONLY
- Install an open end wrench to hold the calliper guide pin in line with the brake calliper while removing or installing the calliper guide pin bolt. DO NOT allow the open end wrench to come in contact with the brake calliper. Allowing the open end wrench to come in contact with the brake calliper will cause a pulsation when the brakes are applied.

3. Using a backup wrench to hold the brake calliper guide pin (1) stationary, remove the brake calliper guide pin bolts (2).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake calliper and support with heavy mechanics wire or equivalent.

Note: Note the location of the brake pad wear sensor for correct installation.

5. Remove the outer brake pad (1).
6. Remove the inner brake pad (2).

7. Remove the brake pad springs (1).

8. Remove the upper brake calliper guide pin (1).

Note: The lower brake calliper guide pin is equipped with a bushing, and must be installed in the same location in the calliper bracket.

9. Remove the lower brake calliper guide pin (2).

10. Remove the brake calliper guide pin seals (1).

Note: Do not reuse the brake calliper bracket bolts.

11. Remove and discard the brake calliper bracket bolts (1).

12. Remove the brake calliper bracket (1).

[Installation Procedure](#)

1. Install the brake calliper bracket (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install 2 new brake calliper bracket bolts (1).
 - 2.1. Tighten the bolts a first pass to **90 N·m (67 lb ft)**.
 - 2.2. Tighten the bolts a final pass an additional **60 degrees**.

3. Install the brake calliper guide pin seals (1).
4. Ensure the brake calliper guide pin seals are fully seated in the groove of the brake calliper bracket.

5. Install the upper brake calliper guide pin (1).

Note: The lower brake calliper guide pin is equipped with a bushing, and must be installed in the same location in the calliper bracket.

6. Install the lower brake calliper guide pin (2).

7. Ensure the brake calliper guide pin seals are fully seated in the groove of the brake calliper guide pins.

8. Install the brake pad springs (1).

Note: Note the location of the brake pad wear sensor for correct installation.

9. Install the outer brake pad (1).
10. Install the inner brake pad (2).
11. Position the brake calliper over the brake pads and to the calliper bracket.

12. Using a backup wrench to hold the brake calliper guide pin (1) stationary, install the brake calliper guide pin bolts (2) and tighten to **28 N·m (21 lb ft)**.
13. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Front Brake Disc Replacement

Special Tools

- *CH-41013* Disc Resurfacing Kit
- *CH-42450-A* Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to [Special Tools](#) .

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note: Do not reuse the brake calliper bracket bolts.

3. Remove and discard the brake calliper bracket bolts (1).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake calliper and bracket as an assembly and support with heavy mechanics wire or equivalent.

5. Remove the brake disc bolt (1).

6. Remove the brake disc (1).

Installation Procedure

1. If installing a new brake disc, clean the friction surfaces of the brake disc with denatured alcohol or equivalent.
2. Using the *CH-42450-A* Wheel Hub Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
3. Using the *CH-41013* Disc Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface of the disc to the hub/axle flange.

4. Install the brake disc (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

5. Install the brake disc bolt (1) and tighten to **9 N·m (80 lb in)**.
6. Position the brake calliper and bracket assembly over the brake disc and to the steering knuckle.

Note: Do not reuse the brake calliper bracket bolts.

7. Install 2 new brake calliper bracket bolts (1).
 - 7.1. Tighten the bolts a first pass to **100 N·m (74 lb ft)**.
 - 7.2. Tighten the bolts a second pass an additional **60 degrees**.
 - 7.3. Tighten the bolts a final pass an additional **15 degrees**.
8. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Rear Brake Disc Replacement

Special Tools

- *CH-41013* Disc Resurfacing Kit
- *CH-42450-A* Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to [Special Tools](#) .

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Note: Do not reuse the brake calliper bracket bolts.

3. Remove and discard the brake calliper bracket bolts (1).

Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the brake calliper and bracket as an assembly and support with heavy mechanics wire or equivalent.

5. Remove the brake disc bolt (1).

6. Remove the brake disc (1).

Installation Procedure

1. If installing a new brake disc, clean the friction surfaces of the brake disc with denatured alcohol or equivalent.
2. Using the *CH-42450-A* Wheel Hub Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
3. Using the *CH-41013* Disc Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface of the disc to the hub/axle flange.

4. Install the brake disc (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

5. Install the brake disc bolt (1) and tighten to **9 N·m (80 lb in)**.
6. Position the brake calliper and bracket assembly over the brake disc and to the suspension knuckle.

Note: Do not reuse the brake calliper bracket bolts.

7. Instal 2 new brake calliper bracket bolts (1).
 - 7.1. Tighten the bolts a first pass to **90 N·m (67 lb ft)**.
 - 7.2. Tighten the bolts a final pass an additional **60 degrees**.
8. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Front Brake Shield Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the front tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Remove the front wheel bearing and hub assembly. Refer to [Front Wheel Bearing and Hub Replacement](#) .

4. Remove the front brake shield (1).

[Installation Procedure](#)

1. Install the front brake shield (1).
2. Install the front wheel bearing and hub assembly. Refer to [Front Wheel Bearing and Hub Replacement](#) .
3. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Rear Brake Shield Replacement

[Removal Procedure](#)

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

3. Remove the rear wheel bearing and hub assembly (1). Refer to [Rear Wheel Bearing and Hub Replacement](#) .

4. Remove the rear brake shield (1).

[Installation Procedure](#)

1. Install the rear brake shield (1).

2. Install the rear wheel bearing and hub assembly (1). Refer to [Rear Wheel Bearing and Hub Replacement](#) .
3. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Brake Disc Assembled Lateral Runout Correction

Note:

- Brake disc thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Disc Thickness Variation Measurement](#) .
- Brake disc assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 4 800-11 300 km (3,000-7,000 mi). Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .

Review the following acceptable methods for bringing the brake disc assembled LRO to within specifications. Determine which method to use for the specific vehicle being repaired.

- The indexing method of correcting assembled LRO is most effective when the LRO specification is only exceeded by a relatively small amount: 0.025-0.127 mm (0.001-0.005 in). Indexing is used to achieve the best possible match of high spots to low spots between related components. Refer to [Brake Disc Assembled Lateral Runout Correction - Indexing](#) .
- The correction plate method of correcting assembled LRO involves the addition of a tapered plate between the brake disc and the hub/axle flange. The correction plate method can be used to correct LRO that exceeds the specification by up to 0.23 mm (0.009 in). Refer to [Brake Disc Assembled Lateral Runout Correction - Correction Plates](#) .
- The on-vehicle brake lathe method is used to bring the LRO to within specifications through compensating for LRO while refinishing the brake disc. Refer to [Brake Disc Assembled Lateral Runout Correction - On Vehicle Lathe](#) .

If the assembled LRO cannot be corrected using these methods, then other components must be suspected as causing and/or contributing to the LRO concern.

Brake Disc Assembled Lateral Runout Correction -- Indexing

Special Tools

CH-45101-100 Conical Brake Disc Washers

For equivalent regional tools, refer to [Special Tools](#).

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Note:

- Brake disc thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Disc Thickness Variation Measurement](#).
- Brake disc assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between

4,800-11, 300 km (3,000-7,000 mi). Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .

1. Remove the *CH-45101-100* Conical Brake Disc Washers and the lug nuts that were installed during the assembled LRO measurement procedure.
2. Inspect the mating surface of the hub/axle flange and the brake disc to ensure that there are no foreign particles or debris remaining.
3. Index the brake disc in a different orientation to the hub/axle flange.
4. Hold the disc firmly in place against the hub/axle flange and install one of the *CH-45101-100* Conical Brake Disc Washers (1) and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the disc secure and tighten the wheel nut firmly by hand.

6. Install the remaining *CH-45101-100* Conical Brake Disc Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
7. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the disc. Refer to [Tyre and Wheel Removal and Installation](#) .
8. Measure the assembled LRO of the brake disc. Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .
9. Compare the amount of change between this measurement and the original measurement.
10. If this measurement is within specifications, proceed to step 14.
11. If this measurement still exceeds specifications, repeat steps 1-9 until the best assembled LRO measurement is obtained.
12. Matchmark the final location of the disc to the wheel studs if the orientation is different than it was originally.
13. If the brake disc assembled LRO measurement still exceeds the maximum allowable specification, refer to [Brake Disc Assembled Lateral Runout Correction](#) .

14. If the brake disc assembled LRO is within specification, install the brake calliper and depress the brake pedal several times to secure the disc in place before removing the *CH-45101-100* Conical Brake Disc Washers and the lug nuts.

Brake Disc Assembled Lateral Runout Correction -- Correction Plates

Special Tools

CH-45101-100 Conical Brake Disc Washers

For equivalent regional tools, refer to [Special Tools](#) .

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Note:

- Brake disc thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Disc Thickness Variation Measurement](#) .
- Brake disc assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 4,800-11,300 km (3,000-7,000 mi). Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .

1. Rotate the brake disc to position the high spot, identified and marked during the brake disc assembled LRO measurement procedure, to face upward.
2. Remove the *CH-45101-100* Conical Brake Disc Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake disc to ensure that there are no foreign particles or debris remaining.
4. Select the correction plate, following the manufacturer's instructions, which has a specification closest to the assembled LRO measurement.

For example: If the assembled LRO measurement was 0.076 mm (0.003 in), the 0.076 mm (0.003 in) correction plate would be used. If the measurement was 0.127 mm (0.005 in), the 0.152 mm (0.006 in) correction plate would be used.

5. Determine the positioning for the correction plate (1) using the high spot mark (3) made during the brake disc assembled LRO measurement procedure.

Note:

- Do NOT install used correction plates in an attempt to correct brake disc assembled LRO.
- Do NOT stack up, or install more than one correction plate onto one hub/axle flange location, in an attempt to correct brake disc assembled LRO.

6. Install the correction plate (1) onto the hub/axle flange, with the V-shaped notch (2) orientated to align with the high spot mark (3), that was positioned to face upward.

7. Install the brake disc to the hub/axle flange. Use the matchmark made prior to removal for proper orientation to the flange.
8. Hold the disc firmly in place against the hub/axle flange and install one of the *CH-45101-100* Conical Brake Disc Washers (1) and one lug nut (2) onto the upper-most wheel stud.
9. Continue to hold the disc secure and tighten the wheel nut firmly by hand.

10. Install the remaining *CH-45101-100* Conical Brake Disc Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
11. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the disc. Refer to [Tyre and Wheel Removal and Installation](#) .
12. Measure the assembled LRO of the brake disc. Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .
13. If the brake disc assembled LRO measurement still exceeds the maximum allowable specification, refer to [Brake Disc Assembled Lateral Runout Correction](#) .
14. If the brake disc assembled LRO measurement is within specification, install the brake calliper and depress the brake pedal several times to secure the disc in place before removing the *CH-45101-100* Conical Brake Disc Washers and the lug nuts.

Brake Disc Assembled Lateral Runout Correction -- On Vehicle Lathe

Special Tools

CH-45101-100 Conical Brake Disc Washers

For equivalent regional tools, refer to [Special Tools](#) .

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Note:

- Brake disc thickness variation **MUST** be checked **BEFORE** checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to [Brake Disc Thickness Variation Measurement](#) .
- Brake disc assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake disc over time, usually between 4 800-11 300 km (3,000-7,000 mi). Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .

1. Ensure that the calliper and calliper bracket that are already being supported, are clear from contacting any rotating components, such as the brake disc.
2. Remove the *CH-45101-100* Conical Brake Disc Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake disc to ensure that there are no foreign particles or debris remaining.
4. Set up the lathe, following the manufacturer's instructions.
5. Refinish the brake disc, following the brake lathe manufacturer's instructions.
6. After each successive cut, inspect the brake disc thickness. Refer to [Brake Disc Thickness Measurement](#) .
7. If at any time the brake disc exceeds the minimum allowable thickness after refinish specification, the brake disc must be replaced. After replacing the disc, proceed to step 10.
8. After refinishing the brake disc, use the following procedure in order to obtain the desired non-directional finish:
 - 8.1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
 - 8.2. Using moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminium oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminium oxide sandpaper.
 - 8.3. After applying a non-directional finish, clean each friction surface of the brake disc with methylated spirit, or an equivalent approved brake cleaner.
9. Remove the lathe from the vehicle.
10. Measure the assembled LRO of the brake disc. Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .
11. If the brake disc assembled LRO measurement still exceeds the maximum allowable specification, refer to [Brake Disc Assembled Lateral Runout Correction](#) .

12. If the brake disc assembled LRO is within specification, install the brake calliper and depress the brake pedal several times to secure the disc in place before removing the *CH-45101-100* Conical Brake Disc Washers and the lug nuts.

Brake Disc Refinishing

Special Tools

- CH-41013 Disc Resurfacing Kit
- CH-42450-A Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to [Special Tools](#) .

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Note:

- The disc brake discs do not require refinishing as part of routine brake system service. New disc brake discs do not require refinishing.
Do not refinish disc brake discs in an attempt to correct the following conditions:
 - Brake system noise - squeal, growl, groan
 - Uneven and/or premature disc brake pad wear
 - Superficial or cosmetic corrosion/rust of the disc brake disc friction surface
 - Scoring of the disc brake disc friction surface less than the maximum allowable specification
- Before refinishing a brake disc, the disc MUST first be checked for adequate thickness to allow the disc to be refinished and remain above the minimum allowable thickness after refinish specification. Refer to [Brake Disc Thickness Measurement](#) .
Disc brake discs should only be refinished if they have adequate thickness to be refinished and if one or more of the following conditions exist:
 - Thickness variation in excess of the maximum allowable specification
 - Excessive corrosion/rust and/or pitting
 - Cracks and/or heat spots
 - Excessive blueing discolouration
 - Scoring of the disc brake disc surface in excess of the maximum allowable specification
- Disc brake discs may need to be refinished as part of the process for correcting brake disc assembled lateral runout (LRO) that exceeds the maximum allowable specification.

Note: If the vehicle is equipped with cross-drilled discs, use a lathe with positive rake tooling. This setup requires less cutting pressure, which will result in less vibration, and a better surface finish. Also, use a vibration dampener when cutting. Otherwise, refinish according to the following instructions.

Note: Whenever the brake disc has been separated from the hub/axle flange, clean any rust or contaminants from the hub/axle flange and the brake disc mating surfaces. Failure to do this may result in increased assembled lateral runout (LRO) of the brake disc, which could lead to brake pulsation.

1. Using the *CH-42450-A* Wheel Hub Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
2. Using the *CH-41013* Disc Resurfacing Kit , thoroughly clean any rust or corrosion from the mating surface and mounting surface of the brake disc.
3. Inspect the mating surfaces of the hub/axle flange and the disc to ensure that there are no foreign particles or debris remaining.
4. Mount the brake disc to the brake lathe according to the lathe manufacturer's instructions, ensuring that all mounting attachments and adapters are clean and free of debris.
5. Ensure that any vibration dampening attachments are securely in place.
6. With the brake lathe running, slowly bring in the cutting tools until they just contact the brake disc friction surfaces.
7. Observe the witness mark on the brake disc. If the witness mark extends approximately three-quarters or more of the way around the brake disc friction surface on each side, the brake disc is properly mounted to the lathe.
8. If the witness mark does not extend three-quarters or more of the way around the brake disc, re-mount the disc to the lathe.
9. Following the brake lathe manufacturer's instructions, refinish the brake disc.
10. After each successive cut, inspect the brake disc thickness. Refer to [Brake Disc Thickness Measurement](#) .
11. If at any time the brake disc exceeds the minimum allowable thickness after refinish specification, the brake disc must be replaced.
12. After refinishing the brake disc, use the following procedure in order to obtain the desired non-directional finish:
 - 12.1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
 - 12.2. Using moderate pressure, apply the non-directional finish:
 - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminium oxide sandpaper.
 - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminium oxide sandpaper.
 - 12.3. After applying a non-directional finish, clean each friction surface of the brake disc with methylated spirit, or an equivalent approved brake cleaner and wipe each friction surface using a clean workshop towel to remove metal particles remaining from machining. Repeat the cleaning process if necessary to remove all metal particles.
13. Remove the brake disc from the brake lathe.
14. Measure the assembled LRO of the brake disc to ensure optimum performance of the disc brakes. Refer to [Brake Disc Assembled Lateral Runout Measurement](#) .
15. If the brake disc assembled LRO measurement exceeds the specification, bring the LRO to within specifications. Refer to [Brake Disc Assembled Lateral Runout Correction](#) .

Disc Brake System Description and Operation

[System Component Description](#)

The disc brake system consists of the following components:

Disc Brake Pads: Applies mechanical output force from the hydraulic brake callipers to friction surfaces of brake discs.

Disc Brake Discs: Uses mechanical output force applied to friction surfaces from the disc brake pads to slow speed of tyre and wheel assembly rotation.

Disc Brake Pad Hardware: Secures disc brake pads firmly in proper relationship to the hydraulic brake callipers; enables a sliding motion of brake pads when mechanical output force is applied.

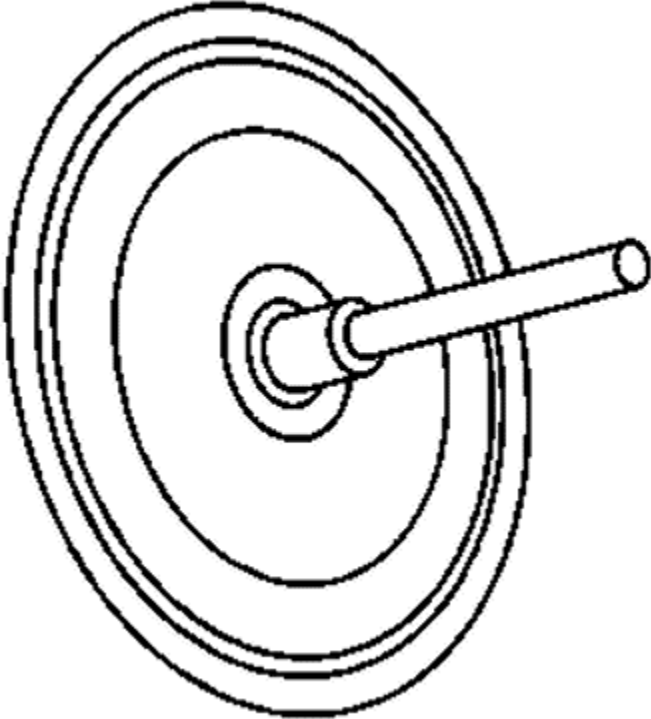

Disc Brake Calliper Hardware: Provides mounting for hydraulic brake calliper and secures the calliper firmly in proper relationship to calliper bracket. Enables a sliding motion of the brake calliper to the brake pads when mechanical output force is applied.

[System Operation](#)

Mechanical output force is applied from the hydraulic brake calliper pistons to the inner brake pads. As the pistons press the inner brake pads outward, the calliper housings draw the outer brake pads inward. This allows the output force to be equally distributed. The brake pads apply the output force to the friction surfaces on both sides of the brake discs, which slows the rotation of the tyre and wheel assemblies. The correct function of both the brake pad and brake calliper hardware is essential for even distribution of braking force.

DTC C0267

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC C0267 00: Low Brake Fluid Indicated

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	C0267 00	1	--
Ground	--	C0267 00	--	--
1. Brake Warning Indicator Malfunction				

[Circuit/System Description](#)

The brake fluid level switch monitors the level of brake fluid in the brake fluid reservoir.

[Conditions for Running the DTC](#)

Vehicle in Service Mode.

[Conditions for Setting the DTC](#)

- A short to ground detected on the brake fluid level signal circuit for 60 seconds.
- Low brake fluid level is detected for 60 seconds.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- The vehicle stability enhancement system (VSES) and traction control system (TCS) is disabled.
- A DIC message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Inspect for proper brake fluid level. The fluid level should be above the minimum level.

If low, refer to [Brake Fluid Loss](#) .

2. Vehicle in Service Mode, observe the scan tool Brake Fluid Level Sensor parameter. The reading should be OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B20 brake fluid level switch.
2. Test for less than 10 Ω between the ground circuit terminal B and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, test for 12.0-12.8 V between the sensor signal circuit terminal A and ground.
If outside specified range, test the signal circuit terminal A for a short to ground.

Note: The parameter may take up to 60 seconds to switch from OK to Low.

4. Install a 3 A fused jumper wire between the signal circuit terminal A and ground circuit terminal B. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
If not the specified value, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the K17 electronic brake control module (EBCM).
5. If all circuits test normal, test or replace the B20 brake fluid level switch.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B20 brake fluid level switch.
2. Test for 9.5-10.5 K Ω between the ground circuit terminal B and the signal circuit terminal A with the switch in the open position.
If outside the specified range, replace the B20 brake fluid level switch.
3. Test for less than 5 Ω between the signal terminal A and ground terminal B with the switch in the closed position.
If greater than the specified range, replace the brake fluid level switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Master Cylinder Reservoir Replacement](#)
- [Control Module References](#) for EBCM replacement, programming and setup

Symptoms - Hydraulic Brakes

Important: The following steps must be completed before using the symptom tables.

1. Perform the [Brake System Vehicle Road Test](#) before using the hydraulic brake symptom tables in order to duplicate the customer's concern.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to the following:
 - [Hydraulic Brake System Description and Operation](#)
 - [Brake System, Hydraulic, Assist, and Control Description and Operation](#)
 - [Hydraulic Brake Component Operation Visual Inspection](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Hydraulic Brake System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Brake Pulsation](#)
- [Brake System Noise](#)
- [Braking Action Uneven - Pulls to One Side](#)
- [Braking Action Uneven - Front to Rear](#)
- [Brake Pedal Excessive Travel](#)
- [Brake Pedal Excessive Effort](#)
- [Brakes Drag](#)
- [Brake System Slow Release](#)
- [Brake Fluid Loss](#)
- [Brake Hydraulic and Assist System Diagnosis](#)

Brake Warning Indicator Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Fluid Level Signal	C0267 00	1	--	--
Ground	--	1	--	--
1. Brake Warning Indicator Malfunction				

[Circuit/System Description](#)

The brake fluid level switch monitors the level of brake fluid in the master cylinder. When the electronic brake control module (EBCM) sees the brake fluid level switch input grounded, it sends a serial data message to the instrument panel cluster to turn ON the Red Brake Warning indicator.

[Reference Information](#)

Description and Operation

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify the brake fluid is at or above the minimum level.
If low, refer to [Brake Fluid Loss](#) .
2. Command the instrument panel cluster lamp test with a scan tool, the warning indicator should turn ON.
If the red brake warning indicator does not illuminate, replace the P16 Instrument Cluster.
3. Vehicle in Service Mode, observe the scan tool Brake Fluid Level Sensor parameter. The reading should be OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch.
2. Test for less than 5 Ω between the ground circuit terminal B and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify the scan tool Brake Fluid Level Sensor parameter is OK.
If not the specified value, test the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the K17 Electronic Brake Control Module.

Note: The parameter may take up to 60 seconds to switch from OK to Low.

4. Install a 3 A fused jumper wire between the signal circuit terminal A and ground circuit terminal B. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
If not the specified value, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the K17 Electronic Brake Control Module.
5. If all circuits test normal, test or replace the B20 Brake Fluid Level Switch.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch.
2. Test for infinite resistance between the ground terminal B and the signal terminal A with the switch in the open position.
If less than the specified value, replace the B20 Brake Fluid Level Switch.
3. Test for less than 5 Ω between the signal terminal A and ground terminal B with the switch in the closed position.
If greater than the specified range, replace the B20 Brake Fluid Level Switch.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Master Cylinder Reservoir Replacement](#)
- [Control Module References](#) for instrument panel cluster, and control module replacement, programming and setup

Brake Pulsation

Step	Action	Yes	No
DEFINITION:			
<ul style="list-style-type: none"> • Fluctuation or pulsation is felt through the brake pedal, steering wheel, seat, floor, and/or in the vehicle ONLY when braking. • Notchy or uneven brake pedal feel during brake apply. • Kickback is felt through the brake pedal during brake apply and release. 			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	<ol style="list-style-type: none"> 1. Inspect the disc brake system for the following conditions: <ul style="list-style-type: none"> • Excessive thickness variation of disc friction surfaces • Excessive assembled lateral runout (LRO) of disc friction surfaces • Hard spots, heat checks, bluing discoloration of disc friction surfaces; possibly due to brake drag • Excessive corrosion of disc friction surfaces; including red, gray or black oxidation • Loose, damaged or missing calliper or lining hardware • Bent or damaged calliper or mounting component • Excessive LRO of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings 2. Perform the disc brake system diagnostic procedure. Refer to Disc Brake System Diagnosis . 3. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 8	Go to Step 3
3	<ol style="list-style-type: none"> 1. Inspect the brake hydraulic and assist systems for the following conditions: <ul style="list-style-type: none"> • Lack of lubrication, binding, excessively worn and/or damaged brake pedal pushrod, pin and/or pedal pivot bushings. • Bent or damaged pedal pushrod, pedal, or pedal bracket. • Restricted brake master cylinder reservoir-to-brake pressure modulator valve (BPMV) feed and/or return hoses. 2. Perform the entire brake and hydraulic assist system diagnostic procedure. Refer to Brake Hydraulic and Assist System Diagnosis . 3. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 8	Go to Step 4

4	Does the brake pedal feel notchy or uneven during brake apply?	Go to Step 6	Go to Step 5
5	Is kickback felt through the brake pedal during brake apply and release?	Go to Step 7	Go to Symptoms - Hydraulic Brakes
6	<ol style="list-style-type: none"> 1. Replace the brake master cylinder for sticking or improperly functioning pistons. Refer to Master Cylinder Replacement . 2. Pressure bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding : Pressure . 3. Perform the entire Antilock Brake System Automated Bleed . <p>Did you find and correct a condition?</p>	Go to Step 8	Go to Symptoms - Hydraulic Brakes
7	<ol style="list-style-type: none"> 1. Replace the brake pressure modulator valve (BPMV) for an improperly functioning boost circuit. Refer to Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement . 2. Pressure bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding : Pressure . 3. Perform the entire Antilock Brake System Automated Bleed . <p>Did you find and correct a condition?</p>	Go to Step 8	Go to Symptoms - Hydraulic Brakes
8	<ol style="list-style-type: none"> 1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . <p>Is the condition still present?</p>	Go to Step 2	System OK

Brake System Noise

Step	Action	Yes	No
DEFINITION: Vehicle exhibits abnormal noise when braking; vehicle may exhibit abnormal noise during motion just after brake pedal release.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Vehicle
2	<p>1. Inspect the disc brake system for the following conditions.</p> <ul style="list-style-type: none"> • Lining wear indicator contact with disc • Debris trapped between disc and splash shield or backing plate; and/or debris trapped between disc and linings • Contaminated linings • Aftermarket linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings • Damaged or excessively worn calliper hardware and/or lining hardware • Incorrectly installed, loose or missing calliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged splash shield or backing plate • Hard spots, heat checks, blueing discolouration of disc friction surfaces • Glazed disc friction surfaces • Bent or damaged calliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to Disc Brake System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Step 3
3	<p>1. Inspect the brake apply system for the following conditions.</p> <ul style="list-style-type: none"> • Lack of lubrication or excessively worn pushrod or pedal pivots or pivot bushes • Bent or damaged pedal pushrod, pedal, or pedal bracket <p>2. Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p>		

	Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	<ol style="list-style-type: none"> 1. Inspect the hydraulic brake system for the following conditions. <ul style="list-style-type: none"> • Improper operation of calliper pistons • Contaminated brake fluid 2. Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis . <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Step 5
5	<p>Inspect the hand brake system for proper operation. Refer to Hand brake System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Diagnostic Starting Point - Vehicle
6	<ol style="list-style-type: none"> 1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . <p>Is the condition still present?</p>	Go to Step 2	System OK

Braking Action Uneven -- Pulls to One Side

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4. Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.
5. Steering components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Vehicle pulls to one side only when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	<ol style="list-style-type: none"> 1. Inspect the brake hydraulic and assist systems for the following conditions: <ul style="list-style-type: none"> • Kinked, pinched or damaged brake pipe or flexible brake hose • Sticking or improperly operating calliper piston • Brake fluid leak 2. Perform the entire brake and hydraulic assist system diagnostic procedure. Refer to Brake Hydraulic and Assist System Diagnosis . 3. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 7	Go to Step 3
3	<ol style="list-style-type: none"> 1. Inspect the disc brake system for the following conditions. <ul style="list-style-type: none"> • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings on one side • Loose, damaged or missing calliper hardware and/or lining hardware • Incorrect linings on one side • Hard spots, heat checks, blueing discolouration of disc friction surfaces; possibly due to brake drag • Glazed disc friction surfaces 		

	<ul style="list-style-type: none"> • Bent or damaged calliper or mounting component <ol style="list-style-type: none"> 2. Perform the disc brake system diagnostic procedure. Refer to Disc Brake System Diagnosis . 3. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 7	Go to Step 4
4	<ol style="list-style-type: none"> 1. Inspect the suspension system for the following conditions. <ul style="list-style-type: none"> • Incorrect tyre pressures • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 7	Go to Step 5
5	<ol style="list-style-type: none"> 1. Inspect the steering system for the following conditions. <ul style="list-style-type: none"> • Loose steering component connections • Excessively worn or damaged steering components 2. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 7	Go to Step 6
6	<ol style="list-style-type: none"> 1. Replace the brake master cylinder for an improperly functioning secondary circuit. Refer to Master Cylinder Replacement . 2. Pressure bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding : Pressure . 3. Perform the entire Antilock Brake System Automated Bleed . <p>Did you find and correct a condition?</p>	Go to Step 7	Go to Symptoms - Hydraulic Brakes
7	<ol style="list-style-type: none"> 1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . <p>Is the condition still present?</p>	Go to Step 2	System OK

Braking Action Uneven -- Front to Rear

[Test Descriptions](#)

The number below refers to the step number on the diagnostic table.

- Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Braking action or stopping force sensitive or grabbing and/or more pronounced at the front or at the rear axle. Sensitive or grabbing brakes: Excessive brake jump-in force relative to brake pedal input.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Vehicle
2	<ol style="list-style-type: none"> Inspect the hydraulic brake system for the following conditions: <ul style="list-style-type: none"> Improper operation of calliper pistons Kinked, pinched or damaged brake pipe or flexible brake hose Brake fluid leak Improperly functioning proportion valve, if equipped Improper operation of dynamic rear proportion (DRP) system, if equipped Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis. <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Step 3
3	<ol style="list-style-type: none"> Inspect the disc brake system for the following conditions: <ul style="list-style-type: none"> Contaminated linings Glazed linings Distorted, cracked or damaged linings Excessively worn linings Aftermarket linings Damaged or excessively worn calliper hardware and/or lining hardware Hard spots, heat checks, blueing discolouration of disc friction surfaces 		

	<ul style="list-style-type: none"> • Glazed disc friction surfaces <p>2. Adjust, repair or replace components as necessary. Refer to Disc Brake System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Step 4
4	<p>1. Inspect the suspension system for the following conditions:</p> <ul style="list-style-type: none"> • Loose suspension component connections • Excessively worn or damaged suspension components <p>2. Adjust, repair or replace components as necessary. Refer to Diagnostic Starting Point - Vehicle .</p> <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Step 5
5	<p>1. Inspect the brake apply system for the following conditions:</p> <ul style="list-style-type: none"> • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket • Binding, bent or damaged brake pedal • Binding, bent or damaged brake pedal bracket <p>2. Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Diagnostic Starting Point - Vehicle
6	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test .</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

Brake Pedal Excessive Travel

Step	Action	Yes	No
DEFINITION: Brake pedal travels further than expected to obtain firm pedal and/or firm pedal cannot be obtained, pedal fades away, or pedal is spongy.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	<p>Inspect the travel and feel of brake pedal applies. Perform the following:</p> <ol style="list-style-type: none"> 1. Ensure the ignition is OFF for at least 60 seconds to depressurise and deplete the power reserve. 2. With the ignition OFF, apply the brake pedal several times to verify the power reserve is fully depleted. 3. With power reserve depleted, apply the brake pedal with light, steady pressure and hold for 15 seconds. Observe pedal travel and feel. 4. Apply the brake pedal with light, steady pressure, then without pumping the pedal, reduce pressure and reapply pressure several times. Observe pedal travel and feel for each apply. 5. Apply the brake pedal slowly, then release and apply the pedal quickly. Observe pedal travel and feel for each apply. <p>Did you complete the brake pedal travel and feel inspections?</p>	Go to Step 3	--
3	<ol style="list-style-type: none"> 1. Inspect the hydraulic brake system for the conditions listed, based on the following symptoms observed during the pedal travel and feel inspections: <ul style="list-style-type: none"> • Pedal feel was spongy <ul style="list-style-type: none"> - Air in hydraulic system - External brake fluid leaks - Soft, weak or damaged hydraulic hoses; expanding under pressure • Pedal fell away and/or traveled to or almost to floor <ul style="list-style-type: none"> - External brake fluid leaks - Poor brake fluid quality; low boiling point - Internal brake fluid leaks; improperly functioning master cylinder • Pedal was somewhat firm then dropped slightly, or pedal rose with successive applies, or pedal travel was different between slow and quick applies <ul style="list-style-type: none"> - Internal brake fluid leaks; improperly functioning master cylinder - Poor brake fluid quality; low boiling point 		

	<ul style="list-style-type: none"> • Pedal returned to rest slowly after any of the applies <ul style="list-style-type: none"> - Internally damaged flexible brake hoses; hindering fluid return - Binding calliper pistons - Internal brake fluid leaks; improperly functioning master cylinder <p>2. Repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p> <p>3. Re-inspect brake pedal apply travel and feel.</p>		
	Did you find and correct a condition?	Go to Step 9	Go to Step 4
4	<p>1. Inspect the disc brake system for the following conditions:</p> <ul style="list-style-type: none"> • Cracked, excessively worn or damaged linings • Cracked, excessively worn or damaged discs • Improperly operating, binding or damaged calliper hardware and/or lining hardware • Loose or missing calliper hardware and/or lining hardware • Excessive assembled lateral runout (LRO) of disc friction surfaces • Bent or damaged calliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to Disc Brake System Diagnosis .</p> <p>3. Re-inspect brake pedal apply travel and feel.</p>		
	Did you find and correct a condition?	Go to Step 9	Go to Step 5
5	<p>Inspect for proper brake pedal travel. Refer to Brake Pedal Travel Measurement and Inspection .</p> <p>Is the brake pedal travel distance within the acceptable limits?</p>		
		Go to Step 8	Go to Step 6
6	<p>1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components.</p> <p>2. Inspect the brake pedal bushes for binding, excessive wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition.</p> <p>3. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged.</p>		
	Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to Step 9	Go to Step 7
7	<p>1. Replace the brake master cylinder assembly.</p> <p>2. Inspect the brake pedal travel. Refer to Brake Pedal Travel Measurement and Inspection .</p>		
	Did you find and correct a condition?	Go to Step 9	Go to Step 8
8	<p>1. Inspect the brake assist system for the following conditions:</p> <ul style="list-style-type: none"> • Internal fluid leaks and/or restrictions within the brake modulator assembly • Damaged or improperly operating brake modulator assembly <p>2. Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p>		
		Go to	Go to Symptoms -

	Did you find and correct a condition?	Step 9	Hydraulic Brakes
9	<ol style="list-style-type: none">1. Install or connect components that were removed or disconnected during diagnosis.2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . <p>Is the condition still present?</p>	Go to Step 2	System OK

Brake Pedal Excessive Effort

Step	Action	Yes	No
DEFINITION: Brake pedal requires an increased amount of input from the driver to obtain good braking action and/or stopping distance is increased.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Vehicle
2	<ol style="list-style-type: none"> Inspect the brake assist system for the following conditions: <ul style="list-style-type: none"> Lack of lubrication, binding or excessively worn pushrod or pedal pivots or pivot bushes Bent or damaged pedal pushrod, pedal, or pedal bracket Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis. <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Step 3
3	<ol style="list-style-type: none"> Inspect the hydraulic brake system for the following conditions: <ul style="list-style-type: none"> Binding calliper pistons Internally damaged flexible brake hoses; hindering fluid flow External brake fluid leaks Kinked or damaged flexible brake hoses and/or pipes Internal brake fluid leaks; improperly operating master cylinder Poor brake fluid quality; low boiling point Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis. <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Step 4
4	<ol style="list-style-type: none"> Inspect the disc brake system for the following conditions: <ul style="list-style-type: none"> Excessively worn linings Glazed linings Cracked, distorted or damaged linings Contaminated linings Binding, damaged or excessively worn calliper hardware and/or lining hardware Lack of lubrication or excessive corrosion on metal to metal contact surfaces Excessively worn or corroded disc friction surfaces 		

	<ul style="list-style-type: none"> • Glazed disc friction surfaces • Hard spots, heat checks, blueing discolouration of disc friction surfaces <p>2. Adjust, repair or replace components as necessary. Refer to Disc Brake System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Diagnostic Starting Point - Vehicle
5	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test .</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

Brakes Drag

Step	Action	Yes	No
DEFINITION: Brake system does not fully release or has delayed release; vehicle motion may be hindered by brake system without applying brakes.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	Is the vehicle equipped with an adjustable stop lamp switch and/or an adjustable cruise control release switch?	Go to Step 3	Go to Step 4
3	1. Inspect the stop lamp switch for proper adjustment to ensure that the brake pedal is fully releasing. 2. Inspect the cruise control release switch, if equipped, for proper adjustment to ensure that the brake pedal is fully releasing. Did you find and correct a condition?	Go to Step 14	Go to Step 4
4	Is the vehicle equipped with a drum-in-disc type of hand brake system?	Go to Step 5	Go to Step 7
5	Ensure the hand brake shoes are not adjusted too tightly, possibly causing drag under certain conditions. Are the hand brake shoes adjusted too tightly?	Go to Step 6	Go to Step 7
6	1. Clean and inspect the hand brake shoes for excessive wear and/or damage. 2. Inspect the drum portion of the discs for excessive wear, blueing discoloration and heat spots. 3. If any of these conditions are present, replace the affected components. 4. Adjust the hand brake system. Did you find and correct a condition?	Go to Step 14	Go to Step 7
7	Inspect the hand brake system for proper operation. Refer to Hand brake System Diagnosis . Did you find and correct a condition?	Go to Step 14	Go to Step 8
8	1. Inspect the disc brake system for the following conditions: <ul style="list-style-type: none"> • Binding, incorrectly installed or missing calliper hardware and/or lining hardware--Ensure free movement of linings and of calliper, if equipped with sliding type calliper • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Distorted or damaged linings • Damaged or excessively worn calliper hardware and/or lining hardware 		

	<ul style="list-style-type: none"> Bent or damaged calliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to Disc Brake System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 14	Go to Step 9
9	<p>1. Separate the brake pushrod from the brake pedal.</p> <p>2. Inspect the brake corners to determine if the brake drag condition is still present.</p> <p>Do the brake corners still exhibit the brake drag condition?</p>	Go to Step 11	Go to Step 10
10	<p>1. Inspect the pushrod for improper positioning and/or damage. Correctly position or replace the pushrod if necessary.</p> <p>2. Inspect the brake pedal assembly for damage and replace if necessary.</p> <p>Did you complete the repair or replacement?</p>	Go to Step 14	--
11	<p>1. For vacuum boost systems, disconnect the vacuum check valve from the booster to relieve vacuum reserve.</p> <p>2. Separate the master cylinder from the brake booster. Do not disconnect any brake pipes.</p> <p>3. Inspect the brake corners to determine if the brake drag condition is still present.</p> <p>Do the brake corners still exhibit the brake drag condition?</p>	Go to Step 13	Go to Step 12
12	<p>Replace the master cylinder assembly.</p> <p>Did you complete the replacement?</p>	Go to Step 14	--
13	<p>1. Inspect the hydraulic brake system for the following conditions.</p> <ul style="list-style-type: none"> Improper operation of calliper pistons Contaminated brake fluid Internally damaged flexible brake hoses; hindering brake release Damaged or improperly operating master cylinder <p>2. Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 14	Go to Symptoms - Hydraulic Brakes
14	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test .</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

Brake System Slow Release

Step	Action	Yes	No
DEFINITION: Brake system releases and returns to rest slowly; vehicle motion is hindered by brake system briefly after release of brake pedal.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	<p>1. Inspect the hydraulic brake and assist system for the following conditions:</p> <ul style="list-style-type: none"> • Improper operation of calliper pistons • Internally damaged flexible brake hoses; hindering brake release • Contaminated brake fluid • Damaged or improperly operating master cylinder • Damaged or improperly operating hydraulic booster, if equipped • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket <p>2. Adjust, repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 4	Go to Step 3
3	<p>1. Inspect the disc brake system for the following conditions:</p> <ul style="list-style-type: none"> • Damaged or excessively worn calliper hardware and/or lining hardware • Distorted or damaged linings • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged calliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to Disc Brake System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 4	Go to Symptoms - Hydraulic Brakes
4	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test .</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

Brake Fluid Loss

Step	Action	Yes	No
DEFINITION: Brake fluid level is low not related to lining wear.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	<p>1. Inspect the following hydraulic brake system components for brake fluid leaks:</p> <ul style="list-style-type: none"> • Flexible brake hose connections; threaded and bolted • Flexible brake hose crimp joints • Brake pipe fittings • Calliper piston seals • Wheel cylinder piston seals, if equipped • Master cylinder reservoir • Master cylinder reservoir low pressure hose, if equipped • Brake pressure modulator valve (BPMV) assembly, if equipped <p>2. Repair or replace components as necessary. Refer to Brake Hydraulic and Assist System Diagnosis .</p> <p>Did you find and correct a condition?</p>	Go to Step 8	Go to Step 3
3	Is the vehicle equipped with a vacuum brake booster?	Go to Step 4	Go to Step 6
4	<p>1. Disconnect the vacuum check valve from the booster to relieve vacuum reserve.</p> <p>2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes.</p> <p>3. Inspect the rear of the master cylinder for a brake fluid leak.</p> <p>4. Inspect for brake fluid in the vacuum brake booster.</p> <p>Did you find a brake fluid leak?</p>	Go to Step 5	Go to Symptoms - Hydraulic Brakes
5	<p>Replace the brake master cylinder and the vacuum brake booster.</p> <p>Did you complete the replacement?</p>	Go to Step 8	--
6	<p>1. Wipe clean the external surface of the master cylinder to hydraulic brake booster area, if equipped.</p> <p>2. Separate the master cylinder from the hydraulic brake booster, if equipped. Do not disconnect any brake pipes.</p> <p>3. Inspect the rear of the master cylinder for a brake fluid leak.</p>		

	Did you find a brake fluid leak?	Go to Step 7	Go to Symptoms - Hydraulic Brakes
7	Replace the brake master cylinder. Did you complete the replacement?	Go to Step 8	--
8	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm proper operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

Disc Brake System Diagnosis

Test Description

The numbers below refer to the step numbers on the diagnostic table:

9. Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.
10. Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.
12. Disc brake disc shields/backing plates that come in contact with disc brake discs may cause brake system noise.
15. Disc brake disc thickness variation that exceeds the maximum acceptable level can cause brake pulsation.
19. Disc brake disc thickness variation that exceeds the maximum acceptable level can cause brake pulsation.
22. Disc brake disc assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Vehicle
2	<p>Visually inspect the disc brake pads for the following conditions:</p> <p>Refer to Brake Pad Inspection .</p> <ul style="list-style-type: none"> • Lining thickness below specifications • Uneven and/or abnormal wear - edge-to-edge and/or side-to-side • Looseness or damage - including pad hardware • Evidence of contamination from an external substance <p>Did you find any conditions to indicate a concern with any of the front and/or rear disc brake pads?</p>	Go to Step 3	Go to Step 12

3	Are any of the front and/or rear disc brake pads contaminated?	Go to Step 8	Go to Step 4
4	Are any of the front and/or rear disc brake pads worn unevenly?	Go to Step 7	Go to Step 5
5	Are any of the front and/or rear disc brake pads and/or pad hardware loose or damaged?	Go to Step 7	Go to Step 6
6	<ol style="list-style-type: none"> 1. Remove and inspect the worn disc brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn disc brake pads as a complete axle set. Refer to Front Disc Brake Pads Replacement and/or Rear Disc Brake Pads Replacement . <p>Did you complete the inspection and replacement?</p>	Go to Step 12	--
7	<p>Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.</p> <p>Note: Do NOT disconnect the hydraulic brake flex hoses from the callipers.</p> <ol style="list-style-type: none"> 1. Remove the front and/or rear disc brake callipers, as appropriate, from the mounting brackets or from the suspension knuckles and support the callipers. Refer to Front Brake Calliper Replacement and/or Rear Brake Calliper Replacement . 2. Inspect the disc brake calliper mounting bracket and the mounting/sliding hardware for the following conditions: Refer to Front Disc Brake Mounting and Hardware Inspection and/or Rear Disc Brake Mounting and Hardware Inspection . <ul style="list-style-type: none"> • Binding or seized hardware • Worn, damaged or missing hardware components • Loose, bent, cracked, or damaged calliper mounting bracket 3. Replace components as required. Refer to the following procedures, as required: <ul style="list-style-type: none"> • Front Brake Calliper Bracket Replacement • Rear Brake Calliper Bracket Replacement 4. Replace the unevenly-worn, loose or damaged disc brake pads as a complete axle set. Refer to Front Disc Brake Pads Replacement and/or Rear Disc Brake Pads Replacement . <p>Did you complete the inspection and replacement?</p>	Go to Step 12	--
8	<ol style="list-style-type: none"> 1. Inspect the disc brake callipers, brake hoses and brake pipes for evidence of an external brake fluid leak. 2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required: <ul style="list-style-type: none"> • Front Brake Calliper Replacement • Rear Brake Calliper Replacement • Front Brake Hose Replacement 		

	<ul style="list-style-type: none"> • Rear Brake Hose Replacement • Brake Pipe Replacement <p>Did you find and correct the source of the leak causing contamination of the pads?</p>	Go to Step 11	Go to Step 9
9	<ol style="list-style-type: none"> 1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the contamination to the pads. <p>Did you find and correct the source of the leak causing contamination of the pads?</p>	Go to Step 11	Go to Step 10
10	<ol style="list-style-type: none"> 1. Inspect the automatic transmission cooling system lines, if equipped, for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 2. Inspect the power steering system hoses for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 3. Replace any components found to be leaking fluid which may be the source of the contamination to the pads. <p>Did you find and correct the source of the leak causing contamination of the pads?</p>	Go to Step 11	--
11	<ol style="list-style-type: none"> 1. Clean the remaining disc brake system components to remove any traces of the contaminant. <p>Caution: Support the brake calliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the calliper in this manner will cause the flexible brake hose to bear the weight of the calliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.</p> <p>Note: Do NOT disconnect the hydraulic brake flex hoses from the callipers.</p> <ol style="list-style-type: none"> 2. Remove the front and/or rear disc brake callipers, as appropriate, from the mounting brackets and support the callipers. Refer to Front Brake Calliper Replacement and/or Rear Brake Calliper Replacement . 3. Inspect the disc brake calliper mounting/sliding hardware for the following conditions: <ul style="list-style-type: none"> • Binding or seized hardware • Distorted, worn, damaged or missing hardware components 4. Replace the calliper mounting/sliding hardware components as required. 5. Replace the contaminated disc brake pads as a complete axle set. Refer to Front Disc Brake Pads Replacement and/or Rear Disc Brake Pads Replacement . <p>Did you complete the cleaning, inspection and replacement?</p>	Go to Step 12	--
12	<p>Visually inspect each of the rear disc brake disc shields/backing plates, if equipped, for evidence of contact with the brake discs.</p> <p>Are any of the brake disc shields/backing plates contacting the brake discs?</p>	Go to Step 13	Go to Step 14
	<p>Repair or replace the disc brake disc shields/backing plates as required. Refer to Front Brake Shield Replacement or Rear Brake Shield</p>		

13	<p>Replacement .</p> <p>Did you complete the repair or replacement?</p>	Go to Step 14	--
14	<p>1. Check the thickness of each of the disc brake discs.</p> <p>Note: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH disc.</p> <p>2. Make a determination for each brake disc if the disc can be REFINISHED and REMAIN ABOVE the minimum requirements.</p> <p>Refer to Brake Disc Thickness Measurement .</p> <p>Does the disc brake disc meet the minimum requirements for REFINISHING?</p>	Go to Step 15	Go to Step 18
15	<p>Note: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH disc.</p> <p>Inspect each of the disc brake discs for thickness variation that exceeds the maximum acceptable level. Refer to Brake Disc Thickness Variation Measurement .</p> <p>Does the brake disc exhibit thickness variation that exceeds the maximum acceptable level?</p>	Go to Step 17	Go to Step 16
16	<p>1. Inspect each of the disc brake discs for the following surface and wear conditions:</p> <p>Refer to Brake Disc Surface and Wear Inspection .</p> <ul style="list-style-type: none"> • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discolouration • Deep or excessive scoring beyond maximum acceptable level <p>Note: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH disc.</p> <p>2. Make a determination for each brake disc if the disc requires refinishing based upon the results of the inspection.</p> <p>If the brake disc exhibits any of the conditions listed previously, it requires refinishing.</p> <p>Does the brake disc require REFINISHING?</p>	Go to Step 17	Go to Step 22
17	<p>1. Refinish the brake disc. Refer to Brake Disc Refinishing .</p> <p>2. Inspect the brake disc thickness. Refer to Brake Disc Thickness Measurement .</p> <p>Were you able to REFINISH the brake disc within the minimum requirements?</p>	Go to Step 22	Go to Step 21
18	<p>Is the brake disc at or below the DISCARD requirements?</p>	Go to Step 21	Go to Step 19
	<p>Note: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH disc.</p>		

19	<p>Inspect each of the disc brake discs for thickness variation that exceeds the maximum acceptable level. Refer to Brake Disc Thickness Variation Measurement .</p> <p>Does the brake disc exhibit thickness variation that exceeds the maximum acceptable level?</p>	Go to Step 21	Go to Step 20
20	<p>1. Inspect each of the disc brake discs for the following surface and wear conditions:</p> <p>Refer to Brake Disc Surface and Wear Inspection .</p> <ul style="list-style-type: none"> • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discolouration • Deep or excessive scoring beyond maximum acceptable level <p>Note: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH disc.</p> <p>2. Make a determination for each brake disc if the disc requires replacement based upon the results of the inspection.</p> <p>If the brake disc exhibits any of the conditions listed previously, it requires replacement.</p> <p>Does the brake disc require REPLACEMENT?</p>	Go to Step 21	Go to Step 22
21	<p>Note: Whenever a brake disc is replaced, the assembled lateral runout (LRO) of the disc must be measured to ensure optimum performance of the disc brakes.</p> <p>Replace the brake disc. Refer to Front Brake Disc Replacement or Rear Brake Disc Replacement .</p> <p>Did you complete the replacement?</p>	Go to Step 24	--
22	<p>Note: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH disc.</p> <p>Inspect each of the disc brake discs for assembled LRO that exceeds the maximum acceptable level. Refer to Brake Disc Assembled Lateral Runout Measurement .</p> <p>Does the brake disc exhibit assembled LRO that exceeds the maximum acceptable level?</p>	Go to Step 23	Go to Step 24
23	<p>Correct the LRO for each brake disc that was determined to have LRO exceeding the maximum acceptable level. Refer to Brake Disc Assembled Lateral Runout Measurement .</p> <p>Did you complete the operation?</p>	Go to Step 24	--
24	<p>Install or connect components that were removed or disconnected during diagnosis.</p> <p>Did you complete the operation?</p>	Disc Brake System OK	--

Brake Hydraulic and Assist System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the brake HYDRAULIC and ASSIST systems in order to determine if the HYDRAULIC and ASSIST systems are operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table or from an electrical diagnostic procedure?	Go to Step 2	Go to Symptoms - Hydraulic Brakes
2	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: <ul style="list-style-type: none"> • Fluid separation, indicating two types of fluid are present <ul style="list-style-type: none"> -- Swirled appearance - oil-based substance -- Layered appearance - silicone-based substance • Fluid discolouration <ul style="list-style-type: none"> - Cloudy appearance - moisture -- Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination.	Go to Step 3	Go to Step 4
3	1. Flush the hydraulic brake system and repair or replace components as directed based upon the type of fluid contamination present. Refer to Hydraulic Brake System Flushing . 2. Pressure bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding : Pressure . 3. Perform the Antilock Brake System Automated Bleed .	Go to Step 4	--
	1. Inspect the following hydraulic brake system components for external fluid leaks: <ul style="list-style-type: none"> • Hydraulic brake hoses • Hydraulic brake pipes • Brake master cylinder reservoir to brake pressure modulator valve (BPMV) feed and return hoses • Brake callipers 		

4	<ul style="list-style-type: none"> • Brake master cylinder • BPMV <ol style="list-style-type: none"> 2. Inspect the hydraulic brake pipes, master cylinder reservoir hoses, and flexible brake hoses for signs of a fluid restriction, such as being bent, kinked, pinched, or damaged. Refer to Brake Pipe and Hose Inspection . 3. Repair or replace any of the hydraulic components found to be leaking brake fluid. 4. Replace any of the hydraulic brake pipes, master cylinder reservoir hoses, and/or flexible brake hoses found to be bent, kinked, pinched, or damaged. <p>Refer to the appropriate procedures:</p> <ul style="list-style-type: none"> • Master Cylinder Replacement Brake master cylinder reservoir cap diaphragm • Front Brake Hose Replacement • Rear Brake Hose Replacement • Brake Pipe Replacement • Brake Master Cylinder Reservoir Hose Replacement • Front Brake Calliper Overhaul or Front Brake Calliper Replacement • Rear Brake Calliper Overhaul or Rear Brake Calliper Replacement • Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement <p>Did you complete the inspections and any necessary repairs or replacements?</p>	-	
5	<p>Perform the system deactivation and vehicle preparation steps:</p> <p>Note: To ensure the complete brake modulator and high pressure accumulator (HPA) pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.</p> <ol style="list-style-type: none"> 1. Enable the propulsion system. 2. Apply and release the brake pedal. 3. Place the transmission in PARK. <p>Note: The power button must be in the OFF position, and without applying the brake pedal to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1-3 minutes.</p> <ol style="list-style-type: none"> 4. Place the power button in the OFF position, without applying the brake pedal. 5. Remove the remote keyless entry (RKE) transmitter and close all of the vehicle doors. 6. Wait approximately 1-3 minutes until the brake modulator and HPA pressure relief is complete. 7. Inspect and adjust the brake fluid level in the brake master cylinder reservoir. Refer to Master Cylinder Reservoir Filling . 8. Connect a battery charger to the 12V battery. Refer to Battery Charging . 	Go to Step 5	--

	<p>9. Install a scan tool to the vehicle.</p> <p>Note: The power button must remain in the ON/RUN position, with the engine OFF during the remainder of this diagnostic procedure, unless otherwise instructed.</p> <p>10. Place the power button in the ON/RUN position.</p> <p>11. Ensure the scan tool is communicating with the vehicle.</p> <p>Did you complete the system deactivation and vehicle preparation steps?</p>	Go to Step 6	
6	Have you already performed the brake sensor performance data checks as part of an electrical DTC diagnostic procedure?	Go to Step 8	Go to Step 7
7	<p>Perform the brake sensor performance data check procedure.</p> <ol style="list-style-type: none"> 1. Place the power button in the ON/RUN position. 2. Place the transmission in PARK. <p>Note: Do not depress the brake pedal during the EBCM relearn.</p> <ol style="list-style-type: none"> 3. Using the scan tool, perform the EBCM relearn. Do not depress the brake pedal. <ol style="list-style-type: none"> 3.1. Select Diagnostics. 3.2. Select the appropriate vehicle information. 3.3. Select Chassis. 3.4. Select EBCM. 3.5. Select Module Setup. 3.6. Select EBCM Relearn and follow the scan tool instructions. <p>Note: To ensure the complete brake modulator and high pressure accumulator (HPA) pressure relief procedure is allowed to occur; the brake controller must see 1 pedal apply with the propulsion system enabled, followed by a proper shutdown without applying the brake pedal.</p> <ol style="list-style-type: none"> 4. Enable the propulsion system. 5. Apply and release the brake pedal. <p>Note: The power button must be in the OFF position, and without applying the brake pedal to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1-3 minutes.</p> <ol style="list-style-type: none"> 6. Place the power button in the OFF position, without applying the brake pedal. 7. Remove the remote keyless entry (RKE) transmitter and close all of the vehicle doors. 8. Wait approximately 1-3 minutes until the brake modulator and HPA pressure relief is complete. <p>Note: The power button must remain in the ON/RUN position, with the engine OFF during the remainder of this diagnostic procedure, unless otherwise instructed.</p>		--

	<p>9. Place the power button in the ON position, engine OFF, and do not apply the brake pedal.</p> <p>10. Using the scan tool, select Data Display for the EBCM, scroll through the data list, select and accept the following:</p> <ul style="list-style-type: none"> • Master Cylinder Pressure Sensor • Rear Brake Pressure Sensor • Brake Pressure Sensor • Accumulator Pressure Sensor • Brake Master Cylinder (BMC) Primary Piston Position Sensor 5V reference • BMC Primary Piston Sensor A • BMC Primary Piston Sensor B <p>11. Power button ON, engine OFF, brakes not applied, verify the following sensor parameters are within the specified values:</p> <ul style="list-style-type: none"> • Master Cylinder Pressure Sensor - Less than 100 kPa (15 psi) • Rear Brake Pressure Sensor - Less than 100 kPa (15 psi) • Brake Pressure Sensor - Less than 100 kPa (15 psi) • Accumulator Pressure Sensor - Less than 800 kPa (116 psi) <p>12. If any of the sensor parameters on the scan tool are not within the specified ranges, replace the BPMV. Refer to Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement .</p> <p>13. With the power button ON, engine OFF, brakes not applied, verify the following sensor parameters are within the specified values:</p> <ul style="list-style-type: none"> • BMC Primary Piston Position Sensor 5V Reference - Between 4.75V and 5.25V • BMC Primary Piston Position Sensor A - Less than 0.8V • BMC Primary Piston Position Sensor B - Greater than 4.2V <p>14. If any of the sensor parameters are not within the specified ranges, see DTC C0277 for further diagnostic information.</p> <p>Did you complete the operation and any required repairs and/or replacements?</p>	Go to Step 8	
8	<p>Inspect for proper brake pedal travel. Refer to Brake Pedal Travel Measurement and Inspection .</p> <p>Was the brake pedal travel within specification?</p>	Go to Step 10	Go to Step 9
9	<ol style="list-style-type: none"> 1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. 2. Inspect the brake pedal bushings for excessive wear and/or damage and inspect the brake pedal for a misaligned, bent and/or damaged condition. 3. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. 4. Perform the entire Antilock Brake System Automated Bleed . 5. Re-inspect for proper brake pedal travel. Refer to Brake Pedal Travel Measurement and Inspection . <p>Is the brake pedal now within specification?</p>	Go to Step 10	Go to Step 20
	Perform the brake master cylinder (BMC) primary circuit test:		

10	<p>Note: The power button must remain in the ON position, engine OFF during this entire procedure.</p> <ol style="list-style-type: none"> 1. Ensure the power button is ON, engine OFF. 2. Using the scan tool, select Data Display for the EBCM, scroll through the Data list, select and accept the following: <ul style="list-style-type: none"> • Master Cylinder Pressure Sensor • Brake Master Cylinder (BMC) Primary Piston Reference Position 3. While observing the master cylinder pressure and the BMC primary piston position sensors on the scan tool data display, using moderate speed and moderate effort, apply and maintain the brake pedal to a force of 2500 kPa (363 psi). 4. Wait for 10 seconds for the system to settle. 5. While ensuring 2500 kPa (363 psi) of force is maintained, observe pedal operation for an additional 30 seconds. <p>Note: The brake pedal should remain firm and steady while maintaining the apply force during the observation period.</p> <p>Did the brake pedal remain firm and steady during the observation period?</p>	Go to Step 11	Go to Step 20
11	<p>Ensure the brake corners are functioning properly:</p> <p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <p>Note: The aid of an assistant will be necessary.</p> <ol style="list-style-type: none"> 1. Raise and support the vehicle. Allow the tyre and wheel assemblies to rotate freely. Refer to Lifting and Jacking the Vehicle . <p>Note: The power button must remain in the ON position, engine OFF during this entire procedure.</p> <ol style="list-style-type: none"> 2. Ensure the power button is in the ON position, engine OFF. 3. Verify the hand brake is released. 4. Place the transmission in NEUTRAL. 5. Continue observing the master cylinder pressure sensor on the scan tool data display. 6. Using moderate speed and moderate effort, apply and maintain the brake pedal to a force of 2500-3000 kPa (363-435 psi). 7. While maintaining the brake apply force, wait 10 seconds, then have an assistant attempt to rotate the rear wheels. 8. If the rear wheels are locked, maintain that amount of apply force. 9. If the rear wheels are not locked, increase the apply force just enough to lock the rear wheels. Maintain that amount of apply force. 10. Have an assistant attempt to rotate the front wheels. 11. Inspect any suspect brake corners for possible component hydraulic restriction and/or mechanical binding. 12. Release the brake pedal and have an assistant rotate each of the wheels again to check for possible brake drag. <p>Note: None of the wheels should be able to be rotated during the brake apply. None of the wheels should exhibit drag after brake release.</p> <p>Did the brake corners apply and release properly?</p>	Go to Step 14	Go to Step 12

12	<p>Determine if the brake calliper is restricting the flow of brake fluid and/or not operating properly.</p> <ol style="list-style-type: none"> 1. Remove the appropriate tyre and wheel assembly. Refer to Tyre and Wheel Removal and Installation . 2. Inspect the hydraulic function of the brake calliper for proper operation. Refer to Hydraulic Brake Component Operation Visual Inspection . 3. Open the suspected calliper bleeder valve. 4. Using a large C-clamp or clamps, evenly compress the calliper piston or pistons. Observe for an unrestricted flow of brake fluid and for free movement of the calliper piston or pistons. 5. Close the calliper bleeder valve. <p>Was the flow of brake fluid unrestricted and did the calliper piston or pistons move freely?</p>	Go to Step 13	Go to Step 19
13	<p>Determine if the brake hose is restricting the flow of brake fluid.</p> <ol style="list-style-type: none"> 1. Carefully inspect the flexible brake hose at the restricted location for signs of a fluid restriction, such as being bent, kinked, pinched, or damaged. Refer to Brake Pipe and Hose Inspection . 2. Replace the brake hose if it is found to be damaged. Refer to the appropriate procedure: <ul style="list-style-type: none"> • Front Brake Hose Replacement • Rear Brake Hose Replacement <p>Did you complete the inspection and any necessary replacement?</p>	Go to Step 14	--
14	<p>Perform the BMC secondary circuit test.</p> <p>Note: The aid of an assistant will be necessary.</p> <ol style="list-style-type: none"> 1. Reinstall the tyre and wheel assembly, if removed previously to verify brake corner function. 2. With the vehicle still supported at a working height, allow the tyre and wheel assemblies to rotate freely. <p>Note: The power button must remain in the ON position, engine OFF during this entire procedure.</p> <ol style="list-style-type: none"> 3. Ensure the power button is ON, engine OFF and the transmission is in NEUTRAL. 4. Continue observing the master cylinder pressure sensor on the scan tool data display. 5. Using moderate speed and moderate effort, apply and maintain the brake pedal to a force of 2500-3000 kPa (363-435 psi). 6. While maintaining the brake pedal apply force, wait 10 seconds, then have an assistant attempt to rotate the rear wheels. 7. If the rear wheels are locked, maintain that amount of apply force. 8. If the rear wheels are not locked, increase the apply force just enough to lock the rear wheels. Maintain that amount of apply force. 9. Wait 20 seconds, then attempt to rotate the front wheels. 10. Attempt to rotate the rear wheels again. <p>Note: None of the wheels should be able to be rotated during the brake apply.</p> <p>Could any of the wheels be rotated during the brake apply?</p>	Go to Step 15	Go to Step 18

15	Were either of the front wheels able to be rotated during the brake apply?	Go to Step 20	Go to Step 16
16	<p>Perform the brake modulator motor, HPA, and fluid control solenoid test:</p> <ol style="list-style-type: none"> Using the scan tool data display, scroll through the Data List, select and accept Accumulator Pressure Sensor. While observing the accumulator pressure sensor data, start the engine and allow it to idle to activate and pressurise the brake system. Observe the accumulator pressure sensor data for 40 seconds. <p>Note: The accumulator pressure sensor data should rise from 0 kPa (0 psi) to 17,000 kPa (2466 psi) within 40 seconds.</p> <p>Did the brake modulator provide the specified amount of pressure within the allotted time period?</p>	Go to Step 18	Go to Step 17
17	<ol style="list-style-type: none"> Perform the entire brake system automated bleed procedure. Refer to Antilock Brake System Automated Bleed . Place the transmission in PARK. <p>Note: The ignition must be OFF, without pausing at ACCESSORY, and without applying the brake pedal to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1-3 minutes.</p> <ol style="list-style-type: none"> Place the power button in the OFF position, without applying the brake pedal. Wait approximately 1-3 minutes until the brake modulator and HPA pressure relief is complete. Again perform the brake modulator motor, HPA, and fluid control solenoid test: <ol style="list-style-type: none"> Using the scan tool data display, scroll through the Data List, select and accept Accumulator Pressure Sensor. While observing the accumulator pressure sensor data, activate the propulsion system to activate and pressurise the brake system. Observe the accumulator pressure sensor data for 40 seconds. <p>Note: The accumulator pressure sensor should rise from 0 kPa (0 psi) to 17,000 kPa (2466 psi) within 40 seconds.</p> <p>Did the brake modulator provide the specified amount of pressure within the allotted time period?</p>	Go to Step 18	Go to Step 21
18	<p>Perform the brake pedal simulator test:</p> <ol style="list-style-type: none"> Activate the propulsion system to activate and pressurise the brake system. Continue observing the master cylinder pressure and the BMC primary piston position sensors on the scan tool data display. Using moderate speed and moderate effort, apply and maintain the brake pedal to a force of 2500 kPa (363 psi). Observe both pedal operation and master cylinder pressure for a period of 20 seconds. <p>Note: The brake pedal should remain firm and steady and master cylinder pressure should remain constant.</p> <p>Did the brake pedal remain firm and steady, and did the master cylinder pressure remain constant?</p>	Go to Step 22	Go to Step 21
19	<p>Repair or replace any brake calliper that was not operating properly. Refer to the appropriate procedure:</p> <ul style="list-style-type: none"> Front Brake Calliper Replacement or Front Brake Calliper Overhaul 		--

	<ul style="list-style-type: none"> • Rear Brake Calliper Replacement or Rear Brake Calliper Overhaul 		
	Did the brake pedal remain firm and steady, and did the master cylinder pressure remain constant?	Go to Step 22	
20	<ol style="list-style-type: none"> 1. Replace the brake master cylinder. Refer to Master Cylinder Replacement . 2. Pressure bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding : Pressure . 3. Perform the entire brake system automated bleed procedure. Refer to Antilock Brake System Automated Bleed . 		--
	Did you complete the replacement and repair procedures?	Go to Step 22	
21	<ol style="list-style-type: none"> 1. Replace the BPMV. Refer to Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement . 2. Pressure bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding : Pressure . 3. Perform the entire brake system automated bleed procedure. Refer to Antilock Brake System Automated Bleed . 		--
	Install or connect any components that were removed or disconnected during diagnosis.	Go to Step 22	
22	Did you complete the operation?	Brake Hydraulic and Assist System OK	--
		Return to Symptom Table	

Brake System Vehicle Road Test

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake master cylinder reservoir fluid level and adjust only if necessary for brake system road testing. Refer to [Master Cylinder Reservoir Filling](#) .
3. Inspect the tyre inflation pressures and adjust as necessary.
4. Inspect the tyre tread patterns to ensure that they are the same or very similar, especially per axle.
5. Ensure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

Warning: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any manoeuvres that could jeopardise vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

1. Start the engine and allow it to idle.
2. Check to see if the brake system warning lamp remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. Refer to [Symptoms - Hydraulic Brakes](#) .
4. Select a smooth, dry, clean and level road or large lot that is as free of traffic and obstacles as possible for brake system low speed road testing.
5. With the transmission in PARK, lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
6. If the brake pedal apply felt spongy, or the pedal travel was excessive, DO NOT drive the vehicle until it is repaired.
7. If the brake pedal apply did not feel spongy and the pedal travel was not excessive, proceed to step 8.
8. Release and apply the brakes.
9. While continuing to apply the brakes, shift the transmission into DRIVE, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
10. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
11. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
12. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 13.
13. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to him.
14. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating

possible brake drag.

15. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
16. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the vehicle without the brakes applied.
17. While continuing to drive the vehicle at a moderate speed, perform several light applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
18. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
19. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 20.
20. While continuing to drive the vehicle at a moderate speed, perform several moderate applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action - either side to side, or front to rear.

A small amount of vehicle front end dip is expected during a moderate apply of the brakes.

21. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.

Brake Pedal Travel Measurement and Inspection

Special Tools

CH-28662 Brake Pedal Effort Gauge

Note: The brake corners must be cool to obtain the most accurate measurement.

1. Place the transmission in PARK.

Note: The ignition must be OFF, without pausing at ACCESSORY, and without applying the brake pedal to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1-3 minutes.

2. Turn the ignition OFF, without pausing at ACCESSORY, and without applying the brake pedal.

Remove the ignition key.

3. Wait approximately 1-3 minutes until the brake modulator and HPA pressure relief is complete.
4. Inspect the battery state of charge. Refer to [Battery Inspection/Test](#) .
5. If necessary, connect a battery charger to the 12V battery. Refer to [Battery Charging](#) .
6. Install the CH-28662 Brake Pedal Effort Gauge to the brake pedal.
7. Install a scan tool to the vehicle.

Note: The ignition switch must remain ON, engine OFF during this entire procedure.

8. Turn the ignition ON with the engine OFF.
9. Using the scan tool, perform the following steps:
 - 9.1. Select Diagnostics
 - 9.2. Select the appropriate vehicle information
 - 9.3. Select Chassis
 - 9.4. Select Electronic Brake Control Module (EBCM)
 - 9.5. Select Data Display
 - 9.6. Scroll through the Data List, select and accept Brake Master Cylinder (BMC) Primary Piston Reference Position, and Master Cylinder Pressure Sensor
10. While observing the master cylinder pressure on the scan tool data display, using moderate speed and moderate effort, press the brake pedal to a force of 5000 kPa (725 psi).

11. Record the distance displayed on the scan tool that the BMC primary piston has travelled at a pedal apply force of 5000 kPa (725 psi).
12. Release the brake pedal.
13. Wait 15 seconds, then repeat steps 10-12 to obtain a second measurement.
14. Compute the average of the first and second measurements recorded during the brake applies.

Specification

Maximum brake master cylinder (BMC) primary piston travel, (measured with the ignition ON, engine OFF and the brakes cool), at a brake pedal apply force of 5000 kPa (725 psi): 18 mm (0.71 in)

Brake System External Leak Inspection

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. In order to inspect for external brake fluid leaks, first check the fluid level in the master cylinder.

While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

If the fluid level is abnormally low, adjust the brake fluid level. Refer to [Master Cylinder Reservoir Filling](#) .

2. Start the engine and allow it to idle.
3. Apply constant, moderate foot pressure to the brake pedal.

If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

4. Turn OFF the ignition.
5. Visually inspect the following brake system components for brake fluid leaks, excessive corrosion, and damage. Give particular attention to all brake pipe and flexible hose connections to ensure that there are not any slight brake fluid leaks - even though the brake pedal may feel firm and hold steady:
 - Master cylinder brake pipe fittings
 - All brake pipe connections
 - Brake pipes
 - Brake hoses and connections
 - Brake callipers and/or wheel cylinders, if equipped
6. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, reinspect the hydraulic brake system to assure proper function.

Brake System Internal Leak Test

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. Ensure ignition is OFF for at least 60 seconds to allow the system to depressurise and deplete the power reserve.
2. Apply the brake pedal several times to verify the power reserve is fully depleted.
3. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
4. Release the brake pedal.
5. If the brake pedal apply felt spongy, but the brake pedal travel was not excessive, perform the following steps:
 - 5.1. Inspect the brake system for external leaks. Refer to [Brake System External Leak Inspection](#).
 - 5.2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. Refer to [Hydraulic Brake System Bleeding : Pressure](#).

6. If the brake pedal apply did not feel spongy, but the brake pedal travel was excessive, perform the following steps:
 - 6.1. Loosen the master cylinder-to-adaptor mounting nuts.

- 6.2. Carefully pull the master cylinder away from the adapter just enough to inspect the mounting surface of the master cylinder.
- 6.3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.
7. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires replacement.
 8. If the master cylinder primary piston (2) does not exhibit any leakage, install the master cylinder to the adapter and pressure bleed the brake system. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .
 9. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, but then gradually fell, then the master cylinder requires replacement due to an internal leak past a piston seal.
 10. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, then fell slightly, then became steady again, then the brake pressure modulator valve (BPMV) may be leaking internally, and may require replacement.

Hydraulic Brake Component Operation Visual Inspection

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. With the tyre and wheel assemblies removed and the brake discs retained by wheel nuts, visually inspect the calliper piston dust boot (2) sealing area to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake calliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the calliper piston (1) in relation to the calliper housing.
4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake calliper.
 - 4.1. Observe the calliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
 - 4.2. Observe the calliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the calliper piston (1) did not exhibit unrestricted and even movement during brake system apply and/or release, the piston square seal (3) may be worn or damaged and the calliper may require overhaul or replacement.

Brake Pipe and Hose Inspection

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. Visually inspect all of the brake pipes for the following conditions:
 - Kinks, improper routing, missing or damaged retainers
 - Leaking fittings, excessive corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe, or pipes, require replacement.
3. Ensure that the vehicle axles are properly supported at ride height in order to maintain the proper relationship of the flexible brake hoses to the chassis.

4. Visually inspect all of the flexible brake hoses for the following conditions:
 - Kinks (1), improper routing, twists, chafing, missing or damaged retainers
 - Leaking connections, cracking, dry-rot, blisters, bulges

5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose, or hoses require replacement.
6. Squeeze the flexible brake hoses with firm finger pressure to check for soft spots (2), indicating an internal restriction. Check the entire length of each flexible brake hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose, or hoses require replacement.

Master Cylinder Reservoir Filling

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. Visually inspect the brake fluid level through the brake master cylinder reservoir.
2. If the brake fluid level is at or below the half-full point during routine fluid checks, the brake system should be inspected for wear and possible brake fluid leaks.
3. If the brake fluid level is at or below the half-full point during routine fluid checks, and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped-off up to the maximum-fill level.
4. If brake system service was just completed, the brake fluid may be topped-off up to the maximum-fill level.
5. If the brake fluid level is above the half-full point, adding brake fluid is not recommended under normal conditions.
6. If brake fluid is to be added to the master cylinder reservoir, clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm. Use only Delco Supreme 11®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.

Master Cylinder Reservoir Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. Remove the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .

2. Remove the brake master cylinder reservoir bolts (1).

3. Carefully pull the master cylinder reservoir (1) straight upward and remove the master cylinder reservoir from the master cylinder.

4. Remove and discard the brake master cylinder reservoir seals (1).

Installation Procedure

1. Lightly lubricate the master cylinder reservoir seals with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .

2. Install the brake master cylinder reservoir seals (1).

3. Carefully install the master cylinder reservoir (1) to the master cylinder.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the brake master cylinder reservoir bolts (1) and tighten to **8 N·m (71 lb in)**.
5. Install the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .

Master Cylinder Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Note: The transmission must be in the PARK position, the power button in the OFF position, and the brakes not applied to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1 to 3 minutes.

1. Place the transmission in PARK.
2. Place the power button in the OFF position.
3. Remove the remote keyless entry (RKE) transmitter and close all of the vehicle doors.

Note: During the pressure relief process, the fluid level in the master cylinder reservoir will rise. Do not remove the master cylinder reservoir cap during the pressure relief process.

4. Wait approximately 3 minutes for the HPA pressure relief to occur.
5. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
6. Remove the bolt and position aside the engine wiring junction block.
7. Remove the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
8. Remove the brake fluid from the master cylinder reservoir and discard into an approved container.
9. Disconnect the brake fluid level indicator electrical connector.
10. Remove the brake master cylinder reservoir supply and return hoses. Refer to [Brake Master Cylinder Reservoir Hose Replacement](#) .

11. Remove the left front brake pipe (1) and the right front brake pipe (2) from the master cylinder.
12. Cap the brake pipe fittings and plug the master cylinder outlet ports to prevent brake fluid loss and contamination.

13. Remove the left front secondary brake pipe (1) from the master cylinder.
14. Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

15. Remove the right front secondary brake pipe (1) from the master cylinder.
16. Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

17. Remove the master cylinder primary brake pipe (1) from the master cylinder.
18. Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

Note: Do not reuse the master cylinder nuts.

19. Remove and discard the 2 master cylinder nuts (1).
20. Remove the brake master cylinder.

Installation Procedure

1. Bench bleed the brake master cylinder. Refer to [Master Cylinder Bench Bleeding](#) .
2. Install the brake master cylinder to the vehicle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Install new master cylinder nuts.

3. Install 2 new master cylinder nuts (1) and tighten to **22 N·m (16 lb ft)**.

4. Install the master cylinder primary brake pipe (1) and tighten the fitting to **23 N·m (17 lb ft)**.

5. Install the right front secondary brake pipe (1) and tighten the fitting to **23 N·m (17 lb ft)**.

6. Install the left front secondary brake pipe (1) and tighten the fitting to **23 N·m (17 lb ft)**.

7. Install the left front brake pipe (1) and the right front brake pipe (2) and tighten the fittings to **23 N·m (17 lb ft)**.
8. Install the brake master cylinder reservoir supply and return hoses. Refer to [Brake Master Cylinder Reservoir Hose Replacement](#) .
9. Connect the brake fluid level indicator electrical connector.
10. Install the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
11. Install the engine wiring junction block and bolt.
12. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
13. Fill the master cylinder reservoir. Refer to [Master Cylinder Reservoir Filling](#) .
14. Bleed the hydraulic brake system. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .

Master Cylinder Bench Bleeding

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

1. Secure the mounting flange of the brake master cylinder in a bench vice so that the rear of the primary piston is accessible.
2. Remove the master cylinder reservoir cap and diaphragm.
3. Install suitable fittings to the master cylinder ports that match the type of flare seat required and also provide for hose attachment.

4. Install transparent hoses to the fittings installed to the master cylinder ports, then route the hoses into the master cylinder reservoir.
5. Fill the master cylinder reservoir to at least the half-way point with GM approved brake fluid from a clean, sealed brake fluid container. Refer to [Master Cylinder Reservoir Filling](#) .
6. Ensure that the ends of the transparent hoses running into the master cylinder reservoir are fully submerged in the brake fluid.
7. Using a smooth, round-ended tool, depress and release the primary piston as far as it will travel, a depth of about 25 mm (1 in), several times. Observe the flow of fluid coming from the ports.

As air is bled from the primary and secondary pistons, the effort required to depress the primary piston will increase and the amount of travel will decrease.

8. Continue to depress and release the primary piston until fluid flows freely from the ports with no evidence of air bubbles.
9. Remove the transparent hoses from the master cylinder reservoir.
10. Install the master cylinder reservoir cap and diaphragm.
11. Remove the fittings with the transparent hoses from the master cylinder ports. Wrap the master cylinder with a clean workshop cloth to prevent brake fluid spills.
12. Remove the master cylinder from the vice.

Brake Fluid Level Indicator Switch Replacement

Callout

Component Name

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Preliminary Procedure

1. Remove the air inlet grille panel. Refer to [Air Inlet Grille Panel Replacement](#) .
2. Loosen, but do not remove, the right side front suspension strut housing brace bolts.
3. Remove the left side front suspension strut housing brace bolts and gently lift the brace upward.

Brake Fluid Level Indicator Switch

Procedure

1

1. Disconnect the electrical connector.
2. Carefully spread the locking tabs and lift the brake fluid level indicator switch upward.
3. After the installation is complete, install the front suspension strut housing brace bolts. Refer to [Front Suspension Strut Housing Brace Replacement](#) .

Brake Pedal Assembly Replacement

[Removal Procedure](#)

1. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
2. Remove the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
3. Remove the bolt and position aside the engine wiring junction block.

Note: Do not reuse the master cylinder nuts.

4. Remove and discard the 2 master cylinder nuts (1).

5. Remove the brake pressure modulator valve (BPMV) bracket nut (1).

6. Remove the BPMV bracket bolt (1).

7. Remove the BPMV bracket bolt (1).

Note: Do not bend the brake pipes.

8. Carefully remove and position aside the master cylinder and the BPMV and bracket assembly. Support the components with heavy mechanics wire or equivalent.

9. Remove the brake pedal assembly nuts (1).
10. Remove the front floor console. Refer to [Front Floor Console Replacement](#) .
11. Remove the left side floor front air outlet duct. Refer to [Floor Front Air Outlet Duct Replacement - Left Side](#) .
12. Remove the steering column. Refer to [Steering Column Replacement](#) .
13. Remove the accelerator pedal position sensor. Refer to [Accelerator Pedal Position Sensor Replacement](#) .
14. Disconnect the brake pedal position sensor electrical connector.
15. Disconnect the electronic brake pedal travel sensor electrical connector.

16. Remove the left upper brake pedal assembly bolts (1).

17. Remove the right upper brake pedal assembly bolts (1).
18. Without removing the instrument panel tie bar assembly, remove the fasteners retaining the tie bar assembly to the vehicle. Refer to [Instrument Panel Tie Bar Replacement](#) .
19. With the aid of an assistant, pull the instrument panel and tie bar assembly rearward and upward approximately 25 mm (1 in) and remove the brake pedal assembly.

Installation Procedure

1. With the aid of an assistant, pull the instrument panel and tie bar assembly rearward and upward approximately 25 mm (1 in) and install the brake pedal assembly.
2. Install the fasteners retaining the tie bar assembly to the vehicle. Refer to [Instrument Panel Tie Bar Replacement](#) .

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the right upper brake pedal assembly bolts (1) and tighten to **12 N·m (106 lb in)**.

4. Install the left upper brake pedal assembly bolts (1) and tighten to **12 N·m (106 lb in)**.
5. Connect the brake pedal position sensor electrical connector.
6. Connect the electronic brake pedal travel sensor electrical connector.
7. Install the accelerator pedal position sensor. Refer to [Accelerator Pedal Position Sensor Replacement](#) .
8. Install the steering column. Refer to [Steering Column Replacement](#) .
9. Install the left side floor front air outlet duct. Refer to [Floor Front Air Outlet Duct Replacement - Left Side](#) .
10. Install the front floor console. Refer to [Front Floor Console Replacement](#) .

11. Install the brake pedal assembly nuts (1) and tighten to **23 N·m (17 lb ft)**.
12. Apply silicone brake lubricant to the brake master cylinder pushrod tip.

Note: Do not bend the brake pipes.

13. Carefully reposition the master cylinder and the BPMV and bracket assembly to the vehicle.

14. Install the BPMV bracket bolt (1) and tighten to **22 N·m (16 lb ft)**.

15. Install the BPMV bracket bolt (1) and tighten to **22 N·m (16 lb ft)**.

16. Install the BPMV bracket nut (1) and tighten to **22 N·m (16 lb ft)**.

Note: Install new master cylinder nuts.

17. Install 2 new master cylinder nuts (1) and tighten to **22 N·m (16 lb ft)**.
18. Install the engine wiring junction block and bolt.
19. Install the front suspension strut housing brace. Refer to [Front Suspension Strut Housing Brace Replacement](#) .
20. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
21. Calibrate the brake pedal position sensor. Refer to [Brake Pedal Position Sensor Calibration](#) .

Brake Pipe Replacement

Special Tools

CH-45405 Brake Pipe Flaring Kit

For equivalent regional tools, refer to [Special Tools](#).

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Warning: Always use double walled steel brake pipe when replacing brake pipes. The use of any other pipe is not recommended and may cause brake system failure. Carefully route and retain replacement brake pipes. Always use the correct fasteners and the original location for replacement brake pipes. Failure to properly route and

retain brake pipes may cause damage to the brake pipes and cause brake system failure.

Note: When servicing the brake pipes, note the following:

- If sectioning the brake pipe, use replacement pipe of the same type and outside diameter.
- Use fittings of the appropriate size and type.
- Only create flares of the same type or design as originally equipped on the vehicle.

1. Inspect the area of brake pipe to be repaired or replaced.
2. Release the brake pipe to be replaced from the retainers, as required.
3. Select an appropriate location to section the brake pipe, if necessary.
 - Allow adequate clearance in order to manoeuvre the *CH-45405* Brake Pipe Flaring Kit .
 - Avoid sectioning the brake pipe at bends or mounting points.
4. Using a string or wire, measure the length of the pipe to be replaced including all pipe bends.
5. Add to the measurement taken the appropriate additional length required for each flare to be created.

Specification

- 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) for 6.35 mm (1/4 in) diameter pipe
- 12.67 mm (0.499 in) for 7.94 mm (5/16 in) diameter pipe

Note: Ensure that the brake pipe end to be flared is cut at a square, 90 degree angle to the pipe length.

6. Using the pipe cutter included in the *CH-45405* Brake Pipe Flaring Kit , carefully cut the brake pipe squarely to the measured length.
7. Remove the sectioned brake pipe from the vehicle.
8. Select the appropriate size of brake pipe and tube nuts, as necessary. The brake pipe outside diameter determines brake pipe size.

9. Strip the nylon coating from the brake pipe end to be flared, if necessary.

- Select the appropriate blade on the coating stripping tool included in the *CH-45405* Brake Pipe Flaring Kit , by unthreading the blade block from the stripping tool and installing the block with the desired blade facing the tool rollers.

Specification

- 6.35 mm (0.250 in) blade for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) blade for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe
- Insert the brake pipe end to be flared into the stripping tool to the depth of the ledge on the tool rollers.
- While holding the brake pipe firmly against the stripping tool roller ledges, rotate the thumbwheel of the tool until the blade contacts the brake pipe coated surface.

Note: Do not gouge the metal surface of the brake pipe.

- Rotate the stripping tool in a clockwise direction, ensuring that the brake pipe end remains against the tool roller ledges.
- After each successive revolution of the stripping tool, carefully rotate the thumbwheel of the tool clockwise, in order to continue stripping the coating from the brake pipe until the metal pipe surface is exposed.
- Loosen the thumbwheel of the tool and remove the brake pipe.

Note: Ensure that all loose remnants of the nylon coating have been removed from the brake pipe.

- Inspect the stripped end of the brake pipe to ensure that the proper amount of coating has been removed.

Specification

- 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe

10. Chamfer the inside and outside diameter of the pipe with the de-burring tool included in the *CH-45405* Brake Pipe Flaring Kit .
11. Install the tube nuts on the brake pipe, noting their orientation.
12. Clean the brake pipe and the *CH-45405* Brake Pipe Flaring Kit of lubricant, contaminants, and debris.

13. Loosen the die clamping screw of the *CH-45405* Brake Pipe Flaring Kit .
14. Select the corresponding die set and install the die halves into the die cage with the full, flat face of one die facing the clamping screw, and the counterbores of both dies facing the forming ram.

15. Place the flat face of an unused die (1) against the die halves in the clamping cage and hold firmly against the counterbored face of the dies.
16. Insert the prepared end of the pipe to be flared through the back of the dies until the pipe is seated against the flat surface of the unused die (1).
17. Remove the unused die (1).
18. Ensure that the rear of both dies are seated firmly against the enclosed end of the die cage.
19. Firmly hand tighten the clamping screw (2) against the dies.

20. Select the appropriate forming mandrel and place into the forming ram.
21. Rotate the hydraulic fluid control valve clockwise to the closed position.
22. Rotate the body of the *CH-45405* Brake Pipe Flaring Kit until it bottoms against the die cage.

23. While guiding the forming mandrel into the exposed end of pipe to be flared, operate the lever of the *CH-45405* Brake Pipe Flaring Kit until the forming mandrel bottoms against the clamping dies.
24. Rotate the hydraulic fluid control valve anticlockwise to the open position to allow the hydraulic forming ram to retract.

25. Insert the finishing cone into the forming ram.
26. Rotate the hydraulic fluid control valve clockwise to the closed position.
27. Rotate the body of the *CH-45405* Brake Pipe Flaring Kit until it bottoms against the die cage.
28. While guiding the finishing cone into the exposed end of pipe to be flared, operate the lever of the *CH-45405* Brake Pipe Flaring Kit until the finishing cone bottoms against the dies.
29. Rotate the hydraulic fluid control valve anticlockwise to the open position to allow the hydraulic forming ram to retract.
30. Loosen the die clamping screw and remove the dies and pipe.
31. If necessary, lightly tap the dies until the die halves separate.

32. Inspect the brake pipe flare for correct shape and diameter (a).

Specification

- 6.74-7.10 mm (0.265-0.279 in) flare diameter for 4.76 mm (3/16 in) diameter pipe
- 8.57-9.27 mm (0.344-0.358 in) flare diameter for 6.35 mm (1/4 in) diameter pipe
- 10.42-10.79 mm (0.410-0.425 in) flare diameter for 7.94 mm (5/16 in) diameter pipe

33. If necessary, using the removed section of brake pipe as a template, shape the new pipe with a suitable brake pipe bending tool.

Note: When installing the pipe, maintain a clearance of 19 mm (3/4 in) from all moving or vibrating components.

34. Install the pipe to the vehicle with the appropriate brake pipe unions, as required.

35. If previously released, secure the brake pipe to the retainers.

36. Bleed the hydraulic brake system. Refer to [Hydraulic Brake System Bleeding](#) : [Pressure](#) .

37. With the aid of an assistant, inspect the brake pipe flares for leaks by starting the engine and applying the brakes.

Brake Master Cylinder Reservoir Hose Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Note: The transmission must be in the PARK position, the power button in the OFF position, and the brakes not applied to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1 to 3 minutes.

1. Place the transmission in PARK.
2. Place the power button in the OFF position.
3. Remove the remote keyless entry (RKE) transmitter and close all of the vehicle doors.

Note: During the pressure relief process, the fluid level in the master cylinder reservoir will rise. Do not remove the master cylinder reservoir cap during the pressure relief process.

4. Wait approximately 3 minutes for the HPA pressure relief to occur.
5. Remove the bolt and position aside the engine wiring junction block.

6. Disconnect the brake master cylinder reservoir supply hose quick connects (1).
7. Remove the brake master cylinder reservoir supply hose.
8. Cap the brake pressure modulator valve (BPMV) inlet port to prevent brake fluid loss and contamination.

9. Disconnect the brake master cylinder reservoir return hose quick connects (1).
10. Remove the brake master cylinder reservoir return hose.
11. Cap the BPMV outlet port to prevent brake fluid loss and contamination.

[Installation Procedure](#)

1. Install the brake master cylinder reservoir return hose.
2. Connect the brake master cylinder reservoir return hose quick connects (1).
3. Ensure the brake master cylinder reservoir return hose quick connects are fully engaged by attempting to pull the return hose from the fittings.

4. Install the brake master cylinder reservoir supply hose.
5. Connect the brake master cylinder reservoir supply hose quick connects (1).
6. Ensure the brake master cylinder reservoir supply hose quick connects are fully engaged by attempting to pull the supply hose from the fittings.
7. Install the engine wiring junction block and bolt.
8. Fill the brake master cylinder reservoir. Refer to [Master Cylinder Reservoir Filling](#) .

Front Brake Hose Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

3. Remove the brake pipe fitting (1) from the front brake hose.
4. Cap the brake pipe fitting to prevent brake fluid loss and contamination.

5. Remove the brake hose retainer (1).

6. Release the brake hose grommet (1) from the strut bracket.

7. Remove the brake hose fitting bolt (1).
8. Remove and discard the brake hose fitting gaskets (2) from the brake hose fitting (3).
9. Remove the brake hose.

[Installation Procedure](#)

1. Assemble the brake hose fitting bolt (1) and the new brake hose fitting gaskets (2) to the brake hose fitting (3).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the brake hose assembly to the brake calliper and tighten the fitting bolt to **40 N·m (30 lb ft)**.

3. Install the brake hose grommet (1) to the strut bracket.

4. Install the brake hose to the wheelhouse bracket and install the retainer (1).

5. Install the brake pipe fitting (1) to the front brake hose and tighten the fitting to **23 N·m (17 lb ft)**.
6. Bleed the hydraulic brake system. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .
7. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Rear Brake Hose Replacement

[Removal Procedure](#)

Warning: Refer to [Brake Dust Warning](#) in the Preface section.

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

3. Remove the rear brake pipe fitting (1) from the rear brake hose.
4. Cap the brake pipe fitting to prevent brake fluid loss and contamination.

5. Remove the rear brake hose retainer (1).

6. Remove the rear brake hose bracket bolt (1).

7. Remove the brake hose fitting bolt (1).
8. Remove and discard the brake hose fitting gaskets (2) from the brake hose fitting (3).
9. Remove the rear brake hose.

[Installation Procedure](#)

1. Assemble the brake hose fitting bolt (1) and the new fitting gaskets (2) to the brake hose fitting (3).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the brake hose assembly to the brake calliper and tighten the fitting bolt to **40 N·m (30 lb ft)**.

3. Install the rear brake hose bracket bolt (1) and tighten to **9 N·m (80 lb in)**.

4. Install the rear brake hose retainer (1).

5. Install the rear brake pipe fitting (1) to the rear brake hose and tighten the fitting to **23 N·m (17 lb ft)**.
6. Bleed the hydraulic brake system. Refer to [Hydraulic Brake System Bleeding : Pressure](#) .
7. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Hydraulic Brake System Bleeding - Pressure

Special Tools

- CH-29532-A Brake Pressure Bleeder, or equivalent
- CH-35589-A Brake Pressure Bleeder Adapter

For equivalent regional tools, refer to [Special Tools](#).

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Caution: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

Note: The transmission must be in the PARK position, the power button in the OFF position, and the brakes not applied to ensure the brake modulator and high pressure accumulator (HPA) pressure relief occurs. This process will take approximately 1 to 3 minutes.

1. Place the transmission in PARK.
2. Place the power button in the OFF position.
3. Remove the remote keyless entry (RKE) transmitter and close all of the vehicle doors.
4. Place a clean shop cloth beneath the brake master cylinder to prevent brake fluid spills.
5. With the power button OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
6. If you have performed a brake master cylinder bench bleeding on this vehicle, or if you disconnected the brake pipes from the master cylinder, you must perform the following steps:
 - 6.1. Ensure that the brake master cylinder reservoir is full to the maximum-fill level. If necessary add Delco Supreme 11®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.

If removal of the reservoir cap and diaphragm is necessary, clean the outside of the reservoir on and around the cap prior to removal.

- 6.2. With the rear brake pipe installed securely to the master cylinder, loosen and separate the front brake pipe from the front port of the brake master cylinder.
- 6.3. Allow a small amount of brake fluid to gravity bleed from the open port of the master cylinder.

- 6.4. Reconnect the brake pipe to the master cylinder port and tighten securely.
- 6.5. Have an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
- 6.6. Loosen the same brake pipe to purge air from the open port of the master cylinder.
- 6.7. Tighten the brake pipe, then have the assistant slowly release the brake pedal.
- 6.8. Wait 15 seconds, then repeat steps 6.2-6.7 until all air is purged from the same port of the master cylinder.
- 6.9. With the front brake pipe installed securely to the master cylinder, after all air has been purged from the front port of the master cylinder, loosen and separate the rear brake pipe from the master cylinder, then repeat steps 6.2-6.8.
- 6.10. After completing the final master cylinder port bleeding procedure, ensure that both of the brake pipe-to-master cylinder fittings are properly tightened.
7. Fill the brake master cylinder reservoir to the maximum-fill level with Delco Supreme 11®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.

Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.

8. Install the *CH-35589-A* Brake Pressure Bleeder Adapter to the brake master cylinder reservoir.
9. Check the brake fluid level in the *CH-29532-A* Brake Pressure Bleeder, or equivalent . Add Delco Supreme 11®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container as necessary to bring the level to approximately the half-full point.
10. Connect the *CH-29532-A* Brake Pressure Bleeder, or equivalent , to the *CH-35589-A* Brake Pressure Bleeder Adapter .
11. Charge the *CH-29532-A* Brake Pressure Bleeder, or equivalent , air tank to 175-205 kPa (25-30 psi).
12. Open the *CH-29532-A* Brake Pressure Bleeder, or equivalent , fluid tank valve to allow pressurised brake fluid to enter the brake system.
13. Wait approximately 30 seconds, then inspect the entire hydraulic brake system in order to ensure that there are no existing external brake fluid leaks.

Any brake fluid leaks identified require repair prior to completing this procedure.

14. Install a proper ring spanner onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
15. Install a transparent hose over the end of the bleeder valve.
16. Submerge the open end of the transparent hose into a transparent container partially filled with Delco Supreme 11®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.
17. Loosen the bleeder valve to purge air from the wheel hydraulic circuit. Allow fluid to flow until air bubbles stop flowing from the bleeder, then tighten the bleeder valve.
18. With the right rear wheel hydraulic circuit bleeder valve tightened securely, after all air has been purged from the right rear hydraulic circuit, install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve.
19. Install a transparent hose over the end of the bleeder valve, then repeat steps 16-17.
20. With the left rear wheel hydraulic circuit bleeder valve tightened securely, after all air has been purged from the left rear hydraulic circuit, install a proper ring spanner onto the RIGHT FRONT wheel hydraulic circuit bleeder valve.
21. Install a transparent hose over the end of the bleeder valve, then repeat steps 16-17.
22. With the right front wheel hydraulic circuit bleeder valve tightened securely, after all air has been purged from the right front hydraulic circuit, install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve.
23. Install a transparent hose over the end of the bleeder valve, then repeat steps 16-17.
24. After completing the final wheel hydraulic circuit bleeding procedure, ensure that each of the 4 wheel hydraulic circuit bleeder valves are properly tightened.
25. Close the *CH-29532-A* Brake Pressure Bleeder, or equivalent , fluid tank valve, then disconnect the *CH-29532-A* Brake Pressure Bleeder, or equivalent , from the *CH-35589-A* Brake Pressure Bleeder Adapter .
26. Remove the *CH-35589-A* Brake Pressure Bleeder Adapter from the brake master cylinder reservoir.

27. Fill the brake master cylinder reservoir to the maximum-fill level with Delco Supreme 11®, GM P/N 12377967 (Canadian P/N 992667), or equivalent DOT-3 brake fluid from a clean, sealed brake fluid container.
28. Slowly depress and release the brake pedal. Observe the feel of the brake pedal.
29. If the brake pedal feels spongy perform the following steps:
 - 29.1. Inspect the brake system for external leaks. Refer to [Brake System External Leak Inspection](#) .
 - 29.2. Using a scan tool, perform the antilock brake system automated bleeding procedure to remove any air that may have been trapped in the brake pressure modulator valve (BPMV). Refer to [Antilock Brake System Automated Bleed](#) .
30. Turn the power button ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

Note: If the brake system warning lamp remains illuminated, DO NOT allow the vehicle to be driven until it is diagnosed and repaired.
31. If the brake system warning lamp remains illuminated, refer to [Symptoms - Hydraulic Brakes](#) .

Hydraulic Brake System Flushing

Warning: Refer to [Brake Fluid Irritant Warning](#) in the Preface section.

Caution: Refer to [Brake Fluid Effects on Paint and Electrical Components Caution](#) in the Preface section.

Caution: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:
 - Fluid separation, indicating two types of fluid are present; a substance other than the recommended brake fluid has been introduced into the brake hydraulic system
 - Swirled appearance - oil-based substance
 - Layered appearance - silicone-based substance
 - Fluid discoloration, indicating the presence of moisture or particles that have been introduced into the brake hydraulic system
 - Cloudy appearance - moisture
 - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust
2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating brake fluid contamination.
3. If the brake fluid WAS contaminated with an oil-based or a silicone-based substance, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following:
 - 3.1. Remove ALL of the following components listed from the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

Refer to the procedures indicated as applicable:

- [Master Cylinder Replacement](#)
- [Front Brake Hose Replacement](#)
- [Rear Brake Hose Replacement](#)
- [Front Brake Calliper Replacement](#)
- [Rear Brake Calliper Replacement](#)
- [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)

- 3.2. Clean out all the hydraulic brake pipes using methylated spirit, or equivalent.

3.3. Dry the brake pipes using non-lubricated, filtered air.

3.4. Repair or replace ALL of the following components listed and install them to the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

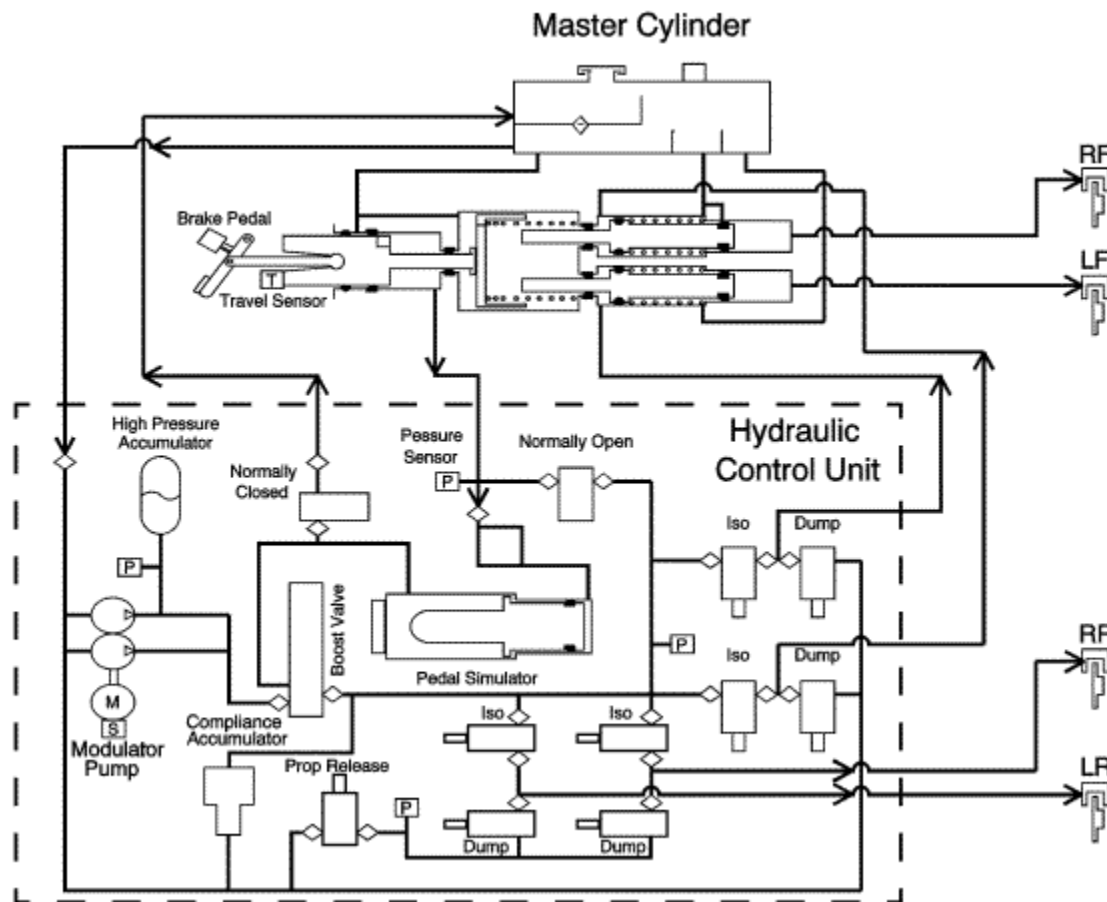

Refer to the procedures indicated as applicable:

- [Master Cylinder Replacement](#) ; also perform the following:
 - Clean the brake master cylinder reservoir using methylated spirit, or equivalent, then dry the reservoir using non-lubricated, filtered air. Inspect the reservoir for cracks and/or damage and replace if necessary. Refer to [Master Cylinder Reservoir Replacement](#) .
 - Replace the brake master cylinder reservoir cap diaphragm.
 - [Front Brake Hose Replacement](#)
 - [Rear Brake Hose Replacement](#)
 - [Front Brake Calliper Overhaul](#) or [Front Brake Calliper Replacement](#)
 - [Rear Brake Calliper Overhaul](#) or [Rear Brake Calliper Replacement](#)
 - [Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement](#)
4. If the brake fluid was NOT contaminated with an oil-based or a silicone-based substance, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm. The diaphragm may have allowed the moisture or particles to enter the hydraulic system.
 5. Fill the brake master cylinder reservoir to the maximum-fill level with Delco Supreme 11®, GM P/N 12377967 (Canada P/N 992667) or equivalent, DOT-3 brake fluid from a clean, sealed brake fluid container.
 6. Pressure bleed the hydraulic brake system. Begin the procedure with the pressure bleeder reservoir filled to the maximum-fill level with the correct brake fluid as indicated. Refer to [Hydraulic Brake System Bleeding](#) : [Pressure](#) .

Brake System, Hydraulic, Assist, and Control Description and Operation

[System Component Description](#)

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir: Contains supply of brake fluid for the hydraulic brake system. Provides for brake fluid to be drawn back into and vented back from the master cylinder primary piston and secondary pistons. Also provides for brake fluid to be drawn into the motor driven pump and high pressure accumulator

(HPA) areas of the brake modulator assembly, and vented back from various areas of the modulator assembly as needed. Provides markings for both the MIN and MAX parameters of the pressurised or operating range; and for the maximum depressurised or system OFF level.

Hydraulic Brake Master Cylinder: Converts mechanical input force into hydraulic output pressure. During normal operation, hydraulic output pressure is distributed from the primary piston of the master cylinder through hydraulic circuits to the pedal feel simulator within the brake modulator assembly. Hydraulic pressure for the wheel apply circuits is generated by a motor driven pump and stored by a high pressure accumulator (HPA) within the modulator assembly. This pressurised fluid is distributed through valves to the rear apply circuits and to the secondary pistons of the master cylinder which, in turn, distribute pressurised fluid to the front wheel apply circuits.

Hydraulic Brake Pipes and Flexible Brake Hoses: Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components: Converts hydraulic input pressure into mechanical output force.

The brake assist system consists of the following:

Brake Pedal: Receives, multiplies and transfers brake system input force from the driver.

Brake Pedal Pushrod: Transfers multiplied input force received from the brake pedal to the brake booster.

Hydraulic Brake Modulator Assembly: Contains several high pressure sensors, valves, solenoids and filters as well as a motor driven pump, high pressure accumulator (HPA), high pressure filter, pedal feedback or pedal simulator and the electronic brake control module (EBCM). The assembly monitors various sensor, control module and driver inputs to determine and command the optimal amount of brake fluid pressure needed for a given situation. The modulator assembly then blends and delivers the pressurised fluid to the wheel apply circuits as appropriate for correct braking balance and performance.

[System Operation](#)

When the power button is placed in ON/RUN or a remote function actuation (RFA) commands remote START, the brake modulator assembly activates and pressurises brake fluid for use at the wheel apply circuits as needed.

The brake modulator assembly incorporates a motor driven pump which is activated as required to draw brake fluid directly from the master cylinder reservoir, lowering the brake fluid level in the reservoir into the pressurised, or operating, range. The pump pressurises and delivers the brake fluid to the high pressure accumulator (HPA) to store for use as necessary. Sensor data of HPA fluid pressure is used by the modulator to operate the pump to maintain the pressure of the brake fluid at the HPA within operating range. Working pressure of the HPA stored fluid is 140-180 bar (2030-2610 psi). Peak allowed pressure is 200 bar (2900 psi). Pressure relief is vented back to the master cylinder reservoir.

Brake system mechanical input force from the driver is multiplied by the brake pedal and transferred by the pedal pushrod to the hydraulic brake master cylinder. This mechanical force is converted into hydraulic pressure by the primary piston of the master cylinder. The pressurised brake fluid from the primary piston is delivered to the brake modulator assembly and is directed within the modulator to the brake pedal feel simulator.

To allow operation of the pedal feel simulator, the brake modulator assembly energises and then closes the normally open (NO) valve to direct brake fluid only to the pedal feel simulator. The brake modulator also energises and opens a normally closed (NC) valve to allow brake fluid to escape from the backside of the brake pedal feel simulator

to the master cylinder reservoir, allowing the simulator piston to move. The pedal feel simulator incorporates a spring which causes increasing brake pedal effort and feedback through the master cylinder, providing brake pedal feel to the driver.

The brake modulator assembly uses sensor data of the brake pedal and pushrod travel and the master cylinder input fluid pressure to determine the amount of braking performance requested by the driver.

Based on the amount of braking action requested by the driver and sensor data inputs of fluid pressure throughout the brake modulator assembly passageways, the modulator uses a boost valve to continuously provide the optimal fluid pressure for use by the wheel apply circuits. The modulator assembly uses the boost valve to both build and relieve pressure within the wheel apply circuits. The boost valve meters the flow of pressurised brake fluid from the HPA to build pressure and relieves pressure as needed by venting fluid through the energised, and open, NC valve to the master cylinder reservoir. The brake modulator assembly also controls various valves in a way similar to a traditional brake modulator, to blend and modulate delivery of brake fluid to the wheel apply circuits, to achieve optimal balance and brake system output performance. The brake modulator delivers brake fluid to the wheel apply circuits as follows:

- Through isolation valves directly to the rear wheel apply circuits
- Through isolation valves directly to the secondary pistons of the master cylinder
- The secondary pistons of the master cylinder then delivers pressurised brake fluid directly to the front wheel apply circuits

Pressurised brake fluid is delivered to the wheel apply hydraulic components through the brake pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses the brake linings against rotating brake system components to slow the vehicle through friction braking.

When the power button is placed in the OFF position and the brake pedal is not applied, the system will deactivate and depressurise. As the system begins to depressurise, brake fluid will discharge from the HPA and vent back into the master cylinder reservoir. This will cause the brake fluid level in the master cylinder reservoir to rise to the depressurised or system OFF range. The system may take up to 3 minutes to fully depressurise.

If the brake pedal is applied before the system has fully depressurised, the brake modulator will maintain the pressure available at the moment of the brake apply until the brake pedal is released. This will increase the amount of time required for the system to depressurise.

Regenerative Braking Function: During a regenerative braking event, the powertrain is used to create drag or torque braking through the drive axle, against the forward motion of the vehicle, while providing a charging function for the batteries.

The brake modulator assembly and the powertrain system controllers are in constant communication with each other. Each system is monitoring various system, sensor data, and driver inputs. Working together, a determination is made as to when the most appropriate opportunity for regenerative braking will occur. The brake modulator will request from the powertrain controllers the amount of torque braking that is available from the powertrain to be delivered through the drive axle. If the powertrain controllers in conjunction with the brake modulator have determined to perform a regenerative braking event, the brake modulator will request a specific amount of regenerative or torque braking to be provided from the powertrain.

Simultaneously, the brake modulator continuously evaluates and provides the correct blend of friction braking from the non-drive axle, and provides the correct blend of regenerative or torque braking and friction braking from the drive axle to provide the most efficient amount of regenerative braking and charging for the needs of the powertrain. All the while, providing optimal braking balance and providing the correct blend and amount of overall vehicle braking action requested by the driver through a brake pedal apply.

Deactivated System: If the brake modulator assembly is powered down either by placing the power button in the OFF position and not applying the brake pedal, or through a system power source failure or if the modulator detects certain critical faults, the system will operate as follows:

Brake system mechanical input force from the driver is multiplied by the brake pedal and transferred by the brake pedal pushrod to the hydraulic brake master cylinder. This mechanical force is converted into hydraulic pressure by the primary piston of the master cylinder.

The pressurised brake fluid from the primary piston is delivered to the brake modulator assembly and is directed within the brake modulator to the wheel apply passageways, rather than to the pedal simulator.

Since the modulator is not energising the normally open (NO) valve to cause it to close and direct pressurised fluid only to the pedal simulator, the NO valve is open and directing fluid to both the pedal simulator and the wheel apply circuit passageways. To prevent any loss of pressure through the pedal simulator, or through the boost valve, the normally closed (NC) valve is closed since it is not energised by the modulator. Since the NC valve is closed, no fluid can escape from the backside of the simulator, thus preventing any movement of the piston within the pedal simulator and any subsequent loss of pressure. The same is true with the boost valve, since the NC valve is closed, no fluid can escape from the pressure relief side of the boost valve, thus preventing loss of pressure. The pressurised fluid is now delivered through the wheel apply circuit passageways within the modulator as follows:

- Through de-energised, open isolation valves directly to the rear wheel apply circuits
- Through de-energised, open isolation valves directly to the secondary pistons of the master cylinder
- The secondary pistons of the master cylinder then deliver pressurised brake fluid directly to the front wheel apply circuits

If a hydraulic failure occurs in the boost circuit of the modulator during further pedal apply, the system will operate as follows:

The mechanical input force is applied further as the primary piston of the master cylinder directly contacts the secondary pistons, which then convert the mechanical force into hydraulic pressure. The pressurised brake fluid from the secondary pistons is delivered directly to the front wheel apply circuits.

Brake Warning System Description and Operation

[Brake Warning Indicator](#)

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check. The brake warning indicator illuminates for 5 seconds.
- When the EBCM detects a too low brake fluid level it sets DTC C0267 and sends a serial data message to the instrument cluster, which will illuminate.

Electronic brake control module (EBCM) monitors the brake fluid level in the brake fluid reservoir. When the fluid within the brake fluid reservoir is below the MIN level, contacts within the brake fluid level switch closes causing the voltage within the signal circuit to drop. The electronic brake control module (EBCM) will detect the voltage drop and will send a serial data message to the instrument cluster commanding the brake warning indicator to illuminate.

Hydraulic Brake System Description and Operation

[System Component Description](#)

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir: Contains supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder: Converts mechanical input force into hydraulic output pressure. Hydraulic output pressure is distributed from the master cylinder through 2 hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System: Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force. Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator.

Hydraulic Brake Pipes and Flexible Brake Hoses: Carries brake fluid to and from hydraulic brake system components.

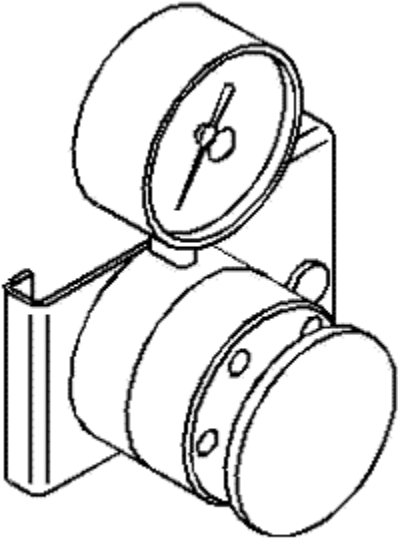

Hydraulic Brake Wheel Apply Components: Converts hydraulic input pressure into mechanical output force.

[System Operation](#)

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

DTC Descriptors

DTC C028A 01: Hand brake Motor Circuit Short to Battery

DTC C028A 02: Hand brake Motor Circuit Short to Ground

DTC C028A 04: Hand Brake Motor Circuit Open Circuit

DTC C028A 08: Hand brake Motor Circuit Performance-Signal Invalid

DTC C028A 28: Hand brake Motor Circuit Performance-Incorrect Frequency

Circuit/System Description

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake switch. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation. The hand brake control module will also diagnose the internal hand brake motor circuit to verify it is functioning properly. The hand brake motor circuit is used to command motor operation, apply and release tension on the hand brake cable, which will apply and release the hand brake.

The hand brake will self diagnose the internal Hand brake Motor Circuit. This circuit is used to drive the motor, which pulls on the hand brake cable, ultimately applying and releasing the hand brake.

Conditions for Running the DTC

- Ignition OFF, ACCESSORY, or RUN mode.
- Battery voltage is between 9 -16V

Conditions for Setting the DTC

The hand brake control module detects an internal motor malfunction.

Action Taken When the DTC Sets

- The electric hand brake is disabled.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- The condition for the DTC is no longer present.

[Circuit/System Description](#)

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake switch. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation. The hand brake control module also contains an internal hand brake motor position sensor which monitors the hand brake motor position.

The Hand brake Motor Position Sensor is an internal sensor to the hand brake control module, this sensor is used to monitor the hand brake motor position.

[Conditions for Running the DTC](#)

Ignition OFF, ACCESSORY, or RUN mode.

[Conditions for Setting the DTC](#)

The hand brake control module detects an internal motor position sensor signal malfunction.

Action Taken When the DTC Sets

- The electric hand brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- Calibrate the hand brake control module.

DTC Descriptors

DTC C0293 01: Hand brake Switch Control Short to Battery

DTC C0293 06: Hand brake Switch Control Low Voltage/Open

DTC C0293 08: Hand brake Switch Control Performance-Signal Invalid

Circuit/System Description

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake control switch. The hand brake control module will perform diagnostics on the hand brake control switch and its wiring harness to verify it is functioning properly. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

The hand brake control switch diagnostic checks for failure conditions in the hand brake switch and associated wiring into the hand brake control module.

Conditions for Running the DTC

Vehicle OFF, Vehicle in Service Mode, Vehicle ON, or Engine Running.

Conditions for Setting the DTC

The hand brake control module detects a short to battery, short to ground, open circuit, or an internal hand brake switch control malfunction.

Action Taken When the DTC Sets

- The electric hand brake is disabled.
- A DIC message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.
- The condition for the DTC is no longer present.

Circuit/System Test

C0293 01 or C0293 06

1. Vehicle OFF, disconnect the harness at the S91 Electric Hand Brake Switch.
2. Verify that a test lamp illuminates between the B+ circuit terminal listed below and ground:
 - Terminal 4
 - Terminal 5

If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K83 Electric Hand brake Control Module.
3. Reconnect the harness at the S91 Electric Hand brake Switch. Disconnect the harness at the K83 Electric Hand brake Control Module.
4. Test for less than 1 V between the circuit terminal listed below and ground:
 - Terminal R
 - Terminal S

If greater than the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the S91 Electric Hand Brake Switch.
5. Vehicle in Service Mode, test for less than 1 V between the following signal circuit terminals at the electric hand brake switch harness connector and ground:
 - Terminal 2
 - Terminal 3
 - Terminal 7

If greater than the specified range, test the signal circuit for a short to voltage.
6. Test for infinite resistance between the signal circuits listed below and ground:
 - Terminal 2
 - Terminal 3
 - Terminal 7

If less than the specified value, test the signal circuit for a short to ground.
7. Test for less than 5 Ω between the following signal circuit terminals:
 - Electric hand brake switch harness terminal 1 and the electric hand brake control module terminal N
 - Electric hand brake switch harness terminal 2 and the electric hand brake control module terminal C
 - Electric hand brake switch harness terminal 3 and the electric hand brake control module terminal B
 - Electric hand brake switch harness terminal 7 and the electric hand brake control module terminal D

If greater than the specified range, test the signal circuit for an open/high resistance.
8. If all circuits test normal, test or replace the S91 Electric Hand brake Switch. If DTC resets, replace the K83 Electric Hand brake Control Module.

C0293 08

Remove the electric hand brake fuse and reinstall. Verify DTC C0293 08 is not set.

If DTC C0293 08 is set, replace the S91 Electric Hand brake Switch.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the hand brake control switch.
2. Test for infinite resistance between the terminals listed below with the switch in the inactive state:
 - B+ terminal 4 and the hand brake control switch signal terminal 1
 - B+ terminal 4 and the hand brake control switch signal terminal 2
 - B+ terminal 5 and the hand brake control switch signal terminal 1
 - B+ terminal 5 and the hand brake control switch signal terminal 2
 - Hand brake control switch signal terminal 3 and the hand brake control switch signal terminal 1
 - Hand brake control switch signal terminal 3 and the hand brake control switch signal terminal 2
 - Hand brake control switch signal terminal 7 and the hand brake control switch signal terminal 1
 - Hand brake control switch signal terminal 7 and the hand brake control switch signal terminal 2If less than the specified range, replace the S91 hand brake control switch.
3. Test for less than 5 Ω between the terminals listed below with the switch in the inactive state:
 - Hand brake control switch signal terminal 1 and terminal 2
 - B+ terminal 4 and hand brake control switch signal terminal 7
 - B+ terminal 5 and hand brake control switch signal terminal 3If greater than the specified range, replace the S91 hand brake control switch.
4. Test for less than 5 Ω between the terminals listed below with the switch in the apply position:
 - Hand brake switch signal terminal 1 and terminal 2
 - B+ terminal 4 and hand brake switch signal terminal 1
 - B+ terminal 4 and hand brake switch signal terminal 2
 - B+ terminal 5 and hand brake switch signal terminal 3If greater than the specified range, replace the S91 hand brake control switch.
5. Test for less than 5 Ω between the terminals listed below with the switch in the apply position:
 - Hand brake control switch signal terminal 1 and terminal 2
 - B+ terminal 5 and hand brake control switch signal terminal 1
 - B+ terminal 5 and hand brake control switch signal terminal 2
 - B+ terminal 4 and hand brake control switch signal terminal 7If greater than the specified range, replace the S91 hand brake control switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Hand brake Switch Replacement](#)
- [Control Module References](#) for hand brake module replacement, programming and setup

DTC C0298

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[DTC Descriptors](#)

DTC C0298 00: Hand brake Unlatch Switch Circuit Malfunction

[Circuit/System Description](#)

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake control switch. When the hand brake control module receives a signal from the switch, the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

[Conditions for Running the DTC](#)

Ignition OFF, ACCESSORY, or RUN mode.

[Conditions for Setting the DTC](#)

The hand brake control module detects the apply or release button was activated for more than 90 seconds.

[Action Taken When the DTC Sets](#)

A message and/or a warning indicator may be displayed.

[Conditions for Clearing the DTC](#)

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- The condition for the DTC is no longer present.
- The hand brake control switch button is released using the scan tool.

Diagnostic Aids

Check if the hand brake control switch is stuck in the apply or release position which may cause the DTC to set.

DTC Descriptors

DTC C0558 55: Calibration Data Too Few Transitions

DTC C0558 5A: Calibration Data Not Plausible

Circuit/System Description

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake control switch. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

C0558 55

The hand brake control module detects a calibration malfunction.

C0558 5A

The hand brake control module detects mechanical problems with the hand brake system.

Action Taken When the DTC Sets

C0558 55

- The electric hand brake is disabled, switch command will not be accepted.
- A message and/or a warning indicator may be displayed.

C0558 5A

- The electric hand brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- Calibrate the hand brake control module.

Diagnostic Aids

- Verify the hand brake control module software and calibrations are the newest available versions.
- Verify the hand brake cable is not broken or pinched.

DTC Descriptors

DTC C0561 71: System Disabled Information Stored-Invalid Serial Data Received

Circuit/System Description

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake control switch. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation. The hand brake module will verify it has a valid signal from other modules before it performs the requested operation.

Conditions for Running the DTC

- Ignition OFF, ACCESSORY, or RUN mode.
- Battery voltage is between 9-16V

Conditions for Setting the DTC

The hand brake control module receives an invalid serial data message or does not receive a serial data message from another module.

Action Taken When the DTC Sets

- A message and/or a warning indicator may be displayed.
- The electric hand brake functionality is degraded.

Conditions for Clearing the DTC

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- The hand brake control module receives Valid signals from other modules.

DTC C0574

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[DTC Descriptors](#)

DTC C0574 01: Circuit Board Temperature Sensor Short to Battery

DTC C0574 02: Circuit Board Temperature Sensor Short to Ground

DTC C0574 54: Circuit Board Temperature Sensor High

[Circuit/System Description](#)

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake control switch. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

[Conditions for Running the DTC](#)

Ignition OFF, ACCESSORY, or RUN mode.

[Conditions for Setting the DTC](#)

C0574 01, C0574 02

The hand brake control module detects a short-circuit to battery or a short-circuit to ground.

C0574 54

The hand brake control module has detected an internal temperature that is above the allowed value.

Action Taken When the DTC Sets

- A message and/or a warning indicator may be displayed.
- The electric hand brake is disabled, one release allowed.

Conditions for Clearing the DTC

- The hand brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- The hand brake control module is replaced or the internal temperature drops below the allowed temperature.

Diagnostic Aids

Check for debris on the hand brake control module which may cause the module to overheat.

Circuit/System Verification

C0574 01 or C0574 02

Remove the EHB fuse and reinstall. Verify DTC C0574 is not set.

If DTC is set, replace the K83 Hand brake Control Module.

C0574 54

Note: Diagnose all other hand brake control module system related faults before performing this diagnostic. Other faults may cause the circuit board to overheat. Do not attempt to apply the electric hand brake.

1. Allow the hand brake control module to cool down for 15 minutes.
2. Verify DTC C0574 54 is not set.

If DTC is set, replace the K83 Hand brake Control Module.

Perform the [Diagnostic Repair Verification](#)

- [Electronic Hand brake Control Module Replacement](#)
- [Control Module References](#)

Symptoms - Hand brake

Important: Review the system operation in order to familiarise yourself with the system functions.

Refer to [Electronic Hand brake Control Module Description](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the hand brake system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

[Hand brake Will Not Hold or Release](#)

Hand brake Will Not Hold or Release

Step	Action	Yes	No
1	Were you sent here from the Hand brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Vehicle
2	Inspect the hand brake system for proper operation. Refer to Hand brake System Diagnosis . Did you find and correct a condition?	Go to Step 5	Go to Step 3
3	Inspect the disc brake system for proper operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to Step 5	Go to Step 4
4	Inspect the hydraulic brake system for proper operation. Refer to Brake Hydraulic and Assist System Diagnosis . Did you find and correct a condition?	Go to Step 5	Go to Diagnostic Starting Point - Vehicle
5	Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to Step 2	System OK

Hand brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the mechanical components of the Hand brake system in order to determine if the Hand brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Hydraulic Brake Symptom table?	Go to Step 4	Go to Step 2
2	Were you sent here from a Hand brake Symptom table?	Go to Step 4	Go to Step 3
3	<p style="color: red; margin: 0;">Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <p>1. Raise and support the vehicle with the rear axle supported by axle stands. Refer to Lifting and Jacking the Vehicle .</p> <p>2. With the hand brake RELEASED, attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag.</p> <p>Do the rear brakes have a significant amount of drag?</p>	Go to Step 7	Go to Step 4
4	<p>1. Apply the hand brake.</p> <p>2. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag.</p> <p>Do the rear brakes have a significant amount of drag?</p>	Go to Step 12	Go to Step 5
5	<p>Visually inspect the hand brake cable connections and the cables that are accessible on the UNDERSIDE of the vehicle for disconnections and/or damage.</p> <p>Were any of the hand brake cables disconnected and/or damaged?</p>	Go to Step 6	Go to Step 7
6	<p>Reconnect or replace the hand brake cables as necessary. Refer to Hand brake Cable Replacement , or Hand brake Rear Cable Replacement - Left Side , or Hand brake Rear Cable Replacement - Right Side .</p> <p>Did you complete the repair and/or replacement?</p>	Go to Step 12	--
7	<p>1. Disconnect the rear hand brake cables from the equaliser and from the brake calliper piston apply levers. Refer to Hand brake Rear Cable Replacement - Left Side and Hand brake Rear Cable Replacement - Right Side .</p> <p>2. Have an assistant apply and maintain the calliper piston apply lever to apply the calliper piston.</p> <p>3. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag.</p> <p>4. Release the calliper piston apply lever.</p> <p>5. Repeat steps 2-4 for the opposite calliper piston apply lever.</p>		

	6. Rotate the rear wheels to check the brake for a significant reduction of drag. Did the brake callipers apply and release properly?	Go to Step 9	Go to Step 8
8	Replace the appropriate rear brake calliper. Refer to Rear Brake Calliper Replacement . Did you complete the replacement?	Go to Step 12	--
9	With the aid of an assistant, apply and release the hand brake while observing the cables for free movement. Did the hand brake cables move freely?	Go to Step 11	Go to Step 10
10	Replace any of the hand brake cables inspected that do not have free movement. Refer to Hand brake Cable Replacement , or Hand brake Rear Cable Replacement - Left Side , or Hand brake Rear Cable Replacement - Right Side . Did you complete the replacement?	Go to Step 12	--
11	Inspect the electronic hand brake control module for proper operation and replace if necessary. Refer to Electronic Hand brake Control Module Replacement . Did you complete the replacement?	Go to Step 12	--
12	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Hand brake System OK	--

Electronic Hand brake Control Module Replacement

Removal Procedure

1. Place the transmission in PARK.
2. Disable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Disabling](#) .
3. Place the power button in the OFF position.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Remove the left rear tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
6. Remove the left rear wheelhouse panel liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .

7. Remove the hand brake cable nut (1) from the electronic hand brake control module.
8. Disconnect the electronic hand brake control module electrical connector.

9. Remove the electronic hand brake control module nuts (1).

10. Lower the front of the electronic hand brake control module (1) and release the module from the grommet in the vehicle body.
11. Remove the electronic hand brake control module.

[Installation Procedure](#)

1. Insert the electronic hand brake control module (1) hanger into the grommet in the vehicle body.
2. Raise the front of the electronic hand brake control module and install onto the studs in the vehicle body.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the electronic hand brake control module nuts (1) and tighten to **10 N·m (89 lb in)**.
4. Connect the electronic hand brake control module electrical connector.

5. Install the hand brake cable nut (1) to the electronic hand brake control module and tighten to **6 N·m (53 lb in)**.
6. Install the left rear wheelhouse panel liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .
7. Install the left rear tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
8. Enable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Enabling](#) .
9. Program the electronic hand brake control module. Refer to [Electronic Hand brake Control Module Programming and Setup](#)

Hand brake Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the radio control assembly. Refer to Radio Control Assembly Replacement .	
	Hand Brake Switch

1

Procedure

1. Disconnect electrical connection.
2. Depress tabs on switch and remove from the panel.

Hand brake Cable Replacement

Removal Procedure

1. Place the transmission in PARK.
2. Disable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Disabling](#) .
3. Place the power button in the OFF position.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Remove the left rear tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
6. Remove the left rear wheelhouse panel liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .

7. Remove the hand brake cable nut (1) from the electronic hand brake control module.

8. Remove the hand brake cable bracket bolt (1).

9. Release the hand brake cable bracket bolt (1) from the vehicle underbody.
10. Remove the fasteners and position aside the evaporative emission canister and bracket assembly. Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#) .

11. Remove the hand brake cable bracket nut (1).

12. Disconnect the hand brake cable equaliser (1) from the left rear hand brake cable.
13. Disconnect the hand brake cable connector (2) from the right rear hand brake cable.
14. Remove the hand brake cable from the vehicle.

Installation Procedure

1. Install the hand brake cable to the vehicle.

2. Connect the hand brake cable equaliser (1) to the left rear hand brake cable.
3. Connect the hand brake cable connector (2) to the right rear hand brake cable.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the hand brake cable bracket nut (1) and tighten to **10 N·m (89 lb in)**.
5. Install the evaporative emission canister and bracket assembly. Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#) .

6. Install the hand brake cable bracket nut (1) and tighten to **10 N·m (89 lb in)**.

7. Install the hand brake cable bracket bolt (1) and tighten to **10 N·m (89 lb in)**.

8. Install the hand brake cable nut (1) to the electronic hand brake control module and tighten to **6 N·m (53 lb in)**.
9. Install the left rear wheelhouse panel liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .
10. Install the left rear tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
11. Enable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Enabling](#) .

Hand brake Rear Cable Replacement - Left Side

Removal Procedure

1. Place the transmission in PARK.
2. Disable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Disabling](#) .
3. Place the power button in the OFF position.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

5. Disconnect the left rear hand brake cable from the actuator lever (1) on the brake calliper.
6. Compress the locking tabs on the left rear hand brake cable conduit (2) and remove the hand brake cable from the bracket.

7. Release the left rear hand brake cable retainer (1) from the hydraulic brake pipe bracket.

8. Release the hand brake cable retainer (1) from the vehicle underbody.
9. Remove and position aside the evaporative emission canister and bracket assembly. Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#) .

10. Disconnect the hand brake cable equaliser (1) from the left rear hand brake cable.

11. Remove the left rear hand brake cable (1) from the bracket on the vehicle underbody by compressing the locking tabs on the cable conduit.
12. Remove the left rear hand brake cable from the vehicle.

[Installation Procedure](#)

1. Install the left rear hand brake cable (1) to the bracket on the vehicle underbody.
2. Secure the locking tabs on the cable conduit to the hand brake cable bracket.

3. Connect the hand brake cable equaliser (1) to the left rear hand brake cable.
4. Install the evaporative emission canister and bracket assembly. Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#) .

5. Install the hand brake cable retainer (1) to the vehicle underbody.

6. Install the hand brake cable retainer (1) to the hydraulic brake pipe bracket.

7. Connect the left rear hand brake cable to the actuator lever (1) on the brake calliper.
8. Secure the locking tabs on the left rear hand brake cable conduit (2) to the bracket.
9. Enable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Enabling](#) .

Hand brake Rear Cable Replacement - Right Side

Removal Procedure

1. Place the transmission in PARK.
2. Disable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Disabling](#) .
3. Place the power button in the OFF position.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

5. Disconnect the right rear hand brake cable from the actuator lever (1) on the brake calliper.
6. Compress the locking tabs on the right rear hand brake cable conduit (2) and remove the hand brake cable from the bracket.

7. Release the right rear hand brake cable retainer (1) from the hydraulic brake pipe bracket.

8. Release the right rear hand brake cable retainer (1) from the vehicle underbody.
9. Remove and position aside the evaporative emission canister and bracket assembly. Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#) .

10. Disconnect the hand brake cable connector (1) from the rear hand brake cable.
11. Remove the right rear hand brake cable (2) from the bracket on the vehicle underbody by compressing the locking tabs on the cable conduit.
12. Remove the right rear hand brake cable from the vehicle.

[Installation Procedure](#)

1. Install the right rear hand brake cable to the bracket on the vehicle underbody.
2. Connect the hand brake cable connector (1) to the rear hand brake cable.
3. Secure the locking tabs on the cable conduit (2) to the hand brake cable bracket.
4. Install the evaporative emission canister and bracket assembly. Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#) .

5. Install the right rear hand brake cable retainer (1) to the vehicle underbody.

6. Install the right rear hand brake cable retainer (1) to the hydraulic brake pipe bracket.

7. Install the right rear hand brake cable to the hand brake cable bracket on rear brake calliper.
8. Connect the right rear hand brake cable to the actuator lever (1) on the brake calliper.
9. Secure the locking tabs on the right rear hand brake cable conduit (2) to the bracket.
10. Enable the hand brake cable adjuster. Refer to [Hand brake Cable Adjuster Enabling](#) .

Hand brake Cable Adjuster Disabling

The hand brake cable tension is controlled by the electronic hand brake (EHB) module. Tension can be fully released from the hand brake cables to allow for service of the hand brake system. Perform one of the following three methods to fully release cable tension.

[Electronic Hand brake Cable Tension Release](#)

With Scan Tool - Preferred Method

1. Block the drive wheels.
2. Install a scan tool to the vehicle.
3. Turn the ignition switch to the ON/RUN position with the engine OFF.
4. Using the scan tool, perform the following:
 - 4.1. From the scan tool menu, select Diagnostics
 - 4.2. Enter the appropriate vehicle information
 - 4.3. Select Chassis
 - 4.4. Select Hand brake Control Module
 - 4.5. Select Special Functions
 - 4.6. Select Cable Replacement
5. Follow the instructions on the scan tool to fully release the tension on the hand brake cables.

Without Scan Tool - Optional Method

1. Block the drive wheels.
2. Turn the ignition switch to the ON/RUN position with the engine OFF.
3. Place the automatic transmission in PARK or manual gearbox in NEUTRAL, as equipped.
4. Apply and hold the brake pedal. The brake pedal must remain applied throughout the hand brake cable tension release process.
5. Press and hold down the electronic hand brake (EHB) switch approximately 5 seconds.
6. Observe the HAND BRAKE lamp on the instrument cluster.
7. When the HAND BRAKE lamp flashes, release then immediately press and release the EHB switch.

The hand brake cable tension is fully released.

8. Release the brake pedal.

Manual Hand brake Cable Tension Release

In the event the above methods to release the hand brake cable tension are unsuccessful, the following procedure may be necessary to release the hand brake cable tension.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Remove the left rear wheelhouse panel liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .

Note: The protective plug for the manual release is located near the electrical connector.

4. Remove the protective plug (1) from the EHB manual release.
5. Using an appropriate square-drive tool, rotate the mechanism clockwise until the tension is fully released from the hand brake cables.

Up to 50 cycles may be required until the hand brake cable tension is fully released.

6. Install the protective plug to the EHB module.

Hand brake Cable Adjuster Enabling

The hand brake cable tension is controlled by the electronic hand brake (EHB) module. Cable tension needs to be set and the EHB module needs to be calibrated following the cable tension disabling procedure. Perform one of the following two methods to fully restore cable tension.

[Electronic Hand brake Cable Tensioning](#)

With Scan Tool - Preferred Method

1. Block the drive wheels.
2. Install a scan tool to the vehicle.
3. Turn the ignition switch to the ON/RUN position with the engine OFF.
4. Using the scan tool, perform the following:
 - 4.1. From the scan tool menu, select Diagnostics
 - 4.2. Enter the appropriate vehicle information
 - 4.3. Select Chassis
 - 4.4. Select Hand brake Control Module
 - 4.5. Select Module Setup
 - 4.6. Select Hand brake Calibration
5. The EHB module will be calibrated and proper tension will be applied to the hand brake cables.

Without Scan Tool - Optional Method

1. Block the drive wheels.
2. Turn the ignition switch to the ON/RUN position with the engine OFF.
3. Apply the brake pedal.
4. Place the automatic transmission in PARK or manual gearbox in NEUTRAL, as equipped.
5. Momentarily lift then release the EHB switch to apply the EHB.
6. Momentarily press down then release the EHB switch to release the EHB.
7. Repeat step 5 and 6 to cycle the EHB on then off an additional 4 times.
8. The EHB module will be calibrated and proper tension will be applied to the hand brake cables.

Electronic Hand brake Control Module Description

Vehicles with the electric hand brake have a switch in the centre console, which takes the place of the manual hand brake system, the foot pedal and release handle. In case of insufficient electrical power, the electric hand brake cannot be applied or released.

[Hand brake Control Module](#)

The hand brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The hand brake control module also contains the logic for applying and releasing the hand brake when commanded by the hand brake control switch. When the hand brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

[Electric Hand brake Apply](#)

The electric hand brake can be applied any time the vehicle is stopped or in motion. The electric hand brake is applied by momentarily lifting up on the hand brake control switch. The red hand brake light will momentarily flash while the hand brake is being applied. Once fully applied, the red hand brake light will turn on. If the electric hand brake is applied while the vehicle is in motion, a chime will sound, and the message "Release Hand brake Switch" will be displayed.

If the red hand brake light is flashing, the electric hand brake is only partially applied or released, or there is a problem with the electric hand brake. The message "Service Hand brake" will be displayed.

[Electric Hand brake Release](#)

To release the electric hand brake, with power mode is Vehicle ON, or Engine Running, apply and hold the brake pedal, and push down momentarily on the hand brake control switch. When the electric hand brake is released the red hand brake light turns off.

The electric hand brake can be used to prevent roll back for vehicles with a manual gearbox taking off on a hill. In a situation where no roll back is desired, an applied electric hand brake will allow both feet to be used for the clutch and accelerator pedals in preparation for starting the vehicle moving in the intended direction. In this situation, perform the normal clutch and accelerator actions required to begin moving the vehicle. There is no need to push the switch to release the electric hand brake. To disable this feature lift and hold the hand brake control switch while the vehicle is in motion, this will keep the electric hand brake applied.

Hand brake System Description and Operation

[System Component Description](#)

The hand brake system consists of the following:

Electronic Hand Brake (EHB) Control Module Assembly: Transfers hand brake system apply input force to the hand brake cable system.

Electronic Hand Brake Switch: Applied by the driver and activates EHB control module or Electronic Stability Control (ESC) braking system.

Hand brake Cable: Transfers input force received from the electronic hand brake control module, through the hand brake cable equaliser, to the hand brake apply lever.

Hand brake Cable Equalizer: Evenly distributes input force to both the left and right hand brake assemblies.

Hand Brake Apply Lever: Multiplies and transfers input force from the hand brake cable to mechanically apply the rear disc brake callipers

Disc Brake Calliper:: Transfers input force from the hand brake apply levers to the rear disc brake pads

Disc Brake Pads:: Applies mechanical output force from the disc brake callipers to the friction portion of the rear disc brake discs

[System Operation](#)

Hand brake apply input force is received by activating the electronic hand brake switch signalling the EHB control module, and transfers an evenly distributed force through the hand brake cables and equaliser to the hand brake apply levers. The hand brake apply levers multiply and transfer the input force to mechanically apply the rear disc brake callipers to prevent the rotation of the rear tyre and wheel assemblies. The electronic hand brake switch signals the EHB module to release applied input force the hand brake cables when activated. The EHB module then removes the applied input force, releasing the hand brake.

Accessory DC Power Control Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS Programming Support Tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select 14 Volt Power Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.

2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least 1 minute.
4. Turn the vehicle ON and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Air Conditioning Compressor Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct power mode.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ACCM or Reprogram ACCM](#)

To program a replacement or an existing Air Conditioning Control Module (ACCM), perform the following procedure:

1. Install EL-49642 SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Air Conditioning Control Module (ACCM) Programming and follow the on-screen instructions.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least one minute.
4. Vehicle in Service Mode, attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Audio Amplifier Programming and Setup

[Replace and Program ECU or Reprogram ECU](#)

This ECU does not require SPS programming or any set-up procedures.

Battery Charger Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct power mode.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool .
2. Connect the drive motor battery charger cable.
3. Access the Service Programming System (SPS) and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Battery Charger - Programming and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select Batter Charger - Setup and follow the on-screen instructions.
6. On the SPS Supported Controllers screen, select Battery Charger - Configuration and follow the on-screen instructions.
7. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least one minute.
4. Vehicle in Service Mode, attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Battery Energy Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Battery Energy Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Body Control Module Programming and Setup

Special Tools

- *EL-49642* SPS Programming Support Tool
- *EL-46079* Tyre Pressure Monitor Diagnostic Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct power mode.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Replace and Program ECU

To program a replacement body control module (BCM), perform the following procedure:

1. Install *EL-49642* SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select BCM Body Control Module - Programming and follow the on-screen instructions.
4. Place the key in the programming slot. Refer to the Help selection button on the SPS Immobiliser Setup screen for the exact slot location. All additional keys must be at least 3 metres away from the vehicle. When replacing a BCM and adding a new key, always program the existing key first before programming the new key.

Note: The following programming step may take between 10-12 min. and progress will appear to have stopped during this process. This is a normal security timer response and a restart should not be performed. If the DTC B389A set immediately after programming a replacement BCM, the Immobiliser Learn procedure was not properly completed. The Immobiliser Learn procedure needs to be performed again.

5. On the SPS Supported Controllers screen, select IMMO Immobiliser Learn - Setup. On the next screen, select Body Control Module IMMO Learn with Existing Transponder or Remote Key and follow the on-screen instructions. When Immobiliser Learn is complete, press the Unlock button on the keyless entry transmitter to allow the keyless entry transmitter to exit the Immobiliser Learn mode.

Note: When performing the Tyre Pressure Monitor Sensor Learn during BCM setup, the *EL-46079* tyre pressure monitor diagnostic tool must be used to activate each tyre pressure sensor.

6. On the SPS Supported Controllers screen, select BCM Body Control Module - Setup and follow the on-screen instructions.
7. Check the driver information centre display for additional messages regarding further calibration instructions. If there are no additional driver information centre instructions present, programming is complete.
8. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Reprogram ECU

To program an existing BCM, perform the following procedure:

1. Install *EL-49642* SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select BCM Body Control Module - Programming and follow the on-screen instructions.

Note: When performing the Tyre Pressure Monitor Sensor Learn during BCM setup, the *EL-46079* tyre pressure monitor diagnostic tool must be used to activate each tyre pressure sensor.

4. On the SPS Supported Controllers screen, select BCM Body Control Module - Setup and follow the on-screen instructions.
5. Check the driver information centre display for additional messages regarding further calibration instructions. If there are no additional driver information centre instructions present, programming is complete.
6. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least one minute.
4. Vehicle in Service Mode, attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Control Solenoid Valve and Transmission Control Module Assembly Programming and Setup - 4ET50

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS Programming Support Tool. .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select TCM - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least one minute.
4. Turn the vehicle ON and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Coolant Heater Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Coolant Heater Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Drive Motor Generator Power Inverter Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS Programming Support Tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Power Inverter Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Immobiliser Learn - Setup and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least 1 minute.
4. Turn the vehicle ON and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Electronic Brake Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection and Maintenance system status indicators to NO.

Special Tools

EL-49642 SPS Programming Support Tool.

For equivalent regional tools, refer to [Special Tools](#)

Replace and Program EBCM or Reprogram EBCM

To program a replacement or an existing Electronic Brake Control Module (EBCM), perform the following procedure:

1. Install EL-49642 SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Electronic Brake Control Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Electronic Brake Control Module - Setup and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
6. If the electronic brake control module was replaced and the hydraulic brake lines were disconnected, perform the [Antilock Brake System Automated Bleed](#) prior to following the last three steps.
7. With a scan tool, access the EBCM, Configuration/Reset Functions, Electronic Brake Control Module Learn.
8. With a scan tool, access the EBCM, Configuration/Reset Functions, Brakes Control Offset Learn.
9. With a scan tool, access the Multi-Axis Acceleration Sensor Module, Configuration/Reset Functions, Yaw Rate Sensor Learn.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all control module, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the control module.
3. If the control module can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the control module. The control module should program.
If the control module still cannot be programmed, replace the control module.

Electronic Parking Brake Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install EL-49642
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Park Brake Control Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Park Brake Control Module - Setup and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
6. With a scan tool, perform the Parking Brake Cable Adjuster Enabling procedure. Refer to [Parking Brake Cable Adjuster Enabling](#)

Engine Control Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#)

The following service procedures require either a programming or a setup event performed for a complete repair.

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[ECM Replacement](#)

If the engine control module (ECM) is replaced, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access Service Programming System (SPS).
2. Before removing the old control module, perform the SPS function Prepare Control Module for Removal.

Note: The Prepare Control Module for Removal function can only be performed when communication with the old control module is still possible.

3. Vehicle OFF, replace the ECM. Refer to [Engine Control Module Replacement](#) .
4. Perform the SPS function Engine Control Module - Programming and follow the onscreen instructions.
5. Perform the SPS function Engine Control Module - Configuration & Setup and follow the onscreen instructions. On the screen Control Module - Configuration and Setup

Function(s), select both control module Configuration/Reconfiguration and the appropriate control module Setup.

6. Clear DTCs after completing the programming procedure.
7. Vehicle ON, engine running.
8. If the SPS function Prepare Control Module for Removal could not be performed, perform the following:

Engine Oil Life Remaining. When available, use a scan tool to reset the Engine Oil Life back to the original percentage recorded before the module was replaced.

ECM Reprogramming

If the ECM needs to be reprogrammed, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS.
2. Perform the SPS function Engine Control Module - Programming and follow the onscreen instructions.
3. Engine Oil Life Remaining. When available, use a scan tool to reset the Engine Oil Life back to the original percentage recorded before the module was reprogrammed.

Setup for Component Replacement

The replacement of some components will require a setup procedure for complete repair.

To speed up the learn process perform the scan tool Fuel Trim Reset function if any of the following components are replaced:

- Manifold absolute pressure sensor
- Accelerator pedal position sensor
- Throttle Body
- Heated oxygen sensor
- Fuel injector
- Crankshaft position sensor
- Camshaft position sensor

Fuel Pump Flow Control Module Programming and Setup

The fuel pump control module must be programmed with the proper calibration software. The module stores and utilizes this information however if it is not properly configured with the correct calibration software, the fuel pump control module will not control all of the vehicle features properly.

Ensure that the following conditions exist in order to prepare for fuel pump control module programming:

1. The battery is fully charged.
2. The MDI data link connectors are secure.
3. The scan tool is loaded with the most current software version.
4. All disconnected modules and devices are reconnected securely.
5. This entire procedure has been reviewed before proceeding.

Do not reprogram the fuel pump control module unless directed by a service procedure or a service bulletin.

Fuel Pump Control Module Programming

To program and setup an existing or new replacement fuel pump control module, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select FPCM Fuel Pump Flow Control Module - Programming and follow the on-screen instructions.

If the fuel pump control module fails to accept the program, verify all scan tool and fuel pump control module connections are secure.

Note: After programming is completed, perform the following to avoid future misdiagnosis:

1. Turn the Vehicle OFF for 10 seconds.
2. Open and close the door.
3. Connect the scan tool to the data link connector.
4. Vehicle in Service Mode, engine OFF.
5. Clear all DTC's from all modules.

Heated Seat Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct power mode.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install EL-49642 SPS Programming Support Tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Seat Heating Control Module- Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least one minute.
4. Vehicle in Service Mode, attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Hybrid Battery Interface Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Battery Energy Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Hybrid Powertrain Control Module 2 Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Hybrid Powertrain Control Module 2 - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs"
5. With a scan tool, perform the [Hybrid/EV Battery Pack Data Reset](#)
6. With a scan tool, perform the [Hybrid/EV Battery Pack Capacity Learn](#)
7. With a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#)
8. With a scan tool, perform the [Clear Secured High Voltage DTCs](#)

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.

4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

HVAC System Control Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool.

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

During HVAC programming you may be required to select multiple calibrations dependant upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install EL-49642
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Remote Heater and Air Conditioning - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Inflatable Restraint Sensing and Diagnostic Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool.

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Diagnostic Aids](#)

The air bag indicator light may remain ON after the body control module (BCM), or SDM is replaced, and during the programming procedure for the BCM until after the procedure is completed. When installing a new SDM, there may be several DTCS set prior to programming. Once programmed, these DTCs should be history and can be cleared.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing Inflatable Restraint Sensing and Diagnostic Module, perform the following procedure:

1. Install *EL-49642* SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Inflatable Restraint Sensing and Diagnostic Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Inflatable Restraint Sensing and Diagnostic Module - Setup and follow the on-screen instructions.

5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Put the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Instrument Cluster Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct power mode.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

Note: This procedure may require a USB flash drive. SPS will indicate if the flash drive is needed.

To program a replacement or an existing ECU, perform the following procedure:

1. Install EL-49642
2. Connect the USB flash drive to the SPS terminal/PC.
3. Access the Service Programming System (SPS) and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Instrument Cluster - Prepare Control Module for Programming and follow the on-screen instructions. If the USB flash drive is needed perform steps 4.1 and 4.2. If the USB is not needed continue on to step 5.

Note: SPS will indicate when it is safe to remove the flash drive from the SPS terminal.

- 4.1. Physically remove the cluster while leaving the connector plugged in to access the USB port on the back of the cluster.
- 4.2. Using cable EL-50344-2 from special tool kit EL-50334-50 , connect the USB flash drive to the instrument cluster.
5. On the SPS Supported Controllers screen, select Instrument Cluster - Programming and follow the on-screen instructions.

Note: If the USB flash drive was required, the instrument cluster will automatically copy files from the flash drive. The SPS screen will indicate 100% completion but SPS will not say programming successful yet, the instrument cluster may still be programming. The instrument cluster screen will display a progression indicator while it is

copying files from the USB drive. Once all files are programmed, SPS will then indicate programming successful.

6. On the SPS Supported Controllers screen, select Instrument Cluster - Setup and follow the on-screen instructions.
7. On the SPS Supported Controllers screen, select Instrument Cluster - Configuration and follow the on-screen instructions.
8. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the vehicle OFF for at least one minute.
4. Vehicle in Service Mode, attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Keyless Entry Control Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS Programming Support Tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Keyless Entry Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Unsuccessful Programming Recovery](#)

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.

2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Mobile Telephone Control Module Programming and Setup

The following service procedures require either a programming or a setup event performed for a complete repair. Do not reprogramme the mobile telephone control module, unless directed by a service procedure, or a service bulletin.

[Mobile Telephone Control Module Replacement and/or Programming](#)

If the mobile telephone control module needs to be replaced and/or reprogrammed, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS. Refer to [Service Programming System \(SPS\)](#) .
2. Perform the SPS function Mobile Telephone Control Module Programming and follow the on-screen instructions.
3. Perform the SPS function Onstar Activation and follow the on-screen instructions.
4. Clear DTCs after completing the programming procedure.

Object Alarm Module Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU](#)

To program a replacement ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Parking Assist Control Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Parking Assist Control Module - Configuration and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

[Reprogram ECU](#)

To reprogram an existing ECU, perform the following procedure:

1. Install *EL-49642* SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Parking Assist Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Passenger Presence System Programming and Setup

Passenger Presence System Preload Test

The passenger presence system (PPS) consists of an electronic control module, a conductive based sensor mat, wiring harness, and PASSENGER AIR BAG ON/OFF indicators. The sensor mat is made up of several flexible conductive metal strips placed underneath the seat cushion trim. These sensor strips transmit and receive a low level electric field. The measured capacitance value of this field is used to determine the type of occupant sitting in the front passenger seat. If the passenger seat bottom cushion, seat bottom trim, or heater pad has been serviced, reinstalled, or removed for any reason, the procedure below will check for any preloads on the PPS. A service replacement PPS module does not require an unlock procedure prior to an initial preload test.

Note:

- Before the PPS can be checked for preloads the front passenger seat must be completely empty of all items. The presence of any items on the front passenger seat will affect the calibration and operation of the PPS. When the preload test is performed, the instrument panel cluster (IPC) and dash lights will begin illuminating at varying intensity. This is normal operation during the preload test procedure and does not indicate additional system faults.
- The [Diagnostic System Check - Vehicle](#) must be performed after successfully completing the preload test procedure to ensure the system is functioning properly.

Passenger Presence System Preload System Test

1. Empty the front outboard passenger seat (this system is susceptible to conductive material).
2. With the scan tool, perform the Preload Passenger Presence System procedure.
3. Using the scan tool, check for DTC B0081 in history. If the test fails or DTC B0081 11 is current, confirm that the seat is empty. Perform the passenger presence sensor learn test again. If the test fails again, for heated seats, ensure that the sensor pad is on top of the heater element. Once the test successfully completes, cycle the Vehicle OFF.
4. Perform the [Diagnostic System Check - Vehicle](#) after successfully completing the preload test procedure to ensure the system is functioning properly.

Power Steering Control Module Programming and Setup

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

[Replace and Program ECU or Reprogram ECU](#)

To program a replacement or an existing ECU, perform the following procedure:

1. Install EL-49642
2. Access the Service Programming System (SPS) and follow the on-screen instructions.

Note: The Prepare Control Module for Programming function can only be performed when communication with the old control module is still possible.

3. On the SPS Supported Controllers screen, select Electronic Power Steering Control Module - Prepare Control Module for Removal and follow the on-screen instructions.
4. Replace the Electric Power Steering Control Module
5. On the SPS Supported Controllers screen, select Electronic Power Steering Control Module - Programming and follow the on-screen instructions.
6. On the SPS Supported Controllers screen, select Electronic Power Steering Control Module - Setup and follow the on-screen instructions.
7. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
8. With a scan tool, perform the steering angle sensor centering and software endstop relearn. Refer to [Power Steering Control Module Calibration](#)

Radio Control Programming and Setup

[Replace and Program ECU or Reprogram ECU](#)

This ECU does not require SPS programming or any set-up procedures.

Radio Programming and Setup

Special Tools

EL-49642 SPS Programming Support Tool.

For equivalent regional tools, refer to [Special Tools](#) .

Note:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the *EL-49642* SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

- During radio programming you may be required to select multiple calibrations dependant upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- The XM satellite radio (if equipped) is integrated into the radio. If XM was activated in the previous radio, the replacement radio will require no additional activation steps. Customer subscription information is transferred to the replacement radio when a replacement radio is ordered.

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install EL-49642
2. Access the Service Programming System (SPS) and follow the on-screen instructions.

3. On the SPS Supported Controllers screen, select Radio - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Vehicle OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Vehicle OFF for at least one minute.
4. Turn the Vehicle in Service Mode and attempt to reprogram the ECU. The ECU should program.
If the ECU still cannot be programmed, replace the ECU.

Remote Control Door Lock Receiver Programming and Setup

[Diagnostic Aids](#)

The remote control door lock receiver only functions as an aerial, receiving the signals sent by the keyless entry transmitter and forwarding them to the body control module (BCM). The keyless entry software is contained wholly within the BCM.

[Replace and Program ECU or Reprogram ECU](#)

This ECU does not require SPS programming or any set-up procedures.

Steering Column Lock Control Module Programming and Setup

The following service procedures require either a programming or a setup event performed for a complete repair.

[Steering Column Lock Control Module Replacement](#)

If the steering column lock control module needs to be replaced, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS. Refer to [Service Programming System \(SPS\)](#) .
2. Perform the SPS function Steering Column Lock Control Module - Programming and follow the on-screen instructions.
3. Perform the SPS function Steering Column Lock Control Module - Configuration & Setup and follow the on-screen instructions. On the screen Control Module - Configuration and Setup Function(s), select both ECU Configuration/Reconfiguration and ECU Setup.
4. Clear DTCs after completing the programming procedure.

[Steering Column Lock Control Module Reprogramming](#)

If the steering column lock control module needs to be reprogrammed, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS. Refer to [Service Programming System \(SPS\)](#) .
2. Perform the SPS function Steering Column Lock Control Module - Programming and follow the on-screen instructions.
3. Clear DTCs after completing the programming procedure.

Theft Deterrent Module Programming and Setup

[Diagnostic Aids](#)

The theft deterrent module only functions as an exciter and aerial, energising the key transponder and receiving the key code information. The immobiliser software is contained wholly in the body control module (BCM).

[Replace and Program ECU or Reprogram ECU](#)

This ECU does not require SPS programming or any set-up procedures.

Tyre Pressure Indicator Receiver Programming and Setup

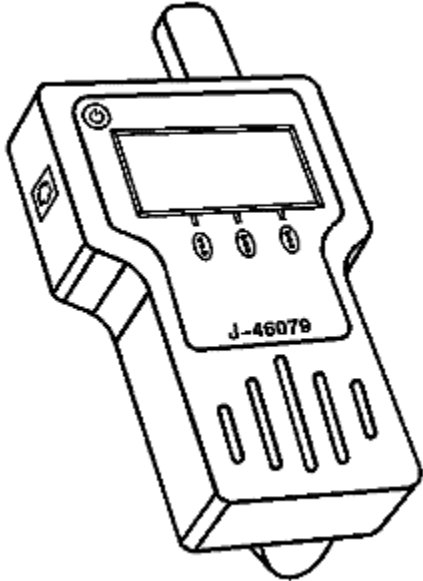

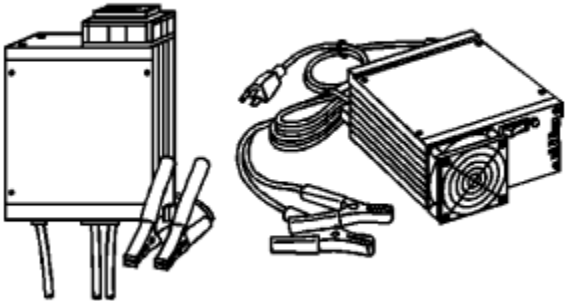

[Replace and Program ECU or Reprogram ECU](#)

This ECU does not require SPS programming but does require the following setup procedures after a new ECU is installed:

Drive the vehicle for at least 9 minutes above 40 km/h (25 MPH) to perform the K65 tyre pressure indicator module autolearn process.

Special Tools

Illustration	Tool Number/ Description
	<p>EL 46079 J 46079 Tyre Pressure Monitor Diagnostic Tool</p>
	<p>EL 49642 EL 50113 Europe - Use recommended equivalent workshop equipment SPS Programming Support Tool</p>

EL 50334-50
USB Cable and Adapter Kit

Body Control Module Scan Tool Information

Table 1: [Body Control Module Scan Tool Data Parameters](#)

Table 2: [Body Control Module Scan Tool Output Controls](#)

Body Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode, Vehicle in Park, All Doors Closed			
Accent Lighting 1 Command	-	Varies	This parameter displays the interior lighting ambient 1 command as a percentage.
Accessory	-	Active	The scan tool displays Active or Inactive.
Accessory Power Mode Indicator Command	-	Varies	This parameter displays ignition switch accessory LED PWM command as a percentage.
Accessory Relay Command	-	Active	The scan tool displays Active or Inactive.
Accessory/Retained Accessory Power Relay Command	-	Active	The scan tool displays Active or Inactive. This parameter displays the retained accessory power relay status.
All Door Lock Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the door lock status.
Ambient Light Sensor	-	Varies	The scan tool displays volts. This parameter displays the ambient light sensor signal voltage.
Ambient Light Status	-	Night	The scan tool displays Unknown, Night, or Day. This parameter displays the ambient light level status.
Automatic Headlamps Disable Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the headlamp disable switch status.
Automatic Transmission	-	Off	The scan tool displays Off or On. This parameter displays the transmission tap up tap down switch status.

Manual Shift Switch			
Reverse Lamps Relay Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the reverse lamps relay status.
Battery Low at Start	-	Inactive	The scan tool displays Active or Inactive. This parameter displays Active when the battery level is low when the vehicle starts.
Battery Reconnect Detected	-	No	The scan tool displays No or Yes when a battery disconnect/reconnect event has been detected.
Battery Voltage	-	Varies	The scan tool displays the current battery voltage.
BCM-Controlled Charging Voltage	-	Active	The scan tool displays Active or Inactive.
BCM-Requested Charging Voltage Reduction	-	Inactive	The scan tool displays Active or Inactive. This parameter displays Active when the BCM has detected a low battery voltage condition.
Boot Software Part Number	-	Varies	The scan tool displays the boot software part number.
Brake Lamp Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the brake lamp command status.
Brake Pedal Initial Travel Position Achieved	-	No	The scan tool displays No or Yes.
Brake Pedal Position Sensor High Voltage During Learn	-	No	The scan tool displays No or Yes.
Brake Pedal Position Sensor Learn	-	No	The scan tool displays No or Yes. This parameter displays Yes when the brake pedal position sensor has learned.
Brake Pedal Position Sensor Learned Home Position	-	Yes	The scan tool displays No or Yes. This parameter displays Yes when the brake pedal position sensor has learned the home position.
Brake Pedal Position Sensor Low Voltage During Learn	-	No	The scan tool displays No or Yes.
Brake Pedal Position Sensor Move During Learn	-	No	The scan tool displays No or Yes. This parameter displays the brake pedal sensor learn status.
Brake Pedal			

Position Sensor Pulled Up from Home Position	-	No	The scan tool displays No or Yes.
Brake Pedal Position Sensor Reference	-	Varies	The scan tool displays the brake pedal position as voltage value. This parameter displays the current brake pedal position sensor reference.
Brake Pedal Pulled Up from Home Position	-	No	The scan tool displays No or Yes.
Brake Transmission Shift Interlock Solenoid Actuator	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the remote start diagnostic status history.
Brake Transmission Shift Interlock Solenoid Actuator Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the last remote start diagnostic status history.
Calibration Part Number 1-20	-	Varies	The scan tool displays the software module calibration part number.
Centre Brake Lamp Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the centre brake lamp status.
Central Door Lock Switch on Centre Console	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the driver door lock switch status.
Child Security Lock Indicator Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the child security lock indicator command status.
Content Theft Deterrent Alarm Status	-	Disarmed	The scan tool displays Off, Armed, or Disarmed. This parameter displays the content theft alarm status.
Content Theft Deterrent Disarmed Until Vehicle Closed	-	No	The scan tool displays No or Yes. This parameter displays the content theft deterrent system status.
Content Theft Deterrent Mode	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.
Content Theft Deterrent Trigger History 1-3	-	None	The scan tool displays None, Driver door, Passenger door, Left rear door, Right rear door, Rear closure, Midgate, Tonneau Cover, Bonnet, Ignition Voltage, Intrusion, Inclination, Telematics enhanced service alarm, Battery reconnect detected, Unauthorised PWM change, Security Indicates Tamper, or Glass Breakage. This parameter displays the content theft deterrent trigger history status.
Courtesy Lamps			

Duty Cycle Command	-	Varies	This parameter displays the interior lights dimming command as a percentage.
Crank Abort	-	Inactive	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.
Cruise Charging Set Level	-	Varies	This parameter displays cruise charging set level.
Cruise Control Switch Status	-	OFF	The scan tool displays CANCEL, OFF, ON, RESUME, SET or ERROR. This parameter displays the cruise control switch status.
Current Content Theft Deterrent Trigger	-	None	The scan tool displays None, Driver door, Passenger door, Left rear door, Right rear door, Rear closure, Midgate, Tonneau Cover, Bonnet, Ignition Voltage, Intrusion, Inclination, Telematics enhanced service alarm, Battery reconnect detected, Unauthorised PWM change, Security Indicates Tamper, Glass Breakage. This parameter displays the content theft deterrent current alarm trigger.
Current Driver	-	1-8	This parameter displays the current driver in vehicle.
Disable Battery Saver Relay Command	-	Inactive	The scan tool displays Active or Inactive.
Interior light Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the interior light switch status.
Driver Door Ajar Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the driver door Ajar switch status.
Driver Door Unlock Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the driver door unlock command status.
Driver Window Learned	-	Yes	The scan tool displays No or Yes.
Driver Window Main Control Down Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the driver window main control down switch input status.
Driver Window Main Control Express Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the driver window switch express input status.
Driver Window Main Control Up Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the driver window switch UP input status.
Driver Window Motor Mode	-	Local Switch Overridden	The scan tool displays Down, Express Down, Express, Up, Error, Inhibit, or Local Switch Overridden. This parameter displays the driver window motor mode status.
Enable Battery Saver Relay Command	-	Inactive	The scan tool displays Active or Inactive.
End Model Part Number	-	Varies	This parameter displays the end model part number.
Engine Stalled	-	Inactive	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.

Environment Identification	-	Unknown	The parameter displays the vehicle environment identification successful status.
Environment Identification	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the front fog lamps status.
Front Fog Lamps Relay Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the front fog light relay status.
Front Fog Lamps Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the front fog lamp switch status.
Front Passenger Window Main Control Down Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the front passenger window down switch status.
Front Passenger Window Main Control Express Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger window switch express input status.
Front Passenger Window Main Control Up Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger window switch UP input status.
Front Tyre Pressure on Placard	-	Varies	The scan tool displays kPa or PSI. This parameter displays the specified tyre pressure placard information programmed in the BCM for tyre pressure monitoring.
Fuel Economy Mode Inhibited - Low Charging Voltage	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the fuel economy mode status.
Generator Regulator Setpoint	-	Varies	The scan tool displays percentage.
Hazard Lamps Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the hazard lamps switch status.
Hazard Lamps Switch Backlight Command	-	Varies	The scan tool displays percentage. This parameter displays hazard switch backlight level PWM command status.
Headlamps On Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the headlamp on switch status.
Headlamps Flash Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the headlamps flash to pass switch status.
Main Beam Select Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the main beam switch status.

Main Beam Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the main beam command status.
Bonnet Ajar Switch	-	Inactive	This parameter display the remote start diagnostic status history or the last remote start diagnostic status history.
Bonnet Ajar Switch Signal 1	-	Inactive	This parameter display the remote start diagnostic status history or the last remote start diagnostic status history.
Bonnet Position	-	CLOSED	The scan tool displays CLOSED, AJAR, or OPENED. This parameter displays the bonnet position.
Horn Relay Command	-	Inactive	The scan tool displays Active or Inactive.
Horn Switch	-	Inactive	The scan tool displays Active or Inactive.
Idle Boost Level 2-3 Counter	-	Varies	This parameter displays the state of the idle boost level as counts.
Idle Charging Set Level	-	Varies	This parameter displays idle charging set level.
Immobiliser Allows Engine To Start	-	Unknown	The scan tool displays Unknown, Incorrect, Not Allowed, or Valid. This parameter displays the immobiliser status.
Immobiliser Automatic Learn Timer	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the automatic learn timer status.
Immobiliser Environment Device 1-4	-	Unknown	The scan tool displays Incorrect, Correct, Not Received, Not Programmed or Unknown. This parameter displays the immobiliser source status.
Immobiliser Password Learn	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the password learn status.
Immobiliser Password Learn Scan Tool Delay	-	Varies	This parameter displays the auto learn timer status.
Immobiliser Security Code Accepted	-	No	The scan tool displays No or Yes.
Immobiliser Security Code Lockout	-	No	The scan tool displays No or Yes.
Immobiliser Security Code Programmed	-	Yes	The scan tool displays No or Yes.
In Park Switch Status	-	On	The scan tool displays On or Off. This parameter displays the park switch status.
Inadvertent Load			

Command	-	Active	The scan tool displays Active or Inactive.
Indicator Dimming Duty Cycle Command	-	Varies	The scan tool displays percentage. This parameter displays indicator lighting PWM command status.
Interior/Courtesy Lighting Master Switch	-	Door	The scan tool displays Door or other lighting switch status.
Interior Boot Lid/Tailgate Window Unlatch Switch	-	Inactive	The scan tool displays Active or Inactive.
Key Capture Solenoid Actuator	-	Active	The scan tool display Active or Inactive. This parameter displays column lock input status.
Key Fob 1-4 Battery Status	-	OK	The scan tool displays OK or other key fob battery status. This parameter displays the key fob battery status.
Key Fob 1-4 Function	-	Undefined	The scan tool displays Inactive, Lock, Unlock Driver Door, All Door Unlock, Release Rear Closure, Actuate Left Sliding Door, Actuate Right Sliding door, Panic Alarm, Release Fuel door, Actuate Power Windows, Actuate Folding Top, Start Engine, Stop Engine, Programmed, Locator Alarm, Close Tailgate, Open Tailgate, Stop Tailgate While Closing, Stop Tailgate While opening, Deadlock All Doors, Stop Tailgate Motion, Start Tailgate Motion, Stop Left Sliding Door Motion, Stop Right Sliding Door Motion, Comfort open, or Comfort close. This parameter displays the key fob function status.
Key Fob in Vehicle	-	Inactive	This parameter displays the current key fob in the vehicle.
Key In Cylinder Switch	-	Active	The scan tool displays Active or Inactive.
Key In Cylinder Switch/Key Fob in Vehicle	-	Yes	The scan tool displays No or Yes.
Key in Ignition Status	-	Inactive	The scan tool displays Key Out or Key In. This parameter displays the key in ignition status.
Key Part Number	-	Varies	This parameter displays the key part number.
Key Type	-	Master Key	The scan tool displays Unknown, Master Key, Valet Key, Fleet Key, or Unconfigured. This parameter displays the key type.
Last Door Lock Function	-	All Doors Lock	The scan tool displays NO Action, PC UNDB Lock, PC Unlock, Unlock, Unlock Driver, Unlock Passenger, Unlock Left Rear, Unlock Right Rear, Unlock Cargo Tailgate, Unlock Driver Side, Unlock Passenger Side, Unlock Non Driver, Unlock All, Lock All, DBL Lock, or UNDBL Lock.
LED Backlight Dimming Command	-	Varies	The scan tool displays as a percentage. This parameter displays LED backlight dimming PWM command status.
Left Brake Lamp	-	Varies	The scan tool displays percentage. This parameter displays left brake lamp command status.

Command			
Left Dedicated Daytime Running Lamp Command	-	Varies	The scan tool displays percentage. This parameter displays left dedicated daytime running lamp command status.
Left Front Tyre Pressure	-	Varies	This parameter displays left front tyre pressure in PSI.
Left Front Tyre Pressure Identification	-	Varies	This parameter displays left front tyre pressure sensor ID.
Left Front Tyre Pressure Sensor Location Learned	-	Yes	The scan tool displays No or Yes. This parameter display tyre pressure monitor system learned status.
Left Front Tyre Pressure Sensor Mode	-	Learn Mode -- Pressure Triggered	The scan tool parameter displays Learn Mode, Undefined, Remeasure Data Mode, Rolling Mode, Enter Off Mode, Exit Off Mode, or Learn Mode Pressure Triggered.
Left Front Tyre Pressure Status	-	Normal	The scan tool displays Unknown, Normal, Very Low Pressure, Low, Weak Signal, or High.
Left Front Indicator Bulb Out Feedback	-	Inactive	The scan tool displays Active or Inactive.
Left Front Indicator/Hazard Lamp Command	-	Inactive	The scan tool displays Active or Inactive.
Left Dipped Beam/Daytime Running Light Command	-	Varies	The scan tool displays percentage. This parameter displays left dipped beam/daytime running lamp status.
Left Sidelights Command	-	Varies	The scan tool displays percentage. This parameter displays rear exterior lighting status.
Left Rear Door Ajar Switch	-	Inactive	This parameter displays Active or Inactive. This parameter displays the left rear door ajar switch status.
Left Rear Tyre Pressure	-	Varies	This parameter displays left rear tyre pressure in PSI.
Left Rear Tyre Pressure Identification	-	Varies	This parameter displays left rear tyre pressure sensor ID.
Left Rear Tyre Pressure Sensor	-	Yes	The scan tool displays No or Yes. This parameter displays tyre pressure monitor system learned status.

Location Learned			
Left Rear Tyre Pressure Sensor Mode	-	Stationary	The scan tool displays Learn Mode, Undefined, Remeasure Data Mode, Rolling Mode, Enter Off Mode, Exit Off Mode, or Learn Mode Pressure Triggered.
Left Rear Tyre Pressure Status	-	Normal	The scan tool displays Unknown, Normal, Very Low Pressure, Low, Weak Signal, or High.
Left Rear Indicator Bulb Out Feedback	-	Inactive	The scan tool displays Active or Inactive. The parameter displays indicator lamp outage status.
Left Rear Indicator/Hazard Lamp Command	-	Inactive	The scan tool displays Active or Inactive.
Left Rear Window Main Control Down Switch	-	Inactive	The scan tool display Active or Inactive. This parameter displays driver window switch inputs.
Left Rear Window Main Control Express Switch	-	Inactive	The scan tool display Active or Inactive. This parameter displays driver window switch inputs.
Left Rear Window Main Control Up Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays driver window switch inputs.
Left Rear Window Motor Mode	-	Local Switch Overridden	The scan tool displays Down, Express, Up, Inhibit, or Local Switch Overridden.
Left Rear Window Switch at Door	-	Inactive	The scan tool displays Active or Inactive.
Left Indicator Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the left indicator switch status.
Number Plate Lamps Command	-	Inactive	The scan tool displays Active or Inactive.
Load Reduction Level 2-3 Counter	-	Varies	The scan tool display as counts.
Dipped Beam Relay Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the headlamp dipped beam relay status.
Manufacturers Enable Counter	-	Varies	This parameter tool displays various counter values.
Master Keys Learned	-	Varies	This parameter displays the total number of master keys learned.
Module Diagnostic			

Address	-	Varies	This parameter displays module diagnostic address.
Number of Key Fobs In Vehicle	--	1	This parameter displays the number of fobs located in the vehicle.
Odometer	-	Varies	This parameter displays the vehicle mileage.
Outside Rear View Mirror Courtesy Lamp Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays front exterior lighting status.
Hand Brake Switch	-	Active	The scan tool displays Active or Inactive. This parameter displays front exterior lighting status.
Sidelights Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays Active when the sidelight switch is activated.
Passenger Door Ajar Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger door ajar switch status.
Passenger Door Lock Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger door lock switch status.
Passenger Door Unlock Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger door unlock switch status.
Passenger Door(s) Unlock Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger door unlock status.
Passenger Window Learned	-	Yes	The scan tool displays No or Yes. This parameter displays the passenger window learned status.
Passenger Window Motor Mode	-	Local Switch Overridden	The scan tool displays Down, Express, Up, Inhibit, or Local Switch Overridden.
Passenger Window Switch at Door	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the passenger window switch status.
Previous Key Type	-	Unknown	This parameter displays previous driver identification device type.
Primary Key Status	-	Yes	The scan tool displays No or Yes.
Push Button Ignition Switch	-	Inactive	The scan tool displays Active or Inactive.
Push Button Ignition Switch Voltage	-	Varies	This parameter displays the push button ignition switch voltage.
Rear Closure Ajar Switch	-	Active	The scan tool displays Active or Inactive.
Rear Closure Cylinder Lock Switch	-	Inactive	The scan tool displays Active or Inactive.
Rear Closure			

Cylinder Unlock Switch	-	Inactive	The scan tool displays Active or Inactive.
Rear Tyre Pressure on Placard	-	Varies	This parameter displays the rear tyre pressure in kPa or PSI. This parameter displays the specified tyre pressure placard information programmed in the BCM for tyre pressure monitoring.
Regulated Voltage Control Mode	-	Voltage	The scan tool displays voltage.
Remote Vehicle Start Attempts Exhausted	-	Varies	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history or remaining start attempts.
Remote Vehicle Start Crank Time	-	Inactive	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.
Remote Vehicle Start Disabled by Driver	-	Inactive	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.
Remote Vehicle Start Source	-	Ignition Switch Start	The scan tool displays Body Control module or Power Take-off Start.
Remote Vehicle Starts Exhausted	-	Varies	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history or remaining remote starts.
Right Brake Lamp Command	-	Varies	The scan tool display percentage. This parameter displays right brake lamp PWM command status.
Right Dedicated Daytime Running Lamp Command	-	Varies	The scan tool display percentage. This parameter displays right dedicated DRL PWM command status.
Right Front Tyre Pressure	-	Varies	This parameter displays right front tyre pressure in PSI.
Right Front Tyre Pressure Identification	-	Varies	This parameter displays right front tyre pressure sensor ID.
Right Front Tyre Pressure Sensor Location Learned	-	Yes	The scan tool displays No or Yes.
Right Front Tyre Pressure Sensor Mode	-	Stationary	The scan tool displays Learn Mode, Undefined, Remeasure Data Mode, Rolling Mode, Enter Off Mode, Exit Off Mode, or Learn Mode Pressure Triggered.
Right Front Tyre Pressure Status	-	Normal	The scan tool displays Unknown, Normal, Very Low Pressure, Low, Weak Signal, or High.
Right Front			

Indicator Bulb Out Feedback	-	Inactive	The scan tool displays Active or Inactive.
Right Front Indicator/Hazard Lamp Command	-	Inactive	The scan tool displays Active or Inactive.
Right Dipped Beam/Daytime Running Light Command	-	Varies	The scan tool displays percentage. This parameter displays right dipped beam/daytime running lamp status.
Right Sidelights Command	-	Varies	The scan tool displays percentage. This parameter displays rear exterior lighting status.
Right Rear Door Ajar Switch	-	Inactive	The scan tool displays Active or Inactive.
Right Rear Tyre Pressure	-	Varies	This parameter displays right rear tyre pressure in PSI.
Right Rear Tyre Pressure Identification	-	Varies	This parameter displays right rear tyre pressure sensor ID.
Right Rear Tyre Pressure Sensor Location Learned	-	Yes	The scan tool displays No or Yes.
Right Rear Tyre Pressure Sensor Mode	-	Learn Mode -- Pressure Triggered	The scan tool displays Learn Mode, Undefined, Remeasure Data Mode, Rolling Mode, Enter Off Mode, Exit Off Mode, or Learn Mode Pressure Triggered. This parameter displays the pressure sensor mode status.
Right Rear Tyre Pressure Status	-	Normal	The scan tool displays Unknown, Normal, Very Low Pressure, Low, Weak Signal, or High. This parameter displays the right rear tyre pressure status.
Right Rear Indicator Bulb Out Feedback	-	Inactive	The scan tool displays Active or Inactive.
Right Rear Indicator/Hazard Lamp Command	-	Inactive	The scan tool displays Active or Inactive.
Right Rear Window Main Control Down Switch	-	Inactive	The scan tool displays Active or Inactive.
Right Rear Window Main Control Express Switch	-	Inactive	The scan tool displays Active or Inactive.

Right Rear Window Main Control Up Switch	-	Inactive	The scan tool displays Active or Inactive.
Right Rear Window Motor Mode	-	Local Switch Overridden	The scan tool displays Down, Express, Up, Inhibit, or Local Switch Overridden.
Right Rear Window Switch at Door	-	Inactive	The scan tool displays Active or Inactive.
Right Indicator Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the right indicator switch status.
Run Abort	-	Inactive	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.
Run Relay Command	-	Active	The scan tool displays Active or Inactive.
Run/Crank	-	Inactive	The scan tool displays Active or Inactive.
Run/Crank Relay Command	-	Active	The scan tool displays Active or Inactive.
Run/Start Power Mode Indicator Command	-	Varies	The scan tool displays percentage. This parameter displays ignition switch run LED PWM command status.
Secondary Key Status	-	No	The scan tool displays No or Yes.
Security Indicator Command	-	Varies	The scan tool displays percentage. This parameter displays security LED PWM command status.
Selected Front Tyre Type	-	Standard Load	The scan tool displays No Tyre Type, Metric Standard Load, Metric Extra Load, Load Range C, Load Range D, or Load Range E. This parameter displays the front tyre type.
Selected Rear Tyre Type	-	Standard Load	The scan tool displays No Tyre Type, Metric Standard Load, Metric Extra Load, Load Range C, Load Range D, or Load Range E. This parameter displays the rear tyre type.
Start-Up State of Charge	-	Varies	The scan tool displays percentage. This parameter displays startup state of charge status.
State of Charge	-	Varies	The scan tool displays percentage. This parameter displays state of charge status.
Sunroof Enabled	-	Active	The scan tool displays Active or Inactive.
Sunroof Motor Overtemperature	-	Inactive	The scan tool displays Active or Inactive.
Sunroof Not Learned	-	Inactive	The scan tool displays Active or Inactive.
Sunroof Position	-	Closed	The scan tool displays Closed, Open, Venting, Comfort Open, Closing, Opening. This parameter displays the current sunroof position.

Sunroof Remote Command	-	Inactive	The scan tool displays Sunroof Secure Close, Venting, Close, or Open. This parameter displays the last sunroof remote command.
Sunroof Slide Switch	-	Inactive	The scan tool displays Inactive, Express Open, Open, Express Close, Close, Short to Ground, Short to Battery, or Stuck. This parameter displays the sunroof slide switch status.
Sunroof Slide Switch	-	Inactive	The scan tool displays Inactive, Open, Close, Short to Ground, Short to Battery or Stuck. This parameter displays the sunroof tilt switch status. When the switch experiences a malfunction Short to Ground, Short to Battery or Stuck will be displayed.
Sunroof/Sunshade Motor Overtemperature	-	Inactive	The scan tool displays Active or Inactive.
Sunroof / Sunshade Switch	-	Inactive	The scan tool displays Inactive, Express Open, Open, Express Close, Close, Short to Ground, Short to Battery, or Stuck. This parameter displays the sunroof or sunshade switch status.
Sunshade Enabled	-	Active	The scan tool displays Active or Inactive.
Sunshade Not Learned	-	Inactive	The scan tool displays Active or Inactive.
Sunshade Position	-	Closed	The scan tool displays Ajar, Closed, Opened, Closing, or Opening. This parameter displays the sunshade position status.
Sunshade Remote Command	-	Inactive	The scan tool displays Close or Open. This parameter displays the last sunshade remote command.
Tamper Status	-	No	The scan tool displays No or Yes.
Telematics Enhanced Service Override Active	-	No	The scan tool displays No or Yes. This parameter displays vehicle theft deterrent system status.
Total Keys Learned	-	Varies	This parameter displays the number of keys learned.
Traction Control Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays Active when the traction control switch is active.
Transponder Authentication	-	Initialising	The scan tool displays Inactive, Initialising, ID Received, Password Received, Data Reception Complete, or Data Transmission Complete. This parameter displays the transponder key communication status.
Transponder Key Status	-	OK	The scan tool displays OK, LIN Bus Initialisation Malfunction, Aerial Initialisation Malfunction, Password Error, No Valid Key Detected, LIN Bus Communication Malfunction, or Aerial Malfunction. This parameter displays the transponder key communication error status.
Trunk Lamp Command	-	Varies	The scan tool displays as percentage.
Boot Lid/Tailgate Window Exterior Unlatch Switch	-	Inactive	The scan tool displays Active or Inactive.
Boot Lid/Tailgate Window Unlatch Command	-	Inactive	The scan tool displays Active or Inactive.

Valet Keys Learned	-	Varies	This parameter displays the number of valet keys learned.
Valet Mode Status	-	Inactive	This parameter displays the remote start diagnostic status history or the last remote start diagnostic status history.
Valet switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays Active when the valet switch is on.
Vehicle Identification Number (VIN)	-	Varies	This parameter displays the vehicle identification number.
Window Lockout Switch	-	Inactive	The scan tool displays Active or Inactive.
Window Lockout Switch Indicator Command	-	Inactive	The scan tool displays Active or Inactive.
Windscreen Washer Relay Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the windscreen washer relay status.
Windscreen Washer Switch	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the windscreen washer switch status.
Windscreen Wiper Park Switch	-	Active	The scan tool displays Active or Inactive.
Windscreen Wiper High Speed Relay Command	-	Inactive	The scan tool displays Active or Inactive.
Windscreen Wiper High Speed Switch	-	Inactive	The scan tool displays Active or Inactive.
Windscreen Wiper Motor Relay Command	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the windscreen wiper relay status.
Windscreen Wiper Stalled During Sweep	-	Inactive	The scan tool displays Active or Inactive.
Windscreen Wiper Stalled in Park Position	-	Inactive	The scan tool displays Active or Inactive. This parameter displays the windscreen wiper stalled status.
Windscreen Wiper Switch	-	Off	The scan tool displays Off, Delay 1, Delay 2, Delay 3, Delay 4, Delay 5, or Low. This parameter displays the windscreen wiper switch status.

Body Control Module Scan Tool Output Controls

Scan Tool Output	
-------------------------	--

Control	Description
Accent Lighting 1 Command	The BCM activates the accent lighting when you select On. The value should be 100%. All accent lighting should illuminate until commanded Off.
Accessory Power Mode Indicator Command	The BCM activates the accessory indicator when you select On. The value should be 100%. The yellow LED accessory indicator on start button should illuminate until commanded Off.
Accessory/Retained Accessory Power Relay Command	The BCM actuates the retained accessory power relay when you select On. The retained accessory power relay should turn on allowing specific vehicle functions to operate.
All Doors Lock Command	The BCM activates all doors lock when you select Lock. All doors should lock.
Reversing Lamps Command	The BCM actuates the reverse lamps relay when you select On. The reverse lamps should illuminate until commanded Off. Engine must be running.
Battery Saver Relay	The BCM activates the battery saver relay when you select Enable. This command sets the low power mode relay in the state in which it does not supply power to the non-essential parts of the vehicle. This is used to prevent the battery from being depleted when the vehicle is not used for a long period of time.
Brake Pedal Position Sensor Learn	The BCM activates the brake pedal position sensor learn when you select Learn. The brake pedal position sensor learn procedure should start.
Centre Brake Lamp Command	The BCM activates the centre brake lamp when you select On. The centre brake lamp should illuminate until commanded Off.
Child Security Lock Motors Command	The BCM actuates the child security door motor when you select Lock. The child security doors should lock.
Clear Driver Window Learned Values	When you select Clear the clear driver window learn procedure should start.
Clear Passenger Window Learned Values	When you select Clear the clear left rear window learn procedure should start.
Courtesy Lamps Command	The BCM activates the courtesy lamps when you select On. The value should be 100%. The courtesy lamps should illuminate until commanded Off.
Driver Door Unlatch Command	The BCM activates the output circuit to unlatch the driver door with a passive entry passive start when you select Unlatch. There is NO door handle on this type of vehicle to open the door. Instead, there is a pad that you press to unlatch the door.
Driver Door Unlock Command	The BCM pulses the driver door unlock motor when you select Unlock. The driver door should unlock.
Driver Window Motor Mode	The BCM activates the driver window motor when you select Up/Down/Stop/Express Up/Express Down. The driver window should follow the appropriate command.
Front Fog Lamps Command	The BCM actuates the front fog lamps relay when you select On. The front fog lamps relay should turn on.
Hazard Lamps Switch Backlight Command	The BCM activates the hazard lamps switch when you select On. The value should be 100%. The hazard lamps switch backlight should illuminate until commanded Off.
Main Beams	The BCM activates the main beam command when you select On. The main beam lights should illuminate. The headlamps have to be on.

Horn Relay	The BCM activates the horn when you select On. The horn should sound.
Inadvertent Load Command	The BCM activates the inadvertent load command when you select On. (It is an electronic request to shut down an electrical or electronic device that is drawing power from the battery at a time when there should be no activity, usually after the key has been removed from the ignition for a period of time.)
LED Backlight Dimming Command	The BCM activates the LED backlight dimming when you select On. The values should be 100%. The LED backlight dimming for control switches should illuminate until commanded Off.
Left Brake Lamp Command	The BCM activates the left brake lamp when you select On. The values should be 100%. The left brake lamp should illuminate until commanded Off.
Left Dedicated Daytime Running Lamp Command	The BCM activates the left dedicated daytime running lamp when you select ON. The value changes to 100%. The left daytime running lamp should illuminate.
Left Front Indicator Lamp Command	The BCM activates the left front indicator lamp when you select On. The left front indicator lamp should illuminate until commanded Off.
Left Sidelights Command	The BCM activates the left sidelights when you select ON with a value of 100%. The left sidelights should illuminate.
Left Rear Indicator Lamp Command	The BCM activates the left rear indicator lamp when you select On. The left rear indicator lamp should illuminate until commanded Off.
Left Rear Window Motor	The BCM activates the left rear window motor when you select Up/Down/Stop/Express Down. The left rear window should follow the appropriate command.
Number Plate Lamps Command	The BCM activates the number plate lamps when you select On. The number plate lights should turn on until commanded Off.
LIN Bus Device Identification Data	When you select Update the LIN Bus Device part number and calibration part number should be updated.
Dipped Beam Relay Command	The BCM activates the dipped beams when you select On. The dipped beam lights should turn on.
Outside Rear View Mirror Courtesy Lamp Command	The BCM activates the outside rear view mirror courtesy lamp when you select On. The outside rear view mirror courtesy lamp (at the bottom) should illuminate.
Passenger Door(s) Unlatch Command	The BCM activates the output circuit to unlatch the passenger door with a passive entry passive start when you select Unlatch. There is NO door handle on this type of vehicle to open the door. Instead, there is a pad that you press to unlatch the door.
Passenger Door(s) Unlock Command	The BCM pulses the passenger door unlock motor when you select Unlock. The passenger door should unlock.
Passenger Window Motor	The BCM activates the passenger window motor when you select Up/Down/Stop/Express Up/Express Down. The passenger window should follow the appropriate command.
Right Brake Lamp Command	The BCM activates the right brake lamp when you select On. The value should be 100%. The right brake lamp should illuminate until commanded Off.
Right Dedicated Daytime Running Lamp Command	The BCM activates the right dedicated daytime running lamp when you select On. The value should be 100%. The right daytime running lamp should illuminate.
Right Front Indicator	The BCM activates the right front indicator lamp when you select On. The right front indicator/hazard lamp should illuminate.

Lamp Command	
Right Sidelights Command	The BCM activates the right sidelights when you select ON with a value of 100%. The right sidelights should illuminate.
Right Rear Indicator Lamp Command	The BCM activates the right rear indicator/hazard lamp when you select On. The right rear indicator lamp should illuminate until commanded Off.
Right Rear Window Motor	The BCM activates the right rear window motor when you select Up/Down/Stop/Express Down. The right rear window should follow the appropriate command.
Run Relay Command	The BCM actuates the run relay when you select On. The run relay should turn on.
Run/Crank Relay Command	The BCM actuates the run/crank relay when you select On. The run/crank relay should turn on.
Run/Start Power Mode Indicator Command	The BCM activates the run/start lamp when you select On. The value should be 100%. The green LED on engine start/stop button should illuminate until commanded Off.
Security Indicator Command	The BCM activates the security indicator command when you select On. The security indicator at centre of dash (or at DRL sensor) should illuminate until commanded Off.
Tyre Pressure Sensors Learn	The BCM activates the tyre pressure sensor learn procedure when you select Learn.
Tyre Type/Pressure Selection	When you select OK, you can change tyre type and load range.
Transmission Range Indicator	The BCM activates the transmission range indicator when you select On. The transmission range indicator at the shifter should illuminate until commanded Off.
Boot Lamp Command	The BCM activates the boot lamp when you select On. The value should be 100%. The boot lamp should illuminate until commanded Off.
Boot Lid/Tailgate Window Unlatch Command	The BCM actuates the rear compartment lid release actuator when you select Unlatch. The boot or tailgate should open.
Windscreen Washer Relay Command	The BCM actuates the windscreen washer relay when you select On. The windscreen washer relay should turn on.
Windscreen Wiper High Speed Relay Command	The BCM actuates the windscreen wiper high speed relay when you select On. The windscreen wiper high speed relay should turn on.
Windscreen Wiper Motor Relay Command	The BCM actuates the windscreen wiper motor relay when you select On. The windscreen wiper motor relay should turn on.

Driver Seat and Passenger Seat Heater Control Module Scan Tool Information

Table 1: [Front Seat Heating Control Module Scan Tool Data Parameters](#)

Table 2: [Front Seat Heating Control Module Scan Tool Output Controls](#)

Front Seat Heating Control Module Scan Tool Data Parameters

Parameter	Expected Value	Description
Operating Conditions: Engine Running		
Driver Seat Cushion Heating Command	Inactive	The scan tool displays Inactive or Active. This parameter displays the commanded output from the seat heating control module to the seat heater elements.
Driver Seat Cushion Temperature Sensor	Varies	The scan tool displays 0 - 5 V. The voltage displayed is an input to the seat heating control module from the seat cushion temperature sensor. Higher voltage readings indicate cooler seat temperatures while lower voltage readings indicate warmer seat temperatures.
Driver Seat Heating/Venting/Cooling Level	Off	The scan tool displays Off, High Medium, or Low. When the heated seat is active, this parameter displays the selected temperature setting.
Driver Seat Heating/Venting/Cooling Mode	Off	The scan tool displays Off or Back & Cushion Heat. This parameter indicates the heated seat mode of operation.
Passenger Seat Cushion Heating Command	Inactive	The scan tool displays Inactive or Active. This parameter displays the commanded output from the seat heating control module to the seat heater elements.
Passenger Seat Cushion Temperature Sensor	Varies	The scan tool displays 0 - 5 V. The voltage displayed is an input to the seat heating control module from the seat cushion temperature sensor. Higher voltage readings indicate cooler seat temperatures while lower voltage readings indicate warmer seat temperatures.
Passenger Seat Heating/Venting/Cooling Level	Off	The scan tool displays Off, High, Medium, or Low. When the heated seat is active, this parameter displays the selected temperature setting.
Passenger Seat Heating/Venting/Cooling Mode	Off	The scan tool displays Off or Back & Cushion Heat. This parameter indicates the heated seat mode of operation.

Front Seat Heating Control Module Scan Tool Output Controls

Control Functions	Description
Operating Conditions: Engine Running	
Driver Seat Cushion Heating	This output control is used to command the driver seat heater elements On.
Passenger Seat Cushion Heating	This output control is used to command the passenger seat heater elements On.

Electronic Brake Control Module Scan Tool Information

Table 1: [Electronic Brake Control Module Scan Tool Data Parameters](#)

Table 2: [Electronic Brake Control Module Scan Tool Output Controls](#)

The electronic brake control module (EBCM) scan tool data parameters list contains all ABS related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists.

Electronic Brake Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Vehicle in Service Mode			
ABS Pump Motor Voltage	-	Varies	The scan tool displays the pump motor voltage.
Antilock Braking System	-	Inactive	The scan tool displays Inactive or Active. Active is displayed when the antilock braking system is in traction control event.
Antilock Braking System Status	-	No	The scan tool displays No or Yes. If there is an ABS malfunction the scan tool will display Yes.
Brake Controls Brake Pedal Position Sensor Circuit 1	-	Varies	This displays volts. This is the brake controls brake pedal position sensor circuit 1 reference value.
Brake Controls Brake Pedal Position Sensor Circuit 2	-	Varies	This displays percentage. This is the brake controls brake pedal position sensor circuit 2 that calculates the percentage of brake pedal applied or released.
Brake Controls Brake Pedal Position Sensor without Offset	-	Varies	This displays mm. This is the value used to compare the position of the primary piston sensors.
Brake Controls Brake Pedal Position Sen. 5 Volt Supply Voltage	-	Varies	This displays volts. This is the voltage supply to the brake controls brake pedal position sensor.
Brake Controls Brake Pedal Position	-	Varies	The scan tool displays the brake pedal counts. Learned or Not Learned. This is the brake controls brake pedal position sensor zeroed or learned value.
Brake Boost Power Status	-	Enabled	The scan tool displays Enabled or Disabled.
Brake Master Cylinder Pressure Sensor	-	Varies	This displays psi/kpa. This is the current brake applied pressure.
Brake Fluid Level Sensor	-	Varies	This displays volts. This is the voltage supply to the brake fluid level sensor signal.
	Brake pedal released	Released	

Brake Pedal Position Sensor Signal	Brake pedal applied	Applied	The scan tool displays Applied or Release depending on the state of the brake pedal.
Brake Pressure Sensor	Brake pedal released	0-1.55 V	The scan tool displays 0-5 V depending on the applied hydraulic brake pressure.
	Brake pedal applied	1.55-5 V	
Dynamic Rear Proportioning Status	-	No	The scan tool displays No or Yes. If the EBCM disables the dynamic rear proportioning due to a fault the scan tool will display Yes.
Engine Drag Control Status	-	No	The scan tool displays No or Yes. If the EBCM detects an ABS event, it sends a signal to the ECM to reduce engine power and Yes is displayed on the scan tool.
High Pressure Accumulator Sensor	-	Varies	This displays the pressure of the accumulator.
Ignition Voltage	-	Varies	This displays volts. This is the voltage status of the electronic brake control module (EBCM).
Left Front Inlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the left front inlet solenoid valve is commanded ON.
Left Front Outlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the left front outlet solenoid valve is commanded ON.
Left Front Wheel Speed Sensor	-	0 km/h (0 MPH)	The scan tool displays km/h (MPH) depending on the current speed of the left front wheel speed sensor.
Left Rear Inlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the left rear inlet solenoid valve is commanded ON.
Left Rear Outlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the left rear outlet solenoid valve is commanded ON.
Left Rear Wheel Speed Sensor	-	0 km/h (0 MPH)	The scan tool displays km/h (MPH) depending on the current speed of the left rear wheel speed sensor.
Panic Brake Assist Status	-	No	The scan tool displays No or Yes. If the EBCM disables the panic brake assist due to a fault the scan tool will display Yes.
Regenerative Braking Status	-	Active	The scan tool displays Active or Inactive.
Right Front Inlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the right front inlet solenoid valve is commanded ON.
Right Front Outlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the right front outlet solenoid valve is commanded ON.
Right Front Wheel Speed Sensor	-	0 km/h (0 MPH)	The scan tool displays km/h (MPH) depending on the current speed of the right front wheel speed sensor.
Right Rear Inlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the right rear inlet solenoid valve is commanded ON.
Right Rear Outlet Solenoid Valve Command	-	Off	The scan tool displays Off or On. On is displayed when the right rear outlet solenoid valve is commanded ON.
Right Rear Wheel Speed Sensor	-	0 km/h (0 MPH)	The scan tool displays km/h (MPH) depending on the current speed of the right rear wheel speed sensor.

Steering Wheel Angle Sensor Signal	Steering wheel in straight position	-5 to +5°	The scan tool displays °. This is the current position of the steering angle sensor.
	Steering wheel turned left until stop	450-550°	
	Steering wheel turned right until stop	-550 to -450°	
System Voltage	-	11-14 V	The scan tool displays V. This is the current battery voltage.
Traction Control System	-	No	The scan tool displays No or Yes. If there is a traction control malfunction the scan tool displays Yes.
Vehicle Stability System Status	-	No	The scan tool displays No or Yes. If there is a stability control malfunction the scan tool displays Yes.

Electronic Brake Control Module Scan Tool Output Controls

Output Control	Description
Automated Brake Bleed	This is used in order to bleed ABS hydraulics.
ABS Pump Motor	This is used in order to command the ABS pump motor On or Off.

Electronic Parking Brake Control Module Scan Tool Information

Table 1: [Parking Brake Control Module Scan Tool Data Parameters](#)

Table 2: [Parking Brake Control Module Scan Tool Output Controls](#)

Parking Brake Control Module Scan Tool Data Parameters

Parameter	Expected Value	Description
Operating Conditions: Vehicle in Service Mode, Parking Brake Off		
Base Hardware	Varies	The scan tool displays the base hardware number.
BCM Brake Pedal Signal	Valid	The scan tool displays Valid or Invalid. This parameter displays the signal status received by the body control module brake pedal as valid or invalid. If the signal received is invalid the parking brake control module will deactivate.
Calculated System Temperature	Varies	The scan tool displays the parking brake control module temperature in degrees Celsius.
Calibrations	Varies	The scan tool displays the calibration number.
EBCM Emergency Park Brake Enable Signal	Valid	The scan tool displays Valid or Invalid. This parameter displays the signal status received by the electronic brake control module emergency park brake enable signal as valid or invalid. If the signal received is invalid the parking brake control module will deactivate.
ECM Accelerator Pedal Position Signal	Valid	The scan tool displays Valid or Invalid. This parameter displays the signal status received by the engine control module accelerator pedal position signal as valid or invalid. If the signal received is invalid the parking brake control module will deactivate.
ECM Clutch Pedal Position Signal	Valid	The scan tool displays Valid or Invalid. This parameter displays the signal status received by the engine control module clutch pedal position signal as valid or invalid. If the signal received is invalid the parking brake control module will deactivate.
ECM Vehicle Speed Signal	Valid	The scan tool displays Valid or Invalid. This parameter displays the signal status received by the engine control module vehicle speed signal as valid or invalid. If the signal received is invalid the parking brake control module will deactivate.
End Model	Varies	The scan tool displays the end model number.
OS/Software	Varies	The scan tool displays the software number.
Park Brake Calibration Status	Passed	The scan tool displays Passed or Failed. This parameter displays if the park brake calibration is properly programmed into the parking brake control module.
Park Brake Cable Position	1	The scan tool displays 1, 2, or 3. This parameter displays the system cycle value. When the park brake is released 1 will be displayed. When the park brake is applied 3 is displayed. When the park brake is being applied or released 2 is displayed.

Park Brake Motor Command	Off	The scan tool displays On or Off. This parameter displays the status of the park brake motor.
Park Brake Motor Direction	Inactive	The scan tool displays Apply, Release or Inactive. This parameter displays the status of the park brake motor direction.
Park Brake Motor Duty Cycle Command	Varies	The scan tool displays the pulse width modulated cycle as a percentage.
Park Brake Release Reason	None	The scan tool displays None, Ign. Cycled, Spd. Threshold, or Brake Applied. This parameter displays the reason the parking brake was released.
Park Brake Status	Released	The scan tool displays Applied, Released, Malfunction or Invalid. This parameter displays the current status of the parking brake.
Park Brake Switch	Inactive	The scan tool displays Applied, Released, Inactive, or Invalid. This parameter displays the current status of the parking brake switch.
TCM Current Gear Signal	Valid	The scan tool displays Valid or Invalid. This parameter displays the signal status received by the transmission control module current gear signal as valid or invalid. If the signal received is invalid the parking brake control module will deactivate.
VIN	Varies	The scan tool displays the vehicle identification number.

Parking Brake Control Module Scan Tool Output Controls

Output Control	Description
Handbrake Shoe Service Reset	The electric handbrake module will reset the dynamic brake counter. When selected the EPB counter will be set to zero.
Parking Brake Calibration	The electric handbrake module will activate the handbrake calibration learn procedure when selected. During the learn procedure the rear brakes will cycle several times.
Parking Brake Cable Apply	The electric handbrake module will apply the handbrake cable tension to diagnose a possible EPB switch failure.
Parking Brake Cable Release	The electric handbrake module will release the handbrake cable to diagnose a possible EPB switch failure.
Handbrake Cable Replacement	The electric handbrake module will unwind the handbrake cable for replacement or service when selected.
Parking Brake Actuator DTC Reset	The electric handbrake module will reset the handbrake actuator when commanded.
Handbrake Switch Procedure	The electric handbrake module will test the handbrake switch signals to verify they are working properly or if there is an open circuit.

Engine Control Module Scan Tool Information

Table 1: [Engine Control Module Scan Tool Data Parameters](#)

Table 2: [Engine Control Module \(ECM\) Scan Tool Output Controls](#)

The engine control module scan tool data list contains all engine related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists, and in some cases may appear more than once, or in more than one data list in order to group certain related parameters together.

Use the engine scan tool data list only after the following is determined:

- The [Diagnostic System Check - Vehicle](#) is completed.
- No diagnostic trouble codes (DTCs)
- On-board diagnostics are functioning properly

The scan tool values from a properly running engine may be used for comparison with the engine you are diagnosing. The engine scan tool data list represents values that may be seen on a normally running engine.

Note: A scan tool that displays faulty data should not be used. The scan tool concern should be reported to the manufacturer. Use of a faulty scan tool can result in misdiagnosis and unnecessary parts replacement.

Only the parameters listed below are referenced in this service manual for use in diagnosis. If all values are within the typical range described below, refer to [Symptoms - Engine Controls](#) for engine diagnosis.

Engine Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Engine Idling/Radiator Hose Hot/Closed Throttle/Park or Neutral/Closed Loop/Accessories Off/Brake Pedal Released			
5 V Reference 1, 2, 3, or 4	Vehicle ON	5 V	This parameter displays the voltage sensed on the 5 V reference circuits at the control module. The scan tool will display a higher value at higher voltage. The scan tool will display a lower value at lower voltage.
5 V Reference 1, 2, 3, or 4 Circuit Status	Vehicle ON	OK	This parameter displays OK if there is no 5 V reference circuit condition. If the circuit is shorted to ground or shorted to B+, Malfunction is displayed.
	Accelerator		

Accelerator Pedal Position	pedal not actuated	0 %	This parameter displays the angle of the APP as calculated by the control module using the signals from the APP sensors.
	Accelerator pedal fully actuated	100 %	
Accelerator Pedal Position	-	%	This parameter displays the angle of the accelerator pedal position (APP) as calculated by the control module using the signals from the APP sensors.
Accelerator Pedal Position When Engine Overspeed Detected	-	%	This parameter displays the accelerator pedal position (APP) observed upon initial detection of an overspeed condition. This value will be updated upon each overspeed condition.
A/C Compressor Clutch Relay Command	A/C ON	ON	This parameter displays the state of the air conditioning (A/C) clutch relay control circuit as commanded by the control module.
A/C Compressor Clutch Relay Control Circuit High Voltage Test Status	A/C ON or OFF	OK/Not Run	This parameter displays the state of the air conditioning (A/C) clutch relay control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
A/C Compressor Clutch Relay Control Circuit Low Voltage Test Status	A/C ON or OFF	OK/Not Run	This parameter displays the state of the air conditioning (A/C) clutch relay control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
A/C Compressor Clutch Relay Control Circuit Open Test Status	A/C ON or OFF	OK/Not Run	This parameter displays the state of the air conditioning (A/C) clutch relay control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
A/C Disable - A/C Pressure Out of Range	A/C ON	No	This parameter displays whether the A/C pressure is out of range for normal operation as determined by the control module.
A/C Disengage 1-8 History	A/C ON	Reason for A/C Disengagement	The parameter displays the reason the air conditioning (A/C) compressor was disengaged. The scan tool displays None, A/C Pressure, Engine Speed, Battery Voltage, Anti Stall, RPM Unstable, wide open throttle (WOT), Launch Performance, Coolant Hot, Accelerator Pedal Position (APP), Air Bag Deploy, or A/C Relay DTC.
A/C High Side Pressure Sensor	A/C OFF	0.75-1.5 V*	This parameter displays the voltage from the A/C high side pressure sensor signal circuit to the control module. *Varies with temperature and relative humidity.
	A/C ON	1.3-2.5 V*	
A/C High Side Pressure Sensor	A/C OFF	450-650 kPa* (65-95 (PSI))*	This parameter displays the pressure from the A/C high side pressure sensor signal circuit to the control module. *Varies with temperature and relative humidity.
	Engine Speed at 2 000 RPM	900-2 350 kPa* (162-341 PSI)*	
A/C OFF for WOT	A/C ON	No	This parameter displays whether the control module is commanding the A/C compressor clutch relay OFF for WOT.
A/C Request Signal	A/C ON	Yes	This parameter displays the state of the A/C request input to the control module from the heating,

			ventilation, and air conditioning (HVAC) controls.
A/C System Refrigerant Monitor Enabled This Ignition Cycle	-	Yes	The scan tool displays Yes when the A/C System Refrigerant Monitor is Enabled. If the scan tool displays No this could indicate a malfunction in the A/C System Refrigerant Monitor circuit. The A/C system must be turned ON for the diagnostic to run.
Air/Fuel Equivalence Ratio Command	-	Varies	This parameter displays the ratio of air to fuel as calculated by the control module based on various sensor inputs. The scan tool will display a lower air fuel ratio when a richer air to fuel mixture is commanded. The scan tool will display a higher air fuel ratio when a leaner air to fuel mixture is commanded. In closed loop operation the air fuel ratio should normally be approximately 14.7:1.
Ambient Air Temperature	-	°C (°F) Varies	This parameter displays the surrounding air temperature, at any given altitude.
APP Sensor 1	Accelerator pedal not actuated	0.88-1.08 V	This parameter displays the actual voltage on the accelerator pedal position (APP) Sensor 1 signal circuit as measured by the control module.
	Accelerator pedal fully actuated	4.17-4.37 V	
APP Sensor 1 and 2	-	Agree	This parameter displays the results of a control module test that compares the signals from the APP sensors 1 and 2. The scan tool will display Agree or Disagree. Agree indicates that APP sensor 1 and APP sensor 2 voltages correspond to the same accelerator pedal position. Disagree indicates that APP sensor 1 and APP sensor 2 voltages correspond to different accelerator pedal positions.
APP Sensor 1 Circuit Status	Vehicle ON	OK	APP Sensor 1 Out of Range indicates that the sensed accelerator pedal position 1 sensor value is currently out of range or that a Malfunction has been detected based upon the sensed accelerator pedal position 1 sensor value being out of range.
APP Sensor 1 Position	Accelerator pedal not actuated	0 %	This parameter displays the angle of the APP sensor 1 as calculated by the control module using the signal from the APP sensor 1. APP sensor 1 is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.
	Accelerator pedal fully actuated	100 %	
APP Sensor 2	Accelerator pedal not actuated	0.39-0.59 V	This parameter displays the actual voltage on the accelerator pedal position (APP) Sensor 2 signal circuit as measured by the control module.
	Accelerator pedal fully actuated	2.02-2.22 V	
APP Sensor 2 Circuit Status	Vehicle ON	OK	APP Sensor 2 Out of Range indicates that the sensed accelerator pedal position 2 sensor value is currently out of range or that a Malfunction has been detected based upon the sensed accelerator pedal position 1 sensor value being out of range.

APP Sensor 2 Position	Accelerator pedal not actuated	0 %	This parameter displays the angle of the APP sensor 2 as calculated by the control module using the signal from the APP sensor 2. APP sensor 2 is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.
	Accelerator pedal fully actuated	100 %	
APP Sensors	-	0 %	This parameter displays the average of the APP sensors as calculated by the throttle actuator control (TAC) module. The APP average is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.
Autostart Inhibit Reason Autostart/Autostop Malfunction	-	No	This parameter displays that a immediate stop was commanded due to a Autostart/Autostop malfunction.
Autostart Inhibit Reason	-	No	The scan tool displays Yes if one of the following Autostart Inhibit Reason is detected. Control Function Active, Crank Abort, ECM Malfunction, ECM Request, Bonnet Ajar, Hybrid/EV Battery Pack Contactor Open, Hybrid/EV Battery Pack Power Low, Hybrid/EV Battery Pack State of Charge Low, Hybrid/EV Battery Pack Voltage Low, Hybrid/EV Propulsion System Inactive, Not Commanded, Run/Crank Not Active, Transmission Range.
Autostart Reason	-	No	This parameter displays Yes if one of the following Autostart Reason is detected. A/C Request, Acceleration Request, Accelerator Pedal Pressed, Auxiliary Transmission Fluid Pump Not Available, Brake Booster Weak Vacuum, Brake Pedal Released, Control Function Active, Drive Motor Inverter Temperature High, Drive Motor Temperature High, ECM Request, Engine Coolant Temperature Out of Range, Bonnet Ajar, Hybrid/EV Battery Module Voltage Low, Hybrid/EV Battery Pack Power Low, Hybrid/EV Battery Pack State of Charge Low, Hybrid/EV Battery Pack Temperature, Hybrid/EV Battery Pack Voltage Low, Hybrid/EV Propulsion System Inactive, Ignition Switch Start, Inclination, Invalid Data Received, Low Voltage Battery Discharge Current High, Low Voltage Battery State of Function Low, Low Voltage Battery State of Health Low, Low Voltage Battery Voltage Low, Maximum Autostop Time Exceeded, Minimum Engine Run Time Not met, Reduced Engine Power Active, Remote Vehicle Start Request, System Optimization, System Voltage Low, TCM Demand, Tow/Haul Mode Switch ON, Transmission Fluid Temperature Out of Range, Transmission In Reverse, Transmission Range, Vehicle Speed Too High.
Autostop Disable Reason	-	No	The scan tool displays Yes if one of the following Autostop Disable Reason is detected. 12 V Start Counter Exceeded, A/C Request, Acceleration Request, Accelerator Pedal Pressed, Auxilliary Transmission Fluid Pump Not Available, Brake Booster Weak Vacuum, Brake Pedal Released, Control Function Active, Drive Motor Inverter Temperature High, Drive Motor Temperature High, ECM Request, Engine Coolant Temperature Out of range, Engine Spped High, Generator Load High, Bonnet Ajar, Hybrid/EV Battery Module Voltage Low, Hybrid/EV Battery Pack Power Low, Hybrid/EV Battery Pack State of Charge Low, Hybrid/EV Battery Pack Temperature, Hybrid/EV Battery Pack Voltage Low, Hybrid/EV Propulsion System Inactive, Idle Boost Mode Active, Igntion Switch Start, Intake Manifold Weak Vacuum, Invalid Data Received, Low Voltage Battery Discharge Current High, Low Voltage Battery State of Charge Low, Low Voltage Battery State of Function Low, Low Voltage Battery State of

			Health Low, Low Voltage Battery Temperature Out of Range, Low Voltage Battery Voltage Low, Maximum Vehicle Stop Time Exceeded, Minimum Engine Run Time Not Met, Reduced Engine Power Active, Remote Vehicle Start Request, Run/Crank Not Active, Stop/Start Select Switch, System Optimization, System Voltage Low, TCM Request, Tow/Haul Mode Switch ON, Transmission Fluid Temperature Out of Range, Transmission in Reverse, Transmission Range, Vehicle Inclination, Vehicle Speed Threshold Not Reached, Vehicle Speed Too High, Wheel Slip Detected.
Average Fuel Age	-	Days	This parameter displays the average age of the fuel in the vehicle's fuel tank.
Axle Torque Command	-	N·m	This parameter displays the torque request for the slow response air path (control of the throttle). Based on current conditions the hybrid controller determines the optimum engine torque, which it sends as a request to the Engine Control Module.
BARO	-	65-104 kPa (8-16 PSI) - Varies with altitude	This parameter displays the barometric pressure (BARO). The control module uses the barometric pressure sensor input for fuel control to compensate for altitude differences.
Brake Pedal Position Signal	-	Released	This parameter displays the serial data message of the brake position sensor signal from the electronic brake and traction control module.
Calculated Air Flow	-	g/s Varies	This parameter displays the air flow of the engine as calculated by the control module.
Calculated Catalyst Temperature	-	°C (°F) Varies	This parameter displays the catalyst converter temperature as calculated by the engine control module.
Calculated Engine Oil Temperature	-	°C (°F) Varies	This parameter displays the temperature of the engine oil as calculated by the control module using various sensor inputs. The engine oil temperature calculated has a range of values indicating a low value when the oil temperature is low to a high value when the oil temperature is high.
Calculated Time Until Next Engine Maintenance Mode	-	Days	This parameter displays the estimated time remaining until the next engine maintenance mode is required.
Calculated Time Until Next Fuel Maintenance Mode	-	Days	This parameter displays the estimated time remaining until the next fuel maintenance mode is required.
Camshaft Position	-	Varies	This parameter displays the position of the intake camshaft in terms of degrees of camshaft rotation (advance) from the park position (a value of zero represents the park position).
Camshaft Position Active Counter	-	0-255 Counts	This parameter displays an incrementing counter when the control module receives a signal from the camshaft position sensors.
Camshaft Position Command	-	%	This parameter displays the commanded duty cycle for the intake cam phase output.
Camshaft Position Sensor	-	Engine Speed	This parameter displays the speed of the engine as calculated by the signal from the camshaft position sensor, shown in RPM.
Catalyst Monitor Complete This Ignition Cycle	-	Yes/No	This parameter displays the monitor completion status during the current driving/monitoring cycle.
Catalyst Monitor Enabled This Ignition Cycle	-	Yes/No	This parameter displays the monitor enable status during the current driving/monitoring cycle.
			This parameter displays the status of the catalyst monitor diagnostic. Off Idle Conditions Met indicates if

Catalyst Monitor Not At Idle Test Conditions Met	-	Yes/No	the off idle conditions for the catalyst monitor diagnostic have been met. Once the Off Idle Conditions are met the vehicle can return to idle and allow the catalyst monitor diagnostic test to run.
Catalyst Monitor Test Counter	-	0 Counts	This parameter displays the number of iterations of the catalyst monitor diagnostic test that have been performed since a code clear (used to determine if a sufficient number of tests have run to report a passing condition).
Catalyst Monitor Test Result	-	Varies	This parameter displays the status of the catalyst monitor diagnostic.
Catalyst Monitor Test State	-	Varies	This parameter displays when the catalyst monitor diagnostic is actively running a test. This condition will only be true when the vehicle is at idle.
Charging Mode	-	Depleting or Continuous	This parameter displays the currently active charging mode for an extended range electric vehicle.
Cold Start Up	-	Varies	This parameter displays whether the engine meets the conditions for a cold startup during the present ignition cycle. The scan tool displays Yes when the conditions for a cold startup are met during this ignition cycle. The scan tool displays No when the conditions for a cold startup are not met during the present ignition cycle. Conditions for a cold startup require the coolant temperature and the intake air temperature to be below a predetermined temperature and within a certain range of each other. These conditions must occur after the engine was warmed up to a specific temperature during the previous ignition cycle.
Cooling Fan Control Circuit High Voltage Test Status	-	Not Run	This parameter displays the diagnostic state of the output driver for the cooling fan relay control circuit. The scan tool will display OK, Malfunction or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cooling Fan Control Circuit Low Voltage Test Status	-	Not Run	This parameter displays the diagnostic state of the output driver for the cooling fan relay control circuit. The scan tool will display OK, Malfunction or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cooling Fan Control Circuit Open Test Status	-	Not Run	This parameter displays the diagnostic state of the output driver for the cooling fan relay control circuit. The scan tool will display OK, Malfunction or Not Run. The scan tool will display OK if the circuit is operating correctly.
Cooling Fan Motor Command	-	%	This parameter displays the amount of cooling commanded by the ECM in a percentage.
Crank Request Signal	-	No	This parameter displays Yes or No when a Crank Request Input Request is received.
Crankshaft Position Active Counter	-	0-255 Counts	This parameter displays an incrementing counter when the control module receives a signal from the crankshaft position sensor.
Crankshaft Position Resynchronisation Counter	-	0 Counts	This parameter displays the number of counts the control module resynchronises with the crankshaft position sensor.
Crankshaft Position Sensor	-	Engine Speed	This parameter displays the engine speed as calculated by the control module using the signal from the crankshaft position sensor.
Cruise Control	Cruise Control ON	Enabled/Disabled	This parameter displays the status of the cruise control system as determined by the control module.

Cruise Control Accelerate Switch	Cruise Control ON	Active/Inactive/Invalid	The scan tool displays ON, when the cruise ON/OFF switch is ON and the accelerate switch is pressed, the ECM detects a predetermined voltage value for this switch.
Cruise Control Cancel Switch	Cruise Control ON	Active/Inactive/Invalid	This parameter displays the status of the cruise control cancel switch.
Cruise Control Coast Switch	Cruise Control ON	Active/Inactive/Invalid	The scan tool displays ON, when the cruise ON/OFF switch is ON and the ECM detects a predetermined voltage value for the coast switch.
Cruise Control Disengage History 1-8	Cruise Control ON	Reason for Cruise Disengagement	The parameter displays the last 8 cruise control disengages in order from 1-8, with 8 being the most recent. There are approximately 40 possible causes for the cruise control to disengage.
Cruise Control Inhibit Reason	Cruise Control ON	Varies	The parameter displays the reason why the cruise control system is inhibited. There are approximately 40 possible causes for the cruise control to be inhibited.
Cruise Control ON/OFF Switch	Cruise Control ON	ON/OFF	The engine control module (ECM) monitors the signal circuit of the cruise control switch. A closed switch is displayed as ON.
Cruise Control Release Switch	Cruise Control ON	Active/Inactive/Invalid	The scan tool displays ON, when the cruise ON/OFF switch is ON and the resume switch is pressed, the ECM detects a predetermined voltage value for the resume switch.
Cruise Control Set Switch	Cruise Control ON	Active/Inactive/Invalid	The scan tool displays ON, when the cruise ON/OFF switch is ON and the ECM detects a predetermined voltage value for the set switch.
Current Gear	--	1	This parameter displays the current forward gear of the transmission
Current Gear When Engine Overspeed Detected	-	Varies	This parameter displays the transmission actual gear observed upon initial detection of an overspeed condition.
Cylinder 1-4 Current Misfire Counter	-	0 Counts	The scan tool displays 0-255 Counts. This parameter displays the number of misfires that have been detected during the last 200 cylinder firing events. The counters may normally display some activity, but the activity should be nearly equal for all of the cylinders, and in low numbers.
Cylinder 1-4 History Misfire Counter	-	0 Counts	The scan tool displays 0-255 Counts. The misfire history counters display the total level of misfire that has been detected on each cylinder. The misfire history counters will not update or show any activity until a misfire DTC P0300 has become active. The misfire history counters will update every 200 cylinder firing events.
Cylinder 1-4 Injector Control Circuit High Voltage Test Status	-	OK	This parameter displays the state of the injector control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
Cylinder 1-4 Injector Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the injector control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
Cylinder 1-4 Injector Control Circuit Open Test Status	-	OK	This parameter displays the state of the injector control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
Cylinder 1-4 Injector Disabled - Misfire	-	No	This parameter displays the status of the fuel injector driver by the control module. The scan tool will display Yes if the fuel injector is being disabled due to a misfire detection. The scan tool will display No if

Detected			the fuel injector is not being disabled by the control module due to a misfire.
Cylinder 1-4 Knock Detected	-	No	This parameter displays the status of each cylinder for knock detection by the control module. The scan tool will display Yes if a knock condition has been detected related to that cylinder combustion event. The scan tool will display No if there is no knock condition detected related to that cylinder combustion event.
Deceleration Fuel Cut-Off	-	Inactive	This parameter displays the status of the operating mode used to turn off the fuel injectors during certain deceleration conditions. When the scan tool displays Active, the control module has turned off the fuel injectors. When the scan tool displays Inactive, the fuel system is operating normally.
Desired ECT	-	°C (°F) Varies	This parameter displays the desired engine coolant temperature (ECT) in °C (°F).
Desired Exhaust Camshaft Position	-	Varies	This parameter displays the desired exhaust camshaft angle as commanded by the engine control module.
Desired Intake Camshaft Position	-	Varies	This parameter displays the desired intake camshaft angle as commanded by the engine control module.
Desired Intake Manifold Runner Control Valve Position	-	Opened or Closed	This parameter displays the commanded state of the Intake Manifold Runner Control output as Opened or Closed.
Desired Throttle Position	-	2-6 %	This parameter displays the desired throttle position angle commanded by the control module.
Distance Since DTC Cleared	-	Varies	This parameter displays the distance accumulated since an emission diagnostic trouble code was cleared. The scan tool will display increasing distance as the vehicle is driven.
Distance Since First Malfunction	Vehicle ON	0 km/h (0 MPH)	This parameter displays in kilometres or miles the distance travelled since a Malfunction occurred.
Distance Since Last Malfunction	-	Varies	This parameter displays the distance accumulated when the emission diagnostic trouble code last failed.
Distance Since Last Oil Pressure Warning	Vehicle ON	0 km/h (0 MPH)	This parameter displays in kilometres or miles the distance travelled since the last oil pressure warning Malfunction occurred.
Drive Motor No Crank At Restart	-	No	Starting System indicates that a condition in the starting system has been detected that would prevent a re-start of the vehicle, and thus Autostops have been disabled.
Driver Requested Axle Torque	-	Varies	This parameter displays the drivers requested axle torque as determined by the ECM. The ECM monitors accelerator pedal position and determines how much axle torque is required in order to meet the drivers request. The parameter display range is -8192 to +8191.75 N·m.
Driver Selected Autostart/Autostop Disable Mode Active	-	No	This parameter displays if the Driver Selected Autostart/Autostop Disable Mode is active.
Driver Selected Autostart/Autostop Disable Mode Available	-	Yes	This parameter displays if the Driver Selected Autostart/Autostop Disable Mode is available.
Driver Selected Economy			

Mode Active	-	No	This parameter displays if the Driver Selected Economy Mode is active.
Driver Selected Economy Mode Available	-	Yes	This parameter displays if the Driver Selected Economy Mode is available.
Driver Selected Hold Mode Active	-	No	This parameter displays if the Driver Selected Hold Mode is active.
Driver Selected Hold Mode Available	-	Yes	This parameter displays if the Driver Selected Hold Mode is available.
Driver Selected Mountain Mode Active	-	No	This parameter displays if the Driver Selected Mountain Mode is active.
Driver Selected Mountain Mode Available	-	Yes	This parameter displays if the Driver Selected Mountain Mode is available.
Driver Selected Sport Mode Active	-	No	This parameter displays if the Driver Selected Sport Mode is active.
Driver Selected Sport Mode Available	-	No	This parameter displays if the Driver Selected Sport Mode is available.
DTC Present	-	No	This parameter displays that a Diagnostic Trouble Code (DTC) has been set that prevents Autostops.
ECM Authentication Status	Vehicle ON	Unknown/Incorrect/Negative Response/Valid	ECM Authentication Status indicates the result of the comparison between the last received immobiliser response and the expected response calculated into the ECM.
ECM Challenge Status	-	Valid	This parameter displays the immobiliser system status of the ECM challenge. This indicates whether the currently calculated ECM challenge is valid.
ECM Response Source	Vehicle ON	Ignition Switch Start/Remote Vehicle Start/Exterior Power Take Off (PTO) Vehicle Start	ECM Response Source indicates the source used to calculate the ECM response.
ECT Sensor	-	-39 to +140°C (-38 to +284°F) Varies	This parameter displays the temperature of the engine coolant based on input to the control module from the engine coolant temperature (ECT) sensor.
ECT vs. IAT Sensor Temperature at Last ECT vs. RCT Malfunction Detection	-	Agree	The ECT/RCT rationality diagnostic will compare the two values during a cold start to determine if one of the sensors is reading incorrectly. If the two coolant sensor values disagree, the sensor values will then be compared to the Intake Air Temperature (IAT) sensor value.
EGR/Camshaft Position Monitor Complete	-	Yes/No	This parameter displays the status of the EGR/Camshaft Position Monitor. The parameter will display Yes when the EGR/Camshaft Position Monitor is complete.
EGR/Camshaft Position Monitor Complete This Ignition Cycle	-	Yes/No	This parameter displays the status of the EGR/Camshaft Position Monitor for this Ignition Cycle. The parameter will display Yes when the EGR/Camshaft Position Monitor is complete this Ignition Cycle.

EGR/Camshaft Position Monitor Enabled	-	Yes/No	This parameter displays the status of the EGR/Camshaft Position Monitor. The parameter will display Yes when the EGR/Camshaft Position Monitor is Enabled.
EGR/Camshaft Position Monitor Enabled This Ignition Cycle	-	Yes/No	This parameter displays the status of the EGR/Camshaft Position Monitor for this Ignition Cycle. The parameter will display Yes when the EGR/Camshaft Position Monitor is Enabled this Ignition Cycle.
Engine Controls Ignition Relay Command	-	ON	This parameter displays the commanded state of the engine control ignition relay control circuit. The scan tool will display ON or OFF. ON indicates the engine control ignition relay control circuit is being grounded by the control module, allowing voltage to other control module circuits and systems. OFF indicates the engine control ignition relay is not being commanded ON by the control module.
Engine Controls Ignition Relay Control Circuit High Voltage Test Status	-	Not Run	This parameter displays the state of the engine control ignition relay control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit Malfunctions are detected during the current test.
Engine Controls Ignition Relay Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the engine control ignition relay control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit Malfunctions are detected during the current test.
Engine Controls Ignition Relay Control Circuit Open Test Status	-	Not Run	This parameter displays the state of the engine control ignition relay control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit Malfunctions are detected during the current test.
Engine Controls Ignition Relay Feedback Signal	-	B+	This parameter displays the voltage available at the engine control ignition relay circuit of the control module.
Engine Coolant Thermostat Heater Command	-	%	This parameter displays the commanded duty cycle for the engine coolant thermostat.
Engine Coolant Thermostat Heater Control Circuit High Voltage Test Status	-	OK	This parameter displays the state of the Engine Coolant Thermostat Heater control circuit. The parameter displays Malfunction if the Engine Coolant Thermostat Heater control circuit is shorted to voltage.
Engine Coolant Thermostat Heater Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the Engine Coolant Thermostat Heater control circuit. The parameter displays Malfunction if the Engine Coolant Thermostat Heater control circuit is shorted to ground.
Engine Coolant Thermostat Heater Control Circuit Open Test Status	-	OK	This parameter displays the state of the Engine Coolant Thermostat Heater control circuit. The parameter displays Malfunction if the Engine Coolant Thermostat Heater control circuit is open.
Engine Load	Engine Idling	11-30 % Varies	This parameter displays the calculated engine load in percent based on inputs to the control module from various engine sensors.
	Engine speed at	25-40 %	

	2 500 RPM		
Engine Maintenance Mode	-	Active/Inactive	This parameter displays that an Engine Maintenance Mode is currently active or inactive.
Engine Maintenance Mode Completed This Ignition Cycle	-	True/False	This parameter displays that an Engine Maintenance Mode has run to completion during the current ignition cycle.
Engine Maintenance Mode Completion Status	-	%	This parameter displays a percent complete of a currently running engine maintenance mode. Once 100 % is reached, the Engine Maintenance Mode has completed this Ignition Cycle.
Engine Maintenance Mode Counter	-	Varies	This parameter displays the accumulated number of engine maintenance mode events over the life of the engine control module.
Engine OFF Time	Ignition Switch in the OFF Position	Varies	This parameter displays the amount of time that has elapsed since the engine was last cycled OFF. The scan tool displays the time in hours, minutes, and seconds. The engine OFF time will reset to zero when the engine starts.
Engine Oil Pressure Switch	-	OK	This parameter displays the state of the engine oil pressure as determined by the control module. The control module monitors the engine oil pressure switch to determine if the engine oil pressure is sufficient. The scan tool displays Low when the engine oil pressure is below a predetermined value.
Engine Oil Temperature When Engine Overspeed Detected	-	Varies	This parameter displays the engine oil temperature observed upon initial detection of an overspeed condition. This value will be updated after each overspeed condition.
Engine Run Time	Engine Operating	Varies	This parameter displays the time elapsed since the engine was started. The scan tool will display the time in hours, minutes and seconds. The engine run time will reset to zero when the engine stops running.
Engine Speed	Engine Cranking	Greater than 60 RPM	This parameter displays the speed of the engine crankshaft rotation from information received from the crankshaft position sensor.
	Engine Idling	Approximately 650-950 RPM	
Engine Speed When Engine Overspeed Detected	-	RPM	This parameter displays the engine speed observed upon initial detection of an overspeed condition. This value will be updated after each overspeed condition.
EVAP Leak Detection Pump Command	-	OFF	This parameter displays the commanded state of the EVAP Leak Check Pump vacuum pump output
EVAP Leak Detection Pump Output Circuit Open Test Status	-	OK	This parameter displays the state of the EVAP Leak Detection Pump Output circuit. The parameter displays Malfunction if the EVAP Leak Detection Pump Output circuit is opened.
EVAP Leak Detection Pump Pressure	-	kPa	This parameter displays EVAP Leak Detection Pump absolute pressure measured by a sensor.
EVAP Leak Detection Pump Pressure	-	Volts	This parameter displays the EVAP Leak Check Pump (ELCP) pressure value input to the control module as a voltage.

EVAP Leak Detection Pump Service Bay Test Abort Reason	-	Varies	This parameter displays the EVAP Leak Detection Pump Service Bay Test Abort Reason.
EVAP Leak Detection Pump Service Bay Test Denial Reason	-	Varies	This parameter displays the reason the EVAP service bay test was denied.
EVAP Leak Detection Pump Service Bay Test Result	-	Varies	This parameter displays the result of the EVAP service bay test.
EVAP Leak Detection Pump Switching Valve Command	-	Not Venting/ Venting	This parameter displays the commanded state of the EVAP Leak Check Pump switching valve output.
EVAP Leak Detection Pump Switching Valve Output Circuit High Voltage Test Status	-	OK	This parameter displays the state of the EVAP Leak Detection Pump Switching Valve Output circuit. The parameter displays Malfunction if the EVAP Leak Detection Pump Switching Valve Output circuit is shorted to voltage.
EVAP Leak Detection Pump Switching Valve Output Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the EVAP Leak Detection Pump Switching Valve Output circuit. The parameter displays Malfunction if the EVAP Leak Detection Pump Switching Valve Output circuit is shorted to ground.
EVAP Leak Detection Pump Switching Valve Output Circuit Open Test Status	-	OK	This parameter displays the state of the EVAP Leak Detection Pump Switching Valve Output circuit. The parameter displays Malfunction if the EVAP Leak Detection Pump Switching Valve Output circuit is opened.
EVAP Monitor Complete This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor completion status during the current driving/monitoring cycle.
EVAP Monitor Enabled This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor enable status during the current driving/monitoring cycle.
EVAP Purge Solenoid Valve Command	-	10-20 %	This parameter displays the on-time or duty cycle of the EVAP canister purge solenoid commanded by the control module. Zero percent indicates no purge. One hundred percent indicates full purge.
EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status	-	OK	This parameter displays the status of the evaporative emission (EVAP) purge solenoid control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
EVAP Purge Solenoid Valve Control Circuit Low Voltage Test Status	-	OK	This parameter displays the status of the evaporative emission (EVAP) purge solenoid control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
EVAP Purge Solenoid Valve Control Circuit Open Test Status	-	OK	This parameter displays the status of the evaporative emission (EVAP) purge solenoid control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.

EVAP Test	-	Varies	This parameter displays the state of the EVAP Test.
EVAP Vent Solenoid Valve Command	-	OFF	This parameter displays the state of the EVAP canister vent solenoid commanded by the control module. The scan tool displays ON Venting or OFF Not Venting.
EVAP Vent Solenoid Valve Control Circuit High Voltage Test Status	-	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission vent solenoid control circuit as determined by the engine control module. The scan tool will display OK, Malfunction or Not Run. The scan tool will display OK if the circuit is operating correctly.
EVAP Vent Solenoid Valve Control Circuit Low Voltage Test Status	-	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission vent solenoid control circuit as determined by the engine control module. The scan tool will display OK, Malfunction or Not Run. The scan tool will display OK if the circuit is operating correctly.
EVAP Vent Solenoid Valve Control Circuit Open Test Status	-	OK	This parameter displays the diagnostic state of the output driver for the evaporative emission vent solenoid control circuit as determined by the engine control module. The scan tool will display OK, Malfunction or Not Run. The scan tool will display OK if the circuit is operating correctly.
Exhaust Camshaft Position	-	Engine Idling: 5 Degrees Engine Speed at 2,000 RPM: 19 Degrees	This parameter displays the actual exhaust camshaft position in degrees.
Exhaust Camshaft Position Active Counter	-	0-255 Counts	This parameter displays an incrementing counter when the control module receives a signal from the exhaust camshaft position sensor.
Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status	-	OK	This parameter displays the state of the exhaust camshaft actuator solenoid control circuit. The parameter displays Malfunction if the camshaft actuator solenoid control circuit is shorted to voltage.
Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the exhaust camshaft actuator solenoid control circuit. The parameter displays Malfunction if the camshaft actuator solenoid control circuit is shorted to ground.
Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status	-	OK	This parameter displays the state of the exhaust camshaft actuator solenoid control circuit. The parameter displays Malfunction if the camshaft actuator solenoid control circuit is open.
Exhaust Camshaft Position Command	-	45-51 %	This parameter displays the on-time or duty cycle of the exhaust camshaft position actuator solenoid valve as commanded by the engine control module.
Exhaust Camshaft Position Variance	-	0.0-0.2 Degrees	This parameter displays in degrees, the difference between the desired exhaust camshaft position and the actual exhaust camshaft position.
Fuel Control Loop Status	-	Closed Loop	This parameter displays the state of the fuel control system as commanded by the control module. Closed loop operation indicates that the control module is controlling the fuel delivery based off the oxygen sensors input signal. In open loop operation the control module ignores the oxygen sensor input signal and bases the amount of fuel to be delivered on other sensor inputs.

Fuel Economy	Engine Idling	Litres per Hour	This Parameter displays the instant fuel consumption rate of the engine in litres per hour.
Fuel Enrichment - Hot Catalyst	-	No	This parameter displays Yes if the engine control module is commanding catalyst converter protection.
Fuel Enrichment - Hot Coolant	-	Inactive	This parameter displays the status of the fuel delivery system. The scan tool will display Active if the fuel system is running in open loop due to a temperature condition. The scan tool will display Inactive if the fuel system is operating normally.
Fuel Level Sensor	-	Varies	This parameter displays the approximate fuel level in the fuel tank as a voltage. The control module calculates this level using the signal from the sensor used to monitor the fuel in the tank. The scan tool will display a low reading when the fuel level in the tank is near empty. The scan tool will display a high reading when the fuel level in the tank is high or near full.
Fuel Maintenance Mode	-	Inactive	This parameter displays if the Fuel Maintenance Mode is active or inactive.
Fuel Maintenance Mode Counter	-	0-255	This parameter displays the number of fuel maintenance mode events over the life of the Engine Control Module (ECM).
Fuel Pump Enable Circuit High Voltage Test Status	-	OK/Not Run	This parameter displays the state of the fuel pump relay control circuit. The parameter displays Malfunction if the fuel pump control circuit is shorted to voltage.
Fuel Pump Enable Circuit Low Voltage Test Status	-	OK/Not Run	This parameter displays the state of the fuel pump control circuit. The parameter displays Malfunction if the fuel pump relay control circuit is shorted to ground.
Fuel Pump Enable Circuit Open Test Status	-	OK/Not Run	This parameter displays the state of the fuel pump control circuit. The parameter displays Malfunction if the fuel pump control circuit is opened.
Fuel Pump Enable Command	-	ON	This parameter displays the control modules commanded state of the fuel pump control circuit.
Fuel System Monitor Complete	-	No	This parameter displays Yes when the Fuel System Monitor is complete.
Fuel System Monitor Complete This Ignition Cycle	-	No	This parameter displays Yes when the Fuel System Monitor is Complete This Ignition Cycle.
Fuel System Monitor Enabled	-	No	This parameter displays Yes when the Fuel System Monitor is enabled.
Fuel System Monitor Enabled This Ignition Cycle	-	No	This parameter displays Yes when the Fuel System Monitor is Enabled This Ignition Cycle.
Fuel Tank Pressure Sensor	-	1.3-1.7 V	This parameter displays the voltage signal received by the control module from the fuel tank pressure sensor.
Fuel Tank Pressure Sensor	-	Varies	This parameter displays the pressure/vacuum inside the fuel tank. A negative value indicates a vacuum, while a positive value indicates a pressure.
Fuel Tank Rated Capacity	-	70 L (18.4 Gal)	This parameter displays the rated maximum quantity of fuel the fuel tank will hold. This is calibrated in the control module to match the vehicle.

Fuel Trim Memory Cell	-	Varies	This parameter displays the fuel trim cell number as calculated by the control module based on engine speed and load inputs. The scan tool will display a lower number as conditions are closer to idle, and a higher number as conditions approach maximum engine speed and maximum load.
Fuel Trim System Test State	-	Monitoring	This parameter indicates the status of the Fuel Trim System Test. The scan tool will display Disabled, Enabled, Monitoring, or Run Purge Test.
HO2S 1 or HO2S 2	Vehicle ON, Engine OFF	50-900 mV	This parameter indicates the heated oxygen sensor (HO2S) sensor 1 or 2, output voltage as measured by the control module. The scan tool will display a higher value during a rich condition, and a lower value during a lean condition.
	Engine Operating	Varies	
HO2S 1 or HO2S 2 Heater	-	0.42-0.62 A	This parameter displays the amperage of the HO2S heater commanded by the engine control module.
HO2S 1 or HO2S 2 Heater Command	-	0-99 %	This parameter displays the commanded state of the HO2S 1 or HO2S 2 heater by the control module. The scan tool will display a higher value as the heater command is increased, and a lower value if the heater is not commanded ON.
HO2S 1 or HO2S 2 Heater Command	-	ON	This parameter displays the commanded state of the HO2S 1 or HO2S 2 heater circuit by the control module. The scan tool will display ON when the heater is commanded ON. The scan tool will display OFF when the heater is commanded OFF.
HO2S 1 or HO2S 2 Heater Control Circuit High Voltage Test Status	-	OK	This parameter displays the status of the control circuit for the HO2S 1 or HO2S 2. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit Malfunctions are detected during the current test.
HO2S 1 or HO2S 2 Heater Control Circuit Low Voltage Test Status	-	OK	This parameter displays the status of the control circuit for the HO2S 1 or HO2S 2. The scan tool displays OK, Malfunction or Not Run. OK indicates that no circuit Malfunctions are detected during the current test.
HO2S 1 or HO2S 2 Heater Control Circuit Open Test Status	-	OK	This parameter displays the status of the control circuit for the HO2S 1 or HO2S 2. The scan tool displays OK, Malfunction or Not Run. OK indicates that no circuit Malfunctions are detected during the current test.
HO2S Heater Monitor Complete	Engine Idling	Yes/No	This parameter displays the diagnostic monitor completion status during the current driving/monitoring cycle.
HO2S Heater Monitor Complete This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor completion status during the current driving/monitoring cycle.
HO2S Heater Monitor Enabled	Engine Idling	Yes/No	This parameter displays the diagnostic monitor enable status during the current driving/monitoring cycle.
HO2S Heater Monitor Enabled This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor enable status during the current driving/monitoring cycle.
Bonnet Ajar Switch 1	-	Ajar	This parameter displays the Bonnet Ajar 1 switch as either Closed or Ajar.

Bonnet Ajar Switch 2	-	Ajar	This parameter displays the Bonnet Ajar 2 switch as either Closed or Ajar.
Bonnet Position	-	Open	This parameter displays the Bonnet Position as Closed, Ajar, Open or Invalid. Bonnet Open indicates that the state of the hood switch prevented an Autostop. Autostops are not allowed with the bonnet open.
Hybrid/EV Battery Pack Charge Remaining	-	Varies	This parameter displays the amount of charge left in the Hybrid/EV Battery Pack.
Hybrid Transmission Mode Command	-	Park/Neutral	This parameter displays the current Hybrid Transmission Mode. <ul style="list-style-type: none"> • Park/Neutral • EV1 • EV2 • Gear 1 • Gear 2 • Gear 3 • Gear 4 • Invalid
IAT Sensor	-	-39 to +140°C (-38 to +284°F)	This parameter displays the temperature of the air entering the air induction system based on input to the control module from the intake air temperature (IAT) sensor.
Ignition 1 Signal	-	B+	This parameter displays B+ when the control module detects a voltage at the ignition 1 input terminal.
Ignition Accessory Signal	-	ON	This parameter displays the state of the ignition accessory position input to the control module from the ignition switch.
Ignition Coil 1 and 4 Control Circuit High Voltage Test Status	-	OK	This parameter displays the state of the Ignition control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
Ignition Coil 1 and 4 Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the Ignition control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit Malfunction are detected during the current test.
Ignition Coil 1 and 4 Control Circuit Open Test Status	-	OK	This parameter displays the state of the Ignition control circuit. The scan tool displays OK, Malfunction or Not Run. OK indicates that no circuit Malfunction are detected during the current test.
Ignition Coil 2 and 3 Control Circuit High Voltage Test Status	-	OK	This parameter displays the state of the Ignition control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
Ignition Coil 2 and 3 Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the Ignition control circuit. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit faults are detected during the current test.
Ignition Coil 2 and 3 Control Circuit Open Test	-	OK	This parameter displays the state of the Ignition control circuit. The scan tool displays OK, Malfunction,

Status			or Not Run. OK indicates that no circuit faults are detected during the current test.
Ignition Cycles Since Last Completed Engine Maintenance Mode	-	Days	This parameter displays the elapsed time in days since the most recent completion of Engine Maintenance Mode.
Ignition Cycles Since Last Completed Fuel Maintenance Mode	-	Days	This parameter displays the elapsed time in days since the most recent completion of Fuel Maintenance Mode.
Ignition Cycles with Malfunction Since 1st Malfunction	Vehicle ON	Counts	This Parameter displays the number of ignition cycles with a malfunction reported since the first ignition cycle with a malfunction reported.
Ignition Cycles without Completed Test Since 1st Malfunction	-	Counts	This Parameter displays the number of ignition cycles without a malfunction reported since the first ignition cycle.
Ignition Cycles without Malfunction Since Last Malfunction	Vehicle ON	Counts	This Parameter displays the number of ignition cycles with a pass reported and no malfunctions reported since the first ignition cycle with a malfunction reported.
Ignition Timing	-	-4 to +15 Degrees	This parameter displays the amount of spark advance the control module is commanding. The engine control module determines the desired advance.
Ignition Timing	-	Degrees	This parameter displays the final spark advance in terms of a crankshaft angle
Immobiliser Password Learn	-	Yes	This parameter displays Yes when a valid theft password has been learned.
Immobiliser Security Information Programmed	-	Yes	This parameter displays if the immobilizer system security code has been programmed.
Immobiliser System Status	-	Varies	This parameter displays the current state of the immobiliser System Status. The states include the following: Standby, Disabled at Startup, Disabled Due to No Response, Disabled Due to Negative Response, Disabled Due to Incorrect Response, Post Release, Pre-Release, Released.
Injector Duty Cycle	-	1.5-3 ms	This parameter displays the average pulse width of the fuel injectors as determined by the control module.
Intake Camshaft Position Active Counter	-	0-255 Counts	This parameter displays an incrementing counter when the control module receives a signal from the intake camshaft position sensor.
Intake Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status	-	OK	This parameter displays the state of the intake camshaft position actuator solenoid valve control circuit. The parameter displays Malfunction if the camshaft actuator solenoid control circuit is shorted to voltage.
Intake Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test Status	-	OK	This parameter displays the state of the intake camshaft position actuator solenoid valve control circuit. The parameter displays Malfunction if the camshaft actuator solenoid control circuit is shorted to ground.

Intake Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status	-	OK	This parameter displays the state of the intake camshaft position actuator solenoid valve control circuit. The parameter displays Malfunction if the camshaft actuator solenoid control circuit is open.
Intake Camshaft Position Variance	-	Degrees	This parameter displays in degrees, the difference between the desired intake camshaft position and the actual intake camshaft position.
Intake Manifold Pressure	-	32-53 kPa (4.6-7.6 PSI)	This parameter displays the pressure difference between the Manifold Absolute Pressure (MAP) and the barometric pressure (BARO) as calculated by the control module.
Knock Retard	-	0°	This parameter displays the amount of spark advance the control module removes from the ignition control spark advance in response to the signal from the knock sensors.
Last Engine Maintenance Mode	-	Incomplete	This parameter displays the status of the Last Engine Maintenance Mode.
Long Term Fuel Trim	-	-10 to +10 %	The scan tool range is -99 to +99 %. This parameter indicates the Long Term fuel trim correction as commanded by the ECM. A change made to the fuel delivery will be indicated by the Long and Short Term values. The Short Term values change rapidly in response to the HO2S signal voltages. These changes fine tune the engine fueling. The Long Term values change in response to the changes in the Short Term. The Long Term makes coarse adjustments to the fueling in order to recenter and restore control to the Short Term. The Short Term and the Long Term can be monitored with a scan tool. A positive fuel trim value indicates that the ECM is adding fuel in order to compensate for a lean condition. A negative fuel trim value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition.
Long Term Fuel Trim Test Average	-	0.98 % Varies	This parameter is the average long term fuel trim for this bank as calculated by the control module. The scan tool will display a value more than 0 % indicating that time is being added to the injector pulse width, increasing the amount of fuel to this bank of the engine. The scan tool will display a value of less than 0, indicating time is being subtracted from the injector pulse width, reducing the amount of fuel to this bank of the engine. A value of 0 % indicates no compensation is required to operate the engine at the desired air/fuel ratio.
Long Term Fuel Trim Test Average without Purge	-	1.02 % Varies	This parameter is calculated by the control module based on the Short Term Fuel Trim value. The Long Term Fuel Trim is used for the long term correction of the fuel delivery. The scan tool will display a high value for a large amount of long term fuel correction, and 0 % for no long term fuel trim correction. The scan tool will display a negative value when fuel system is running too rich and fuel is being removed from the combustion event. The scan tool will display a positive value if the fuel system is running lean and fuel is being added to the combustion event.
Low Voltage Battery Discharge Current	-	No	This parameter displays the state of the 12 V Low Voltage Battery Discharge.
MAF Performance Test	-	OK	This parameter displays the status of the mass air flow (MAF) performance test by the control module. The scan tool will display OK if no condition is detected. The scan tool will display Malfunction if the control module detects a condition during the test.
	Engine		

MAF Sensor	Idling	1.7-3.7 g/s	This parameter indicates the quantity calculated by the control module based on a signal from the MAF sensor. The scan tool will display a high value at high engine speeds, and a low value at low engine speeds.
	Engine speed at 2 500 RPM	5.5-7.5 g/s	
MAF Sensor	-	1 700-2 100 Hz	This parameter indicates the frequency signal received from the MAF sensor by the control module. The scan tool will display a high value at high engine speeds, and a low value at low engine speeds.
MAF Sensor Supply Voltage Command	-	ON	This parameter displays the commanded state of the MAF sensor supply voltage output.
MAF Sensor Supply Voltage Control Circuit High Voltage Test Status	-	OK or Not Run	This parameter displays the status of the Supply Voltage Control circuit for the MAF Sensor. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
MAF Sensor Supply Voltage Control Circuit Low Voltage Test Status	-	OK or Not Run	This parameter displays the status of the Supply Voltage Control circuit for the MAF Sensor. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
MAF Sensor Supply Voltage Control Circuit Open Test Status	-	OK or Not Run	This parameter displays the status of the Supply Voltage Control circuit for the MAF Sensor. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
MAF When Engine Overspeed Detected	-	g/s	This parameter displays the intake mass airflow observed upon initial detection of an overspeed condition. This value will be updated upon each subsequent overspeed condition.
Maintenance Mode Disabled Low Fuel Level	-	No	This parameter displays Maintenance Mode Disabled Due to Low Fuel Level. The scan tool displays Yes or No.
Maintenance Mode Status	-	Varies	This parameter displays the current status of the Maintenance Mode.
MAP Performance Test 1	-	OK	This parameter displays the status of the MAP performance test 1 by the engine control module. The scan tool will display OK if no malfunction is found. The scan tool will display malfunction if the engine control module detects a malfunction during the test.
MAP Performance Test 2	-	OK	This parameter displays the status of the MAP performance test 2 by the engine control module. The scan tool will display OK if no malfunction is found. The scan tool will display malfunction if the engine control module detects a malfunction during the test.
MAP Sensor	-	26-52 kPa (3.7-7.6 PSI)	This parameter displays the pressure from the MAP sensor to the engine control module.
MAP Sensor	-	0.98-1.42 V	This parameter displays the signal voltage from the MAP sensor to the engine control module.
Maximum Engine Speed When Engine Overspeed Detected	-	RPM	This parameter displays the maximum engine speed observed during all overspeed condition and stores this information in the engine control module.
MIL Command	Vehicle ON	ON/OFF	This parameter displays the commanded state of the malfunction indicator lamp (MIL) control circuit by the engine control module (ECM).
MIL Control Circuit High Voltage Test Status	-	OK	This parameter displays the status of the control circuit for the malfunction indicator lamp control (MIL). The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are

			detected during the current test.
MIL Control Circuit Low Voltage Test Status	-	OK	This parameter displays the status of the control circuit for the malfunction indicator lamp control (MIL). The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
MIL Control Circuit Open Test Status	-	OK	This parameter displays the status of the control circuit for the malfunction indicator lamp control (MIL). The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
MIL Requested	Vehicle ON	Yes/No	This parameter displays the reason the engine control module illuminated the MIL. The scan tool will display Yes when the MIL is requested as a result of an A or B type DTC. The scan tool will display No if the MIL is illuminated for another reason, such as transmission DTCs.
MIL Requested by DTC	-	No	This parameter indicates the reason the control module illuminated the MIL. The scan tool will display Yes when the MIL is requested as a result of an A or B type DTC. The scan tool will display No if the MIL is illuminated for another reason, such as transmission DTCs.
Misfire Monitor Complete	-	No	This parameter displays the status of the Misfire Monitor. The parameter will display Yes when the Misfire Monitor is Complete.
Misfire Monitor Complete This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor completion status during the current driving/monitoring cycle.
Misfire Monitor Enabled	-	Yes/No	This parameter displays the status of the Misfire Monitor. The parameter will display Yes when the Misfire Monitor is Enabled.
Misfire Monitor Enabled This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor enable status during the current driving/monitoring cycle.
Not in Run Mode	-	No	This parameter displays Yes or No if the Run/Crank mode is not active.
Number of DTC(s)	-	0	This parameter indicates the number of diagnostic trouble codes (DTCs).
O2S/HO2S Monitor Complete	Engine Idling	Yes/No	This Parameter displays the enable and completion status during the current driving/monitoring cycle of each continuous legislated emission related monitor and non continuous legislated emission related monitor.
O2S/HO2S Monitor Complete This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor completion status during the current driving/monitoring cycle.
O2S/HO2S Monitor Enabled	Engine Idling	Yes/No	This Parameter displays the enable and completion status during the current driving/monitoring cycle of each continuous legislated emission related monitor and non continuous legislated emission related monitor.
O2S/HO2S Monitor Enabled This Ignition Cycle	-	Yes/No	This parameter displays the diagnostic monitor enable status during the current driving/monitoring cycle.
Odometer When Engine Overspeed Detected	-	km/miles	This parameter displays the vehicle odometer reading in km/miles upon initial detection of an overspeed condition by the engine control module.
	Vehicle		

Output Shaft Speed Sensor	needs to be moving	RPM	This Parameter displays the transmission output speed (the speed at the output of the gear box) determined from the speed measured by the transmission output speed sensor.
Power Mode	Vehicle ON	OFF/Accessory/Run/Crank Request	This Parameter displays the state of the System Power Mode. This signal is based upon the state of the system power mode received over serial communication from the vehicle electronics. If the serial data signal not received, the Parameter will display OFF.
Radiator Coolant Temperature Sensor	-	88-105°C (190-221°F)	The temperature of the engine coolant based on a voltage input from the radiator coolant temperature (RCT) sensor to the engine control module.
RCT vs. IAT Sensor Temperature at Last ECT vs. RCT Malfunction Detection	-	Agree, Disagree, Disabled	RCT/IAT Sensors Disagree indicates that the temperature values of the RCT and IAT sensors did not agree at the time of the most recent failure of the ECT/RCT rationality diagnostic (DTC P00B6).
Reduced Engine Power	-	Inactive	This parameter displays the status of the operating mode of the control module used to reduce engine power to prevent catalyst converter or engine damage or due to a Throttle Actuator Control (TAC) system condition.
Reduced Engine Power History	-	OK	This parameter displays the last reason that ECM has Commanded Reduced Engine Power. The scan tool displays one of the following when Reduced Engine Power is commanded: <ul style="list-style-type: none"> • TAC DTC • Fan Control DTC • ECT Overtemperature • Engine Oil Overtemperature
Remaining Fuel in Tank	-	0-100 % Varies	This parameter displays the amount of fuel remaining in the fuel tank as measured in percentage. The control module determines the amount of fuel remaining in the tank by using information from the fuel level sensors. The scan tool will display a higher value with a full fuel tank, and a lower value with an empty fuel tank.
Remaining Fuel in Tank	-	Litres (Gallons) Varies	This parameter displays the amount of fuel remaining in the fuel tank as measured in litres (gallons). The control module determines the amount of fuel remaining in the tank by using information from the fuel level sensor. The scan tool will display a higher value with a full fuel tank, and a lower value with an empty fuel tank.
Short Term Fuel Trim	-	-10 to +10 %	The Short Term values change rapidly in response to the HO2S signal voltages. These changes fine tune the engine fueling. The Long Term values change in response to the changes in the Short Term. The Long Term makes coarse adjustments to the fueling in order to recenter and restore control to the Short Term. The Short Term and the Long Term can be monitored with a scan tool. A positive fuel trim value indicates that the ECM is adding fuel in order to compensate for a lean condition. A negative fuel trim value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition.
Short Term Fuel Trim Test Average	-	-3 to +99 % Varies	This parameter displays the short term closed loop fuel correction. This value is compared to predetermined thresholds to determine if the fuel trim diagnostic is passing or failing.

Starter Relay Command	-	OFF	The scan tool displays ON or OFF. The scan tool displays OFF until the ignition is placed into the CRANK position.
Starter Relay Control Circuit High Voltage Test Status	-	OK	This parameter displays the status of the control circuit for the starter relay. The scan tool displays OK, Malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
Starter Relay Control Circuit Low Voltage Test Status	-	Not Run	This parameter displays the status of the control circuit for the starter relay. The scan tool displays OK, Malfunctions, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
Starter Relay Control Circuit Open Test Status	-	OK	This parameter displays the status of the control circuit for the starter relay. The scan tool displays OK, malfunction, or Not Run. OK indicates that no circuit malfunctions are detected during the current test.
Start Up ECT	-	-39 to +140°C (-38 to +284°F)	This parameter displays the temperature of the engine coolant on start up based on input to the control module from the ECT sensor 1.
Start Up IAT	-	-39 to +140°C (-38 to +284°F)	This parameter displays the temperature of the intake air at start in the air induction system based on input to the control module from the IAT sensor.
SVS Indicator Command	-	OFF	This parameter displays that the Service Vehicle Soon lamp is being commanded on due to the malfunction of a non emission related diagnostic test.
TAC Forced Engine Shutdown	-	No	This parameter displays the status of TAC control by the control module. The scan tool will display Yes if the engine has been shut down due to a throttle control malfunction. The scan tool will display No if the engine has not been shut down by a throttle control malfunction.
TAC Motor	-	Disabled	This parameter displays the status of the TAC motor driver by the control module. The scan tool will display Enabled if TAC motor operation is allowed. The scan tool will display disabled if the TAC motor is disabled.
TAC Motor Command	-	0-100 % Varies	This parameter displays the percentage of the commanded state of the TAC motor by the control module.
Throttle Body Idle Air Flow Compensation	-	0-100 % Varies	This parameter displays the amount of airflow compensation in response to engine intake air flow restrictions.
Throttle Position	-	2-9 %	This parameter displays the actual throttle position angle indicated by the control module using information from the two Throttle Body sensors.
Throttle Position Performance Test	-	OK	This parameter displays the status of the throttle position performance test by the control module. The scan tool will display OK if no malfunction is found. The scan tool will display Malfunction if the control module detects a malfunction during the test.
Throttle Position Sensor 1	Accelerator pedal not actuated	4.14-4.34 V	This parameter displays the voltage signal sent to the control module from throttle position sensor 1 of the throttle assembly. The throttle position sensor 1 is a range of values indicating a high voltage when the throttle is closed to a low voltage when the throttle plate is fully open.
	Accelerator pedal fully	3.50-3.37 V	

	actuated		
Throttle Position Sensor 1 Learned Minimum	-	0.5-0.71 V	This parameter displays the learned minimum voltage for throttle position sensor 1 as determined by the control module this ignition cycle.
Throttle Position Sensor 1 Position	-	2-6 %	This parameter displays the angle of the throttle position sensor 1 as calculated by the control module using the signal from the throttle position sensor 1. The throttle position sensor 1 is a range of values indicating a low percentage when the throttle is closed to a high percentage when the throttle is fully open.
Throttle Position Sensor 2	Accelerator pedal not actuated	0.68-0.88 V	This parameter displays the voltage signal sent to the control module from throttle position sensor 2 of the throttle assembly. The throttle position sensor 2 is a range of values indicating a low voltage when the throttle is closed to a high voltage when the throttle plate is fully open.
	Accelerator pedal fully actuated	1.35-1.55 V	
Throttle Position Sensor 2 Learned Minimum	-	0.55-0.75 V	This parameter displays the learned minimum voltage for throttle position sensor 2 as determined by the control module this ignition cycle.
Throttle Position Sensor 2 Position	-	2-6 %	This parameter displays the angle of the throttle position sensor 2 as calculated by the control module using the signal from the throttle position sensor 2. The throttle position sensor 2 is a range of values indicating a low percentage when the throttle is closed to a high percentage when the throttle is fully open.
Throttle Position Sensors 1 and 2	-	Agree	This parameter displays the results of a control module test that compares the signals from the Throttle Body sensors 1 and 2. The scan tool will display Agree or Disagree. Agree indicates that throttle position sensor 1 and throttle position sensor 2 voltages correspond to the same throttle position. Disagree indicates that throttle position sensor 1 and throttle position sensor 2 voltages correspond to different throttle positions.
Time Since Last Refuel Event	-	Days	This parameter displays the amount of time in the form of days since the most recent refuelling event.
Torque Management Ignition Timing Retard	-	15-25 Degrees	This parameter displays how much the ignition spark timing is being retarded to control torque by the control module. The scan tool will display a higher value under extreme torque control conditions such as spinning wheels. The scan tool will display a lower value under low torque control conditions such as light driving.
Torque Request Inhibit - Fuel	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.
Torque Request Inhibit - Ignition Timing	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.
Torque Request Inhibit - Ignition Timing Advance	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.
Torque Request Inhibit - Minimum Idle	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.

Torque Request Inhibit - Minimum Torque	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.
Torque Request Inhibit - TAC	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.
Torque Request Inhibit - TAC Limit	Engine Idling	Yes/No	This Parameter displays the existing condition in the ECM causing the transmission torque request to be limited.
Total Knock Retard	-	0°	This parameter displays how much ignition spark timing is being retarded due to all control systems monitored by the control module. The scan tool will display a high value during extreme conditions such as high temperatures and antilock braking. The scan tool will display a lower value during lighter driving conditions.
Vehicle Speed Sensor	-	0 km/h (0 MPH)	This parameter displays the speed of the vehicle as calculated by the transmission control module (TCM) from information received from the vehicle speed sensor.
Vehicle Speed When Engine Overspeed Detected	-	km/MPH	This parameter displays the vehicle speed observed upon initial detection of an overspeed condition by the engine control module.
Warm-Ups Since DTC Cleared	-	Varies	This parameter displays the number of warm-ups since the DTC was cleared in counts.
Warm-Ups without Emission Malfunctions	-	Varies	This parameter displays the number of warm-up cycles that have occurred without an emission malfunction present. The scan tool will display a 0 if a malfunction has occurred. The scan tool will display a higher count if a number of warm-up cycles have occurred without an emission malfunction.
Warm-Ups without Non-Emission Malfunctions	-	Varies	This parameter displays the number of warm-up cycles that have occurred without a non-emission malfunction present. The scan tool will display a 0 if a malfunction has occurred. The scan tool will display a higher count if a number of warm-up cycles have occurred without a non-emission malfunction.
Wide Open Throttle	-	No	This parameter displays the throttle status commanded by the control module. The scan tool will display Yes if the vehicle throttle is commanded to wide open. The scan tool will display No if the vehicle throttle is commanded to an amount less than 100 %.

Engine Control Module (ECM) Scan Tool Output Controls

Output Control	Description
A/C Compressor Clutch Relay	This device control is used to activate the Air Conditioning Compressor Clutch.
Camshaft Position Actuator Solenoid Valve	This device control is used to override the state of the camshaft position actuator solenoid output.
Crankshaft Position Variation Learn	This device control is used to activate the crankshaft position variation learn software which calculates the reference pulse correction factors for the misfire diagnostic.
	This function disables the selected fuel injector. The normal commanded state is None. The scan tool initiates the test when the following conditions

Cylinder Power Balance	<p>are met:</p> <ul style="list-style-type: none"> • The engine is operating and the engine idle is stable. • The vehicle speed is 0 km/h (0 mph). • There are no vehicle speed sensor DTCs set. <p>If the fuel injector is disabled after 30 s, fuel injector control is not allowed again on the same fuel injector for 60 s.</p>
Engine Speed	<p>This function controls the idle speed override in 25 RPM, 100 RPM, and 500 RPM increments, from the base idle speed to 1 950 RPM. The scan tool initiates the test when the following conditions are met:</p> <ul style="list-style-type: none"> • The vehicle speed is 0 km/h (0 mph). • There are no VSS sensor DTCs set.
EVAP Leak Detection Pump Command	<p>This function turns the EVAP Leak Detection Pump ON and OFF.</p>
EVAP Leak Detection Pump Switching Valve Command	<p>This device control is used to change the state of the canister vent control valve output from Not Venting or Venting.</p>
EVAP Purge Solenoid Valve	<p>This function controls the EVAP purge solenoid valve. The normal commanded state is None. The system will increase or decrease the amount of purge by changing the duty cycle of the purge valve in 10 % increments within a range of 0-100 %. The scan tool initiates the test when the following conditions are met:</p> <ul style="list-style-type: none"> • The vacuum level in the EVAP purge system is within range. • There are no EVAP DTCs set. • The EVAP system test is not in progress. • In the correct Power Mode.
EVAP Vent Solenoid Valve Command	<p>This function controls the EVAP vent solenoid. The normal commanded state is None. When commanded ON, the vent valve switches to not venting. When commanded OFF, the vent valve switches to venting. The scan tool initiates the test when the following conditions are met:</p> <ul style="list-style-type: none"> • The vacuum level in the EVAP purge system is within range. • There are no EVAP DTCs set. • The EVAP system test is not in progress. • In the correct power mode.
Fuel Control Loop Status	<p>This device control is used to enable or disable closed loop fuel control.</p>
Fuel Filter Life Reset	<p>This device control is used to reset the Fuel Life in the ECM after replacement.</p>
	<p>This function enables the fuel injector in order to verify proper fuel injector flow. The ECM will pulse the selected injector when the following conditions are met:</p> <ul style="list-style-type: none"> • All instruction on the scan tool completed.

Fuel Injector Balance	<ul style="list-style-type: none"> • Fuel injector selected. • Key ON, engine OFF. <p>The selected fuel injector can only be flowed or pulsed once per ignition cycle.</p>
Fuel Pump Enable	<p>This function controls the fuel pump. The normal commanded state is NONE. The scan tool initiates the test when the following conditions are met:</p> <ul style="list-style-type: none"> • There are no vehicle speed sensor DTCs set. • The vehicle speed is 0 km/h (0 mph). <p>When commanded ON/OFF, the engine control module (ECM) turns the fuel pump module ON/OFF. If the engine is running and the fuel pump is commanded OFF, the engine will stall. The system remains in the commanded state for about 2 seconds or until cancelled by the scan tool or the ECM detects a vehicle speed.</p>
Fuel Trim Enable	This function enables or disables the ECM fuel trim learning. The normal commanded state is None.
Fuel Trim Reset	This function is used to reset the learned fuel trim values to their initial values.
HO2S Heater Learn	This function is used to trigger the reset of the learned resistances for the oxygen sensor heaters following a replacement. The learned resistances are reset to a calibration used to prevent overheating of the sensors until more accurate resistances may be learned following an extended engine OFF time.
HO2S Heater Sensor 1 or 2	<p>This function controls the selected HO2S heater. The normal commanded state is None, ON, and OFF. Commanding the HO2S heater ON turns on the heater driver. The scan tool initiates the test when the following conditions are met:</p> <ul style="list-style-type: none"> • The engine is operating. • The exhaust temperature is within range. • In the correct power mode. • The HO2S heaters are not over temperature. • The ignition voltage is not out of range while commanding the heaters ON.
HO2S Test	This device control is used to trigger a service bay procedure to execute the oxygen sensor response test following a sensor replacement in service. This procedure is required to set the oxygen sensor inspection and maintenance ready flag.
Idle Ignition Timing	Disables and enables idle spark advance with the engine running.
Ignition Timing Retard	This function is used to control the amount of spark retard. The normal commanded state is None. The system will increase or decrease the amount of spark retard by 1° increments within a range of 0-10° maximum retard. The system remains in the commanded state until cancelled by the tool.
MAF Sensor Supply Voltage Low Side Driver Command	<p>This device control is used to override the state of the mass air flow sensor supply voltage output.</p> <p>Engine must be running.</p>
Malfunction Indicator Lamp (MIL)	This function controls the malfunction indicator lamp (MIL). The normal commanded state is None. When commanded ON or OFF, the ECM turns the malfunction indicator lamp (MIL) ON or OFF. This output can also be monitored on the scan tool data parameter MIL Command. The system remains in the commanded state until cancelled by the scan tool.
Misfire Graphic	This function is used to graph the accumulated misfires occurring in each cylinder. The scan tool allows for a reset of the misfire graph.
Programming History	This function displays the history buffer entries for the primary calibration part in the engine controller.

Throttle Position	<p>This function controls the throttle valve in 10 % increments. The scan tool initiates the test when the following conditions are met:</p> <ul style="list-style-type: none">• The engine speed is 0 RPM.• The vehicle speed is 0 km/h (0 mph). <p>The system remains in the commanded state until cancelled by the scan tool.</p>
Throttle Sweep	<p>This function moves the Throttle plate slowly from a closed position to wide open position, aiding diagnosis of TAC motor.</p>

Fuel Pump Flow Control Module Scan Tool Information

Table 1: [Fuel Pump Flow Control Module Scan Tool Data Parameters](#)

Table 2: [Fuel Pump Flow Control Module Scan Tool Output Controls](#)

Fuel Pump Flow Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Vehicle in Service Mode/Engine Idling at Normal Operating Temperature / Vehicle is in Park or Neutral			
Desired Fuel Rail Pressure	-	306.8 kPa (44.5 psi)	This displays kPa (psi). This is the desired fuel rail pressure.
Fuel Pump Command	-	On	The scan tool displays On or Off. This is the current state of the fuel pump command.
Fuel Pump Signal Command	-	Varies	This displays %. This is the commanded fuel pump signal measured in percentage.
Fuel Rail Pressure Sensor	-	296.4-310.3 kPa (43-45 psi)	This displays kPa (psi). This is the current pressure at the fuel rail pressure sensor.
Fuel Rail Pressure Sensor	-	4.90-5.01 Volts	This displays Volts. This is the fuel rail pressure sensor voltage.
Ignition 1 Signal	-	Varies	This displays Volts. This is the current ignition 1 signal.
LT Fuel Pump Trim	-	Varies	This displays a numeric value. This is the long term (LT) fuel pump trim.
ST Fuel Pump Trim	-	Varies	This displays a numeric value. This is the short term (ST) fuel pump trim.

Fuel Pump Flow Control Module Scan Tool Output Controls

Output Control	Description
Fuel Pressure Control	This output control is used to control the fuel pressure.
Fuel Pump	This output control is used to command the fuel pump ON and OFF.
Fuel Pump Trim Reset	This output control is used to reset the fuel pump trim.

Hybrid Powertrain Control Module 2 Scan Tool Information

Table 1: [Battery Charger Control Module Scan Tool Data Parameters](#)

Table 2: [Contactor Scan Tool Data Parameters](#)

Table 3: [Hybrid/EV/EV Battery Contactor Scan Tool Data Parameters](#)

Table 4: [Fuel System Scan Tool Data Parameters](#)

Table 5: [HVAC System Scan Tool Data Parameters](#)

Table 6: [Hybrid Powertrain Control Module 2 Scan Tool Data Parameters](#)

Table 7: [Temperature Scan Tool Data Parameters](#)

Table 8: [Voltage Scan Tool Data Parameters](#)

Battery Charger Control Module Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Battery Charging System High Voltage Interlock Circuit Status	Unknown/Pass/Fail	The status (on/off) of the interlock circuit that is used by the hybrid battery charging system to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Battery Charging System High Voltage Interlock Circuit	De-energised/Energised	This interlock circuit is used by the hybrid battery charging system to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Battery Charger Input	Volts	Battery Charger Control Module Input voltage or current.
Battery Charger Input	Amps	Battery Charger Control Module Input voltage or current.
Battery Charging System Operating Conditions	Not OK/OK	Indicates if the situation under which the battery charging system is operating are in range to allow charging.
Battery Charger Input 120V AC	No/Yes	Indicates the battery charging system is connected to 120V AC.
Battery Charger Input 240 VAC	No/Yes	Indicates the battery charging system is connected to 240V AC.
Hybrid/EV battery		

Pack at Maximum Voltage	Yes/No	Indicates the Hybrid/EV Battery pack is at the maximum allowable voltage.
Battery Charging System	Not OK/OK	Components that make up the system which allows the battery to be charged.
Battery Charging System Sensors	Not OK/OK	Sensors that monitor the status of the components that make up the system which allows the battery to be charged.
Battery Charging System Contactor Inhibit	Yes/No	Indicates if the battery charging system contactors (relays) are being prevented from closing.
Battery Charging Allowed	Yes/No	Indicates if battery charging of the hybrid system is permissible by the control module.
Charging	Inactive/Active	This string is used to describe a Status or Setting. Indicates an electronic system is in the process of being energised
Hybrid/EV battery Pack Charging Process Status	Complete/Incomplete	Indicates if the Hybrid/EV Battery pack charging has completed or not.
Battery Charging Delay Timer	Not Expired/Expired	The timer that allows charging to be delayed to a later time. For hybrid vehicles.
Battery Charging Run Timer	Expired/Not Expired	The timer for maximum charging time.
Battery Charger Capacitors	Discharged/Charged	Energy storage devices within the battery charger.
Battery Charging System Receptacle Switch	Inactive/Active/Low/High/Invalid	Switch at the receptacle where the vehicle is plugged in for battery charging.
Battery Charging System Receptacle Door	Closed/Open/Unknown	Door at the receptacle where the vehicle is plugged in for battery charging.
Battery Charger High Output	kW	Battery Charger Control Module high voltage or current output.
Battery Charger Low Output	kW	Battery Charger Control Module low voltage or current output.
Battery Charger High Voltage Power Output Available	kW	The maximum battery charger power output available for hybrid battery pack charging. In kW.
Battery Charger Power Input Available	kW	The maximum power available at the battery charger plug receptacle coming from a wall outlet.
Hybrid/EV battery		

Pack Charging Request	Inactive/Active	The request to charge the Hybrid/EV Battery pack.
Battery Charger Total Power Output Available	Watts	The maximum battery charger power output available for low voltage battery and hybrid battery pack charging
Hybrid/EV battery Pack Charging Limit	Watts	The maximum Hybrid/EV Battery pack charge power in Watts.
Battery Charger High Output	Volts	Battery Charger Control Module high voltage or current output.
Battery Charger High Output	Amps	Battery Charger Control Module high voltage or current output.
Battery Charger Low Output	Volts	Battery Charger Control Module low voltage or current output.
Battery Charger Low Output	Amps	Battery Charger Control Module low voltage or current output.
Battery Charger Temperature	Degrees C	Battery Charger Control Module temperature.
Battery Charger High Voltage Energy Output During Last Charge	kW-Hr	The energy (kWh) the battery charger has pumped into the high voltage hybrid battery pack during the last charge event.
Battery Charging System Indicator Status	Inactive/Waiting/Charging/Complete/Error	Status of the charging system indicator (LEDs/Bulbs/Icons) on the dash of the vehicle.
Proximity Detection Circuit	Volts	The proximity detection circuit is used as a means to detect the presence of the EV Connector, upon initial insertion of the EV Connector into the EV Inlet and before any electrical contact is established, at the point where damage could occur to the Coupler if the vehicle were moved. The means shall provide a signal to activate the vehicle control system and interlock the vehicle drive system.

Contactor Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Hybrid/EV Battery Pack Positive Contactor Command	Closed/Open	Serial data command to control the contactor (relay) on the (+) side of the Hybrid/EV Battery pack.
Hybrid/EV Battery		

Pack Negative Contactor Command	Closed/Open	Serial data command to control the contactor (relay) on the (-) side of the Hybrid/EV Battery pack.
Hybrid/EV Battery Pack Precharge Transistor Command	Closed/Open	Serial data command to control the operation of the Hybrid/EV Battery pack precharge transistor. A transistor is a component that amplifies a signal or opens or closes a circuit. Pre-charge of the powerline voltages in a high voltage DC application is a preliminary mode which current-limits the power source such that a controlled rise time of the system voltage during power up is achieved.
Hybrid/EV Battery Pack Multifunction Contactor Command	Closed/Open	Serial data command for the contactor (relay) that has more than one function on the Hybrid/EV Battery pack.
Battery Charging System Positive Contactor Command	Closed/Open	Serial data command to control the contactor (relay) on (+) side of the battery charging system.
Battery Charging System Negative Contactor Command	Closed/Open	Serial data command to control the contactor (relay) on (-) side of the battery charging system.

Hybrid/EV/EV Battery Contactor Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Hybrid/EV Battery System Precharge Current Too High	No/Yes	Pre-charge of the powerline voltages in a high voltage DC application is a preliminary mode which current-limits the power source such that a controlled rise time of the system voltage during power up is achieved.
Shutdown Mode	Yes/No	Shutdown Mode is the operational state while the system is turning off. Eg. when a PC is commanded to turn itself off, it takes a while until it actually turns off. In that time it is in Shutdown Mode.
Hybrid/EV Battery System Precharge Time Short	Yes/No	A Control module used to regulate the battery voltage on a hybrid car. (Sometimes uses the acronym BECM). 'Precharge' is a method used to gradually bring the Hybrid/EV Battery circuit up to high voltage without electrical damage to components caused by arcing.
Hybrid/EV Battery System Precharge Time Too Long	Yes/No	The time allowed to initially charge a high voltage circuit has not taken too long.
Stuck Open	No/Yes	Symptom description that is displayed behind DTCs. This sub type is used for failures where the ECU does not detect any motion upon commanding the operation of a motor, solenoid, relay, etc., to close some piece of equipment.
Overtemperature	Yes/No	This string is used to describe a Status or Setting. The state of a component when it's heat content is above the normal acceptable range.
Discharging	Yes/No	This string is used to describe a Status or Setting. Indicates a state in which a charge or load is in the process of being relieved
Hybrid/EV Powertrain Control Module Request	Yes/No	Indicates the hybrid system control module is requesting the engine be operated with all cylinders enabled.
Crash Event Detected	Yes/No	This parameter contains a value indicating whether a crash has been detected by the control module.

High Voltage Interlock Circuit	Yes/No	If the cover for the high voltage cables is removed, the interlock circuit opens the high voltage circuit to make working on the high voltage cables safe.
Airbag Deployed	Yes/No	Indicates the reason the module that controls the movement of the rear closure is not functioning. In this instance it is because the air bag is deployed.

Fuel System Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Fuel Tank Pressure	KPa	A sensor used to measure the amount of pressure created in the fuel tank.
Refuel System Status	Off/Waiting/Ready to Refuel/Invalid	The state of the system used while refuelling the vehicle, e.g. tank ventilation.
Refuel Request	Inactive/Active	State of the refuel system request.
Refuel Request Switch	Inactive/Active/Unknown	The switch for the driver to indicate to the refuel system that adding fuel to the vehicle is about to happen.
Refuel System Vent Requested	No/Yes	Indicates if the system that is used when refuelling the vehicle is asked to vent (depressurise) itself.
Refuel System Vented	No/Yes	Indicates if the system that is used when refuelling the vehicle is vented (depressurised).
Service Refuel System Indicator	Off/On	Malfunction indicator (LED, bulb, icon) of the system used for refuelling.
Fuel Door Indicator	Off/On	Indicator (LED, bulb, icon) for the fuel filler door
Fuel Door Position	Open/Closed/Unknown	The state of the fuel filler door (open, closed, unknown)
Fuel Door Lock	Unlocked/Locked/Unknown	The mechanism that secures the fuel filler door.

HVAC System Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Electric A/C Compressor Power Request for Hybrid Battery Pack Cooling	kW	This electric power is need by the Electric A/C Compressor motor to cool the Hybrid/EV Battery Pack.
Electric A/C Compressor Power		The power command from the Hybrid Powertrain Control

Command for Hybrid Battery Pack Cooling	kW	Module 2 to the (electric) A/C compressor to provide Hybrid/EV Battery pack cooling.
Electric A/C Compressor Power Request for Passenger Compartment Cooling	kW	Amount of power the A/C compressor has requested from the hybrid battery pack to provide passenger compartment cooling.
Electric A/C Compressor Power Command for Passenger Compartment Cooling	kW	The power command from the Hybrid Powertrain Control Module 2 to the A/C compressor to provide passenger compartment cooling.
A/C Compressor Speed	RPM	Command from HVAC controller on how fast the compressor should run (rpm)
A/C Compressor Clutch Status	Allowed, High Side Pressure Out of Range, Ambient Air Temperature Out of Range, Battery Voltage Out of Range, Coolant Temperature Out of Range, HVAC Blower Off, Engine Off, A/C Not Requested, Low Pressure Switch Open, A/C Evaporator Temperature Sensor Out of Range, Hybrid Electronics Coolant Temperature Out of Range, Transmission Fluid Temperature Out of Range, Error, A/C Compressor Command, Electric A/C Compressor Control Module Malfunction, Control Function Active, A/C Refrigerant High Side Pressure Malfunction, Low Refrigerant Pressure Detected, Engine Overspeed, A/C Evaporator Temperature, Shutdown Mode, A/C Compressor Power Limit, A/C Low Side Pressure, Low Refrigerant Pressure Detected, Engine Overspeed, Shutdown Mode, A/C Compressor Power Limit, A/C Low Side Pressure	This string indicates the state of the air conditioning compressor clutch. A/C clutch which controls the amount of rotation in the compressor which creates the pressure in the system used to create cold air.
A/C Low Side Pressure Sensor	kPa	In a pneumatic or hydraulic system that has a high pressure part and a low pressure part, the pressure of the low side is monitored by this sensor.
A/C Low Side Pressure	Volts	In a pneumatic or hydraulic system that has a high pressure part and a low pressure part, the pressure of

Sensor		the low side is monitored by this sensor.
Ambient Air Temperature	Degrees C	This parameter indicates the temperature of the air surrounding the vehicle.
A/C Compressor Power Limit	No/Yes	Displays the amount of power the A/C compressor is allowed to use in kW.
Passenger Compartment Heater Power Limited	No/Yes	Indicates if the passenger compartment heater power is limited this ignition cycle.
A/C Evaporator Temperature	Degrees C	This indicates the temperature (degrees of heat) of the air conditioning system's evaporator.

Hybrid Powertrain Control Module 2 Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Distance With MIL On	km	The accumulated distance driven with the malfunction indicator lamp (MIL) on.
Warm-Ups Since DTC Cleared	Counts	This parameter contains the number of OBD defined warm-up cycles since the last time codes were cleared with a scan tool or, when applicable, with a battery disconnect. A warm up means that the engine started from a cold start condition (which is some calibrated value which is usually around 70 or 80 degrees F) and warms to operating temperature in a single key cycle.
Distance Since DTC Cleared	km	This parameter displays the distance in miles or kilometres since engine control module diagnostic trouble codes (DTCs) have been cleared using the service tool (tech 2 or aftermarket).
Ambient Air Temperature	Degrees C	This parameter indicates the temperature of the air surrounding the vehicle.
Ignition 1 Signal	Volts	This is the name for a circuit between the engine control module and the battery via the ignition switch.
High Voltage System Interlock Circuit	De-Energised/Energised	A low voltage circuit used to provide safety against high voltage exposure. If the low voltage circuit is opened the high voltage circuit will be disabled.
High Voltage System Interlock Circuit Status	Unknown/Pass/Failed	The status (on/off) of the interlock circuit used to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.

Battery Charging System High Voltage Interlock Circuit Status	Unknown/Pass/Fail	The status (on/off) of the interlock circuit that is used by the hybrid battery charging system to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Battery Charging System High Voltage Interlock Circuit	De-energised/Energised	This interlock circuit is used by the hybrid battery charging system to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Isolation Test Resistance	kOhm	The control unit tests the high voltage lines for shorts. This is the resistance to ground that has been detected (is infinite if isolation is OK).
Bonnet Ajar Switch	Open/Closed/Low Voltage/High Voltage/Invalid	This string refers to the electronic device that warns when the engine compartment metal cover is slightly open.
High Voltage System Isolation Test Status	Running/Not Running/Incomplete/Complete	Indication of the diagnostic test status which detects if the High Voltage circuit is electrically isolated from the chassis (ground).
Battery Charging System Isolation Test Status	Passed/Failed	Indication of the diagnostic test status which detects if the Hybrid/EV Battery Charging System is electrically isolated from the chassis (ground).
Hybrid/EV Battery Pack Isolation Test Status	Passed/Failed	Indication of the diagnostic test status which detects if the Hybrid/EV Battery Pack is electrically isolated from the chassis (ground).
Power Mode	Off/Accessory/Run/Crank Request	The state of the electrical system on the vehicle depending on the position of the ignition switch.This indicates the status of the ignition switch.

Temperature Scan Tool Data Parameters

Parameter	Expected Value	Definition
<i>Operating Conditions:</i> Vehicle in Service Mode		
Ambient Air Temperature	Degrees C	This parameter indicates the temperature of the air surrounding the vehicle.
Maximum Hybrid/EV Battery Module Temperature	Degrees C	The Hybrid/EV Battery contains many individual hybrid batteries wired in series. This is the temperature of the Hybrid/EV Battery module with the highest temperature.
Minimum Hybrid/EV Battery Module Temperature	Degrees C	The Hybrid/EV Battery contains many individual hybrid batteries wired in series. This is the temperature of the Hybrid/EV Battery module with the lowest temperature.
Average Hybrid/EV Battery Pack Temperature	Degrees C	Displays an average temperature of the Hybrid/EV Battery obtained from the ECM.
Hybrid/EV Battery Pack Coolant	Degrees C	The first of two sensors used to monitor the temperature of coolant used to maintain Hybrid/EV Battery temperatures is

Temperature Sensor 1		not functioning properly.
Hybrid/EV Battery Pack Coolant Temperature Sensor 2	Degrees C	The second of two sensors used to monitor the temperature of coolant used to maintain Hybrid/EV Battery temperatures is not functioning properly.
Hybrid/EV Battery Pack Coolant Pump Command	%	Serial data command to control the pump motor for the coolant of the Hybrid/EV Battery.
Hybrid/EV Battery Pack Coolant Pump Feedback	%	Measured speed in RPM of the pump for the Hybrid/EV Battery coolant.
Hybrid/EV Battery Pack Coolant Pump Speed	RPM	Hybrid/EV Battery pack coolant pump speed in RPM.
Hybrid/EV Battery Pack Coolant Control Solenoid Valve Command	100%,90%,80%,70%,60%,50%,40%,30%,20%,10%,Normal,Bypass	Serial data command to control the solenoid valve that controls the coolant flow through the Hybrid/EV Battery pack.
Hybrid/EV Battery Pack Coolant Control Solenoid Valve Feedback	100%,90%,80%,70%,60%,50%,40%,30%,20%,10%,Normal,Bypass	Measured position of the solenoid valve.
Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn Status	Not Run/Running/Complete/Error	Indicates if the learning procedure for the solenoid valve was executed by the control module.
Hybrid/EV Electronics Coolant Temperature	Degrees C	Temperature of the coolant within the hybrid electronics cooling system.
Hybrid/EV Electronics Coolant Pump Command	%	Serial data command to control the pump motor for the coolant of the hybrid electronics.
Hybrid/EV Electronics Coolant Pump Feedback	%	Measured speed of the pump for the coolant of the hybrid powertrain electronics.
Hybrid/EV Electronics Coolant Pump Speed	RPM	Speed of the pump motor for the coolant of the hybrid electronics.
14V Power Module Fan	%	The command to control the speed of the 14V power module fan.
14 Volt Power Module Fan Feedback	%	Measured speed of the fan for the module that supplies 14V.
14V Power Module Fan Speed	RPM	Speed of the cooling fan for the module that supplies 14V.
Hybrid/EV Battery Pack Heater Power Command	kW	Serial data command to control the heater for the Hybrid/EV Battery pack.
Hybrid/EV Battery Pack Heater Power Command	%	Serial data command to control the heater for the Hybrid/EV Battery pack.
Hybrid/EV Battery Pack Heater Power Request	kW	Amount of power the Hybrid/EV Battery pack heater has requested to provide Hybrid/EV Battery pack heating.
Hybrid/EV Battery Pack Heater Power Limited	No/Yes	Indicates if the Hybrid/EV Battery pack heater power is limited this ignition cycle.
		Serial data command to control the solenoid valve that

Passenger Compartment Heater Coolant Control Solenoid Valve Command	%	controls the coolant flow through the heater core for the passenger compartment.
Passenger Compartment Heater Coolant Control Solenoid Valve Feedback	%	Measured position of the solenoid valve that controls the coolant flow through the heater core for the passenger compartment.
Passenger Compartment Heater Coolant Control Solenoid Valve Learn Status	Not Learned/Learned	Status of the passenger compartment heater coolant control solenoid valve learn.
Cooling Fan Motor Command	%	This displays either in percentage or commanded state of the engine cooling fan.

Voltage Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
High Voltage System Interlock Circuit	De-energised/Energised	A low voltage circuit used to provide safety against high voltage exposure. If the low voltage circuit is opened the high voltage circuit will be disabled.
High Voltage System Interlock Circuit Status	Unknown/Pass/Failed	The status (on/off) of the interlock circuit used to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Battery Charging System High Voltage Interlock Circuit Status	Unknown/Pass/Fail	The status (on/off) of the interlock circuit that is used by the hybrid battery charging system to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Battery Charging System High Voltage Interlock Circuit	De-energised/Energised	This interlock circuit is used by the hybrid battery charging system to turn off high voltage circuits to prevent persons from getting hurt in case of service repairs.
Hybrid/EV Battery Pack Voltage	Volts	The electrical potential of the Hybrid/EV Battery.
Minimum Hybrid/EV Battery Module Voltage	Volts	The Hybrid/EV Battery contains many individual hybrid batteries wired in series. The battery energy control module (BECM) measures voltage across the Hybrid/EV Battery modules in pairs. This parameter displays the minimum voltage measured at any of the module pairs during the current ignition cycle.
Hybrid/EV Battery Voltage Sensor with Minimum Value	Sensor Number	Index-number of the Hybrid/EV Battery voltage sensor that is reporting the lowest voltage.
Maximum Hybrid/EV Battery Module Voltage	Volts	This parameter displays the maximum voltage monitored during the current ignition cycle.
Hybrid/EV Battery Voltage Sensor with Maximum Value	Sensor Number	Index-number of the Hybrid/EV Battery voltage sensor that is reporting the highest voltage.
Hybrid/EV Battery Pack	Volts	The Hybrid/EV Battery pack maximum voltage allowed.

Maximum Voltage		
Hybrid/EV Battery Pack Minimum Voltage	Volts	The Hybrid/EV Battery pack minimum voltage allowed.
Hybrid/EV Battery Voltage Sensor Average	Volts	The average voltage of all sensor readings within the Hybrid/EV Battery Pack.
Hybrid/EV Battery Pack State of Charge	%	The available capacity remaining in a Hybrid/EV Battery
Hybrid/EV Battery Pack Minimum State of Charge Limit	%	Minimum permissible Hybrid/EV Battery pack state of charge. The battery must not be discharged below this limit.
Hybrid/EV Battery Pack Maximum State of Charge Limit	%	Indicates the maximum allowed state of charge (%) of the Hybrid/EV Battery pack. (Might be reduced at cold temperatures).
Hybrid/EV Battery Pack State of Charge Gauge	%	The reading on the Hybrid/EV Battery pack state of charge gauge located on the dash of the vehicle.
Hybrid/EV Battery Pack Resistance	Ohms	The Hybrid/EV Battery resistance value in ohms.
Hybrid/EV Battery Pack Current	Amps	This indicates the amount of Hybrid/EV Battery current is in amperage
Hybrid/EV Battery Pack Maximum Discharge Current Limit	Amps	The Hybrid/EV Battery pack highest discharge current allowed.
14V Power Module Power Available From Hybrid/EV Battery Pack	kW	The amount of power (kW) being supplied from the Hybrid/EV Battery Pack to the 14V Power Module.
Hybrid/EV/EV Battery Capacity	Ah	Measures the capacity of the battery

Inflatable Restraint Passenger Presence System Scan Tool Information

Sensing and Diagnostic Module Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Base Model Part Number	Varies, 8 Digit Number	The scan tool displays the part number of the PPS module which is stored in non volatile memory.
Battery Voltage	Volts	The scan tool will display battery voltage.
Calibration Part Number	Varies, 8 Digit Number	The scan tool displays the part number of the calibration file in the PPS module.
End Model Part Number	Varies, 8 Digit Number	The scan tool displays the part number of the PPS module in production.
Manufacturer's Traceability Number	Varies, 16 Digit Number	The scan tool displays the 16 digit traceability number in the PPS module.
Passenger Classification	Empty Seat	The scan tool displays Unknown, Calibration Mode, Empty Seat, Small Occupant Type 1, Small Occupant Type 2, Small Occupant Type 3, Small Occupant Type 4, Large Occupant Type 1, Large Occupant Type 2, Large Occupant Type 3, Large Occupant Type 4, Module Setup, Not Available, Child Seat Facing Rearward, Child Seat Facing Forward, Child Seat Facing Unknown Direction. This is the state of what occupies the passenger seat, as monitored by the passenger presence system.
Passenger Presence Module Primary Key	Hex Value	The scan tool indicates the primary key Hex value.
Passenger Presence System Reporting	Yes/No	The PPS module will report if there are DTCs set in the passenger presence module.

DTC(s)		
Passenger Seat Occupancy Status	Empty Seat	The scan tool displays Undefined, Empty Seat, Occupied, or Invalid. This is the state of the passenger seat if it is occupied or empty and monitored by the passenger presence system.
Power Mode	Off / Accessory / Run / Crank Request	The scan tool will display the power mode of the vehicle.
Primary Key Status	Valid/Invalid	The scan tool displays Valid if the primary key matches what is stored to memory in the PPS module.
Received Primary Key	Hex Value	The scan tool displays a Hex value indicating the PPS module received primary key data.
Software Part Number	Varies, 8 Digit Number	The scan tool displays the software part number in the PPS module.

Inflatable Restraint Sensing and Diagnostic Module Scan Tool Information

Sensing and Diagnostic Module Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
2nd Row Left Seat Belt Reminder Sensor Pad Enable Status	Disabled/Enabled	The scan tool displays if the left rear seat belt reminder sensor pad is enabled to the SDM.
2nd Row Left Seat Belt Reminder Sensor Pad Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the left rear seat belt reminder sensor pad has been learned by the SDM.
2nd Row Left Seat Belt Status	Buckled/Unbuckled	The scan tool displays Buckled or Unbuckled. This is the state of the left rear seat belt switch when the seat belt is buckled or unbuckled.
2nd Row Middle Seat Belt Reminder Sensor Pad Enable Status	Disabled/Enabled	The scan tool displays if the rear middle seat belt reminder sensor pad is enabled to the SDM.
2nd Row Middle Seat Belt Reminder Sensor Pad Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the rear middle seat belt reminder sensor pad has been learned by the SDM.
2nd Row Middle Seat Belt Status	Buckled/Unbuckled	The scan tool displays Buckled or Unbuckled. This is the state of the middle rear seat belt switch when the seat belt is buckled or unbuckled.
2nd Row Middle Seat Belt Reminder Sensor Pad Enable Status	Disabled/Enabled	The scan tool displays if the rear right seat belt reminder sensor pad is enabled to the SDM.
2nd Row Middle Seat Belt Reminder Sensor Pad Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the rear right seat belt reminder sensor pad has been learned by the SDM.
2nd Row Right Seat Belt Status	Buckled/Unbuckled	The scan tool displays Buckled or Unbuckled. This is the state of the right rear seat belt switch when the seat belt is buckled or unbuckled.
Air Bag Malfunction Indicator	On/Off/Flashes	The scan tool will display On or Flashes if there is a problem with the SIR system. Any problems within the SIR system will illuminate the air bag indicator. The indicator will either flash or stay on.
Base Model Part Number	Varies, 8 Digit Number	The scan tool displays the part number of the SDM which is stored in non volatile memory.
Calibration Part Number	Varies, 8 Digit Number	The scan tool displays the part number of the calibration file in the SDM.
Deployment Loop 1-18 Enable Status	Enabled/Disabled	The scan tool displays Enabled or Disabled. This is the status of the air bag or pretensioner.
Deployment Loop 1-18 Learn Status	Learned/Not Learned	The scan tool displays Learned or Not learned. Learned is displayed if the SDM has defined the number loop programmed from an air bag or pretensioner.

Deployment Loop 1-18 Resistance	1.44-4.25 Ohms	The scan tool displays the resistance of the learned loop of the air bag or pretensioner when connected to the SDM.
Deployment Loop 1-18 Type	Varies	The scan tool displays the name of the air bag or pretensioner associated with the loop type 1-18.
Driver Seat Belt Reminder Indicator	On/Off	The scan tool displays On if this indicator is on. If the indicator is on it means the seat belt has not been buckled.
Driver Seat Belt Sensor Enable Status	Enabled/Disabled	The scan tool displays if the seat belt sensor in the seat belt buckle is enabled to the SDM.
Driver Seat Belt Sensor Learn Status	Learned/Not learned	The scan tool displays Learned or Not Learned. Learned is displayed if the driver seat belt sensor has been learned by the SDM.
Driver Seat Belt Status	Buckled/Unbuckled	The scan tool displays Buckled or Unbuckled. This is the state of the driver seat belt switch when the seat belt is buckled or unbuckled.
Driver Seat Position Sensor	Rearward/Forward	The scan tool will display if the driver seat is forward or rearward of the sensor set position.
Driver Seat Position Sensor Enable Status	Enabled/Disabled	The scan tool displays if the seat position sensor is enabled to the SDM.
Driver Seat Position Sensor Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the driver seat position sensor has been learned by the SDM.
End Model Part Number	Varies, 8 Digit Number	The scan tool displays the part number of the SDM in production.
Impact Sensor 1-8 Enable Status	Enabled/Disabled	The scan tool displays Enabled or Disabled This is the status of the impact sensor.
Impact Sensor 1-8 Learn Status	Learned/Not Learned	The scan tool displays Learned or Not learned. Learned is displayed if the SDM has learned and has assigned a number to that impact sensor.
Impact Sensor 1-8 Type	Equipped/Not Equipped	The scan tool displays the name of the impact sensor associated with the type 1-8.
Inflatable Restraint Sensing and Diagnostic Module Primary Key	Hex Value	The scan tool indicates the primary key Hex value.
Manufacturer's Traceability Number	Varies, 16 Digit Number	The scan tool displays the 16 digit traceability number in the SDM.
Module Setup	Incomplete/Complete	The scan tool indicates if the SDM is set up.
Passenger Air Bag Disabled Switch	On/Off	The scan tool displays Off when the customer manually turns the passenger airbag off with this switch.
Passenger Air Bag Off Indicator	On/Off	The scan tool displays Off when the passenger indicator is not illuminated. This indicator is off when the disable switch is in the off position or no one is sitting in the passenger seat.
Passenger Air Bag On Indicator	On/Off	The scan tool displays On when the passenger indicator is illuminated. This indicator is on when the disable switch is in the on position and someone is sitting in the passenger seat.
Passenger Air Bag Status	Enabled/Disabled	The scan tool displays if the passenger air bag is enabled to the SDM.
Passenger Air Bag Disable Indicator Enable Status	Enabled/Disabled	The scan tool displays if the passenger air bag disable indicator is enabled to the SDM.
Passenger Air Bag Disable Indicator Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the SDM has learned the status of the passenger air bag disable indicator.
Passenger Air Bag Disable Switch	Enabled/Disabled	The scan tool displays if the passenger air bag disable switch is enabled to the SDM.

Enable Status		
Passenger Air Bag Disable Switch Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the SDM has learned the status of the passenger air bag disable switch.
Passenger Air Bag Enable Indicator Enable Status	Enabled/Disabled	The scan tool displays if the passenger air bag enable indicator is enabled to the SDM.
Passenger Air Bag Enable Indicator Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the SDM has learned the status of the passenger air bag enable indicator.
Passenger Classification	00-07	The scan tool will display what type of individual is sitting in the passenger seat.
Passenger Presence Detection System Enable Status	Enabled/Disabled	The scan tool displays if the passenger presence system is enabled to the SDM.
Passenger Presence Detection System Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the SDM has learned the passenger presence system.
Passenger Presence Detection System Reporting DTC(s)	Yes/No	The SDM will report if there are DTCs set in the passenger presence module.
Passenger Seat Belt Reminder Indicator	On/Off	The scan tool displays On if this indicator is on. If the indicator is on it means the seat belt has not been buckled.
Passenger Seat Belt Reminder Indicator Enable Status	Disabled/Enabled	The scan tool displays if the passenger seat belt reminder indicator is enabled to the SDM.
Passenger Seat Belt Reminder Indicator Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the passenger seat belt reminder indicator has been learned by the SDM.
Passenger Seat Belt Reminder Sensor Pad Enable Status	Disabled/Enabled	The scan tool displays if the passenger seat belt reminder sensor pad is enabled to the SDM.
Passenger Seat Belt Reminder Sensor Pad Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the passenger seat belt reminder sensor pad has been learned by the SDM.
Passenger Seat Belt Sensor Enable Status	Enabled/Disabled	The scan tool displays if the seat position sensor is enabled to the SDM.
Passenger Seat Belt Sensor Learn Status	Learned/Not learned	The scan tool displays Learned or Not Learned. Learned is displayed if the passenger seat belt sensor has been learned by the SDM.
Passenger Seat Belt Status	Buckled/Unbuckled	The scan tool displays Buckled or Unbuckled. This is the state of the passenger seat belt switch when the seat belt is buckled or unbuckled.
Passenger Seat Occupancy Status	Empty Seat/Occupied	The scan tool displays Occupied if someone is sitting in the passenger seat.
Passenger Seat Position Sensor	Rearward/Forward	The scan tool will display if the passenger seat is forward or rearward of the sensor set position.
Passenger Seat Position Sensor Enable Status	Disabled/Enabled	The scan tool displays if the passenger seat position sensor pad is enabled to the SDM.
Passenger Seat Position Sensor Learn Status	Learned/Not Learned	The scan tool displays Learned or Not Learned. Learned is displayed if the passenger seat position sensor has been learned by the SDM.
	Off/Accessory/Run/Crank	

Power Mode	Request	The scan tool will display the power mode of the vehicle.
Primary Key Status	Valid/Invalid	The scan tool displays Valid if the primary key matches what is stored to memory in the SDM.
Primary Key Status Last Ignition Cycle	Invalid/Valid	The SDM checks to see if the primary key data received is valid.
Received Primary Key	Hex Value	The scan tool displays a Hex value indicating the SDM received primary key data.
Rollover Sensor Enable Status	Disabled/Enabled	The scan tool displays if the rollover sensor is enabled to the SDM.
Rollover Sensor Learn Status	Learn/Unlearn	The scan tool displays Learned or Not Learned. Learned is displayed if the rollover sensor has been learned by the SDM.
Security Code Accepted	Yes/No	The SDM either accepts the security code or it does not. The scan tool displays Yes if the security code has been accepted by the SDM.
Security Code Lockout	Yes/No	The scan tool displays Yes if the SDM has been locked out because of the security code not being accepted.
Security Code Lockout Active Timer	Random Value	The SDM uses a timer before the security code is locked in the SDM.
Security Code Programmed	Yes/No	The scan tool displays Yes if the SDM has been programmed with the security code.
Security Code Programming Counter	Random Value	The SDM uses a counter for the value of the security code programming.
Security Code Reset Counter	Random Value	The SDM uses a counter to reset the value of the security code.
Software Part Number	Varies, 8 Digit Number	The scan tool displays the software part number in the SDM.
Vehicle Identification Number	Varies, 17 Digit Number	The VIN number of the vehicle programmed into the SDM.
VIN Programmed	Yes/No	The scan tool displays Yes if the VIN has been programmed into the SDM.
VIN Programming Counter	Random Value	The SDM uses this counter while programming the VIN.

Instrument Cluster Scan Tool Information

Table 1: [Instrument Cluster Scan Tool Data Parameters](#)

Table 2: [Instrument Cluster Scan Tool Output Controls](#)

Instrument Cluster Scan Tool Data Parameters

Parameter	Expected Value	Description
Operating Conditions: Vehicle in Service Mode		
Ambient Air Temperature	15 °C	The scan tool displays outside temperature in °C.
Battery Voltage	12-14 V	The scan tool displays Volts. This is the current battery voltage signal.
Coolant Level Switch	Open	The scan tool displays either Open, Closed, or Not Available.
Driver Information Centre Switch	Active/Inactive	The scan tool displays Active or Inactive. This is the state of the driver information centre reset switch.
Driver Information Centre Switch	Varies	The scan tool displays Volts. This is the current driver information centre switch input voltage.
	Inactive	The scan tool displays either Inactive, Up, Down, or Menu. This is the state of the driver information centre switch.
Engine Speed	Varies	The scan tool displays the engine RPM.
Odometer Lock Status	Active/Inactive	The scan tool displays Active or Inactive. Active means the odometer is locked.
Washer Fluid Level Switch	Open	The scan tool displays either Open, Closed, or Not Available.
Vehicle Speed	Varies	The scan tool displays the vehicle speed.

Instrument Cluster Scan Tool Output Controls

Output Control	Description
All Indicators	This function is used to command all the indicators ON or OFF.
CAN Bus Configuration Learn	This function is used to Reset the source ID for low speed CAN Bus communications.
Driver Information Centre Dimming	This function is used to command the dimming of the driver information display to Increase or Decrease by 10%.
Driver Information Centre Options	This function is used to command the driver information centre buttons using the scan tool.
Driver Information Centre Segments	This function is used to command the driver information centre segments ON and OFF.
Instrument Cluster Gauge Sweep	Since there are no gauges, the instrument cluster will go through a screen test sequence instead of sweeping the gauges.

Keyless Entry Control Module Scan Tool Information

Keyless Entry Control Module Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Battery Voltage	V	This parameter indicates the battery voltage as measured at the module
Driver Door Ajar Switch	Active/Inactive	This parameter indicates that the driver door is ajar; it is open, but the safety latch is engaged.
Driver Door Open Switch	Active/Inactive	This parameter indicates that the driver door is more than just ajar, it is open.
Driver Door Unlock Switch	Active/Inactive	This parameter indicates if the driver door is locked or unlocked.
Exterior Driver Door Handle Switch	Active/Inactive	This switch begins the challenge and response to determine if the door should be unlocked. If the vehicle responds correctly to the challenge, the door will be unlocked or unlatched.
Exterior Driver Door Handle Proximity Sensor	Active, Inactive, Fault	This is a capacitive proximity sensor on the exterior of the driver door handle. It allows the user to lock the door by pressing a small rectangle on the outside of the door handle if a key is detected leaving the vehicle.
Passenger Door Open Switch	Active/Inactive	This parameter indicates that the passenger door is more than just ajar, it is open.
Passenger Door Ajar Switch	Active/Inactive	This parameter indicates that the passenger door is ajar; it is open, but the safety latch is engaged.
Exterior Passenger Door Handle Switch	Active/Inactive	This switch begins the challenge and response to determine if the door should be unlocked. If the vehicle responds correctly to the challenge, the door will be unlocked or unlatched.
Exterior Passenger Door Handle Proximity Sensor	Active, Inactive, Fault	This is a capacitive proximity sensor on the exterior of the driver door handle. It allows the user to lock the door by pressing a small rectangle on the outside of the door handle if a key is detected leaving the vehicle.
Left Rear Door Ajar Switch	Active/Inactive	This parameter indicates that the driver's side rear door is ajar; it is open, yet the safety latch is engaged.
Exterior Left Rear Door Handle Switch	Active/Inactive	This switch begins the challenge and response to determine if the door should be unlocked. If the vehicle responds correctly to the challenge, the door will be unlocked or unlatched.
Right Rear Door Ajar Switch	Active/Inactive	This parameter indicates that the passenger's side rear door is ajar; it is open, yet the safety latch is engaged.
Exterior Right Rear Door Handle Switch	Active/Inactive	This switch begins the challenge and response to determine if the door should be unlocked. If the vehicle responds correctly to the challenge, the door will be unlocked or unlatched.
Tailgate Ajar Switch	Active/Not Active	This switch indicates if the rear closure of the vehicle is ajar.
Tailgate Handle Switch	Active/Inactive	This switch begins the challenge and response to determine if the rear closure should be unlatched. If the vehicle responds correctly to the challenge, the rear tailgate will be unlatched.

Mobile Telephone Control Module Scan Tool Information

Table 1: [Mobile Telephone Control Module Scan Tool Data Parameters](#)

Table 2: [Mobile Telephone Control Module Scan Tool Output Controls](#)

The mobile telephone control module scan tool data parameters list contains all mobile telephone control module related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists.

Mobile Telephone Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Ignition ON			
Battery Voltage	-	11-14 V	The scan tool displays V. This is the current battery voltage.
Bluetooth Signal Strength	-	0-20 dB	The scan tool displays the wireless devices (Bluetooth) reception field strength.
GSM Signal Strength	-	-113 to -51 dBm	The scan tool displays the Global System for Mobile Communications (GSM) signal strength.
Microphone Signal	-	1-16 V	The scan tool displays the voltage level of the microphone power supply.
Phone Cradle to Vehicle Status	Cradle is connected	Connected	The scan tool displays the different aspects of the cradle status.
	Cradle is not connected	Disconnected	
Phone in Cradle	Phone in cradle	Yes	The scan tool displays the status if a phone is connected in the cradle.
	Phone not in cradle	No	

Mobile Telephone Control Module Scan Tool Output Controls

Output Control	Description
Audio Tone	This output control is used to command the Mobile Telephone Control Module audio tone enable or disable.

Object Alarm Module Scan Tool Information

Table 1: [Parking Assist Control Module Scan Tool Data Parameters](#)

Table 2: [Object Alarm Module Scan Tool Output Controls](#)

Parking Assist Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Vehicle in Service Mode/Engine OFF/Parking Assist ON			
Battery Voltage	-	11-14 V	The scan tool displays V. This is the current battery voltage.
Calculated Gearbox Range	Gearbox in reverse	Reverse	The scan tool displays Park, Reverse, Neutral, Drive or Unknown depending on the state of the commanded gear.
Obstacle Detected	-	No	The scan tool displays Yes or No. Yes is displayed if there is an object within the measuring range of the object sensors.
Park Assist Chime	-	Varies	The scan tool displays On or Off. On is displayed if there is an object within the measuring range of the object sensors.
Park Assist Disable History 1	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.
Park Assist Disable History 2	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.
Park Assist Disable History 3	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.
Park Assist Disable History 4	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.
Park Assist Disable History 5	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.

Park Assist Disable History 6	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.
Park Assist Disable History 7	-	Varies	The scan tool displays None, Manual Disable, Park Brake Applied, Trailer or Other Attached Object, Excessive Speed in Reverse, No or Invalid Sensor Signals, Sensor Disturbance, Sensors Dirty, Sound Signal Return Time Not Plausible. This is the state of the park assist disable history.
Park Assist Sensors	-	On	The scan tool displays On or Off.
Park Assist Sensors Reference Voltage	-	7.3-9.1 V	The scan tool displays V. This is the amount of voltage being sent to the object sensors.
Park Assist Switch	Parking assist switch released	Inactive	The scan tool displays Inactive or Active depending on the parking assist switch state.
	Parking assist switch pressed	Active	
Park Assist Switch LED	Parking assist ON	On	The scan tool displays On or Off. This is the state of the parking assist switch indicator.
	Parking assist OFF	Off	
Park Assist System Status	-	Enabled	The scan tool displays Disabled, Enabled, Inhibited or Failed. This is the state of the parking assist system.
Power Mode	-	Run	The scan tool displays Off, Accessory, Run or Crank. This is the state of the ignition switch.

Object Alarm Module Scan Tool Output Controls

Output Control	Description
Park Assist Switch LED	The object alarm module illuminates the parking assist switch indicator when commanded from the scan tool.

Power Steering Control Module Scan Tool Information

Table 1: [Power Steering Control Module Scan Tool Data Parameters](#)

Table 2: [Power Steering Control Module Scan Tool Output Controls](#)

The power steering control module scan tool data parameters list contains all power steering related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists.

Power Steering Control Module Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Ignition ON			
Battery Voltage	-	9-16 V	The scan tool displays the current battery voltage.
Ignition Mode	-	On	The scan tool displays On or Off dependent on the current ignition mode.

Power Steering Control Module Scan Tool Output Controls

Output Control	Description
Pressure Control Solenoid Valve	Commands the solenoid valve Increase or Decrease.

Radio Scan Tool Information

Table 1: [Radio Scan Tool Data Parameters](#)

Table 2: [Radio Scan Tool Output Controls](#)

Radio Scan Tool Data Parameters

Parameter	Expected Value	Definition
Operating Conditions: Vehicle in Service Mode		
Aerial Module	Enabled	The scan tool displays Enabled or Disabled. This indicates if the system uses an aerial module and the output status between the radio and the aerial module.
Auxiliary Audio Input	Present	The scan tool displays Present or Not Present. This parameter displays active when an auxiliary input is connected.
Battery Voltage	Varies	The scan tool displays volts. This is the voltage at the input to the radio.
Digital Radio Receiver	Present	The scan tool displays Present or Not Present. This is the state of the Digital Audio Broadcast.
Phone Signal	Present	The scan tool displays Present or Not Present. This parameter will display whether this system uses discrete a phone arbitration or not.
Power Mode	Run	The scan tool displays Off, Accessory, Run or Crank Request. This is the power mode radio.
Rear Seat Audio	Not Present	The scan tool displays Present or Not Present. This parameter displays Present if the system detects a rear seat audio module.
Radio Signal Strength	Varies	This displays the signal strength in dB. This is the signal strength of the radio signal.
Theft Lock Armed	Learned VIN	The scan tool displays Learned VIN or No VIN. This is the state of the VIN programming in the radio.
Radio Theft Lock Status	Inactive	The scan tool displays Active or Inactive. This is the state of the theft lock system.
Valet Mode Status	Inactive	The scan tool displays Active or Inactive. This is the state of the valet mode.
Video Display 1	Inactive	The scan tool displays Active or Inactive. When the rear video display 1 is ON, the scan tool will display Active.
Video Display 2	Inactive	The scan tool displays Active or Inactive. When the rear video display 2 is ON, the scan tool will display Active.
End Model Part Number	Varies	The scan tool displays the end model part number.
Boot Software Part Number	Varies	The scan tool displays the boot software ID number.
Calibration Part Number 1	Varies	The scan tool displays the software module ID 1.
Calibration Part Number 2	Varies	The scan tool displays the software module ID 2.
Calibration Part Number 3	Varies	The scan tool displays the software module ID 3

Calibration Part Number 4	Varies	The scan tool displays the software module ID 4.
Calibration Part Number 5	Varies	The scan tool displays the software module ID 5.
Calibration Part Number 6	Varies	The scan tool displays the software module ID 6.
Calibration Part Number 7	Varies	The scan tool displays the software module ID 7.
Calibration Part Number 8	Varies	The scan tool displays the software module ID 8.
Calibration Part Number 9	Varies	The scan tool displays the software module ID 9.
Calibration Part Number 10	Varies	The scan tool displays the software module ID 10.
Calibration Part Number 11	Varies	The scan tool displays the software module ID 11.
Calibration Part Number 12	Varies	The scan tool displays the software module ID 12.
Calibration Part Number 13	Varies	The scan tool displays the software module ID 13.
Calibration Part Number 14	Varies	The scan tool displays the software module ID 14.
Calibration Part Number 15	Varies	The scan tool displays the software module ID 15.
Calibration Part Number 16	Varies	The scan tool displays the software module ID 16.
Vin Digits 2-17	Varies	The scan tool displays the vin digits 2-17.
Digital Radio Receiver ID	Varies	The scan tool displays the Digital Audio Broadcast receiver ID.
DVD Region Code	Varies	The scan tool displays the DVD region code.
DVD Region Code Changes Remaining	Varies	The scan tool displays the number DVD region code changes remaining.

Radio Scan Tool Output Controls

Scan Tool Output Control	Description
Left Front Speaker	This output control is used to command the speaker ON and OFF. Commanding the speaker ON will generate a test tone to be generated through the selected loudspeaker.
Left Rear Speaker	This output control is used to command the speaker ON and OFF. Commanding the speaker ON will generate a test tone to be generated through the selected loudspeaker.
Right Front Speaker	This output control is used to command the speaker ON and OFF. Commanding the speaker ON will generate a test tone to be generated through the selected loudspeaker.
Right Rear Speaker	This output control is used to command the speaker ON and OFF. Commanding the speaker ON will generate a test tone to be generated through the selected loudspeaker.
Centre Speaker	This output control is used to command the speaker ON and OFF. Commanding the speaker ON will generate a test tone to be generated through the selected loudspeaker.
Subwoofer Speaker	This output control is used to command the speaker ON and OFF. Commanding the speaker ON will generate a test tone to be generated through the selected loudspeaker.
Eject	This output is a reset command to eject the disc.
Info Display/Infotainment	

Faceplate Reset	This output is a reset command to reset the radio display.
Info Display/Infotainment Faceplate Wakeup	This output commands a wakeup at the display and the faceplate controls.
Clear Hard Disc Drive	This output commands a HDD to clear all customer data. This includes music files, eBooks and navigation addresses. This does not clear Nav database data.

Steering Column Lock Control Module Scan Tool Information

Scan Tool Data Parameters

Parameter	Expected Value	Description
Operating Conditions: Ignition ON		
Column Lock Status	Varies	The scan tool displays Failed, Unknown, Locked and Unlocked. The scan tool displays the current state of the column lock.

Transmission Control Module Scan Tool Information

Table 1: [Scan Tool Data Parameters](#)

Table 2: [Scan Tool Output Controls](#)

The Transmission Control Module Scan Tool Data List contains all transmission related parameters that are available on the scan tool. The list is arranged in alphabetical order. A given parameter may appear in any one of the data lists, and in some cases may appear more than once, or in more than one data list in order to group certain related parameters together.

The values below represent a typical display recorded from a properly functioning system.

Note: Do not use a scan tool that displays faulty data. Report the condition to the scan tool manufacturer. The use of a faulty scan tool can result in misdiagnosis and the unnecessary replacement of parts.

Only the parameters listed below are used/referenced in this manual for diagnosis. If a scan tool displays other parameters, those values are not recommended by General Motors for use in diagnosis.

If all values are within the expected range described below, refer to Symptoms - Automatic Transmission for diagnosis.

The scan tool values from a properly functioning transmission may be used for comparison with the transmission you are diagnosing. The values below represent a typical display recorded from a properly functioning system.

Scan Tool Data Parameters

Parameter	System State	Expected Value	Description
Operating Conditions: Engine at idle, upper radiator hose hot, closed throttle, transmission in Park, closed loop operation, accessories OFF, brake pedal not applied.			
Calculated Clutch 1 Torque	N·m (lb ft)	-3.7 lb ft	The transmission control module calculates the torque applied to each clutch in the transmission. This parameter displays the calculated torque value for Clutch 1.
Calculated Clutch 2 Torque	N·m (lb ft)	-3.7 lb ft	The transmission control module calculates the torque applied to each clutch in the transmission. This parameter displays the calculated torque value for Clutch 2.
Calculated Clutch 3	N·m (lb ft)	49.9 lb ft	The transmission control module calculates the torque applied to each clutch in the transmission. This parameter displays the calculated torque value for Clutch 3.

Torque			
Calculated Line Pressure	kPa (PSI)	46.4 psi	This parameter indicates the expected real line pressure after accounting for pump loss factors.
Calculated Throttle Position	%	0%	This parameter contains the accelerator effective position, which represents the driver's intended request for torque or acceleration. It is determined from the maximum of the driver requests to open the throttle (e.g., accelerator pedal, cruise control, etc.) and is normalized to 0 to 100%, where 0% represents an idle or coast request and 100% represents a request for wide open throttle (WOT). Calculated throttle position displays a throttle position that is calculated. Meaning idle is 0% (even though the throttle is slightly open at idle) and wide open throttle is 100% (Which may be less than fully open).
Clutch 1 Slip Speed	RPM	0	This parameter represents the clutch slip in RPM for the Variable low and 1-2 reverse clutch (C1) Clutch. When a clutch is engaged it is monitored to see if it is working properly. A clutch is a material which connects (couples) two shafts or other components together when desired. For example: When the clutch is engaged, the event results in both shafts spinning at the same speed. When it is disengaged, one shaft will spin while the other remains stationary. If after engagement they are not spinning at the same speed it is considered slipping.
Clutch 1 Status	Applied / Released	Applied	This parameter represents the clutch status engaged or disengaged. When a clutch is engaged it is monitored to see if it is working properly. A clutch is a material which connects (couples) two shafts or other components together when desired. For example: When the clutch is engaged, the event results in both shafts spinning at the same speed. When it is disengaged, one shaft will spin while the other remains stationary. If after engagement they are not spinning at the same speed it is considered slipping.
Clutch 1 Torque Command	N·m (lb ft)	-3.7 lb ft	This parameter displays the serial data command to control the torque at clutch 1.
Clutch 2 Slip Speed	RPM	-1400 RPM	This parameter represents the clutch slip in RPM for the variable hi and 2-3-4 (C2) Clutch Slip. When a clutch is engaged it is monitored to see if it is working properly. A clutch is a material which connects (couples) two shafts or other components together when desired. For example: When the clutch is engaged, the event results in both shafts spinning at the same speed. When it is disengaged, one shaft will spin while the other remains stationary. If after engagement they are not spinning at the same speed it is considered slipping.
Clutch 2 Status	Applied / Released	Released	This parameter represents the clutch status engaged or disengaged status of the variable hi and 2-3-4 (C2) clutch. When a clutch is engaged it is monitored to see if it is working properly. A clutch is a material which connects (couples) two shafts or other components together when desired. For example: When the clutch is engaged, the event results in both shafts spinning at the same speed. When it is disengaged, one shaft will spin while the other remains stationary.
Clutch 2 Torque Command	N·m (lb ft)	-3.7 lb ft	This parameter displays the serial data command to control the torque at the variable hi and 2-3-4 clutch.
Clutch 3 Slip	RPM	0 RPM	This parameter represents the clutch slip in RPM for the 1-3 reverse clutch assembly (C3) Clutch Slip. When a clutch is engaged it is monitored to see if it is working properly. A clutch is a material which connects (couples) two shafts or other components together when desired. For example: When the clutch is engaged,

Speed			the event results in both shafts spinning at the same speed. When it is disengaged, one shaft will spin while the other remains stationary. If after engagement they are not spinning at the same speed it is considered slipping.
Clutch 3 Status	Applied / Released	Applied	This parameter represents the 1-3 reverse clutch assembly (C3) status engaged or disengaged. When a clutch is engaged it is monitored to see if it is working properly. A clutch is a material which connects (couples) two shafts or other components together when desired. For example: When the clutch is engaged, the event results in both shafts spinning at the same speed. When it is disengaged, one shaft will spin while the other remains stationary.
Clutch 3 Torque Command	N·m (lb ft)	49.4 lb ft	This parameter displays the serial data command to control the torque at 1-3 reverse clutch assembly.
Distance Since DTC Cleared	km / miles	Varies	This parameter displays the distance in miles or kilometres since engine control module diagnostic trouble codes (DTCs) have been cleared using the scan tool.
Distance Since First Malfunction	km / miles	Varies	This parameter displays the distance in miles or kilometres since the time that a failure record was first captured for a diagnostic failure.
Distance Since Last Malfunction	km / miles	Varies	This parameter displays the distance in miles or kilometres since the time that a failure record was last captured for a diagnostic failure.
Distance with MIL On	km / miles	Varies	This parameter displays the accumulated distance driven with the malfunction indicator lamp (MIL) on.
Driver Requested Axle Torque	N·m (lb ft)	-4.4 lb ft	This parameter displays the vehicle operator's requested amount of torque to be provided to the axle. Torque is the measured ability of a rotating element, as of a gear or shaft (axle), to overcome turning resistance.
Engine Coolant Temperature	°C (°F)	83°C (181°F)	This parameter displays the temperature of the engine coolant (fluid used to cool a system by transferring heat away from one part to another).
Engine Speed	RPM	1400 RPM	Indicates the speed of the internal combustion engine in rpm.
Engine torque	N·m (lb ft)	Varies	This parameter displays the amount of torque currently being produced by the engine as a percentage of total available. Torque is the twisting force created in an engine by rotating parts.
High Side Driver 1	On / Off	Enabled	This displays the current state of the high side driver 1 which provides supply voltage to the pressure control solenoids. A solenoid valve which controls fluid pressure to a transmission fluid passage.
High Side Driver 1 Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This contains the status of the high voltage test for the shared high side driver circuit. The high side driver is output from the transmission control module that supplies the voltage to the component.

High Side Driver 1 Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This contains the status of the low voltage test for the shared high side driver circuit. The high side driver is output from the computer that supplies the voltage to the control solenoid valve assembly.
High Side Driver 1 Circuit Open Test Status	OK, Malfunction, Not Run	OK	This contains the status of the open test for the shared high side driver circuit. The high side driver is output from the computer that supplies the voltage to the control solenoid valve assembly.
High Side Driver 2	On / Off	Enabled	This displays the current state of the high side driver 2 which is a Power switching device on the positive side.
High Side Driver 2 Circuit High Voltage Test Status	OK, Malfunction, Not Run	Not Run	This contains the status of the high voltage test for the shared high side driver circuit. The high side driver is output from the computer that supplies the voltage to the component.
High Side Driver 2 Circuit Low Voltage Test Status	OK, Malfunction, Not Run	Not Run	This contains the status of the low voltage test for the shared high side driver circuit. The high side driver is output from the computer that supplies the voltage to the component.
High Side Driver 2 Circuit Open Test Status	OK, Malfunction, Not Run	Not Run	This contains the status of the open test for the shared high side driver circuit. The high side driver is output from the computer that supplies the voltage to the component.
Hybrid Transmission Mode	Park/Neutral, Single Electric Motor Dual Electric Motors Single Electric Motor and ICE Dual Electric Motors and ICE, Invalid	Park/Neutral	The actual hybrid transmission mode as detected by the hybrid control module such as Park/Neutral, Single Electric Motor Dual Electric Motors, Single Electric Motor and ICE, Dual Electric Motors and ICE
Hybrid Transmission Mode Command	Park/Neutral, Single Electric Motor Dual Electric Motors Single Electric Motor and ICE Dual Electric Motors and ICE, Invalid	Park/Neutral	This parameter displays the hybrid transmission mode command as sent by the hybrid control module such as Park/Neutral, Single Electric Motor Dual Electric Motors, Single Electric Motor and ICE, Dual Electric Motors and ICE
Ignition Voltage	Volts	14.2 V	This parameter displays the voltage available to the transmission control module on the ignition voltage circuit.

Internal Mode Switch	Park, Reverse, Neutral, Drive (Drive 3), Low (Drive 2), Invalid	Park	This switch indicates transmission range. This is a contact switch attached to the control valve body within the transmission. The 9 outputs from the switch indicate which position is selected by the transmission manual shaft.
Internal Mode Switch A/B/C/P	High / Low	Low/High/High/Low	This displays the position of each internal mode switch state. A/B/C/P are identification for the 4 switches.
Line Pressure Control Solenoid Valve Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the short to power (high voltage) test status of the control circuit for Line Pressure Solenoid Valve (electro-magnetic valve that can control the flow of fluid in a linear way.) which controls the overall hydraulic pressure of an automatic transmission.
Line Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the short to ground (Low voltage) test status of the control circuit for the Line Pressure Solenoid Valve (electro-magnetic valve that can control the flow of fluid in a linear way.) which controls the overall hydraulic pressure of an automatic transmission.
Line Pressure Control Solenoid Valve Performance Test Status	OK, Malfunction, Not Run	OK	This parameter displays the performance test status of the Line Pressure Solenoid Valve (electro-magnetic valve that can control the flow of fluid in a linear way.) which controls the overall hydraulic pressure of an automatic transmission.
Line Pressure Control Solenoid Valve Pressure Command	kPa (PSI)	10.7 PSI	This parameter displays the serial data command to control the pressure control solenoid for the main supply line.
Malfunction Counter	Counts	0	This parameter displays the Counts of the number of malfunction occurrences.
Not Run Counter	Counts	0	This parameter displays the counts of the number of situations in which a specific DTC test condition could not be executed to its end.
OSS Supply Voltage	OK, Out of Range	OK	This parameter displays the regulated transmission output shaft speed supply voltage is OK or outside of the normal operating range. Measurements are made by transmission control module.
Output Shaft	Forward/Reverse/Unknown	Unknown	This Parameter indicates the direction of a transmission output shaft rotation. The transmission output shaft

Direction			delivers rotating torque to the drive axles, enabling movement of the vehicle.
Output Speed Sensor Circuit	RPM	0 RPM	This parameter displays the RPM of the output from the transmission to the drive wheels.
Pass Counter	Counts	Varies	This parameter displays the counts of situations in which a specific DTC test condition was successfully executed.
Pressure Control Solenoid Valve 2 Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for high voltage on the pressure control solenoid valve control circuit.
Pressure Control Solenoid Valve 2 Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for low voltage on the pressure control solenoid valve 2 control circuit.
Pressure Control Solenoid Valve 2 Performance Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test of the pressure control solenoid valve 2 functionality.
Pressure Control Solenoid Valve 2 Pressure Command	kPa (PSI)	0 psi	This parameter displays the command in kPa of the transmission control module to the pressure control solenoid valve 2.
Pressure Control Solenoid Valve 3 Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for high voltage on the pressure control solenoid valve 3 control circuit.
Pressure			

Control Solenoid Valve 3 Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for low voltage on the pressure control solenoid valve 3 control circuit.
Pressure Control Solenoid Valve 3 Performance Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test of the pressure control solenoid valve 3 functionality.
Pressure Control Solenoid Valve 3 Pressure Command	kPa (PSI)	0 psi	This parameter displays the command in kPa of the transmission control module to the pressure control solenoid valve 3.
Pressure Control Solenoid Valve 4 Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for high voltage on the pressure control solenoid valve 4 control circuit.
Pressure Control Solenoid Valve 4 Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for low voltage on the pressure control solenoid valve 4 control circuit.
Pressure Control Solenoid Valve 4 Performance Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test of the pressure control solenoid valve 4 functionality.
Pressure Control			

Solenoid Valve 4 Pressure Command	kPa (PSI)	2000 PSI	This parameter displays the command in kPa of the transmission control module to the pressure control solenoid valve 4.
Pressure Control Solenoid Valve 5 Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for high voltage on the pressure control solenoid valve 5 control circuit.
Pressure Control Solenoid Valve 5 Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for low voltage on the pressure control solenoid valve 5 control circuit.
Pressure Control Solenoid Valve 5 Performance Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test of the pressure control solenoid valve 5 functionality.
Pressure Control Solenoid Valve 5 Pressure Command	kPa (PSI)	0.0 psi	This parameter displays the command in kPa of the transmission control module to the pressure control solenoid valve 5.
Replicated Transmission OSS Circuit Open Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for an open in the transmission output speed circuit. Replicated Transmission Output Shaft Speed is a circuit from the transmission control module to the ECM whose signal has been reproduced (replicated) from the Transmission Output Speed Signal circuit.
Replicated Transmission OSS Signal	On/Off	Off	This parameter displays the Replicated Transmission Output Shaft Speed (Replicated TOS) received from the Transmission Control Module. Replicated Transmission Output Shaft Speed is a circuit from the transmission control module to the ECM whose signal has been reproduced (replicated) from the Transmission Output Speed Signal circuit to the ECM.
Shift Solenoid			

Valve 1	On / Off	On	This parameter displays the command of the transmission control module to the shift solenoid valve 1.
Shift Solenoid Valve 1 Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for high voltage on the shift solenoid valve 1 control circuit.
Shift Solenoid Valve 1 Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for low voltage on the shift solenoid valve 1 control circuit.
Shift Solenoid Valve 1 Control Circuit Open Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test for an open in the shift solenoid valve 1 circuit.
Shift Solenoid Valve 2	On / Off	Off	This parameter displays the command of the transmission control module to the shift solenoid valve 2.
Shift Solenoid Valve 2 Control Circuit High Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for high voltage on the shift solenoid valve 2 control circuit.
Shift Solenoid Valve 2 Control Circuit Low Voltage Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test which is testing for low voltage on the shift solenoid valve 2 control circuit.
Shift Solenoid Valve 2 Control Circuit Open Test Status	OK, Malfunction, Not Run	OK	This parameter displays the status of the transmission control module test for an open in the shift solenoid valve 2 circuit.
TCM Temperature	°C (°F)	74°C (165°F)	This parameter displays the temperature of the Transmission Control Module.
Transmission Fluid Pressure Switch 1	High / Low	High	This parameter displays the status of the transmission fluid pressure switch 1. An active pressure switch indicates that the associated clutch has been exhausted while an inactive pressure switch indicates that pressure is applied to the associated clutch.

Transmission Fluid Pressure Switch 3	High / Low	High	This parameter displays the status of the transmission fluid pressure switch 3. An active pressure switch indicates that the associated clutch has been exhausted while an inactive pressure switch indicates that pressure is applied to the associated clutch.
Transmission Fluid Pressure Switch 4	High / Low	Low	This parameter displays the status of the transmission fluid pressure switch 4. An active pressure switch indicates that the associated clutch has been exhausted while an inactive pressure switch indicates that pressure is applied to the associated clutch.
Transmission Fluid Pressure Switch 5	High / Low	High	This parameter displays the status of the transmission fluid pressure switch 5. An active pressure switch indicates that the associated clutch has been exhausted while an inactive pressure switch indicates that pressure is applied to the associated clutch.
Transmission Fluid Temperature	°C (°F)	69°C (156°F)	This parameter displays the temperature of the transmission fluid temperature.
Transmission ISS	RPM	1400 RPM	This parameter displays the rotational speed of the transmission input shaft. The scan tool displays input shaft speed in revolutions per minute (RPM).
Transmission OSS	RPM	0	This parameter measures the rotational speed of the transmission output shaft expressed as RPM.
Vehicle Speed	km/h (mph)	0	This parameter displays the rate of vehicle movement in km/h (MPH).
Warm-ups Since DTC Cleared	Counts	Varies	This parameter displays the number of OBD defined warm-up cycles since the last time codes were cleared with a scan tool or, when applicable, with a battery disconnect. A warm up means that the engine started from a cold start condition (which is some calibrated value which is usually around 70 or 80°F) and warms to operating temperature in a single key cycle.
Warm-Ups without Emission Malfunctions	Counts	Varies	The scan tool displays a range of 0-255. This parameter counts the number of warm up cycles without an emission fault present. The counter increments to 255 and rolls back to 0 unless a fault occurs. If a fault occurs, the counter reverts back to 0 until the fault is corrected. Clearing the information with a scan tool or a loss of power to the PCM also resets the counter to 0. The scan tool displays counts. This display indicates the number of warm-up cycles without a emission failure. A warm up means that the engine started from a cold start condition (which is some calibrated value which is usually around 70 or 80°F) and warms to operating temperature in a single key cycle.
Warm-Ups without Non-Emission Malfunctions	Counts	Varies	The scan tool displays a range of 0-255. This parameter counts the number of warm up cycles without a non-emission fault present. The counter increments to 255 and rolls back to 0 unless a fault occurs. If a fault occurs, the counter reverts back to 0 until the fault is corrected. Clearing information with a scan tool or a loss of power to the PCM also resets the counter to 0. A warm up means that the engine started from a cold start condition (which is some calibrated value which is usually around 70 or 80°F) and warms to operating temperature in a single key cycle.

Scan Tool Output Controls

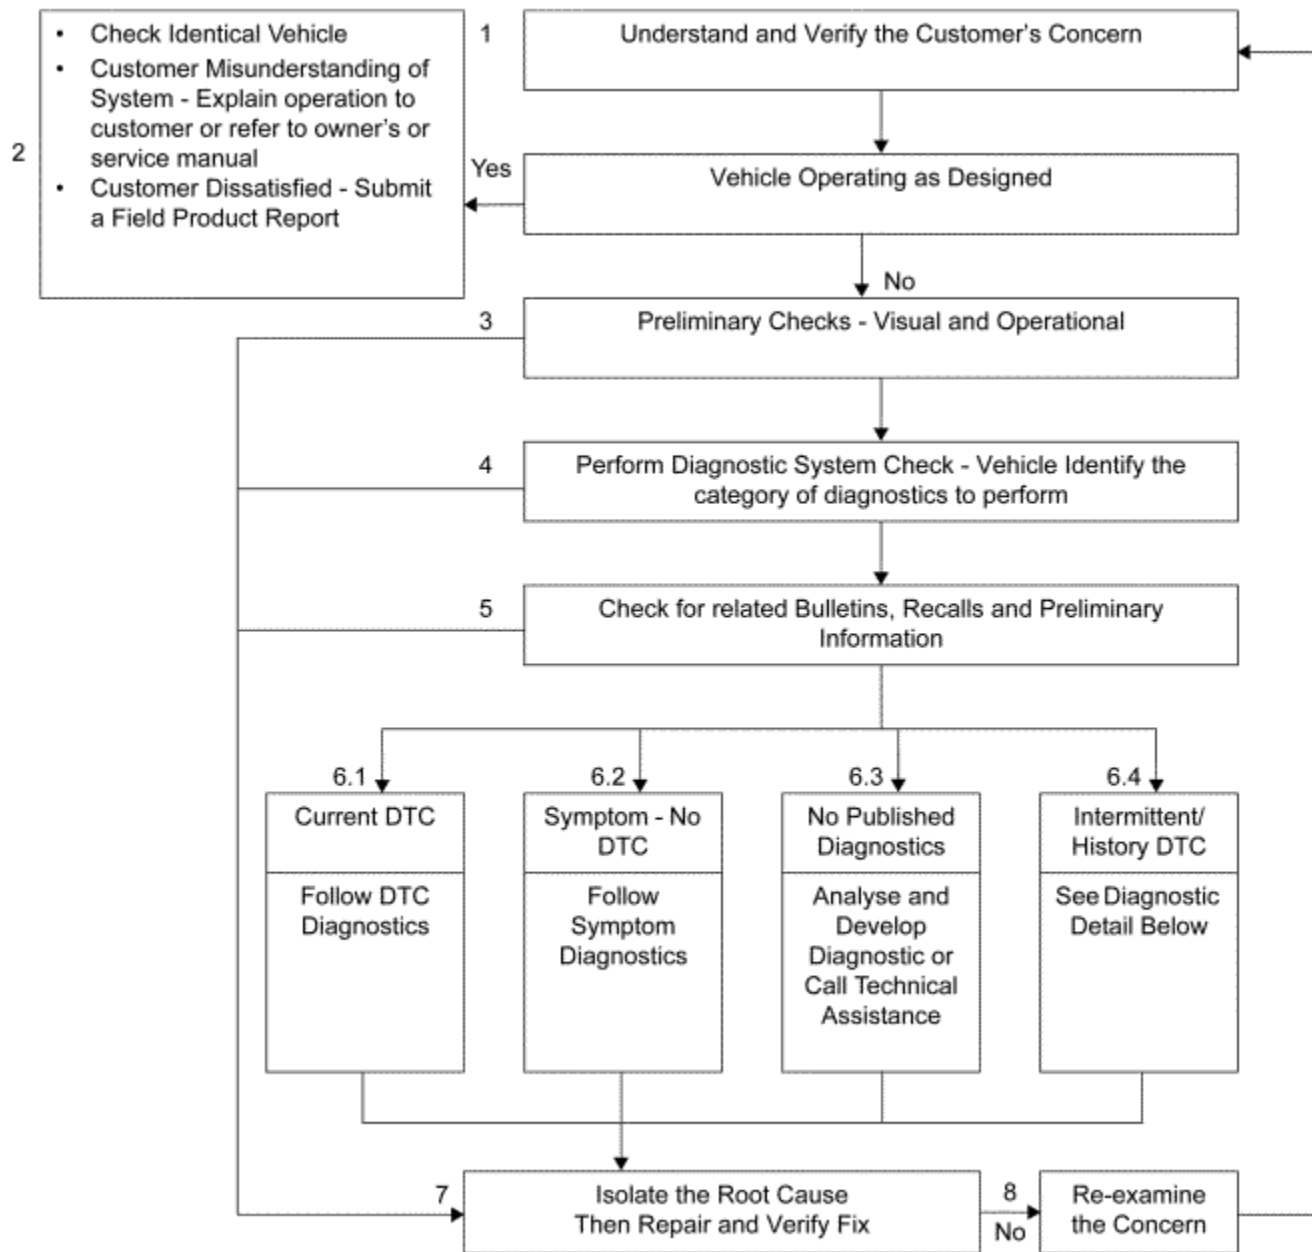

Output Control	Description
----------------	-------------

Shift Solenoid 1	<ul style="list-style-type: none"> • The TCM commands Shift Solenoid 1 and Shift Solenoid 2 ON and OFF. • When the vehicle is ON, and the engine is OFF, there are no limits to this control. The solenoid remains On until commanded OFF, and vice versa. When the output control is exited, the solenoid state is determined by the TCM.
Shift Solenoid 2	<ul style="list-style-type: none"> • When the engine is running, the following control limits apply: If the engine is running, the message "Engine Running" appears on the scan tool display.
Line PC Solenoid	<ul style="list-style-type: none"> • The scan tool is used to request pressure in increments of 207 kPa (30 PSI) from 0-1862 kPa (0-270 PSI). The TCM will then command the solenoid to achieve the requested pressure. • When the vehicle is in Service Mode, the pressure request may be controlled within calibrated limits. There are no limits to the output control when the engine is OFF. • When the engine is running, the following control limits apply: <ul style="list-style-type: none"> -When the transmission range is Park or Neutral, the pressure request may be controlled within calibrated limits. The engine speed must be less than 1,500 RPM. If the engine speed is greater than 1,500 RPM, the message "TR in park/neutral and engine speed over 1,500 RPM" appears on the scan tool display. -When the transmission range is not Park or Neutral, the requested pressure can only be controlled equal to or greater than the pressure determined by the TCM. The TCM does not allow a pressure to be selected that may cause damage to the transmission. If the requested pressure is less than allowed by the TCM, the message "Requested pressure for the Line PC Solenoid is too low" appears on the scan tool display. -Transmission range DTCs must not be active. If a transmission range DTC is active, the message "Engine running with transmission DTC present" appears on the scan tool display.
PC Solenoid 2	<ul style="list-style-type: none"> • The TCM commands the pressure control solenoids in order to apply and release the clutches. • The TCM commands the pressure control solenoids. The solenoid remains ON until commanded OFF, and vice versa. When the output control is exited, the solenoid state is determined by the TCM.
PC Solenoid 3	<ul style="list-style-type: none"> • When the vehicle is in Service Mode, there are no limits to this control. The solenoid remains ON until commanded OFF, and vice versa. When the output control is exited, the solenoid state is determined by the TCM.
PC Solenoid 4	<ul style="list-style-type: none"> • When the engine is running, the following control limits apply: If the engine is running, the message "Engine Running" appears on the scan tool display.
PC Solenoid 5	<ul style="list-style-type: none"> • Transmission range DTCs must not be active. If a transmission range DTC is active, the message "Engine running with transmission DTC present" appears on the scan tool display.

Strategy Based Diagnosis

The goal of Strategy Based Diagnosis is to provide guidance when you create a plan of action for each specific diagnostic situation. Following a similar plan for each diagnostic situation, you will achieve maximum efficiency when you diagnose and repair vehicles. Although each of the Strategy Based Diagnosis boxes is numbered, you are not required to complete every box in order to successfully diagnose a customer concern. The first step of your diagnostic process should always be Understand and Verify the Customer's Concern. The final step of your diagnostic process should be Repair and verify the Fix. Refer to the following chart for the correct Strategy Based Diagnosis.

1. Understand and Verify the Customer's Concern: The first part of this step is to obtain as much information as possible from the customer. Are there aftermarket accessories on the vehicle? When does the condition occur? Where does the condition occur? How long does the condition last? How often does the condition occur? In order to verify the concern, the technician should be familiar with the normal operation of the system and refer to the owner or service manual for any information needed.
2. Vehicle Operating as Designed: This condition exists when the vehicle is found to operate normally. The condition described by the customer may be normal. Compare with another like vehicle that is operating normally under the same conditions described by the customer. Explain your findings and the operation of the system to the

- customer. If the customer is dissatisfied submit a Field Product Report.
3. Preliminary Checks: Conduct a thorough visual inspection. Review the service history. Detect unusual sounds or odours. Gather diagnostic trouble code (DTC) information in order to achieve an effective repair.
 4. Perform Published Diagnostic System Check- Vehicle: The [Diagnostic System Check - Vehicle](#) verifies the proper operation of the system. This will lead the technician in an organised approach to diagnostics and identify what category of diagnostic to perform.
 5. Check for related Bulletins, Recalls and Preliminary Information (PI).
 6. Diagnostic categories:
 - 6.1. Current DTC: Follow the designated DTC diagnostic in order to make an effective repair. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - 6.2. Symptom - No DTC: Select the appropriate symptom diagnostic. Follow the diagnostic steps or suggestions in order to complete the repair. Refer to [Symptoms - Vehicle](#) .
 - 6.3. No Published Diagnostics: Analyse the Concern. Develop a plan for the diagnostics. The service manual schematics will help you to see system power, ground, input, and output circuits. You can also identify splices and other areas where multiple circuits are tied together. Look at component locations to see if components, connectors or harnesses may be exposed to extreme temperature, moisture, or corrosives (road salt, battery acid, oil or other fluids). Utilise the wiring diagrams, system description and operation, and system circuit description.
 - 6.4. Intermittent/History DTC: An intermittent condition is one that does not occur continuously, may be difficult to duplicate, and will only occur when certain conditions are met. Generally, an intermittent is caused by faulty electrical connections and wiring, malfunctioning components, electromagnetic/radio frequency interference, driving conditions, or aftermarket equipment. The following approaches/tools may prove to be beneficial in locating and repairing an intermittent condition or history DTC.
 - Combining technicians knowledge with the available service information.
 - Evaluate the symptoms and conditions described by the customer on the [Customer Concern Verification Sheets](#) .
 - Follow the suggestions on [Testing for Intermittent Conditions and Poor Connections](#) .
 - Use the available scan tool, digital multi-meter, or J-42598-B with data capturing capabilities.
 7. Isolate the Root Cause then Repair and Verify Fix: After isolating the root cause, make the repairs and validate for the correct operation by performing the [Diagnostic Repair Verification](#) . Verifying that the DTC or symptom has been corrected may involve road testing the vehicle.
 8. Re-examine the Concern: If a technician cannot successfully find or isolate the concern, a re-evaluation is necessary. Re-verify the concern. The concern could be an intermittent or normal condition.

Diagnostic Procedure Instructions

The following is an overview of instructions for all 16 categories which may be included in a diagnostic procedure.

[Diagnostic Instructions](#)

A link to the [Diagnostic System Check - Vehicle](#) is provided here. This procedure should be performed prior to performing other diagnostic procedures, as this prevents misdiagnosis where there are integrated system dependencies.

A link to the [Strategy Based Diagnosis](#) is provided here. This provides an overview on how a technician should diagnose a vehicle.

A link to the [Diagnostic Procedure Instructions](#) is provided here. This information is an overview of instructions for all 16 categories which may be included in a diagnostic procedure.

[DTC Descriptor](#)

Describes what DTCs are diagnosed in this procedure. The DTC number, with Symptom Description when applicable, and descriptor are written out.

[Diagnostic Fault Information](#)

The diagnostic Fault Information table identifies each circuit that makes up an electrical subsystem and the associated circuit faults. DTCs and symptoms are listed in the table for all circuit fault modes. This information can be used to diagnose an electrical fault, or as a quick visual aid showing how the different symptoms and DTCs apply for the subsystem being diagnosed.

Even though all the DTCs and symptoms are shown in this table it does not mean they will all be diagnosed in the same procedure.

An example table from an engine coolant temperature (ECT) procedure:

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
ECT Sensor Signal	P0117	P0118	P0118	P0125, P0128
ECT Low Reference	-	P0118	P0118	P0125, P0128

[Typical Scan Tool Data](#)

The Typical Scan Tool Data table identifies a scan tool data parameter and its value in reference to potential circuit faults.

An example table from an ECT procedure:

ECT Sensor Temperature – PCM

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: -32 to +130°C (-26 to +275°F)			
ECT Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	-	-40°C (-40°F)	-40°C (-40°F) ¹
¹ Internal ECM damage may occur if shorted to B+			

Circuit/System Description

Circuit/System Description identifies how a circuit/system normally functions.

Conditions for Running the DTC

Conditions for Running the DTC, identifies what conditions must be present to allow the diagnostic to run.

Conditions for Setting the DTC

Conditions for Setting the DTC, identifies the condition(s) that must be present in order to fail the diagnostic and when to set the DTC.

Action Taken When the DTC Sets

Actions Taken When the DTC sets, identifies the default actions taken when a control module sets a DTC.

Conditions for Clearing the DTC

Conditions for Clearing the DTC, identifies the conditions that must be met in order to clear the DTC.

Diagnostic Aids

Diagnostic Aids are suggestions which explain other methods to diagnose the condition. It also provides unique information about the system used to assist the technician in finding and repairing a vehicle condition.

Reference Information

Reference Information includes links providing additional information for the diagnostic procedure.

For example:

- Schematic Reference
- Connector End View Reference
- Description and Operation
- Electrical Information Reference
- DTC Type Reference
- Scan Tool Reference
- Special Tools Required

Circuit/System Verification

The diagnostic format does not force a technician to any of the 3 diagnostic categories (Circuit/System Verification, Circuit/System Testing and Component Testing). However, performing the Circuit/System Verification category first, aids in determining if a vehicle condition is current. Some diagnostic categories may state that another category must be performed first when there are testing dependencies.

This category also serves to route the technician to other diagnostic procedures which should be performed first; for example, a DTC with a higher priority.

Circuit/System Verification is a non-intrusive procedure outlining how to verify that a system or a portion of a system is functioning correctly. During the verification process, the vehicle is kept intact and tested as a complete system. This verification is used to assist the technician in determining whether a condition is current or intermittent. When a condition is determined to be intermittent, a technician can use the link in Electrical Information Reference: [Testing for Intermittent Conditions and Poor Connections](#) for additional testing information.

The technician should be able to identify if the fault is occurring on the input circuit – signal or on the output circuit – control when applicable. The technician will need to decide from the verification results if the system is working correctly or if further diagnosis needs to be performed in either Circuit/System Testing and/or Component Testing.

To assist the technician in identifying a common part a component code is used. These codes are not translated so they will always be the same even though the part name may have slight variance. The component codes will always be the same once assigned to a unique part name and will be found on the schematics and in the diagnostic procedure categories Circuit/System Verification, Circuit/System Testing, and Component Testing categories.

Component Codes

The component codes used on the schematics will have the base code with an extension to identify location or quantity. For example the ABS wheel speed sensors are identified on the schematic with a base code (B5) and a location extension (LF, RF, LR, and RR) as seen below:

- B5LF Wheel Speed Sensor (WSS)-Left Front
- B5RF Wheel Speed Sensor (WSS)-Right Front

- B5LR Wheel Speed Sensor (WSS)-Left Rear
- B5RR Wheel Speed Sensor (WSS)-Right Rear

B5 is the base code for the wheel speed sensor and the LF, RF, LR, and RR indicate the on vehicle location.

The diagnostic procedures will use the base code (B5) for a wheel speed sensor but may or may not use the extension identifying location (LF, RF, LR, and RR). Example: Ignition OFF, disconnect the harness connector at the appropriate B5 wheel speed sensor. This is done so the diagnostic procedure can be common for all four wheel speed sensors and not have to take into account part location or quantity.

Where the diagnostic states "the appropriate" it is up to the technician to identify which component is being diagnosed by the symptom stated on the RO (drivers door lock is inoperative) or by the DTC descriptor (DTC C0585 04: Left Rear Actuator Circuit Open).

Circuit/System Testing

The diagnostic format does not force a technician to any of the 3 diagnostic categories (Circuit/System Verification, Circuit/System Testing and Component Testing). However, beginning with the Circuit/System Verification category aids in determining if a vehicle condition is current. Some diagnostic categories may state that another category must be performed first when there are testing dependencies.

Circuit/System Testing is a step by step, positive-flow, testing sequence which allows the technician to perform each test step, in sequence, until a fault is detected. If the result of a numbered test step is achieved, the normal flow is to proceed to the next numbered test step (indicated by the down pass arrow). If the result of a numbered test step is NOT achieved, the right repair arrow bullet below the failed test will identify what actions need to take place.

Intrusive diagnostics are performed to locate the system fault. System harness connections are disconnected from the module or component to test individual circuit functions. The module or component will be used to assist in verifying the circuit function. When a test does not pass, the repair steps () will indicate what circuit faults to test for example, short to voltage, short to ground or open/high resistance.

When testing for individual circuit faults, the technician is expected to include terminal inspections such as connection surfaces and terminal tension at both the harness and component/module. Additionally, a technician can use the links in Electrical Information Reference: [Testing for Intermittent Conditions and Poor Connections](#) or [Circuit Testing](#) for additional information.

The control modules and components will also be diagnosed during these test steps. A retest of a control module or component should always be performed before replacement. For example, re-connect all components and modules and retest the system to verify the condition still exists before replacing modules or components.

Component Testing

The diagnostic format does not force a technician to any of the 3 diagnostic categories (Circuit/System Verification, Circuit/System Testing and Component Testing). However, beginning with the Circuit/System Verification category aids in determining if a vehicle condition is current. Some diagnostic categories may state that another category must be performed first when there are testing dependencies.

Component Testing can offer static and/or dynamic component tests. These tests can be used to verify if a component is operating correctly to avoid unnecessary replacement.

Testing modules in this category will not be offered. In most cases, the module is used to verify the harness circuits in the Circuit/System Testing category and a retest of the module should always be performed before replacement.

[Repair Instructions](#)

Repair Instructions provides a link to [Diagnostic Repair Verification](#) . This link describes how to verify the vehicle is repaired.

All links to Repair or Replacement procedures are located here.

[Repair Verification](#)

Repair Verification describes how to verify the vehicle is repaired when additional instructions are needed beyond what is in Diagnostic Repair Verification.

Diagnostic System Check Instructions

The following is an overview of instructions for the general information and 14 step System Verification included in the Diagnostic System Check - Vehicle procedure.

[Diagnostic Instructions](#)

A link to [Strategy Based Diagnosis](#) is provided as an overview on how a technician should diagnose a vehicle.

A link to the Diagnostic System Check Instructions is provided. This provides an overview of instructions and examples for the general information and 14 step System Verification included in the Diagnostic System Check - Vehicle procedure. The examples in this document are intended to give the technician a general idea of what the test step is referring to. They are not intended to list every possible condition or situation.

Diagnostic Systems Check steps are listed by priority to guide the technician to the appropriate diagnostic procedure to correct the customer concern. There are many ways to determine the priority of diagnosing a vehicle concern. Some faults can cause customer perceived symptoms in areas unrelated to the fault. Using an example from the System Check, after reading DTCs, the technician is asked to verify there are no Electronic Control Unit Internal Performance Faults present. It is important that any internal performance issues are addressed prior to continuing through the System Check. There is no benefit addressing other DTCs that could be set due to an internal fault to a control module. If the fault is present, performing the diagnostic procedure for that fault will likely correct the customer perceived concern and possibly eliminate other DTCs that may be set.

Not all steps of the Diagnostic System Check have to be performed. The Diagnostic System Check tries to prioritise the test steps with the highest priority faults first. The technician is then lead to another document to do the actual diagnosis or repair. The strategy is to repair higher level faults that may be the cause of other system or component level symptoms. Additionally, the Diagnostic System Check can only be used for a single fault at a time. If additional faults are present, the technician must perform the diagnostic system check for each concern until all customer concerns are corrected.

Once a repair has been completed, General Motors diagnostic strategy is to always have the technician verify that the customer concern has been corrected. This is to prevent comebacks and to ensure customer satisfaction with their dealership experience. Therefore a link has been provided to [Diagnostic Repair Verification](#) procedure for the technician to verify the customer concern has been corrected.

There are some assumptions made when General Motors prepares service information. They include the following areas which are presumed to function as designed:

- The 12 V battery is fully charged. General Motors assumes the majority of vehicles brought in for repair will be able to start and be driven into the service stall. If the vehicle has a dead battery, it is slow cranking or for any other reason the technician feels the customer concern may be battery related, a link is provided to [Battery Inspection/Test](#) . This procedure will guide the technician through inspecting and verifying the battery functions properly.
- Fuses should not be open. General Motors does not call out in diagnostic procedures to verify a fuse. The technician is expected to find an open fuse when the diagnostic test step states to check for an open circuit condition. Therefore a link has been provided to [Power Distribution Schematics](#) and [Electrical Centre Identification Views](#) for technicians to reference power sources and fuse locations if they feel there may be loss of power due to an open fuse condition.

- Ground circuits are clean, tight, and in the correct location. General Motors assumes that the original ground circuits have not been compromised. The technician is expected to find a poor ground connection when the diagnostic test step states to test the ground circuit for an open/high resistance. Therefore a link has been provided to [Ground Distribution Schematics](#) and [Harness Routing Views](#) for technicians to reference ground locations and which ground circuits may be related to the customer concern.
- All connections/connectors are fully seated. General Motors assumes that all connections are properly installed. The technician is expected to find an open or poor connection when the diagnostic test step asks to test the circuit for an open/high resistance. Therefore a link has been provided to [Component Connector End Views](#) for technicians to reference which connections may be related to the customer concern.
- There are no aftermarket devices that affect the operation of the system. General Motors can only author diagnostic and repair information for vehicle systems and components that are original equipment or genuine GM Accessories. Aftermarket equipment can negatively affect original equipment operation and lead a technician's diagnosis of a concern in the wrong direction. Therefore a link has been provided to [Checking Aftermarket Accessories](#) that guides a technician through the possible causes of vehicle problems related to aftermarket accessories.
- The scan tool powers up. General Motors assumes that power is available at the Data Link Connector and the scan tool will power on. Therefore a link has been provided to [Scan Tool Does Not Power Up](#) if the technician finds that the scan tool does not power on.

Diagnostic System Check

1. VERIFY CUSTOMER CONCERN--This step is to obtain as much information as possible from the customer. Are there aftermarket accessories on the vehicle? When does the condition occur? Where does the condition occur? How long does the condition last? How often does the condition occur? Review the service history of the vehicle for previous repairs that could help diagnose the current concern.

Now that the technician understands the customer concern, they should validate the concern on the vehicle. In order to verify the concern, the technician should be familiar with the normal operation of the system and refer to the owner or service manual for any information needed. Inspect the visible system components for obvious damage or conditions that could cause the concern. Conduct a thorough visual inspection. Detect unusual sounds or odours.

The condition described by the customer may be normal. If the technician finds the vehicle to operate normally, compare with another like vehicle that is operating normally, under the same conditions described by the customer. If this is the case, explain your findings and the operation of the system to the customer. If the customer is dissatisfied, submit a Field Product Report.

2. BULLETIN SEARCH--By searching for related bulletins, recall/field actions and preliminary information documents, a procedure for a known field issue may resolve the customer concern with little or no diagnosis necessary saving the technician diagnostic time.
3. MECHANICAL CONCERNS--This step is designed to take the technician directly to a list of symptom diagnostic procedures. The technician is asked to verify the symptoms exhibited by the system are mechanical in nature and not related to an electrical system, see some examples below. If the technician feels the concern could be related to an electrical system, they should continue through the Diagnostic System Check to verify the electrical functionality of vehicle. If the technician feels the concern is exclusively related to a mechanical system, a link to [Symptoms - Vehicle](#) is provided to select the appropriate symptom diagnostic procedure for the customer concern.

Examples:

- Brake noise or diagnosing irregular pad wear
- Water leak diagnosis
 - Engine or transmission fluid leak diagnosis

- - Manual window or door lock diagnosis
 - Vehicle vibration diagnosis
 - Exhaust noise or leak diagnosis
4. VEHICLE POWER UP VERIFICATION--The technician is asked in this step to turn the ignition key ON and verify that the vehicle powers up. The technician should look for clues that multiple vehicle systems are receiving vehicle powermode messages, such as the cluster waking up, the radio powers on, the HVAC blower is operational, windshield wipers turn on, etc, with the key ON. This would be a rare condition as both the powermode master and back-up powermode master would have to be inoperable, however, if the vehicle does not power up, a link to [Power Mode Mismatch](#) is provided.
 5. CONTROL MODULE COMMUNICATION and DTC CHECK--The technician is asked in this step to record the following three pieces of data on the Repair Order; any control module that the scan tool determined is not communicating, any DTC and symptom byte set current or history, and the control module that has set the DTC.

This is considered a setup step for the rest of the Diagnostic System Check. The technician is not expected to do anything other than record the three pieces of data provided by the scan tool on the Repair Order. This provides the information needed to complete the rest of the diagnostic system check.

To complete this step, the technician is asked to utilise the scan tool function called Vehicle DTC Information located in Vehicle Control Systems. This function will query every possible control module on the vehicle requesting all DTCs. During the DTC query, the scan tool will try to establish communication with each control module. If the scan tool can communicate with the control module during the DTC request, it will display PRESENT and provide the number of DTCs set in the control module. If the scan tool cannot communicate with a control module, it will only display NOT COMMUNICATING. Since the scan tool cannot determine if a given control module should be present or not, the technician is asked in a future step to verify that the vehicle was not built with control modules listed as NOT COMMUNICATING.

If the scan tool cannot establish communications with ALL of the vehicles control modules, a link to [Data Link References](#) is provided. A faulty control module or fault with the serial data circuit can cause no communication with all of the control modules on the vehicle. If any control module communicates on the serial data circuit, continue through the Diagnostic System check, as a future step will address any specific non communicating or group of non communicating control modules.

Once the scan tool has completed the routine, the technician should review each control module that has set a DTC and document them on the Repair Order. When reviewing the DTCs, the technician should take notice if any DTCs are powertrain related, and if so, navigate in the scan tool to the Powertrain area and utilise the Capture Info function. This will upload any Freeze Frame/Failure Records stored in the control module to the scan tool in case the data is lost from the control module. As an example, if the technician commands a Clear DTCs function on a powertrain controller, all diagnostic information stored in the controller is erased. This includes Freeze Frame/Failure Records and Inspection/Maintenance System Status indicators, if required for your region.

6. CONTROL MODULE INTERNAL PERFORMANCE FAULTS--The technician is asked to review the DTCs recorded in step 4 and verify there are no control module internal performance faults set current. This type of fault may be the cause of other symptoms or DTCs displayed by the vehicle. By addressing this fault first, the technician may find the other concerns are resolved. The technician should always follow the diagnostic procedure for these types of faults prior to replacing any control module. If the technician finds a control module has an internal performance fault, a link is provided to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to select the appropriate DTC diagnostic procedure.

Examples:

- B1000 Electronic Control Unit Performance
- B101D ECU Hardware Performance

- C0550 Electronic Control Unit Performance
 - C056D ECU Hardware Performance
 - C0570 Auxiliary Electronic Control Unit Performance
 - P0606 Control Module Internal Performance
 - P0607 Control Module Performance
7. CONTROL MODULE COMMUNICATION VERIFICATION--This step is used to ensure the control modules that are NOT COMMUNICATING were not built on the vehicle. To understand if the vehicle was built with that option, we provide a link to the [Data Link References](#) document where Regular Production Options (RPOs) are listed next to ECU names and can be compared to those the vehicle was built with. If the technician determines that a control that is NOT COMMUNICATING should be present, the technician is asked to follow the appropriate diagnostic procedure listed in the [Data Link References](#) document.
8. COMMUNICATION and POWERMODE FAULTS--This step is asking the technician to look for communication DTCs or DTCs related to control modules powering up based on power mode, communication enable or wake-up circuits. See in the below table some examples of the DTCs the technician should diagnose prior to continuing through the Diagnostic System Check. The technician should review the list of DTCs recorded in step 4 and verify that none of these type of DTCs are present. If so, the technician is referred to the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to select the appropriate DTC diagnostic procedure.

Examples:

- U0140 Lost Communication With Body Control Module
 - U0164 Lost Communication With HVAC Control Module
 - U0170 Lost Communication With Passenger Presence Detection Module
 - U0402 Invalid Data Received From Transmission Control Module
 - U0452 Invalid Data Received From Inflatable Restraint Sensing and Diagnostic Module
 - U1814 Powertrain High Speed Communication Enable Circuit
 - B1428 Ignition Switched Power Run/Crank Relay Circuit
 - B137B Accessory Power Module Wake Up Circuit
 - C0897 Control Module Power Moding
 - P2536 Ignition Accessory Switch Circuit
9. POWER MODE VERIFICATION--This step verifies the Power Mode Master is receiving the proper output state of the push button switch. The technician should use the main power mode input, which is the push button switch. The test should not be performed using a key fob, if the MIL is illuminated the powertrain controller may disable this input. The technician is asked to perform the test with the driver door open. This ensures the retained accessory power mode is inactive during this test which could result in different scan tool readings. The technician is only asked to verify the current Power Mode parameter in the power mode data display list. If the parameter does not match the actual vehicle power mode state, a link is provided to perform the [Power Mode Mismatch](#) diagnostic procedure.
10. REMAINING DTC REVIEW--Here the technician is asked to review any remaining DTCs that were not addressed in previous steps. The technician is asked first to verify there are no control module supply voltage, system voltage or 5 V circuit DTCs present. Control modules, systems or components with insufficient or zero voltage can cause one or multiple symptoms to exist on the vehicle. Control module voltage issues could also be the cause of failures during a programming event. The technician should correct voltage issues prior to addressing any programming or configuration DTCs. The technician should then check for any ECU programming, setup or configuration DTCs. By programming software or configuring a control module, the technician could correct the customer concern unobtrusively. The remaining DTCs, which are usually specific system or component faults, are diagnosed last. They can include ECU input and output circuit DTCs or individual circuit faults that

usually cause single symptoms or failure modes on the vehicle and can be fixed following the proper DTC diagnostic procedure. In general, the technician should think about what DTCs or faults could be caused by another DTC or fault. A failed sensor may set a component DTC and then the system may set a DTC indicating the system cannot operate properly. By correcting the sensor fault, the system may now operate properly and the system level DTC will transition to history. Refer to the examples within each category below to understand the differences between these DTCs. If DTCs of these type are current, the technician is referred to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to choose the correct DTC diagnostic procedure.

10.1. Voltage DTCs

- B1325 Device Power 1 Circuit
- C0875 Device Voltage Reference Input 2 Circuit
- C1001 Adaptive Cruise Control Indicators Supply Voltage Circuit
- P0641 5 V Reference Circuit
- P0787 Downshift Timing Solenoid Control Circuit Low Voltage

10.2. Programming, Setup, Configuration or Software Performance DTCs

- B3943 Steering Column Lock has Not Learned Column Integration Module
- B101E ECU Software Performance
- B1019 System Configuration Error
- C0558 Calibration Data Not Programmed
- P0630 VIN Not Programmed or Mismatched - Powertrain Control Module (PCM)

10.3. Component related DTCs

- B0013 Driver Frontal Deployment Loop Stage 2
- B0163 Passenger Compartment Temp Sensor Circuit
- C0045 Left Rear Wheel Speed Sensor Circuit
- P0565 Cruise Control Switch Circuit
- P0751 1-2 Shift Solenoid (SS) Valve Performance

10.4. System related DTCs

- B1010 System Sensors Data Mismatch
- C0176 System Thermal Error
- C0561 System Disabled Information Stored
- P1564 Vehicle Acceleration Too High - Cruise Control Disabled
- P1625 Transmission Control Module (TCM) System Reset

10.5. Any other remaining DTCs--The technician should diagnose and correct any other DTCs that are left that were not from the categories above.

11. EMISSION RELATED INSPECTION/MAINTENANCE TESTING CONCERNS--Several regions require that a vehicle pass on-board diagnostic system tests and the inspection/maintenance emission tests in order to renew number plates or vehicle registration. This is accomplished by viewing the Inspection/Maintenance System Status display on a scan tool. Using a scan tool, the technician can observe the Inspection/Maintenance System Status in order to verify that the vehicle meets the criteria that comply with the local area requirements. If inspection and maintenance checks are required in your region, and the customer concern is related to not

passing an Inspection/Maintenance test, a link is provided to [Inspection/Maintenance System Check](#) where the technician can choose the appropriate Inspection/Maintenance System Check for the actual engine application being used.

12. SYMPTOM DIAGNOSIS--At this step, the diagnostics are assuming that the only information the technician has available to diagnose the customer concern are symptoms of a problem. There are no DTCs set current or history. There may be a Driver Information Centre display message or a system indicator to aid in identifying the root cause. The technician should evaluate the symptoms and conditions described by the customer and perform the symptoms diagnostics for the area of customer concern. A link is provided to [Symptoms - Vehicle](#) which contains a list of all symptoms related to this service manual publication.

Diagnostic Starting Point - Vehicle

Begin the system diagnosis with [Diagnostic System Check - Vehicle](#) . The Diagnostic System Check - Vehicle will provide a complete strategy to locate and repair a mechanical or electrical vehicle fault. Not following this strategy may cause additional diagnostic time and/or misdiagnosis.

The Diagnostic System Check - Vehicle will provide the following strategy:

- When to verify the customer concern and identify related bulletins, recalls and preliminary information
- When to identify a control module that is not communicating, a control module that has set a DTC, and the DTC diagnostic priority
- When to address power mode concerns
- When to verify the engine cranks and runs
- When to diagnose symptom related concerns

Diagnostic System Check - Vehicle

Diagnostic Instructions

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic System Check Instructions](#) provides an overview of each diagnostic category.
- Continue through the Diagnostic System Check until you are directed to follow a particular diagnostic or repair procedure. Once a repair has been completed, perform the [Diagnostic Repair Verification](#) and verify the customer concern has been corrected.

The diagnostic procedures within this manual are developed on the assumption that the following areas function as designed:

- The 12 V battery is fully charged and cables are clean and tight. Refer to [Battery Inspection/Test](#) .
- Fuses are not open. Refer to [Power Distribution Schematics](#) and [Electrical Centre Identification Views](#) .
- Ground circuits for the area of customer concern are clean, tight, and in the correct location. Refer to [Ground Distribution Schematics](#) and [Harness Routing Views](#) .
- All connections/connectors for the area of concern are fully seated. Refer to [Component Connector End Views](#) .
- There are no aftermarket devices that affect the operation of the system. Refer to [Checking Aftermarket Accessories](#) .
- The scan tool powers up. Refer to [Scan Tool Does Not Power Up](#) .

Diagnostic System Check

1. **VERIFY CUSTOMER CONCERN** - Understand and validate the customer concern. Inspect the visible system components for obvious damage or conditions that may cause the concern.
2. **BULLETIN SEARCH** - Check for related bulletins, recalls/field actions, and preliminary information.
3. **MECHANICAL CONCERNS** - Verify the symptom is not exclusively a mechanical concern.

If the symptom is exclusively a mechanical concern

Refer to [Symptoms - Vehicle](#) .

If the symptom is not a mechanical concern

Note: Do not clear any DTCs unless instructed to do so by a diagnostic procedure. If any DTC is Powertrain related, select Capture Info to store DTC and Freeze Frame/Failure Records to the scan tool.

4. **VEHICLE POWER UP VERIFICATION** - Vehicle in Service Mode, verify the vehicle powers up.
If the vehicle does not power up
Refer to [Power Mode Mismatch](#) .

If the vehicle powers up

5. **CONTROL MODULE COMMUNICATION and DTC CHECK** - Using a scan tool, perform the Vehicle DTC Information function and verify at least one control module communicates with the scan tool. Record on the Repair Order the following information:
- Any control module that is not communicating.
 - Any DTC, including symptom byte, and the control module that has set the DTC.

If the scan tool does not communicate with any control module on the vehicle

Refer to [Data Link References](#) .

If the scan tool communicates with any control module

6. **CONTROL MODULE INTERNAL PERFORMANCE FAULTS** - Verify there is no current control module Internal Performance DTCs set.

If any DTC of this type is set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If no DTC of this type is set

7. **CONTROL MODULE COMMUNICATION VERIFICATION** - Verify the vehicle is not built with any control module listed as not communicating with the scan tool; refer to [Data Link References](#) .

If the vehicle is built with a control module that is not communicating

Refer to [Data Link References](#) .

If all control modules the vehicle is built with are communicating

8. **COMMUNICATION and POWERMODE FAULTS** - Verify there are no current control module Power Mode or Communication DTCs set.

If any DTC of this type is set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If no DTC of this type is set

Note: The electric propulsion system will be active in the vehicle ON state during this test. Ensure the vehicle is out of gear and the handbrake is applied. Turn the vehicle power mode to vehicle OFF as soon as the vehicle ON power mode parameter has been observed.

9. **POWER MODE VERIFICATION** - Driver door open, observe the scan tool Power Mode parameter while cycling the push button switch through all the power modes. Verify the current Power Mode parameter matches the actual vehicle power mode states.

If the Power Mode parameter does not match the vehicle power mode states

Refer to [Power Mode Mismatch](#) .

If the Power Mode parameter matches the vehicle power mode states

10. **REMAINING DTC REVIEW** - Verify there are no other DTCs set.

If other DTCs are set

Diagnose them in the order listed below. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

10.1. Voltage DTCs

10.2. Programming, Setup or Configuration or Software Performance DTCs

10.3. Component related DTCs

10.4. System related DTCs

10.5. Any remaining DTCs

If no other DTCs are set

11. **EMISSION RELATED INSPECTION/MAINTENANCE TESTING CONCERNS** - If inspection and maintenance checks are required in your region, verify the customer concern is not related to inspection/maintenance testing.

If the customer concern is related to inspection/maintenance testing

Refer to [Inspection/Maintenance System Check](#) .

If the customer concern is not related to inspection/maintenance testing

12. **SYMPTOM DIAGNOSIS** - Diagnose any remaining customer concern. Refer to [Symptoms - Vehicle](#) .

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

[Emissions Related DTCs](#)

Action Taken When the DTC Sets - Type A

- The control module illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Freeze Frame/Failure Records.

Action Taken When the DTC Sets - Type B

- The control module illuminates the MIL on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a malfunction on the second consecutive ignition cycle, the control module records the operating conditions at the time of the malfunction. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.
- The following applies to misfire DTCs:
 - If the control module detects a low level or an emission level misfire condition during 2 consecutive trips, the control module illuminates the MIL.
 - If the control module detects a high level or catalyst damaging misfire, the control module flashes the MIL at a rate of once per second.
 - If the control module detects a misfire during 2 non-consecutive trips, the stored conditions are compared with the current conditions. The control module illuminates the MIL when the following conditions occur:
 - The engine load is within 20% of the previous test that failed.
 - The engine speed is within 375 RPM of the previous test that failed.
 - The engine coolant temperature is in the same range of the previous test that failed.
- The following applies to fuel trim DTCs:
 - If the control module detects a fuel trim condition during 2 consecutive trips, the control module illuminates the MIL.
 - If the control module detects a fuel trim condition during 2 non-consecutive trips, the stored conditions are compared with the current conditions. The control module illuminates the MIL when the following conditions occur:
 - The engine load is within 20% of the previous test that failed.
 - The engine speed is within 375 RPM of the previous test that failed.
 - The engine coolant temperature is in the same range of the previous test that failed.

Conditions for Clearing the MIL/DTC - Type A or Type B

- The control module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warmup cycles, if no malfunctions are reported by this or any other emission related diagnostic.
- Clear the MIL and the DTC with a scan tool.

Non Emissions Related DTCs

Action Taken When the DTC Sets - Type C

- The control module stores the DTC information into memory when the diagnostic runs and fails.
- The MIL will not illuminate.
- The control module records the operating conditions at the time the diagnostic fails. The control module stores this information in the Failure Records.
- The driver information centre, if equipped, may display a message.

Conditions for Clearing the DTC - Type C

- A current DTC Last Test Failed clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warmup cycles, if no malfunctions are reported by this or any other non emission related diagnostic.
- Clear the DTC with a scan tool.

Action Taken When the DTC Sets - Type D

- The control module will take default actions but no DTC will be stored in Failure Records.
- The MIL or SVS will not illuminate.

Conditions for Clearing the DTC - Type D

Clear the DTC with a scan tool.

Engine Cranks But Does Not Run

Refer to the appropriate diagnostic procedure below for the vehicle being serviced.

[Engine Cranks But Does Not Run](#) for the 1.4L (LUU) engine

Inspection/Maintenance System Check

Refer to the appropriate diagnostic procedure below for the vehicle being served.

[Inspection/Maintenance System Check](#) for the 1.4L (LUU) engine

Diagnostic Repair Verification

Note: After a repair has been made, some DTCs require the ignition to be turned OFF then back ON before the scan tool function will clear the DTC.

1. Ignition OFF.
2. Install any components or connectors that have been removed or replaced during diagnosis.
3. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
4. Ignition ON.
5. Clear the DTCs.
6. Turn the ignition OFF for 60 seconds.
7. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) and perform the appropriate diagnostic procedure.

Or

If the repair was symptom related, duplicate the conditions under which the customer concern occurred to verify the repair. If the customer concern reoccurs or another symptom is present, return to [Symptoms - Vehicle](#) and perform the appropriate symptom diagnostic.

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Front Wheel Intermediate Shaft Bracket Bolt	58 N·m	43 lb ft
Wheel Drive Shaft Nut		
First Pass	150 N·m	111 lb ft
Second Pass	loosen 45 degrees	
Final Pass	250 N·m	184 lb ft

Volt

Adhesives, Fluids, Lubricants, and Sealers

Application	Type of Material	GM Part Number

Symptoms - Wheel Drive Shafts

Important: Review the following description prior to beginning the wheel drive shaft diagnosis.

Review the system operation in order to become familiar with the system function. Refer to [Wheel Drive Shafts Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket equipment and modifications which could affect the operation of the wheel drive shafts or other rotating components.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Thoroughly inspect the entire wheel drive shaft for visible damage, leaking joint seals, and missing seal clamps.
- Inspect the wheel drive shaft seals for cuts, tears, or other damage which may allow the loss of lubricant and the entry of contaminants.

Symptom List

After performing the Visual/Physical Inspection and no visual signs of damage or other interference impairing the wheel drive shaft function is apparent, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the joints manually. Any binding or otherwise impeded movement of the joints may indicate damage which could contribute to the concern. Refer to the following:

- [Click Noise In Turns](#)
- [Clunk When Accelerating from Coast](#)
- [Clunk Noise When Accelerating During Turns](#)

Click Noise In Turns

A click noise occurring during turns may be caused by a worn or damaged wheel drive shaft outer joint. This may be more apparent while simultaneously turning and accelerating. This click is caused by wear and/or damage to the constant velocity joint bearings and/or races. Commonly, this damage or wear is caused by the loss of lubricating grease from the constant velocity joint and the entry of foreign material or contaminants.

Carefully inspect the wheel drive shaft seals for cuts, tears or other damage which may allow the lubricating grease to escape. The loss of this grease will cause damage to the wheel drive shaft constant velocity joint in a very short period of time.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the outer joint manually. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

Clunk When Accelerating from Coast

A clunk noise occurring when accelerating from coast or a standing start may be caused by a worn or damaged wheel drive shaft inner joint. The common cause of wheel drive shaft inner joint damage is the loss of lubricating grease and/or the presence of foreign material and contaminants in the joint. This usually occurs as a result of a torn or damaged inner joint seal.

Carefully inspect the wheel drive shaft seal for cuts, tears or other damage that may allow the loss of the lubricating grease and/or the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the inner joint manually. Do not allow the joint to separate from the wheel drive shaft bar. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

Clunk Noise When Accelerating During Turns

A clunk noise that occurs while accelerating during turns may be caused by wear and/or damage to the inboard and the outboard joints in combination. The loss of lubricant and/or the presence of contaminants can cause damage to the internal components of the joints.

Carefully inspect the joint seals for cuts, tears or other damage. Joint seals that are damaged may allow lubricant leakage and the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the joints manually. Do not allow the joints to separate from the wheel drive shaft bar. Any binding or impeded movement of the joints may indicate damage which could contribute to the concern.

Front Wheel Drive Intermediate Shaft Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .2. Remove the tire and wheel assembly. Refer to Tyre and Wheel Removal and Installation .3. Remove the wheel drive shaft. Refer to Front Wheel Drive Shaft Replacement .	

1	<p>Front Wheel Drive Intermediate Shaft Bracket Bolt (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 58 N·m (43 lb ft).</p>
2	<p>Front Wheel Drive Intermediate Shaft and Bracket</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove and discard the O-ring. DO NOT re-use, replace with NEW only.2. Use the <i>DT 44394-A</i> protector to install the front wheel drive intermediate shaft. <p>Special Tools</p> <p><i>DT 44394-A</i> Seal Protector</p> <p>For equivalent regional tools, refer to Special Tools .</p>

Front Wheel Drive Shaft Replacement

Special Tools

CH 28733-B Wheel Hub and Drive shaft Remover

For equivalent regional tools, refer to [Special Tools](#)

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tire and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Remove the front wheelhouse panel splash shield. Refer to [Front Wheelhouse Front Liner Replacement](#) .
4. Disconnect the electrical connector for the front wheel speed sensor at the frame.
5. Remove the front wheel speed sensor wiring harness from the front lower control arm.
6. Remove the stabiliser shaft link. Refer to [Stabilizer Shaft Link Replacement](#) .

7. Insert a drift or a punch (1) in the brake disc cooling fins.
8. Rotate the brake disc until the drift or punch rests against the brake calliper mounting bracket.
9. Using a breaker bar and the proper size socket (2), loosen the wheel drive shaft nut.

10. Remove and discard the wheel drive shaft nut (1).

11. Using the *CH 28733-B* remover (2), separate the wheel drive shaft from the front wheel hub (1).

12. Remove the outer tie rod end from the knuckle. Refer to [Steering Linkage Outer Track rod Replacement](#) .

13. Remove the lower control arm ball joint bolt from the knuckle. Refer to [Steering Knuckle Replacement](#) .

Note: Position a drain pan under the transmission when servicing the left wheel drive shaft.

14. With help from an assistant, move the front knuckle assembly to the side.

15. Using a large flat bladed screwdriver or pry bar (2), remove the wheel drive shaft (1) from the differential or intermediate shaft.

16. Remove the wheel drive shaft from the vehicle.

Note: If there is no washer on the wheel drive shaft, install a NEW washer.

17. Remove and discard the washer (1) from the front wheel drive shaft (2). DO NOT re-use the washer, replace with NEW only.

[Installation Procedure](#)

1. With the NEW washers installed, position the wheel drive shaft (1) in the vehicle.
2. With help from an assistant, move the front knuckle assembly into the proper position.
3. Install the wheel drive shaft in the front wheel hub.
4. Install the lower control arm ball joint bolt. Refer to [Steering Knuckle Replacement](#) .
5. Install the outer tie rod end. Refer to [Steering Linkage Outer Track rod Replacement](#) .
6. Install the stabiliser shaft link. Refer to [Stabilizer Shaft Link Replacement](#) .

7. Install wheel drive shaft nut (1), hand-tighten

8. Insert a drift or a punch (1) in the brake cooling fin.
9. Rotate the brake disc until the drift or the punch rests against the brake calliper mounting bracket.
10. Using a torque wrench (2) tighten the wheel drive shaft nut to:
 - First Pass, **150 N·m (111 lb ft)**
 - Second Pass, **Loosen the nut 45 degrees**
 - Final Pass, **250 N·m (185 lb ft)**
11. Reconnect the electrical connector for the front wheel speed sensor.
12. Install the front wheel speed sensor wiring harness.
