5	<p>Rear Shock Absorber Upper Mount</p>
6	<p>Rear Shock Absorber Bumper Upper</p>

Shock Absorber Disposal

Warning: Gas charged shock absorbers contain high pressure gas. Do not remove the snap ring from inside the top of the tube. If the snap ring is removed, the contents of the shock absorber will come out with extreme force which may result in personal injury.

Warning: To prevent personal injury, wear safety glasses when centre punching and drilling the shock absorber. Use care not to puncture the shock absorber tube with the centre punch.

1. Make an indentation 10 mm (0.4 in) from the bottom (4) of the tube (3) using a centre punch.
2. Clamp the shock absorber in a vice horizontally with the shock absorber rod (1) completely extended.
3. Drill a hole in the shock absorber at the centre punch (4) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the shock absorber. Use workshop towels in order to contain the escaping oil.
4. Make an indentation in the middle (2) of the tube (3) with a centre punch.
5. Drill a second hole in the shock absorber at the centre punch (2) using a 5 mm (3/16 in) drill bit. Oil will exhaust when the drill bit penetrates the shock absorber. Use workshop towels in order to contain the escaping oil.
6. Remove the shock absorber from the vice. Hold the shock absorber over a drain pan horizontally with the holes down. Move the rod (1) in and out of the tube (3) to completely drain the oil from the shock absorber.

Rear Spring, Insulator, and Jounce Bumper Replacement

Callout	Component Name
Preliminary Procedure	
Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle	
1	<p>Rear Suspension Spring</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Support the rear axle with a suitable jack stand. 2. If the springs are being removed to service or to service other suspension components and the tags are missing, mark the relationship of the rear spring prior to removal for the proper installation. 3. Remove the lower shock absorber bolt. Refer to Shock Absorber Replacement . <p>Tip The rear springs are indexed with color are tags toward the rear of the vehicle and towards the top of the spring.</p>

2	Rear Suspension Spring Insulator
3	Rear Suspension Stop
4	Rear Suspension Spring Insulator

Rear Axle Replacement

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tires and wheels. Refer to [Tyre and Wheel Removal and Installation](#) .

Note:

- It is not necessary to remove the brake rotor from the rear wheel bearing/hubs. The brake rotors can remain on the rear wheel bearing/hub assembly.
- When removing the rear brake caliper assemblies, it is not necessary to remove the hydraulic brakes lines, or the park brake cable from the rear brake caliper. Relocate the brake caliper assembly to the side and support with mechanic's wire.

3. Remove the rear wheel bearing/hubs assemblies. Refer to [Rear Wheel Bearing and Hub Replacement](#) .

4. Secure the rear axle assembly to the hydraulic transmission jack (1).

Note: Replace the rear spring insulators or the rear suspension jounce bumper if they are found to be damaged.

5. Remove the rear springs and the insulators. Refer to [Rear Spring, Insulator, and Jounce Bumper Replacement](#) .
6. Remove two lower fasteners for the rear wheel house panel liner to allow enough clearance to remove the trailing arm through bolt. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .

7. Remove the rear axle bushing nuts (1) and discard the bolts (2). Replace with NEW only.

Note: It may be necessary to have an assistant to help remove the rear axle from the vehicle.

8. Using the hydraulic transmission jack (1), remove the rear axle (2) from the vehicle.
9. With the aid of an assistant, remove the rear axle assembly from the hydraulic transmission jack.

[Installation Procedure](#)

1. With the aide of an assistant, position the rear axle assembly (2) on the hydraulic transmission jack (1).

2. Using the hydraulic transmission jack (1) and the aid of an assistant, position the rear axle (2) in the rear axle brackets.

3. Install the rear axle bushing nuts (1) and the NEW bolts (2) and hand tighten.
4. Install the rear springs. Refer to [Rear Spring, Insulator, and Jounce Bumper Replacement](#)
5. Install the rear wheel bearings/hub assemblies. Refer to [Rear Wheel Bearing and Hub Replacement](#) .
6. Install the two front lower rear wheel house panel liner fasteners. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .
7. Install the tyre and wheels. Refer to [Tyre and Wheel Removal and Installation](#)
8. Remove the support and lower the vehicle.
9. Inspect the trim height and adjust as required. Refer to [Trim Height Inspection](#) .

Warning: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause bodily injury and damage to the vehicle or component.

10. Once the trim heights have been checked, tighten the trailing arm nuts (1) to:
 - First Pass: **70 N·m (52 lb ft)**
 - Final Pass: **additional 120 degrees**

Wheel Stud Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the tyre and wheel assembly. Refer to Tyre and Wheel Removal and Installation . 3. Remove the rear brake rotor. Refer to Rear Brake Rotor Replacement 	
1	<p>Wheel Stud (Qty: 5)</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Rotate the wheel hub to gain enough worker area to remove the wheel stud. 2. Using the <i>CH 43631</i> remover, remove and discard the wheel stud from the wheel hub. Replace with new only. 3. When installing the wheel stud, use the proper amount of washers to allow the wheel stud to be fully seated against the wheel hub flange. 4. Use a wheel nut with the flat side of the wheel nut facing the washers to fully seat the wheel stud.

Special Tools

CH 43631 Ball Joint Remover

For equivalent regional tools, refer to [Special Tools](#) .

Rear Suspension Description and Operation

This vehicle has a semi-independent twist-beam rear suspension system consisting of the following components:

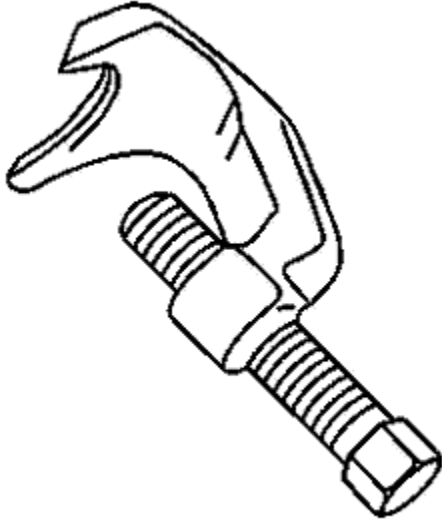

- An axle with integral trailing arms
- A "V" shaped twisting cross beam
- Two coil springs
- Two shock absorbers

[Axle Assembly](#)

The axle assembly attaches to the underbody through a rubber bushing and bracket located at the front of each integral trailing arm. The brackets are bolted to the underbody side rails. The axle structure itself maintains the geometrical relationship of the wheels relative to the centreline of the body.

Special Tools

Illustration	Tool Number / Description
	<p>CH 43631 J-43461 Ball Joint Remover</p>

Trim Height Specifications

Model	Tyre Size	P	R	Z	D
All	P 215/55R17	706 ± 12 mm (27.8 ± 0.5 in)	714 ± 12 mm (28.1 ± 0.5 in)	39 ± 10 mm (1.54 ± 0.4 in)	236 ± 10 mm (9.29 ± 0.4 in)
All measurements have a cross tolerance of ± 10 mm (0.39 in)					

Body Leans or Sways in Corners

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	
2	Verify the vehicle leans or sways in corners. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the following components for wear or damage: <ul style="list-style-type: none"> • Rear Coil Springs • Front Coil Springs Are the components worn or damaged?	Go to Step 5	Go to Step 4
4	1. Inspect the stabiliser shaft link for wear or damage. 2. Repair as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 2
5	Replace the springs as necessary. Did you complete the repair?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Torque Steer

Step	Action	Yes	No
DEFINITION: On a dry, smooth, flat road, the vehicle has a left or right steering force only during acceleration.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	
2	<ol style="list-style-type: none"> 1. Drive the vehicle on a straight, smooth, flat road. 2. Press the accelerator and determine if any additional steering input is required to maintain a straight ahead direction. 3. Repeat this test with the vehicle travelling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by uneven roads and crosswinds are considered normal. <p>Does the vehicle exhibit torque steer when the accelerator is pressed?</p>	Go to Step 3	System OK
3	<ol style="list-style-type: none"> 1. Drive the vehicle on a straight, smooth, flat road at 64-97 km/h (40-60 mph). 2. Remove your foot from the accelerator. 3. Shift the transmission into NEUTRAL in order to allow the vehicle to freewheel. 4. Is any additional steering input required to maintain a straight ahead direction. 5. Repeat this test with the vehicle travelling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by uneven roads and crosswinds are considered normal. <p>Does the vehicle direction change when the steering wheel is momentarily released?</p>		Go to Step 4
4	<p>Inspect the front suspension and powertrain mounts for worn or damaged components and repair as necessary.</p> <p>Did you find and correct the condition?</p>	Go to Step 6	Go to Step 5
5	<p>Inspect the vehicle trim height. Refer to Trim Height Inspection .</p> <p>Did you find and correct the condition?</p>	Go to Step 6	-
6	<p>Operate the vehicle in order to verify the repair.</p> <p>Did you correct the condition?</p>	System OK	-

Memory Steer

Step	Action	Yes	No
DEFINITION: A lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	
2	Verify that memory steer is present. Does the system operate normally?	System OK	Go to Step 3
3	1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Lubricate the track rod ends and the ball joints if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to Step 7	Go to Step 4
4	Inspect for binding strut bearings. 1. Disconnect the strut from the steering knuckle. 2. If the strut is abnormally difficult to rotate, repair or replace the upper bearing mount. Did you find and complete the repair?	Go to Step 7	Go to Step 5
5	Inspect for binding in the lower ball joints. If joint is binding, replace the joint. Did you find and complete the repair?	Go to Step 7	Go to Step 6
6	Inspect the wheel alignment and adjust as necessary. Refer to Wheel Alignment Measurement . Did you complete the wheel alignment?	Go to Step 7	-
7	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

Trim Height Inspection

[Trim Height Measurement](#)

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause the vehicle to bottom out over bumps, damage to the suspension components and symptoms similar to wheel alignment problems. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

Perform the following before measuring the trim heights:

- Set the tyre pressure to the specifications shown on the certification label. Refer to [Vehicle Certification, Tyre Placard, Anti-Theft, and Service Parts ID Label](#) .

Note: One U.S. gallon of petrol weighs approximately **6.5 lbs**. One litre of petrol weighs approximately **0.7 kg**.

- Check the fuel level. Add additional weight if necessary to simulate a full tank.
- Make sure the passenger and rear compartments are empty, except for the spare tyre.
- Make sure the vehicle is on a flat and level surface, such as an alignment rack.
- Check that all the vehicle doors are securely closed.
- Check that the vehicle bonnet and rear deck lids are securely closed.
- Check for installed after market accessories or modifications that could affect trim height measurement:
 - Larger or smaller than production wheels and tyres.
 - Lifting or Lowering Kits
 - Wheel Opening Flares or Ground Affects

[Measuring the P and R Dimension](#)

Measurement Definitions

P Height: The vertical distance from the ground to the top of the wheel opening through the centreline of the front wheel.

R Height: The vertical distance from the ground to the top of the wheel opening through the centreline of the rear wheel.

Use the following procedures to measure the P and R dimensions:

Note:

- Measure from the centre of the wheel well opening to the ground.
- The left and right P and R height differences should be no more than **10 mm (0.39 in)**.

1. Push the front bumper down a minimum of **25 mm (1 in)** and release. Perform this step three times.
2. Measure and record the trim height per the "Measurement Definitions" above.
3. Lift the bumper up a minimum of **25 mm (1 in)** and release. Perform this step three times.
4. Measure and record the trim height per the "Measurement Definitions" above.

5. The true P height measurement is the average of the measurements taken in step 2 and 4. Refer to [Trim Height Specifications](#)
6. Repeat the above steps at the rear of the vehicle for the R heights.
7. If the P and R heights are outside of the specifications, measure the Z & D heights.

[Measuring the Z Dimension](#)

Measurement Definitions

The Z Height: The vertical distance from the forward front lower control arm (2) attachment bolt tip to the centre of the ball joint cup (1).

Use the following procedures to measure the Z dimensions:

Note: The left and right Z height differences should be no more than **10 mm (0.39 in)**.

1. Push the front bumper down a minimum of **25 mm (1 in)** and release. Perform this step three times.

2. Measure and record the trim height per the "Measurement Definitions" above.
3. Lift the front bumper a minimum of **25 mm (1 in)** and release. Perform this step three times.
4. Measure and record the trim height per the "Measurement Definitions" above.
5. The true Z height dimension is the average of the measurements taken in steps 2 and 4. Refer to [Trim Height Specifications](#) .
6. If these measurements are out of specifications, inspect for the following conditions:
 - Worn or damaged suspension components
 - Collision damage

D Height Measurement

Measurement Definitions

The D Height: The vertical distance from the bottom surface of the body side rail (1) to the centre of the lower shock attaching bolt head (2).

Use the following procedure to check the D dimension:

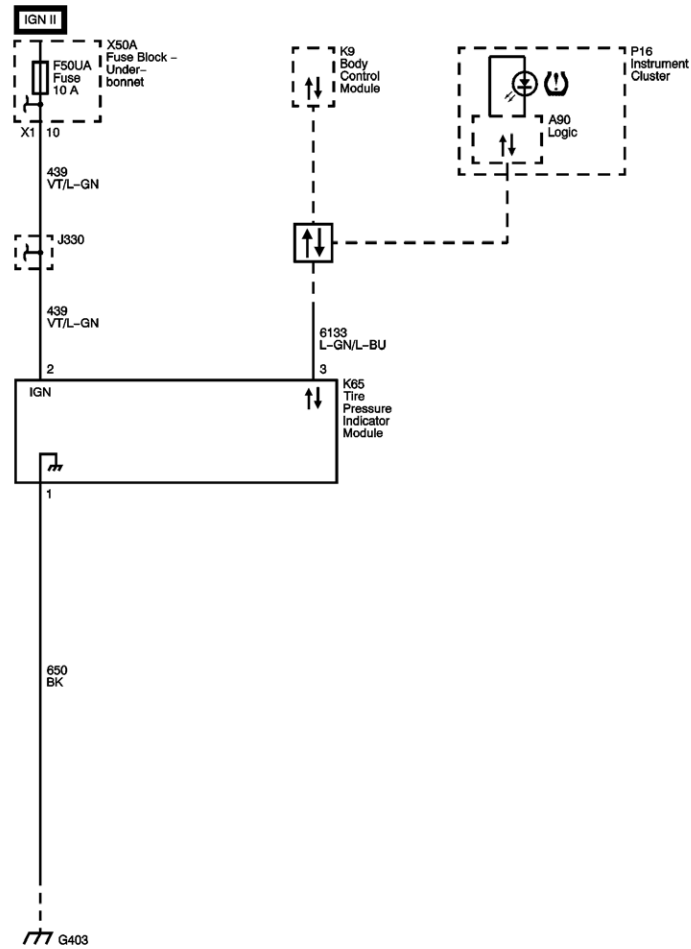

Note: The left and right D height difference should be no more than **10 mm (0.39 in)**.

1. Push the rear bumper down a minimum of **25 mm (1 in)** and release. Perform this step three times.
2. Measure and record the trim height per the "Measurement Definitions" above.
3. Lift the rear bumper up a minimum of **25 mm (1 in)** and release. Perform this step three times.
4. Measure and record the trim height per the "Measurement Definitions" above.
5. The true D height is the average of the measurements taken in steps 2 and 4. Refer to [Trim Height Specifications](#) .
6. If these measurements are out of specifications, inspect for the following conditions:
 - Worn or damaged suspension components
 - Collision damage

Tire Pressure Monitoring System Schematics

Tyre Pressure Monitoring

[Master Electrical Component List](#)

DTC C0569

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00: System Configuration Malfunction

Circuit/System Description

If the tyre type and pressure information is not entered with the scan tool during the body control module (BCM) setup, the tyre pressure monitor system indicator icon on the instrument cluster will flash for 1 min. and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The tyre type and pressure information is not entered into the BCM during programming and setup.

Action Taken When the DTC Sets

- The tyre pressure monitor system indicator icon on the instrument cluster flashes for 1 min. and then remains illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has undergone the tyre type and pressure selection setup procedure and 1 power switch cycle has occurred.

Diagnostic Aids

A newly replaced BCM will set DTC C0569 after programming on its initial power switch ON cycle if the module setup information has not been entered.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0750 03: Left Front Tire Pressure Sensor Low Voltage

DTC C0750 29: Left Front Tire Pressure Sensor Too Few Pulses

DTC C0750 39: Left Front Tire Pressure Sensor Internal Malfunction

DTC C0755 03: Right Front Tire Pressure Sensor Low Voltage

DTC C0755 29: Right Front Tire Pressure Sensor Too Few Pulses

DTC C0755 39: Right Front Tire Pressure Sensor Internal Malfunction

DTC C0760 03: Left Rear Tire Pressure Sensor Low Voltage

DTC C0760 29: Left Rear Tire Pressure Sensor Too Few Pulses

DTC C0760 39: Left Rear Tire Pressure Sensor Internal Malfunction

DTC C0765 03: Right Rear Tire Pressure Sensor Low Voltage

DTC C0765 29: Right Rear Tire Pressure Sensor Too Few Pulses

DTC C0765 39: Right Rear Tire Pressure Sensor Internal Malfunction

[Circuit/System Description](#)

The tire pressure monitor system has a radio frequency transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force closes the sensors internal roll switch, which puts the sensor into Drive mode. The remote control door lock receiver receives and then sends the tyre pressure and temperature data to the body control module (BCM). The tyre pressure indicator module sends sensor ID and location data to the BCM. The BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the remote control door lock receiver waits for the sensors to go into Drive mode. If one or more sensors do not go into Drive mode, or do not transmit at all, the BCM will set DTC C0750, C0755, C0760, or C0765 respectively.

[Conditions for Running the DTC](#)

Vehicle speed is greater than 40 km/h (25 MPH).

[Conditions for Setting the DTC](#)

- A sensor does not transmit or transmits invalid data to the BCM.
- The tyre pressure indicator module does not send or sends invalid data to the BCM.
- A sensor low battery condition.

[Action Taken When the DTC Sets](#)

- The tyre pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

[Conditions for Clearing the DTC](#)

A current DTC will clear when the malfunction is no longer present and 1 power cycle occurs.

[Diagnostic Aids](#)

- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- Occasionally sensor transmissions are not received by the remote control door lock receiver due to vehicle level radio frequency interference from items such as but not limited to aftermarket power systems, DVD players, CB radios, or metallic type window tinting.

[Tire Pressure Indicator Sensor Replacement](#)

DTC C0775

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC C0775 00: Tire Pressure Monitoring System Sensors Malfunction

[Circuit/System Description](#)

If the body control module (BCM) has been reprogrammed or replaced and the tyre pressure sensor autolearn process has not occurred, the tyre pressure monitor system indicator icon on the instrument cluster will flash for 1 min. and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set in the BCM and the tyre pressure sensor autolearn process will need to be performed for the system to function correctly. The remote control door lock receiver receives and then sends the tyre pressure and temperature data to the body control module (BCM). The tyre pressure indicator module receives and then sends sensor ID and location data to the BCM. The tyre pressure indicator module determines tyre side to side position by the rotating direction of the tyres and the front to rear position by the strength of the signals received. To complete the tyre pressure indicator module autolearn process it is required that the vehicle be driven for at least 9 minutes above 40 km/h (25 MPH).

[Conditions for Running the DTC](#)

Vehicle ON or Vehicle in Service Mode.

[Conditions for Setting the DTC](#)

The body control module (BCM) has not received tyre sensor ID and location information from the tyre pressure indicator module.

[Action Taken When the DTC Sets](#)

- The tyre pressure monitor system indicator icon on the instrument cluster will flash for 1 min. and then remain illuminated after the power switch is cycled ON and the

instrument cluster bulb check is complete.

- If equipped, the driver information center displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has received tyre sensor ID and location information from the tyre pressure indicator module and at least 1 power switch cycle has occurred.

1. Drive the vehicle for at least 9 minutes above 40 km/h (25 MPH).
2. Verify DTC C0775 is not set.

If the DTC is set

- 2.1. Replace the K65 tyre pressure indicator module.

2.2. Drive the vehicle for at least 9 minutes above 40 km/h (25 MPH).

2.3. Verify DTC C0775 is not set.

If the DTC is set, replace the K9 body control module.

If the DTC is not set

2.4. All OK.

If the DTC is not set

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for tyre pressure indicator module and BCM replacement, programming, and setup.

Symptoms - Tyre Pressure Monitoring

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Tyre Pressure Monitor Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Low Tyre Pressure Indicator Malfunction](#) in order to diagnose the symptom.

Low Tyre Pressure Indicator Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The tire pressure monitor system has a radio frequency transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force closes the sensors internal roll switch, which puts the sensor into Drive mode. The remote control door lock receiver receives and then sends the tyre pressure and temperature data to the body control module (BCM). The tyre pressure indicator module sends sensor ID and location data to the BCM. The BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the remote control door lock receiver waits for the sensors to go into Drive mode.

Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the BCM memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the BCM continuously compares IDs and pressure data in the received transmissions to the learned IDs and pressures to determine if all 4 sensors are present and if one or more tyres are low. If the BCM detects a low tyre pressure condition, a variation in pressure between 2 tyres on the same axle, or a malfunction in the system, it will send a serial data message to the instrument cluster requesting the appropriate tyre pressure monitor indicator illumination and also to display the appropriate data message on the driver information centre, if equipped.

[Diagnostic Aids](#)

- If unsure about the condition, cycle the power switch and observe the tyre pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the instrument cluster bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to [Vehicle Certification, Tyre Placard, Anti-Theft, and Service Parts ID Label](#) . If the tyre pressure monitor indicator icon flashes for 1 minute after the instrument cluster bulb check is completed and then remains illuminated, a tyre pressure monitor system DTC is set. Perform the [Diagnostic System Check - Vehicle](#) to proceed with the proper diagnosis.
- Temperature can greatly affect tyre pressures. Low tyre pressure on a cold morning may cause the tyre pressure monitor indicator icon to turn ON. The air pressure in the tyre increases as the ambient temperature rises or as the tyre warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tyre pressure monitor indicator icon.
- Aftermarket wheel valve stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.

- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to [Tire Pressure Indicator Sensor Replacement](#) .
- Occasionally sensor transmissions are not received by the BCM due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.

[Circuit/System Verification](#)

Note: Low tyre pressure in one or more tyres is indicated by a continuously illuminated tyre pressure monitor indicator icon after the instrument cluster bulb check is completed. If equipped with a driver information centre, a check tyre pressure type message will also be displayed.

When a tyre pressure monitor DTC is set, the tyre pressure monitor indicator icon will flash for 1 minute after the instrument cluster bulb check is completed and then remains illuminated. If equipped with a driver information center, a service tire monitor type message will also be displayed.

1. Adjust all tyre pressures to the correct pressure. Refer to [Vehicle Certification, Tyre Placard, Anti-Theft, and Service Parts ID Label](#)
2. Drive the vehicle over 40 km/h (25 mph) for greater than 9 minutes.
3. Verify the low tyre pressure indicator is OFF.

If the low tyre pressure indicator is ON

- 3.1. Record each sensor tyre pressure parameter from the scan tool.
- 3.2. Check and record the tyre pressures with a known accurate hand held tyre pressure gauge.
- 3.3. Verify that the pressure readings from the scan tool do not differ more than 27.6 kPa (4 psi) from the actual tyre pressure readings.

If the pressure readings differ more than 27.6 kPa (4 psi), replace the appropriate B2 tyre pressure sensor then drive the vehicle over 40 km/h (25 mph) for more than 9 minutes.

If the pressure readings do not differ more than 27.6 kPa (4 psi)

- 3.4. Verify the BCM Tyre Type and Pressure selections are setup correctly with a scan tool. Refer to the [Vehicle Certification, Tyre Placard, Anti-Theft, and Service Parts ID Label](#) .

If the BCM Tire Type and Pressure selections are incorrect, input the proper placard values for the vehicle with the scan tool then drive the vehicle over 40 km/h (25 mph) for more than 9 minutes.

If the BCM Tyre Type and Pressure selections are correct

- 3.5. Vehicle in Service Mode.

- 3.6. Verify the tyre pressure monitor indicator icon turns ON and OFF when commanding the instrument cluster All Indicators ON and OFF with a scan tool.

If the tyre pressure monitor icon does not turn ON and OFF, replace the P16 instrument cluster.

If the tyre pressure monitor icon turns ON and OFF

- 3.7. All OK

If the tyre pressure indicator is OFF

4. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Tire Pressure Indicator Sensor Replacement](#)
- [Control Module References](#) for instrument cluster replacement, programming, and setup.

Tire Pressure Indicator Sensor Replacement

Removal Procedure

1. Raise the vehicle on a suitable support. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre/wheel assembly from the vehicle. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Dismount the tire from the rim.

Note: When servicing the tyre pressure sensor always use a new Schrader® tyre pressure monitoring (TPM) sensor and a new TORX screw during installation.

4. Remove the TORX screw (1) from the tyre pressure sensor (2) and pull it straight off the tyre pressure valve stem (3).

Caution: Do not scratch or damage the clear coating on aluminium wheels with the tyre changing equipment. Scratching the clear coating could cause the aluminium wheel to corrode and the clear coating to peel from the wheel.

5. Remove the tyre pressure valve stem by pulling it through the rim.

Installation Procedure

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note:

- Ensure the flat of the valve lines up with the flats of the snap in the enclosure.
- TPM valves and TORX screws are single use items.

1. Assemble the tyre pressure sensor (2) to the valve stem and install the new TORX screw (3), tighten to **1.3 N·m (11.5 lb in)**.

Note: Use an approved tyre mounting lubricant. **DO NOT** use silicon or corrosive base compounds to lubricate the tyre bead and the wheel rim. A corrosive type compound can cause tyre or rim deterioration.

2. Apply tyre soap to the rubber portion of the valve stem (1).

3. Using a tyre valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

Note: Snap Fit TPM sensors are shipped in the OFF mode. The sensor will exit its OFF state when the tyre is inflated.

4. Mount the tyre to the rim.

5. Install the tyre/wheel assembly on the vehicle. Refer to [Tyre and Wheel Removal and Installation](#) .

6. Lower the vehicle.

7. Re-learn the tyre pressure sensors.

Tyre Pressure Monitor Description and Operation

[Tire Pressure Monitoring System Operation](#)

The tyre pressure monitor system warns the driver when a significant loss or gain of tyre pressure occurs in any of the 4 tyres. It allows the driver to display the individual tyre pressures and their locations on the driver information centre.

The system uses the body control module (BCM), driver information centre, instrument cluster, remote control door lock receiver, tyre pressure indicator module and a radio frequency transmitting pressure sensor in each tyre assembly. Each sensor has an internal power supply.

When the vehicle is stationary, the sensors internal accelerometer is inactive which puts the sensors into a Stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force closes the sensors internal roll switch, which puts the sensor into Wake and then Drive mode. The remote control door lock receiver receives and then sends the tyre pressure and temperature data to the body control module (BCM). The tyre pressure indicator module sends sensor ID and location data to the BCM. The BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the remote control door lock receiver waits for the sensors to go into Drive mode.

Each sensor has its own unique identification (ID) code which it transmits as part of each RF message and must be learned into the BCM memory. Once all 4 ID's have been learned and vehicle speed is greater than 40 km/h (25 mph), the BCM continuously compares ID's and pressure data in the received transmissions to the learned ID's and pressures to determine if all 4 sensors are present and if one or more tyres are low. If the BCM detects a low tyre pressure condition, a variation in pressure between 2 tyres on the same axle, or a malfunction in the system, it will send a serial data message to the instrument cluster requesting the appropriate tyre pressure monitor indicator illumination and also to display the appropriate data message on the driver information centre, if equipped.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in Learn Mode-Pressure Triggered if a 8.3 kPa (1.2 PSI) change in tyre pressure has been detected in either a Stationary or Drive state. When the tyre pressure system detects a significant loss, or gain of tyre pressure, the tyre pressure monitor indicator icon is continuously illuminated on the instrument cluster and if equipped, a check tyre pressure type message is displayed on the driver information centre.

Both the indicator icon and driver information centre message can be cleared by adjusting the tyre pressures to the recommended kPa/PSI and driving the vehicle above 40 km/h (25 MPH) for at least 9 minutes.

If power is disconnected from the BCM or if the vehicle battery is disconnected each tire pressure sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the BCM cannot assume that the tire pressures were maintained over an unknown period of time. Cars equipped with the driver information centre will display dashes and the scan tool will indicate a default tyre pressure value of 1020 kPa (148 PSI) for each tyre. To reactivate the sensors, the vehicle must be driven above 40 km/h (25 MPH) for at least 9 minutes. When the sensors are activated, the driver information centre displays the current tyre pressures.

The BCM has the ability to detect malfunctions within the tire pressure monitor system. In the event a DTC is set, the tyre pressure monitor indicator icon on the instrument cluster will flash for 1 min. and then remain illuminated after the power switch is turned ON and the instrument cluster bulb check has been completed. Any malfunction detected will cause the driver information center to display a service tire monitor system type message.

Tyre and Wheel Removal and Installation

Special Tools

- CH 41013 Rotor Resurfacing Kit
- CH 42450-A Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to [Special Tools](#)

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the wheel center cap, if equipped.
3. Remove the wheel centre cap nuts, if equipped.
4. Remove the wheel nuts.
5. Remove the tyre and wheel assembly.

Caution: Never use heat to loosen a tight wheel bolt or nut. This can shorten the life of wheel and damage wheel bearings.

6. If the tyre and wheel assembly is difficult to remove or cannot be removed, perform the following steps:
 - 6.1. Apply a small amount of penetrating oil to the wheel nuts, and the centre hub. Allow a few moments for the penetrating oil to work.
 - 6.2. Loosen each wheel nut 2 complete turns.
 - 6.3. Lower the vehicle.
 - 6.4. Rock the vehicle from side to side.
 - 6.5. Repeat the procedure if necessary.
7. If the tyre and wheel assembly still does not loosen, perform the following:
 - 7.1. Start the engine.
 - 7.2. Allow the vehicle to move forward, and quickly apply the brakes. Repeat this procedure in reverse.
 - 7.3. Repeat this procedure if necessary.
8. With the tyre and wheel assembly loose, raise and support the vehicle.
9. Remove the tyre and wheel assembly.

Caution: Before installing wheels, remove any build-up of corrosion on the wheel mounting surface by scraping and wire brushing. Installing wheels without good metal-to-metal contact at the mounting surfaces can cause wheel bolts or nuts to loosen, which can later allow a wheel bolt or nut to come off while the vehicle is moving.

Wheel bolts or nuts must be tightened in sequence and to proper torque to avoid bending the wheel, brake drum or rotor.

Note:

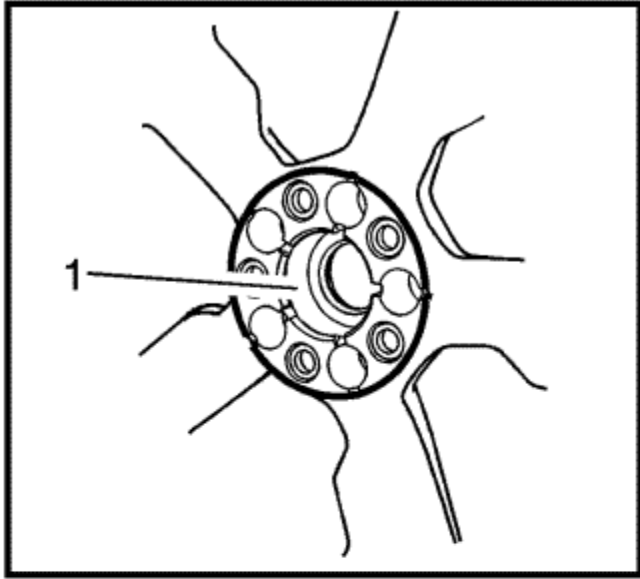

- Wear approved safety glasses when performing the following service procedures.
- DO NOT use power grinders to clean any of the brake rotor or brake drum to wheel contact areas.

10. Using a wire brush or wire wheel, clean the rotor to the wheel or brake drum to wheel hub contact area.
11. Where possible, use the *CH 41013* kit to clean the contact areas of the wheel to brake rotor or brake drum.

12. Using the *CH 42450-A* kit, clean the surface around the wheel studs.
13. Clean the threads of the wheel studs. If the threads are damaged, replace the wheel stud.
 - For the front wheel stud replacement, refer to [Wheel Stud Replacement](#) .
 - For the rear wheel stud replacement, refer to [Wheel Stud Replacement](#) .
14. After cleaning all the contact areas, use brake clean or denatured alcohol to remove all the penetrating oil, dirt and debris from the wheel nuts, brake rotor or brake drum.

Installation Procedure

Note: Only apply a small amount the lubricant to the pilot hole of the wheel and NOT the wheel bearing flange. DO NOT apply it to the entire pilot hole of the wheel.

1. Apply a small amount of lubricant to the inner diameter of the wheel hub pilot hole (1) where it contacts the with the wheel bearing/hub flange. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#)
2. Install the tyre and wheel assembly.
3. Hand start the wheel nuts.

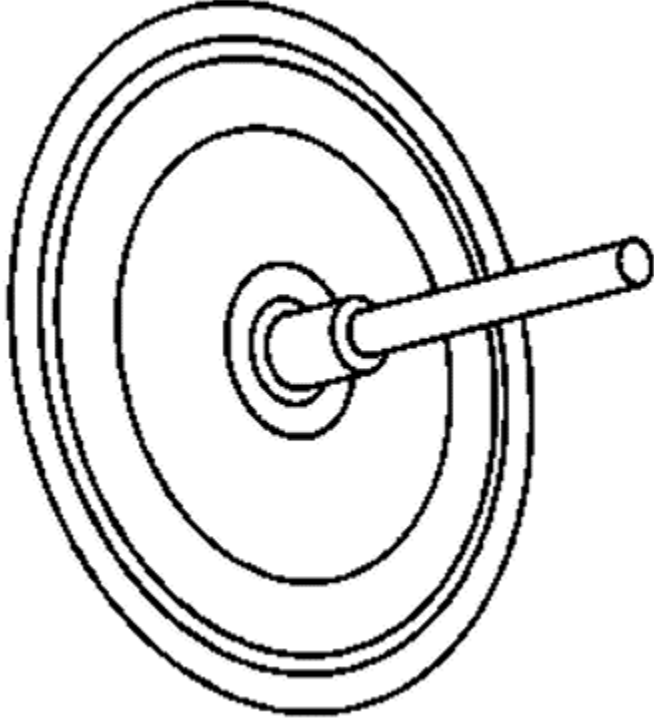

Caution: Improperly tightened wheel bolts or nuts can lead to brake pulsation and rotor damage. In order to avoid expensive brake repairs, evenly tighten the wheel bolts or nuts to the proper torque specification.

4. Using the proper size socket and the torque wrench, tighten the wheel nuts in the proper sequence. Refer to [Fastener Tightening Specifications](#)
5. Install the wheel centre cap, if required.
6. Install the wheel cap nuts, if required.
7. Remove the support and lower the vehicle.

Wheel Alignment Measurement

Steering and vibration complaints are not always the result of improper alignment. One possible cause is wheel and tyre imbalance. Another possibility is tyre lead due to worn or improperly manufactured tyres. Lead/pull is defined as follows: At a constant motorway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path. Lead is the vehicle deviation from a straight path on a level road without pressure on the steering wheel.

Before performing any adjustment affecting wheel alignment, perform the following inspections in order to ensure correct alignment readings:

- Inspect for visible damage to the suspension components and replace as necessary.
- Inspect the tyres for the proper inflation and irregular tyre wear. Refer to [Vehicle Certification, Tyre Placard, Anti-Theft, and Service Parts ID Label](#) .
- Inspect the runout of the wheels and the tyres. Refer to [Tire and Wheel Runout Specifications](#) .
- Inspect the wheel bearings for backlash and excessive play.
- Inspect the ball joints for looseness or wear.
- Inspect the track rod ends for looseness or wear.
- Inspect the control arms and stabiliser shaft for looseness or wear.
- Inspect the steering gear for looseness at the frame. Refer to [Fastener Tightening Specifications](#) .
- Inspect the struts/shock absorbers for wear, leaks, and any noticeable noises.
- Inspect the vehicle trim height. Refer to [Trim Height Inspection](#) .
- Inspect the steering wheel for excessive drag or poor return due to stiff or rusted linkage or suspension components.
- Inspect the fuel level. The fuel tank should be full or the vehicle should have a compensating load added.

Give consideration to excess loads, such as tool boxes, sample cases, etc. If normally carried in the vehicle, these items should remain in the vehicle during alignment adjustments. Give consideration also to the condition of the equipment being used for the alignment. Follow the equipment manufacturer's instructions.

Satisfactory vehicle operation may occur over a wide range of alignment settings. However, if the setting exceeds the service allowable specifications, correct the alignment to the service preferred specifications. Refer to [Wheel Alignment Specifications](#) .

Perform the following steps in order to measure the front and rear alignment angles:

1. Install the alignment equipment according to the manufacturer's instructions.
2. Jounce the front and the rear bumpers 3 times prior to checking the wheel alignment.
3. Measure the alignment angles and record the readings.

Note:

- Record the "Before" and "After" alignment measurements.

- When performing adjustments to vehicles requiring a 4-wheel alignment, set the rear toe adjustment first in order to obtain proper front alignment angles.

4. Adjust alignment angles to vehicle specification, if necessary. Refer to [Wheel Alignment Specifications](#) .

Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment

Note: Before performing any adjustments affecting the wheel alignment, refer to [Wheel Alignment Measurement](#).

1. Ensure that the steering wheel is set in a straight ahead position and centred.
2. Loosen the tie rod nut (5).
3. Adjust the toe to specification. Refer to [Wheel Alignment Specifications](#)

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Tighten the tie rod nut (5).

Tighten

Tighten the tie rod nut (5) to 60 N·m (44 lb ft).

Rear Camber Adjustment

The rear camber is not adjustable. If the rear camber angle is not within specifications, inspect for suspension support misalignment or rear suspension damage. Replace any damaged suspension components as necessary.

Rear Toe Adjustment

The rear toe is not adjustable. If the rear toe angle is not within specifications, inspect for suspension support misalignment or rear suspension damage. Replace any damaged suspension components as necessary.

Caster Description

Caster is the tilting of the uppermost point of the steering axis either forward or backward, when viewed from the side of the vehicle. A backward tilt is positive (+) and a forward tilt is negative (-). Caster influences directional control of the steering but does not affect the tyre wear. Caster is affected by the vehicle height, therefore it is important to keep the body at its designed height. Overloading the vehicle or a weak or sagging rear spring will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear of the vehicle is higher than its designated trim height, the front suspension moves to a less positive caster.

With too little positive caster, steering may be touchy at high speed and wheel returnability may be diminished when coming out of a turn. If one wheel has more positive caster than the other, that wheel will pull toward the centre of the vehicle. This condition will cause the vehicle to pull or lead to the side with the least amount of positive caster.

Cross Caster is the difference between the left caster value and the right caster value.

Cross caster = L caster - R caster

DTC P060B: Control Module Analog to Digital Performance

DTC P062F: Control Module Long Term Memory Performance

DTC P16F3: Control Module Redundant Memory Performance

DTC P16F7: Control Module Pressure Control Solenoid Command Incorrect

DTC P16F8: Control Module Clutch Command Incorrect

DTC P179B: Range State Command Circuit

[Circuit/System Description](#)

This is an internal fault detection of the transmission control module (TCM). The transmission control module is part of the control solenoid valve assembly, and is not serviced separately. This fault is handled inside the transmission control module and no external circuits are involved.

[Conditions for Running the DTC](#)

The system voltage is 9.5-18V.

[Conditions for Setting the DTC](#)

The transmission control module has detected an internal malfunction.

[Action Taken When the DTC Sets](#)

- DTCs P0601, P0602, P0603, P0604, P0606, P060B, P062F, P16F3, P16F7, P16F8, and P179B are Type A DTCs.
- The TCM shifts to a default mode and turns OFF.

[Conditions for Clearing the DTC](#)

DTCs P0601, P0602, P0603, P0604, P0606, P060B, P062F, P16F3, P16F7, P16F8, and P179B are Type A DTCs.

[Diagnostic Aids](#)

When attempting to set transmission control module internal DTCs, vehicle ON for at least 1 minute, and then vehicle OFF for 30 seconds. Following this procedure will allow for a complete transmission control module shutdown.

DTC P0634

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0634: Transmission Control Module (TCM) Overtemperature

Circuit/System Description

The transmission control module (TCM) has a built-in temperature sensor to detect possible over-temperature condition of the transmission control module. This temperature sensor is used to protect the TCM from heat damage due to an over temperature condition. The transmission control module is part of the control solenoid valve assembly and is not serviced separately.

Conditions for Running the DTC

- The system voltage is 11-18V.
- The TCM temperature is at least -50°C (-58°F) and no more than 146°C (295°F) for 5 seconds.

Conditions for Setting the DTC

- The TCM temperature is greater than 141°C (286°F) for 2 seconds.
- The system voltage is greater than 18 V and the transmission control module temperature is greater than 50°C (122°F).

Action Taken When the DTC Sets

- DTC P0634 is a Type A DTC.
- The TCM shifts to a default gear and turns OFF.

[Conditions for Clearing the DTC](#)

DTC P0634 is a Type A DTC.

[Diagnostic Aids](#)

Inspect the transmission cooler, transmission fluid lines, engine cooling system, and transmission fluid level, inspect for any obstructions in the cooling system airflow which may cause an overheat condition. Enquire about any towing by the customer or extreme driving conditions. An engine cooling system or transmission cooling system malfunction may cause this diagnostic to set.

DTC P0667, P0668, or P0669

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0667: Transmission Control Module (TCM) Temperature Sensor Performance

DTC P0668: Transmission Control Module (TCM) Temperature Sensor Circuit Low Voltage

DTC P0669: Transmission Control Module (TCM) Temperature Sensor Circuit High Voltage

Circuit/System Description

The transmission control module (TCM) temperature sensor is located inside of the transmission control module. The transmission control module is located within the control solenoid valve assembly and is not serviced separately. The TCM temperature sensor provides the transmission control module temperature. This temperature reading is used in various shifting and diagnostic routines in the transmission control module software.

Conditions for Running the DTC

- The system voltage is 11 to 18 V.
- Engine speed is greater than 450 RPM.
- DTC P0722 or P0723 is not set.

P0667

- DTC P0711, P0712, P077B, or P215C is not set.
- DTC P0667 has not passed this key ON.

- The TCM temperature is at least -39°C (-38°F) and no more than +149°C (+300°F).

P0668

DTC P0668 has not failed this ignition cycle.

P0669

- The transmission OSS parameter is greater than 200 RPM for greater than 200 seconds.
- DTC P0669 has not failed this ignition cycle.

Conditions for Setting the DTC

- The difference between the TCM temperature and Trans. Fluid Temp. is greater than 15-50°C (59-122°F), depending on the highest of the Trans. Fluid Temp., TCM temperature and TCM power-up temperatures.
- The difference between the TCM power-up temperature and TCM substrate temperature is greater than 15-50°C (59-122°F), depending on the highest of the Trans. Fluid Temp., TCM temperature and TCM power-up temperatures.
- The above conditions have to be met for 5 minutes.

P0668

The TCM temperature parameter is less than or equal to -60°C (-76°F) for greater than 60 seconds.

P0669

The TCM temperature parameter is greater than or equal to 160°C (320°F) for greater than 60 seconds.

Action Taken When the DTC Sets

DTCs P0667, P0668 and P0669 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0667, P0668 and P0669 are Type B DTCs.

Diagnostic Aids

This DTC may be set due to an overheating condition. The system is operating normally when the Transmission Fluid Temperature parameter is within 10°C (18°F) of the TCM temperature parameter.

DTC P06AC, P06AD, or P06AE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P06AC: Control Module Power Up Temperature Sensor Performance

DTC P06AD: Control Module Power Up Temperature Sensor Circuit Low Voltage

DTC P06AE: Control Module Power Up Temperature Sensor Circuit High Voltage

Circuit/System Description

The transmission control module (TCM) power-up temperature sensor is located within the transmission control module. The transmission control module is located within the control solenoid valve assembly and is not serviced separately. The transmission control module power-up temperature sensor provides the transmission control module temperature at power-up. This temperature reading is used in various shifting and diagnostic routines in the transmission control module software.

Conditions for Running the DTC

- The engine is running for greater than or equal to 60 seconds.
- Vehicle speed is less than 201 km/h (124 mph).

P06AC

- DTC P0712, P0713, P0721, P0722, P0723, P0658, P0668, P0669, P06AD, P06AE, or P215C is not set.
- The TCM power-up temperature is at least -39°C (-38°F) and no more than +149°C (+300°F).
- The vehicle is not in Park or Neutral.

- No engine torque or accelerator position sensor faults.

P06AD

- DTC P0721, P0722, P0723 or P215C is not set.
- The transmission output shaft speed is greater than 200 RPM for greater than 200 seconds.
- Estimated drive motor power loss is greater than or equal to 0.4 kW for 200 seconds.

P06AE

DTC P06AE has not failed this ignition cycle.

Conditions for Setting the DTC

P06AC - Condition 1

- Vehicle speed is greater than 8 km/h (5 mph) for 300 seconds cumulative.
- The TCM power-up temperature is at least -40°C (-58°F) and no more than +21°C (+70°F).
- The TCM power-up temperature has changed by less than 2°C (3.6°F) in 100 seconds.
- The transmission fluid temperature is greater than 70°C (158°F).
- The transmission fluid temperature has increased by 55°C (99°F) since startup.

P06AC - Condition 2

- Vehicle speed is greater than 8 km/h (5 mph) for 300 seconds cumulative.
- The TCM temperature sensor is between 120-150°C (248-302°F).
- The TCM power-up temperature has changed by less than 2°C (3.6°F) in 100 seconds.
- The transmission fluid temperature is greater than 70°C (158°F).
- The transmission fluid temperature has increased by 55°C (99°F) since startup.

P06AC - Condition 3

The TCM power-up temperature changes by greater than 20°C (36°F) 14 times over 7 seconds.

P06AD

The TCM power-up temperature is less than or equal to -61°C (-77°F) for greater than 10 seconds.

P06AE

The TCM power-up temperature is greater than or equal to 161°C (321°F) for greater than 10 seconds.

Action Taken When the DTC Sets

DTCs P06AC, P06AD and P06AE are Type B DTCs.

Conditions for Clearing the DTC

DTCs P06AC, P06AD and P06AE are Type B DTCs.

Diagnostic Aids

This DTC may be set due to an overheating condition. The system is operating normally when the Transmission Fluid Temperature parameter is within 10°C (18°F) of the TCM Power Up Temperature parameter.

---------------	----	-------------------------	--------------------------

* Internal TFT sensor damage may result if shorted to B+

Circuit/System Description

The primary sources of heat in the transmission are the drive motor generators. The drive motor generators are cooled by the transmission fluid. Hot fluid exits the drive motor generators and flows to the transmission cooler supply line. The supply line connects to the transmission cooler, which is internal to the radiator. The transmission fluid cooler pipe assembly is equipped with an internal thermostat that opens at 80°C (176°F) for optimum transmission operation and fuel economy. The transmission cooler pipe thermostat is part of the transmission fluid cooler pipe assembly, located near the transmission and is not serviced separately. From the cooler, the fluid returns through the transmission fluid cooler pipe assembly and enters the lubrication circuits. After lubricating the internal components, the fluid returns to the oil pan. The transmission fluid temperature sensor is part of the control solenoid valve assembly and is not serviced separately.

Conditions for Running the DTC

- No OSS DTCs P0721, P0722, or P0723, P077B, P215C.
- The ignition is greater than 5 seconds.
- The system voltage is 11-18 V.
- The estimated drive motor power loss is greater than 0.4 kw for 200 seconds.

P0711

The TCM temperature parameter is -49 to +169°C (-56 to +336°F).

P0712

DTC P0712 is not failed this ignition cycle.

P0713

DTC P0713 is not failed this ignition cycle.

Conditions for Setting the DTC

P0711

- The difference between the TCM temperature and Trans. Fluid Temp. is greater than 15-50°C (59-122°F), depending on the highest of the Trans. Fluid Temp., TCM temperature and TCM power-up temperatures.
- The difference between the TCM power-up temperature and TCM substrate temperature is greater than 15-50°C (59-122°F), depending on the highest of the Trans. Fluid Temp., TCM temperature and TCM power-up temperatures.

- The above conditions have to be met for 5 minutes.

P0712

The Transmission Fluid Temperature parameter is less than or equal to -60°C (-76°F) for greater than 60 seconds.

P0713

The Transmission Fluid Temperature parameter is greater than or equal to 160°C (320°F) for greater than 60 seconds.

Action Taken When the DTC Sets

- DTC P0711 is a Type B DTC.
- DTCs P0712 and P0713 are Type A DTCs.

Conditions for Clearing the DTC

- DTC P0711 is a Type B DTC.
- DTCs P0712 and P0713 are Type A DTCs.

Diagnostic Aids

The Transmission Fluid Temperature parameter on the scan tool should rise steadily to a normal operating temperature, and then stabilise. Ask about the customer's driving habits, overloading, etc. Ensure the engine and transmission cooling system is functioning normally.

Special Tools

GE 24731 Tempil Stick

[Circuit/System Verification](#)

Vehicle ON, observe the scan tool Transmission Fluid Temperature and the TCM temperature parameters. The readings should vary less than 30°C (86°F).

If within the specified range, test for a transmission overheat condition. Refer to [Automatic Transmission Overheating](#) .

If greater than the specified range, replace the Q8 control solenoid valve assembly.

[Component Testing](#)

- Perform the [Fluid Leak Diagnosis](#) .
- Perform the [Transmission Fluid Level and Condition Check](#) procedure.
- Perform the [Line Pressure Check](#) procedure.
- Perform the [Main Fluid Pump Pressure High or Low](#) procedure.
- With a hand held infra red thermometer, or *GE 24731* tempil stick test for the transmission cooler supply line thermostat for opening at 80°C (176°F). The transmission cooler supply line temperature should be higher on the transmission side of the thermostat than the cooler side until 80°C (176°F) is reached.
If the test indicates that the thermostat is stuck open or closed, replace the transmission cooler supply pipe assembly.

DTC Descriptors

DTC P0721: Output Speed Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
OSS Supply Voltage	P215C	P215C	P215C	P0721, P077B
Low Reference	P215C	P215C	P215C	P0721, P077B

Typical Scan Tool Data

Output Shaft Direction

Circuit	Normal Range	Open/High Resistance	Short to Voltage	Short to Ground
Operating Conditions: Vehicle moving, normal operating temperature				
OSS Signal	Forward/Reverse	Invalid/Unknown	Invalid/Unknown	Invalid/Unknown
OSS Supply Voltage	OK	Out of Range	Out of Range	Out of Range

Circuit/System Description

The A/Trans Output Speed Sensor Assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor is internal to the transmission and mounts to the A/Trans case assembly and is connected to the transmission control module (TCM) through the control solenoid valve assembly and

transmission internal harness. The A/Trans Output Speed Sensor Assembly faces the park gear machined teeth surface. The sensor receives 8.3-9.3 volts on the OSS supply voltage circuit from the TCM. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the transmission control module for speed and direction and is transmitted through the serial data circuits to the engine control module (ECM) and the hybrid powertrain control module. The ECM, hybrid powertrain control module, and transmission control module compare the output speed sensor signal with the antilock brake system (ABS) wheel speed sensor signal. The TCM is part of the control solenoid valve assembly and is not serviced separately. The hybrid powertrain control module is part of the drive motor generator power inverter module and is not serviced separately.

[Conditions for Running the DTC](#)

The vehicle is ON.

[Conditions for Setting the DTC](#)

The transmission control module detects an invalid Automatic Transmission Output Shaft Speed Sensor direction.

[Action Taken When the DTC Sets](#)

The hybrid powertrain control module 1 calculates vehicle direction based on the drive motor direction. The vehicle speed is calculated by the antilock brake system (ABS) wheel speed sensors.

[Conditions for Clearing the DTC](#)

DTC P0721 is a Type A DTC.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0751: Shift Solenoid (SS) 1 Valve Performance - Stuck Off

Circuit/System Description

The shift solenoid 1 and transmission control module are part of the control solenoid valve assembly and are not serviced separately. The transmission control module supplies 12 V to shift solenoid 1 on the high side driver 1 circuit. The transmission control module controls the normally closed shift solenoid 1 on the shift solenoid 1 control circuit. The shift solenoid 1 controls the transmission fluid to the shift solenoid valve (523).

Conditions for Running the DTC

- Any transmission shift or engine On command.
- Line pressure command is greater than 325 kPa.

Conditions for Setting the DTC

The transmission control module detects shift solenoid valve 1 is OFF when commanded ON.

Action Taken When the DTC Sets

- P0751 is a Type A DTC.
- The driver information centre may display ENGINE NOT AVAILABLE SERVICE SOON.
- The internal combustion engine may not start.

Conditions for Clearing the DTC

P0751 is a Type A DTC.

DTC Descriptor

DTC P0757: Shift Solenoid (SS) 2 Valve Performance - Stuck On

Circuit/System Description

The shift solenoid valve 2 and transmission control module are part of the control solenoid valve assembly and are not serviced separately. The shift solenoid valve 2 is a normally closed solenoid valve and controls fluid to the hybrid low, 1-2 clutch boost valve assembly and related clutches. During this diagnostic test, intrusive actions are taken by the transmission control module to test the shift solenoid valve 2 to see if the valve is stuck ON when in dual motor or dual motor and ICE modes. If the correct gear ratio is not achieved in a predetermined period of time, the transmission control module commands second gear and if second gear ratio is attained this indicates a stuck ON shift solenoid valve 2 and the DTC will set.

Conditions for Running the DTC

- Shift from two motor to any other state.
- Line pressure is greater than 325 kPa.

Conditions for Setting the DTC

Transmission pressure switch 1 is high when shift solenoid valve 2 is commanded Off.

Action Taken When the DTC Sets

P0757 is a Type A DTC.

Conditions for Clearing the DTC

P0757 is a Type A DTC.

4. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) .
5. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) .
If the shift solenoid 2 is found to be leaking or stuck ON, replace the Q8 control solenoid valve assembly.
If the Q8 control solenoid valve assembly tests normal, inspect the valve body and hydraulic circuits for a leak or a stuck valve. Refer to [Control Valve Body Diagnostic Inspection](#)
6. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Control Valve Body Replacement](#) for control valve body replacement.
- [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming, and setup.

DTC P0776 or P0777

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0776: Pressure Control Solenoid 2 - Stuck OFF

DTC P0777: Pressure Control Solenoid 2 - Stuck ON

Circuit/System Description

The clutch pressure control solenoid 2 is part of the control solenoid valve assembly and is not serviced separately. The clutch pressure control solenoid 2 controls transmission fluid pressure to the variable hi and 2-3-4 clutch regulator valve. The transmission control module monitors the transmission fluid pressure switch 3 state, in order to determine function of the clutch pressure control solenoid 2 and the variable hi and 2-3-4 clutch regulator valve. When the clutch pressure control solenoid 2 is commanded ON, the transmission fluid pressure switch 3 state should be High. When the clutch pressure control solenoid 2 is commanded Off, the transmission fluid pressure switch 3 parameter state should be Low.

Conditions for Running the DTC

P0776 or P0777

- Shift solenoid valve 1 is not in a transition state.
- The transmission line pressure is greater than 325 kPa (47 psi).

P0776

The clutch pressure control solenoid 2 commanded pressure is greater than 1800 kPa (261 psi) for up to 5 seconds depending on transmission temperature.

P0777

The clutch pressure control solenoid 2 commanded pressure is less than 5 kPa (1 psi) for up to 5 seconds depending on transmission temperature.

Conditions for Setting the DTC

P0776 - Condition 1

The clutch pressure control solenoid 2 commanded pressure is 1800 kPa (261 psi) and the transmission fluid pressure switch 3 state is Low for 30 seconds.

P0776 - Condition 2

The clutch pressure control solenoid 2 commanded pressure is 1800 kPa (261 psi) and the transmission fluid pressure switch 3 state is Low for 2 seconds greater than 5 times during a key cycle.

P0777 - Condition 1

The clutch pressure control solenoid 2 commanded pressure is 5 kPa (1 psi) and the transmission fluid pressure switch 3 state is High for 36 seconds.

P0777 - Condition 2

The clutch pressure control solenoid 2 commanded pressure is 5 kPa (1 psi) and the transmission fluid pressure switch 3 state is High for 2 seconds greater than 5 times during a key cycle.

Action Taken When the DTC Sets

- DTC P0776 is a type B and DTC P0777 is a Type A DTC.
- The transmission control module commands maximum line pressure.
- The transmission control module freezes transmission adaptive functions.

Conditions for Clearing the DTC

DTC P0776 is a type B and DTC P0777 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. With a scan tool, monitor the pressure control solenoid valve 2 pressure command and the transmission fluid pressure switch 3 state parameters. Drive the vehicle to obtain two motor EV. The most likely cause of this DTC is an intermittent transmission pressure switch 3 -- verify transmission fluid pressure -- fault. Perform this operation 2 times. When the pressure

control solenoid valve 2 pressure command is Yes, the transmission fluid pressure switch 3 state should be high. When the pressure control solenoid valve 2 pressure command is No, the transmission fluid pressure switch 3 state should be Low. The most likely cause of this DTC is an intermittent transmission pressure switch problem.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P077B: Output Speed Sensor Direction Incorrect

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
OSS Supply Voltage	P215B	P0721, P215B	P0721, P215B	P077B, P0721, P215C
OSS Signal	P215B	P0721, P215B	P0721, P215B	P077B, P0721, P215C

[Typical Scan Tool Data](#)

[Output Shaft Direction](#)

Circuit	Normal Range	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature			
OSS Signal	Forward/Reverse	Out of Range	Out of Range
OSS Supply Voltage	OK	Out of Range	Out of Range

[Circuit/System Description](#)

The transmission output shaft speed sensor has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The transmission output shaft speed sensor mounts to the A/Trans case assembly and is connected to the control solenoid valve assembly through a wire harness and connector. The sensor faces the front

differential drive pinion, w/transfer gear, gear assembly machined teeth surface. The sensor receives 8.3-9.3 volts on the OSS supply voltage circuit from the transmission control module (TCM). As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the transmission output shaft speed sensor are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the TCM for speed and direction and is transmitted through the GMLAN circuits to the engine control module (ECM) and the hybrid powertrain control module. The ECM, hybrid powertrain control module, and TCM compare the OSS signal with hybrid motor speed/direction and the ABS wheel speed sensor signal.

Conditions for Running the DTC

- The OSS speed parameter is less than 50 RPM.
- The drive motor estimated output speed is greater than 50 RPM.

Conditions for Setting the DTC

The hybrid powertrain control module or the transmission control module detects an incorrect OSS direction.

Action Taken When the DTC Sets

Hybrid Powertrain Control Module

The hybrid powertrain control module calculates OSS direction based on drive motor 1 and drive motor 2 direction.

Transmission Control Module

The hybrid powertrain control module 1 and ECM use the ABS wheel speed to calculate vehicle speed.

Conditions for Clearing the DTC

Hybrid Powertrain Control Module

P077B is a Type A DTC.

Transmission Control Module

P077B is a Type A DTC.

[Diagnostic Aids](#)

Inspect the output speed sensor, harness, connector and control solenoid valve assembly pins for metallic debris and output shaft machined face for damage or misalignment. Proper torque of the output speed sensor mounting bolt is critical to proper output speed sensor operation. Use a terminal test kit for any test that requires probing the control solenoid valve assembly harness connector or a component harness connector.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0796: Pressure Control Solenoid 3 - Stuck Off

DTC P0797: Pressure Control Solenoid 3 - Stuck On

Circuit/System Description

The clutch pressure control solenoid 3 is part of the control solenoid valve assembly and is not serviced separately. The transmission control module (TCM) supplies 12 volts to the clutch pressure control solenoid 3 on the high side driver 1 circuit. The TCM controls the pressure control solenoid 3 through the clutch pressure control solenoid 3 control circuit. The normally high clutch pressure control solenoid 3 controls fluid to the following components:

- Variable low 1-2 reverse clutch
- Drive motor 2 cooling

Conditions for Running the DTC

P0796 or P0797

- Shift solenoid valve 1 is not in a transition state.
- The transmission line pressure is greater than 325 kPa (47 psi).

P0796

The clutch pressure control solenoid 3 commanded pressure is greater than 1800 kPa (261 psi) for up to 5 seconds depending on transmission temperature.

P0797

The clutch pressure control solenoid 3 commanded pressure is less than 5 kPa (1 psi) for up to 5 seconds depending on transmission temperature.

Conditions for Setting the DTC

P0796 - Condition 1

The clutch pressure control solenoid 3 commanded pressure is 1800 kPa (261 psi) and the transmission fluid pressure switch state is Low for 30 seconds.

P0796 - Condition 2

The clutch pressure control solenoid 3 commanded pressure is 1800 kPa (261 psi) and the transmission fluid pressure switch 5 state is Low for seconds greater than 5 times during a key cycle.

P0797 - Condition 1

The clutch pressure control solenoid 3 commanded pressure is 5 kPa (1 psi) and the transmission fluid pressure switch 5 state is High for 30 seconds.

P0797 - Condition 2

The clutch pressure control solenoid 3 commanded pressure is 5 kPa (1 psi) and the transmission fluid pressure switch 5 state is High for 2 seconds greater than 5 times during a key cycle.

Action Taken When the DTC Sets

- DTC P0796 is a Type B and DTC P0797 is a Type A DTC.
- The TCM commands 450 kPa (65 psi) line pressure.
- The TCM freezes transmission adaptive functions.

Conditions for Clearing the DTC

DTC P0796 is a Type B and DTC P0797 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions.

2. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Control Valve Body Diagnostic Inspection](#) .
- [Control Valve Body Replacement](#) for control valve body replacement.
- [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming, and setup.

DTC P079A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P079A: Transmission Clutch 1 Slip Detected

[Typical Scan Tool Data](#)

[Variable Low and 1-2 Reverse Clutch Reference](#)

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0-161 km/h (0-100 mph)			
Parameter Normal Range: 0-6,000 RPM			
Clutch 1 Slip Speed	0 RPM	0-6,000 RPM	0-6,000 RPM
Clutch 1 Status	Applied	Released	Applied

[Circuit/System Description](#)

The transmission control module (TCM) monitors the Clutch 1 Slip Speed for each Hybrid Transmission Mode Commanded state. The transmission control module monitors clutch slip when the variable Low and 1-2 reverse clutch is applied. The transmission control module is part of the control solenoid valve assembly and is not serviced separately.

[Conditions for Running the DTC](#)

- The clutch pressure control solenoid valve 3 commanded pressure is 1800 kPa (261 psi) for 3 seconds.

- The variable low and 1-2 reverse clutch torque estimated is greater than 200 N·m (148 lb ft).
- The variable low and 1-2 reverse clutch fill detected.
- The commanded mode is:
 - Reverse
 - Dual Electric Motors
 - Dual Electric Motors and ICE

Conditions for Setting the DTC

- The transmission control module detects Hybrid low, 1-2 clutch slip greater than 200 RPM for 3 seconds.
- C1 slip greater than 200 RPM for greater than 1 second 3 times during one key cycle. Retries are 30 seconds apart.
- Motor 1 or 2 are approaching over-speed limits due to clutch slip, the fault will set instantly.

Action Taken When the DTC Sets

- P079A is a Type A DTC.
- The transmission control module inhibits:
 - Dual Electric Motors
 - Dual Electric Motors and ICE

Conditions for Clearing the DTC

P079A is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

- [Electronic Component Description](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

[Circuit/System Verification](#)

1. Verify that DTCs P0721, P0796, P0966, P0967, P0969, P0970, P0971, P0973, P0974, P0976, P0977, P215C, P2720, P2721, P2728, P2729, or P2730 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level and condition.
3. Perform the [Line Pressure Check](#) to verify correct oil pressure.
4. Operate the vehicle in Duel Electric Motors and Duel Electric Motors and ICE mode. The Clutch 1 Slip Speed parameter reading should be less than 200 RPM when the Clutch 1 Status parameter reading is Applied.

[Component Testing](#)

1. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) to verify control solenoid valve assembly condition.
2. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) to verify control solenoid valve assembly function.
If a malfunction is found, replace the Q8 control solenoid valve assembly.
3. Inspect the a/trans fluid level control valve for stuck closed or damaged condition.
If you found cause for concern in the a/trans fluid level control valve, replace the a/trans fluid level control valve.
4. Inspect the valve body components and hydraulic circuits listed below for a leak or a stuck valve:
 - Control valve body spacer (w/gasket) plate assembly
 - 1-3 reverse clutch and drive motor/generator stator cooling regulator valveIf you found cause for concern in the valve body, repair or replace the valve or valve body.
5. Inspect the 1-3 reverse clutch assembly snap ring, piston, clutch discs, and housing for a slipping or damaged condition.
If you found cause for concern in the 1-3 reverse clutch assembly, repair or replace the 1-3 reverse assembly as necessary.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Control Valve Body Assembly Disassemble](#) for Valve Body inspection procedures.
 - [Control Valve Body Replacement](#) for control valve body replacement.
 - [Variable Low and 1-2 Reverse Clutch Piston Removal](#) and [Variable Low and 1-2 Reverse Clutch Piston Installation](#) for 1-3-Reverse Clutch Assembly replacement.
 - [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming, and setup.
-

DTC P079B

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P079B: Transmission Clutch 2 Slip Detected

[Typical Scan Tool Data](#)

[Variable Hi and 2-3-4 Clutch Reference](#)

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0-80 km/h (0-50 mph)			
Parameter Normal Range: 0-6,000 RPM			
Clutch 2 Slip Speed	0 RPM	0-6,000 RPM	0-6,000 RPM
Clutch 2 Status	Applied	Released	Applied

[Circuit/System Description](#)

The transmission control module (TCM) monitors Clutch 2 Slip Speed for each Hybrid Transmission Mode Commanded state. The transmission control module monitors clutch slip when the variable high, 2-3-4 clutch is commanded ON.

[Conditions for Running the DTC](#)

- Variable hi and 2-3-4 clutch is applied.
- The clutch pressure control solenoid valve 2 commanded pressure is 1800 kPa (261 psi) for 3 seconds.

[Conditions for Setting the DTC](#)

- The TCM detects the variable hi and 2-3-4 clutch slip is greater than 200 RPM for greater than 1 second 3 times within the same key cycle. The TCM retries at 30 seconds apart.
- Motor 1 or 2 are approaching over-speed limits due to clutch slip, the fault will set instantly.

[Action Taken When the DTC Sets](#)

- P079B is a Type A DTC.
- The TCM inhibits Single Electric Motor and Dual Electric Motors and ICE mode.

[Conditions for Clearing the DTC](#)

P079B is a Type A DTC.

[Diagnostic Aids](#)

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

Circuit/System Verification

1. Verify that DTCs P0721, P0723, P0776, P0777, P0966, P0967, P0969, P0970, P0971, P0973, P0974, P0976, P0977, P215C, P2720, P2721, P2728, P2729, or P2730 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level and condition.
3. Perform the [Line Pressure Check](#) to verify correct oil pressure.
4. Operate the vehicle in Dual Motors mode. The Clutch 2 Slip Speed parameter reading should be less than 200 RPM when the Clutch 2 Status parameter reading is Applied.

Component Testing

1. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) to verify Q8 control solenoid valve assembly condition.
2. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) to verify Q8 control solenoid valve assembly function.
If a malfunction is found, replace the Q8 control solenoid valve assembly.
3. Inspect the a/trans fluid level control valve for stuck closed or damaged condition.
If you found cause for concern in the a/trans fluid level control valve, replace the a/trans fluid level control valve.
4. Inspect the variable hi and 2-3-4 clutch and drive motor/generator stator cooling regulator boost valve for sticking or damage.
If you found cause for concern in the variable hi and 2-3-4 clutch and drive motor/generator stator cooling regulator boost valve, repair or replace the valve or valve body.
5. Inspect the variable hi and 2-3-4 clutch assembly piston, snap ring, and clutch discs for a damaged condition.
If you found the variable hi, 2-3-4 clutch to be damaged, repair or replace the variable high, 2-3-4 clutch as necessary.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Variable High and 2-3-4 Clutch Hub and Clutch Removal](#) and [Variable High and 2-3-4 Clutch and Hub Installation](#) for variable High, 2-3-4 Clutch replacement
- [Control Valve Body Replacement](#) for control valve body replacement.

DTC P079C

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P079C: Transmission Clutch 3 Slip Detected

[Typical Scan Tool Data](#)

[1-3 Reverse Clutch Reference](#)

Parameter	Commanded ON	Commanded OFF	Slipping when Commanded ON
Operating Conditions: Vehicle speed 0-161 km/h (0-100 mph)			
Parameter Normal Range: 0-6,000 RPM			
Clutch 3 Slip Speed	0 RPM	0-6,300 RPM	0-6,300 RPM
Clutch 3 Status	Applied	Released	Applied

[Circuit/System Description](#)

The transmission control module (TCM) monitors the Clutch Slip 3 Speed for each Hybrid Transmission Mode Commanded state. The TCM is part of the control solenoid valve assembly and is not serviced separately.

[Conditions for Running the DTC](#)

- The clutch pressure control solenoid 3 commanded pressure is 1800 kPa (261 psi) for 1 second.
- Clutch fill is detected.

- Clutch torque commanded is greater than 50 N·m (37 lb ft).

Conditions for Setting the DTC

- The TCM detects the clutch 3 Slip Speed is greater than 300 RPM for greater than 1 second. The TCM retries 3 times at 30 second intervals.
- Motor 1 or 2 are approaching over-speed limits due to clutch slip, the fault will set instantly.

Action Taken When the DTC Sets

P079C is a Type A DTC.

Conditions for Clearing the DTC

P079C is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

DTC P07A3

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P07A3: Transmission Clutch 1 Stuck On

[Typical Scan Tool Data](#)

[Variable Low and 1-2 Reverse Clutch Reference](#)

Parameter	Commanded ON	Commanded OFF	Stuck/Welded When Commanded OFF
Operating Conditions: Vehicle speed 0-50 MPH (80 km/h)			
Parameter Normal Range: 0-6,000 RPM			
Clutch 1 Slip Speed	0 RPM	0-9,500 RPM	0 RPM
Clutch 1 Status	Applied	Released	Released

[Circuit/System Description](#)

The hybrid/electric vehicle (EV) powertrain control module 1 monitors the variable low and 1-2 reverse clutch slip speed for each Hybrid/EV Transmission Mode Command state. Low clutch slip speed when the clutch is commanded Off indicates a stuck or welded clutch condition. If the hybrid/EV powertrain control module 1 detects a stuck clutch condition, the hybrid/EV powertrain control module 1 will cycle the clutch 3 times within 30 seconds. The customer may feel 3 bumps before the DTC sets.

[Conditions for Running the DTC](#)

Variable low and 1-2 reverse clutch (C1) is commanded OFF.

[Conditions for Setting the DTC](#)

Clutch slip is less than 30 RPM 3 times within 30 seconds.

[Action Taken When the DTC Sets](#)

- P07A3 is a Type A DTC.
- Inhibits dual motor operation.

[Conditions for Clearing the DTC](#)

P07A3 is a Type A DTC.

[Diagnostic Aids](#)

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

[Control Module References](#) for scan tool information.

Circuit/System Verification

1. Verify that P0721, P0797, P0966, P0967, P0969, P0970, P0971, P0973, P0974, P0976, P0977, P1B03, P1B04, P215C, P2720, P2721, P2728, P2729, or P2730 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level and condition.
If the transmission fluid is low or discoloured, refer to [Transmission Fluid Replacement](#) .
3. Operate the vehicle in Dual Electric Motors and ICE mode while monitoring the Clutch 1 Slip Speed parameter. The Clutch 1 Slip Speed parameter should display greater than 30 RPM when the Clutch 1 Status parameter displays Released.
If the DTC P07A3 resets, go to Component Testing.

Component Testing

1. Perform the [Line Pressure Check](#) .
2. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) .
If a malfunction is found, replace the Q8 control solenoid valve assembly.
3. Inspect the valve body assembly for sticking or damaged valves. Refer [Control Valve Body Diagnostic Inspection](#) .
If you found a stuck or damaged valve, repair or replace the valve or valve body.
4. Inspect the variable low and 1-2 reverse clutch for a stuck On or damaged condition.
If you found cause for concern in the variable low and 1-2 reverse clutch, repair or replace the variable low and 1-2 reverse clutch assembly as necessary.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Variable Low and 1-2 Reverse Clutch Piston Removal](#) and [Variable Low and 1-2 Reverse Clutch Piston Installation](#) for variable low and 1-2 reverse clutch repair or replacement.
- [Control Valve Body Replacement](#) for control valve body replacement.
- Perform the valve body inspection procedure, refer to [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) . If the inspection procedure indicates to replace the valve body, refer to [Control Valve Body Replacement](#) .
- [Transmission Replacement](#) for transmission removal.
- [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming and setup.

DTC P07A5

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P07A5: Transmission Clutch 2 Stuck On

[Typical Scan Tool Data](#)

[Variable High and 2-3-4 Clutch Reference](#)

Parameter	Commanded ON	Commanded OFF	Stuck/Welded When Commanded OFF
Operating Conditions: Vehicle speed 0-50 MPH (80 km/h)			
Parameter Normal Range: 0-6,000 RPM			
Clutch 2 Slip Speed	0 RPM	0-6,000 RPM	0 RPM
Clutch 2 Status	Applied	Released	Released

[Circuit/System Description](#)

The hybrid/electric vehicle (EV) powertrain control module monitors the Clutch Slip parameters for each Hybrid/EV Transmission Mode Command state. Low clutch slip speed when the clutch is commanded Off indicates a stuck or welded clutch condition. If the hybrid/EV powertrain control module 1 detects a stuck clutch condition, the hybrid/EV powertrain control module 1 will cycle the clutch 3 times within 30 seconds. The customer may feel 3 bumps before the DTC sets.

[Conditions for Running the DTC](#)

Variable high and 2-3-4 clutch is commanded Off.

Conditions for Setting the DTC

- Clutch slip is less than 30 RPM 2 times within 20 seconds,
or
- Engine speed is greater than 360 RPM and actual Variable high and 2-3-4 clutch slip speed is below 100 RPM 2 times within 20 seconds.

Action Taken When the DTC Sets

P07A5 is a Type A DTC.

Conditions for Clearing the DTC

P07A5 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

[Circuit/System Verification](#)

1. Verify that P0721, P0776, P0777, P0966, P0967, P0969, P0970, P0971, P0973, P0974, P0976, P0977, P0AB9, P1B03, P1B04, P215C, P2720, P2721, P2728, P2729, or P2730 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level and condition.
If the transmission fluid is low or discoloured, refer to [Transmission Fluid Replacement](#) .
3. Operate the vehicle in Single Electric Motor or Single Electric Motor and ICE mode while observing the Clutch 2 Slip Speed parameter. The Clutch 2 Slip Speed parameter should display greater than 30 RPM when the Clutch 2 Status parameter displays Released.
If the DTC P07A5 is set, go to Component Testing.

[Component Testing](#)

1. Perform the [Line Pressure Check](#) .
If you found cause for concern, take corrective action.
2. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) .
If a malfunction is found, replace the Q8 control solenoid valve assembly.
3. Inspect the valve body assembly for sticking or damaged valves. Refer [Control Valve Body Diagnostic Inspection](#) .
If you found cause for concern, repair or replace the valve or valve body.
4. Inspect the variable high and 2-3-4 clutch for a stuck On or damaged condition.
If you found cause for concern in the variable high and 2-3-4 clutch, repair or replace the variable high and 2-3-4 clutch assembly as necessary.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Variable High and 2-3-4 Clutch Hub and Clutch Removal](#) and [Variable High and 2-3-4 Clutch and Hub Installation](#) for variable high and 2-3-4 clutch replacement or overhaul.
- [Control Valve Body Replacement](#) for control valve body replacement.

- [Transmission Replacement](#) for transmission removal.
- [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming, and setup.

DTC P07A7

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P07A7: Transmission Clutch 3 Stuck On

[Typical Scan Tool Data](#)

[1-3 Reverse Clutch Reference](#)

Parameter	Commanded ON	Commanded OFF	Stuck/Welded When Commanded OFF
Operating Conditions: Vehicle speed 0-50 MPH (80 km/h)			
Parameter Normal Range: 0-6,000 RPM			
Clutch 3 Slip Speed	0 RPM	0-6,000 RPM	0 RPM
Clutch 3 Status	Applied	Released	Released

[Circuit/System Description](#)

The hybrid/electric vehicle (EV) powertrain control module 1 monitors the clutch slip speed for each Hybrid/EV Transmission Mode Command. When the 1-3 Reverse Clutch is commanded OFF, low clutch slip speed indicates a stuck or welded clutch condition. If the hybrid/EV powertrain control module 1 detects a stuck clutch condition, the hybrid/EV powertrain control module 1 will cycle the clutch 3 times within 30 seconds. The customer may feel 3 bumps before the DTC sets.

[Conditions for Running the DTC](#)

- 1-3 Reverse Clutch is commanded Off.

- The Calculated Trans Input Speed is greater than 360 RPM.

Conditions for Setting the DTC

The 1-3 Reverse Clutch is commanded OFF for 3 seconds and the hybrid/EV powertrain control module 1 detects the clutch 3 slip speed is less than 100 RPM for 3 seconds, when commanded OFF.

Action Taken When the DTC Sets

DTC P07A7 is a Type A DTC.

Conditions for Clearing the DTC

DTC P07A7 is a Type A DTC.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions. Ensure the transmission fluid level is correct and there are no leaks. If there are any other transmission DTCs set, diagnose those first.

DTC P0961-P0963

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0961: Line Pressure Control Solenoid System Performance

DTC P0962: Line Pressure Control Solenoid Control Circuit Low Voltage

DTC P0963: Line Pressure Control Solenoid Control Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Line Pressure Control Solenoid Low Side Driver	P0962	P0963	P0963	P0961

[Circuit/System Description](#)

The line pressure control solenoid regulates the transmission fluid line pressure. The transmission control module varies the current to the normally high line pressure control solenoid valve from 0.1 amp for maximum line pressure, to 1.1 amps for minimum line pressure. This is accomplished by varying the current in order to obtain the desired line pressure in kPa (psi). The line pressure control solenoid is part of the control solenoid valve assembly and is not serviced separately.

[Conditions for Running the DTC](#)

- The propulsion system is active.
- The system voltage is 11-18 volts.

Conditions for Setting the DTC

P0961

The transmission control module detects an internal electrical performance malfunction of the line pressure control solenoid control circuit for 5 seconds.

P0962

The transmission control module detects an internal low voltage electrical malfunction of the line pressure control solenoid control circuit for 300 milliseconds.

P0963

The transmission control module detects an internal high voltage electrical malfunction of the line pressure control solenoid control circuit for 300 milliseconds.

Action Taken When the DTC Sets

- DTC P0961 is a Type B DTC.
- DTCs P0962 and P0963 are Type A DTCs.

DTC P0962

The transmission control module commands maximum line pressure.

Conditions for Clearing the DTC

- DTC P0961 is a Type B DTC.
- DTCs P0962 and P0963 are Type A DTCs.

[DTC Descriptor](#)

DTC P0965: Pressure Control Solenoid 2 System Performance

DTC P0966: Pressure Control Solenoid 2 Control Circuit Low Voltage

DTC P0967: Pressure Control Solenoid 2 Control Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Clutch Pressure Control Solenoid 2 Control	P0966	P0967	P0967	P0965

[Circuit/System Description](#)

The transmission control module supplies 12 volts to the clutch pressure control solenoid 2 on the high side driver 2 circuit. The transmission control module controls the pressure control solenoid 2 through the clutch pressure control solenoid 2 control circuit. The normally high clutch pressure control solenoid 2 directs fluid flow to the variable high and 2-3-4 clutch assembly and drive motor 2 when commanded ON. The clutch pressure control solenoid 2 is part of the control solenoid valve assembly and is not serviced separately.

[Conditions for Running the DTC](#)

The system voltage is 11-16 V.

Conditions for Setting the DTC

P0965

The transmission control module detects an internal electrical performance malfunction of the clutch pressure control solenoid control circuit for 5 seconds.

P0966

The transmission control module detects an internal low voltage electrical malfunction of the clutch pressure control solenoid control circuit for 1 second.

P0967

The transmission control module detects an internal high voltage electrical malfunction of the clutch pressure control solenoid control circuit for 1 second.

Action Taken When the DTC Sets

- DTC P0965 is a Type B DTC.
- DTCs P0966 and P0967 are Type A DTCs.

Conditions for Clearing the DTC

- DTC P0965 is a Type B DTC.
- DTCs P0966 and P0967 are Type A DTCs.

DTC P1762

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1762: Transmission Mode Switch Signal Message Counter Incorrect

Circuit/System Description

The ECM monitors the state of the drive mode switch signal message from the body control module (BCM), over the serial data circuits. The ECM uses this message to determine the following driver selected mode of operation:

- Normal
- Sport
- Mountain

Conditions for Running the DTC

The propulsion system is active.

Conditions for Setting the DTC

The ECM has detected a drive mode signal rolling count error for 0.8 seconds.

Action Taken When the DTC Sets

DTC P1762 is a Type C DTC.

Conditions for Clearing the DTC

DTC P1762 is a Type C DTC.

Diagnostic Aids

When attempting to set ECM serial data DTCs, run the vehicle in propulsion system active mode for at least 1 minute, and then shut the vehicle off for 30 seconds. Following this procedure will allow for a complete ECM shutdown.

Reverse (R)	LOW	LOW	HI	HI
Neutral (N)	HI	LOW	HI	LOW
Drive (D)	HI	LOW	LOW	HI
Low (L)	HI	HI	LOW	LOW

[Circuit/System Description](#)

The automatic transmission manual shift shaft position switch assembly, also called the internal mode switch assembly, is a dual sliding hall-effect switch attached to the control valve body within the transmission. The 9 outputs from the switch indicate which position is selected by the transmission manual shaft. Four outputs (A, B, C, P) are range selection inputs to the transmission control module (TCM). Five outputs (R1, R2, D1, D2, S) are direction selection inputs to the hybrid powertrain control module. The input voltage at the modules is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as Internal Mode Switch A/B/C/P and Internal Mode Switch Status D1/D2/R1/R2/S. The Internal Mode Switch Range input parameters represented are transmission range signal A, signal B, signal C, and signal P. The Internal Mode Switch Direction input parameters represented as Internal Mode Switch Status signal R1, signal R2, signal D1, signal D2, and signal Start.

Conditions for Running the DTC

- No Output Shaft Speed DTCs P0722 or P077B.
- The system voltage is 11-18 V.

P182E

- Vehicle ON greater than 5 seconds.
- The system voltage is 11-18 V.

Conditions for Setting the DTC

Any one or more of the following conditions:

- The IMS signal circuit A, B, or P are Low in Park for greater than 8 seconds.
- The IMS signal circuit A is Low in D for 8 seconds.
- The IMS signal circuit C is High in D for 8 seconds.
- The TCM detects an invalid range from the IMS for 3.25 seconds.
- The IMS signal circuit C is high in D for greater than 8 seconds.
- Park/Neutral Switch equals P/N and the IMS state is not Park or Neutral, or the Park/Neutral switch is not Park or Neutral and the IMS state equals Park or Neutral for 4 seconds.
- Or the automatic transmission manual shift shaft position switch assembly indicates a transitional state for 8 seconds.

Action Taken When the DTC Sets

The PRNDL position indicator on the instrument cluster will be blank.

Conditions for Clearing the DTC

DTCs P1824, P182A-P182F, P1838, and P1839 are Type B DTCs.

Diagnostic Aids

The automatic transmission manual shift shaft position switch assembly connects electrically to the control solenoid valve assembly. Inspect the automatic transmission manual shift shaft position switch, harness, connector, and control solenoid assembly pins for metallic debris. Use a terminal test kit for any test that requires probing the control solenoid assembly harness connector or a component harness connector. The automatic transmission manual shift shaft position switch assembly can be damaged by currents exceeding 2 mA. Test the automatic transmission manual shift shaft position switch assembly for an open condition whenever a short to voltage condition is observed.

- [Wiring Repairs](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Scan Tool Reference

[Control Module References](#) for scan tool information.

[Circuit/System Verification](#)

1. Vehicle ON, observe the scan tool Internal Mode Switch A/B/C/P parameter while moving the gear shift lever from Park, through all gear selector positions, and back to Park. The parameter should match each gear range that is selected. Refer to [Transmission Internal Mode Switch Logic](#) .
2. Perform the [Range Selector Lever Cable Adjustment](#) procedure to verify correct adjustment.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

[Circuit/System Testing](#)

1. Vehicle OFF, remove the control valve body cover. Refer to [Control Valve Body Cover Removal](#) .
2. Vehicle OFF, disconnect the X2 harness connector at the B15 Transmission Internal Mode Switch.
3. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10.0 Ω between the ground circuit terminal 7 and ground.

- If greater than the specified range, test the ground circuit for an open/high resistance. If the circuit tests normal, replace the Q8 control solenoid assembly.
4. Vehicle ON, Verify the scan tool Internal Mode Switch A/B/C/P parameter displays HI for all four signal circuits.
If not the specified value, test the signal circuits for a short to ground or short together. If the circuits test normal, replace the Q8 control solenoid valve assembly.
 5. Vehicle ON, test for 9.6-12.5V between the voltage circuit terminal 2 and terminal 7.
If not within the specified range, test the voltage circuit for an open/high resistance. If the circuit tests normal, replace the Q8 control solenoid assembly.
 6. Vehicle ON, Install a 3 A fused jumper wire between each signal circuit listed below and the ground circuit terminal 7. Verify the scan tool Internal Mode Switch A/B/C/P parameter is Low:
 - Switch Signal A: terminal 6 to terminal 7
 - Switch Signal B: terminal 5 to terminal 7
 - Switch Signal C: terminal 4 to terminal 7
 - Switch Signal P: terminal 3 to terminal 7If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the Q8 control solenoid assembly.
 7. If all circuits test normal, replace the B15 Transmission Internal Mode Switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Note: Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) for the following components before replacing the components.

- [Manual Shift Shaft Position Switch and Fluid Level Control Valve Removal](#) and [Manual Shift Shaft Position Switch and Fluid Level Control Valve Installation](#) for Manual Shift Shaft Position Switch, also called the Internal Mode Switch, replacement.
- [Automatic Transmission Wiring Harness and Output Speed Sensor Removal](#) and [Automatic Transmission Wiring Harness and Output Speed Sensor Installation](#) for Automatic Transmission Control Wiring Extension Harness Assembly replacement.

[Transmission Output Shaft Speed Sensor](#)

Circuit	Normal Range	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, normal operating temperature			
Signal	0-7,000 RPM	0 RPM	0 RPM
Supply Voltage	-	0 RPM	0 RPM

[OSS Supply Voltage](#)

Circuit	Normal Range	Open/High Resistance	Short to Voltage

Operating Conditions: Key ON, Engine OFF or Engine running, normal operating temperature

Signal	OK	OK	OK
Supply Voltage	OK	Out of Range	Out of Range
8.3-9.3 Volts = OK, Any other voltage = Out of range			

Circuit/System Description

The A/Trans Output Speed Sensor Assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor is internal to the transmission and mounts to the A/Trans case assembly and is connected to the transmission control module (TCM) through the control solenoid valve assembly and transmission internal harness. The A/Trans Output Speed Sensor Assembly faces the park gear machined teeth surface. The sensor receives 8.3-9.3 volts on the OSS supply voltage circuit from the TCM. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the transmission control module for speed and direction and is transmitted through the serial data circuits to the engine control module (ECM) and the hybrid powertrain control module. The ECM, hybrid powertrain control module, and transmission control module compare the output speed sensor signal with the anti lock brake system (ABS) wheel speed sensor signal. The TCM is part of the control solenoid valve assembly and is not serviced separately. The hybrid powertrain control module is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- The vehicle speed is greater than 10 km/h (6 mph).
- The vehicle is not in Park or neutral.

Conditions for Setting the DTC

ECM

The ECM OSS signal and the ABS wheel speed sensor signals differ by greater than 10 km/h (6 mph) for more than 10 seconds.

Hybrid Powertrain Control Module

The ECM OSS signal and the ABS wheel speed sensor signals differ by greater than 10 km/h (6 mph) for more than 10 seconds.

Action Taken When the DTC Sets

ECM

- The ECM commands reduced vehicle power.
- PROPULSION POWER REDUCED message is displayed on the driver information centre.

Hybrid Powertrain Control Module

The hybrid powertrain control module calculates the transmission output speed.

[Conditions for Clearing the DTC](#)

ECM

P215B is a Type A DTC.

Hybrid Powertrain Control Module

P215B is a Type B DTC.

[Diagnostic Aids](#)

The hybrid system is very sensitive to the OSS signal for overall operation.

As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The two sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the two signals and send a signal with a different pulse width. This signal is interpreted by the transmission control module for speed and direction and is transmitted through the serial data circuits to the engine control module (ECM) and the hybrid powertrain control module. The ECM, hybrid powertrain control module, and transmission control module compare the output speed sensor signal with the anti lock brake system (ABS) wheel speed sensor signal. The TCM is part of the control solenoid valve assembly and is not serviced separately. The hybrid powertrain control module is part of the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- The vehicle is moving.
- The transmission control module correlates the transmission output speed with the ABS wheel speed and motor speed to detect any failures in the transmission output speed sensor.

Conditions for Setting the DTC

The difference between transmission output speed and the calculated average of output speed from the drive motors and ABS wheel speed sensors is greater than 150 RPM. The difference between the average of wheel speed sensors and drive motors and the output speed sensor is greater than 175 RPM.

Action Taken When the DTC Sets

- P215C is a Type B DTC.
- The transmission control module calculates output speed based on the ABS wheel speed.
- The HCP calculates vehicle direction based on drive motor direction.

Conditions for Clearing the DTC

P215C is a Type B DTC.

Special Tools

EL 38522 Variable Signal Generator

Circuit/System Verification

Operate the vehicle at 16-32 km/h (10-20 mph) while observing the Transmission OSS and ABS wheel parameters on the scan tool.

The Transmission OSS and ABS wheel speed signal parameters should not vary by greater than 10 km/h (6 mph).

Circuit/System Testing

1. Verify that DTC C0035-C0050, C1207-C1210, C1221-C1228, C1232-C1235, C005A, C0245, or C122E is not set in the electronic brake control module.
If the DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Output Shaft Speed Input Test](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Perform the [Automatic Transmission Wiring Harness and Output Speed Sensor Removal](#) and [Automatic Transmission Wiring Harness and Output Speed Sensor Installation](#) for OSS replacement.

[DTC Descriptor](#)

DTC P2534: Ignition 1 Switch Circuit Low Voltage

DTC P2535: Ignition 1 Switch Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P2534	P2535	P2535	P2534

[Typical Scan Tool Data](#)

[Ignition Voltage](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Key ON			
Parameter Normal Range: 8-18 volts			
IGN	0 volts	0 volts	B+

[Circuit/System Description](#)

The transmission control module (TCM) samples the system voltage on the Ignition 1 voltage circuit every 0.1 seconds. higher or lower than normal voltage may cause erratic transmission operation.

[Conditions for Running the DTC](#)

The transmission control module is communicating on the serial data circuits.

[Conditions for Setting the DTC](#)

The transmission control module detects less than 2 volts on the ignition voltage circuit at the transmission control module for greater than 10 seconds.

[Action Taken When the DTC Sets](#)

- DTCs P2534 and P2535 are Type A DTCs.
- The transmission control module turns OFF all solenoids.
- The transmission control module commands maximum line pressure.
- The transmission control module freezes transmission adaptive functions.

[Conditions for Clearing the DTC](#)

DTCs P2534 and P2535 are Type A DTCs.

[Diagnostic Aids](#)

- Verify the control solenoid valve assembly X1 connector and harness terminals are clean and not damaged.
- Verify the charging system is functioning correctly.

DTC Descriptors

DTC P2714: Pressure Control Solenoid 4 - Stuck Off

DTC P2715: Pressure Control Solenoid 4 - Stuck On

Circuit/System Description

The clutch pressure control solenoid 4 is part of the control solenoid valve assembly and is not serviced separately. The transmission control module supplies 12 volts to the clutch pressure control solenoid 4 through the high side driver 1 circuit. The transmission control module controls the clutch pressure control solenoid 4 through the clutch pressure control solenoid 4 control circuit. The normally low clutch pressure control solenoid 4 flows fluid to the 1-3 and reverse clutch when commanded ON and exhausts fluid when commanded OFF. The clutch pressure control solenoid 4 regulates the transmission fluid pressure to the 1-3 and reverse clutch.

Conditions for Running the DTC

- Shift solenoid valve 1 is not in a transition state.
- The transmission line pressure is greater than 325 kPa (47 psi).
- Propulsion system is active.

P2714

The clutch pressure control solenoid 4 commanded pressure is greater than 1800 kPa (261 psi) for 5 seconds.

P2715

The clutch pressure control solenoid 4 commanded pressure is less than 5 kPa (1 psi) for 5 seconds.

Conditions for Setting the DTC

P2714 - Condition 1

The clutch pressure control solenoid 4 commanded pressure is 1800 kPa (261 psi) and the transmission fluid pressure switch 4 state is Low for 30 seconds.

P2714 - Condition 2

The clutch pressure control solenoid 4 commanded pressure is 1800 kPa (261 psi) and the transmission fluid pressure switch 4 state is Low for 2 seconds greater than 5 times during a key cycle.

P2715 - Condition 1

The clutch pressure control solenoid 4 commanded pressure is 5 kPa (1 psi) and the transmission fluid pressure switch 4 state is High for 36 seconds.

P2715 - Condition 2

The clutch pressure control solenoid 4 commanded pressure is 5 kPa (1 psi) and the transmission fluid pressure switch 4 state is High for 2 seconds greater than 5 times during a key cycle.

Action Taken When the DTC Sets

- P2714 and P2715 are Type B DTCs.
- The transmission control module commands 450 kPa (65 psi) line pressure.
- The transmission control module freezes transmission adaptive functions.
- The driver information centre may display ENGINE NOT AVAILABLE SERVICE SOON.

Conditions for Clearing the DIC/DTC

P2714 and P2715 are Type B DTCs.

Diagnostic Aids

When attempting to set transmission performance DTCs, observe the Freeze Frame and Failure Records to assist in duplicating the failure conditions.

Scan Tool Reference

[Control Module References](#) for scan tool information.

Special Tools

DT-47825 Control Solenoid Test Plate

Circuit/System Verification

1. Perform the [Transmission Fluid Level and Condition Check](#) to verify correct fluid level.
2. Perform the [Line Pressure Check](#) to verify correct oil pressure.
3. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) to verify control solenoid valve assembly condition.
4. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) to verify control solenoid valve assembly function.
5. Inspect the control valve upper body assembly for sticking valves, damage, scored bores, or debris. Refer to [Control Valve Body Diagnostic Inspection](#) .
If there is cause for concern in the valve body, repair or replace the valve body as necessary.

Component Testing

- Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) .
- Perform the [Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Verify P07A7, P079C, P0AB9 do not set after repair.

- [Control Valve Body Diagnostic Inspection](#)
- [Control Valve Body Cover Removal](#)
- [Control Valve Body Replacement](#) for control valve body replacement.
- [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming, and setup.

DTC P2719-P2721

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P2719: Pressure Control Solenoid 4 System Performance

DTC P2720: Pressure Control Solenoid 4 Control Circuit Low Voltage

DTC P2721: Pressure Control Solenoid 4 Control Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Clutch Pressure Control Solenoid 4 Control	P2720	P2721	P2721	P2719

[Circuit/System Description](#)

The transmission control module supplies 12 volts to the clutch pressure control solenoid 4 through the high side driver 1 circuit. The transmission control module controls the clutch pressure control solenoid 4 through the clutch pressure control solenoid 4 control circuit. The normally low clutch pressure control solenoid 4 directs fluid flow to the 1-3 reverse clutch, or cools motor 1 depending on shift solenoid 1 position, when commanded ON and exhausts fluid when commanded OFF. The clutch pressure control solenoid 4 regulates the transmission fluid pressure to the 1-3 reverse clutch. The clutch pressure control solenoid 4 is part of the control solenoid valve assembly and is not serviced separately.

[Conditions for Running the DTC](#)

- The propulsion system is active.

- The system voltage is 11-16 V.

Conditions for Setting the DTC

P2719

The transmission control module detects an internal electrical performance malfunction of the clutch pressure control solenoid 4 control circuit for 1 second.

P2720

The transmission control module detects an internal low voltage electrical malfunction of the clutch pressure control solenoid 4 control circuit for 1 second.

P2721

The transmission control module detects an internal high voltage electrical malfunction of the clutch pressure control solenoid 4 control circuit for 1 second.

Action Taken When the DTC Sets

- P2719 is a Type B DTC.
- P2720 and P2721 are Type A DTCs.

Conditions for Clearing the DTC

- P2719 is a Type B DTC.
- P2720 and P2721 are Type A DTCs.

Diagnostic Aids

When this fault is present the system waits for a performance or clutch slip DTC to set.

DTC P2728-P2730

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P2728: Pressure Control Solenoid 5 System Performance

DTC P2729: Pressure Control Solenoid 5 Control Circuit Low Voltage

DTC P2730: Pressure Control Solenoid 5 Control Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Clutch Pressure Control Solenoid 5 Control	P2729	P2730	P2730	P2728

[Circuit/System Description](#)

The clutch pressure control solenoid 5 is part of the control solenoid valve assembly and is not serviced separately. The transmission control module supplies 12 volts to the pressure control solenoid 5 through the high side driver 1 circuit. The transmission control module controls the pressure control solenoid 5 through the pressure control solenoid 5 control circuit. The normally low pressure control solenoid 5 directs fluid flow to the damper clutch when commanded ON and exhausts fluid when commanded OFF. The clutch pressure control solenoid 5 regulates to the damper clutch during auto start/stop transitions.

[Conditions for Running the DTC](#)

- The propulsion system is active.
- The system voltage is 11-16 V.

Conditions for Setting the DTC

P2728

The transmission control module detects an internal electrical performance malfunction of the clutch pressure control solenoid 5 control circuit for 5 seconds.

P2729

The transmission control module detects an internal low voltage electrical malfunction of the clutch pressure control solenoid 5 control circuit for 1 second.

P2730

The transmission control module detects an internal high voltage electrical malfunction of the clutch pressure control solenoid 5 control circuit for 1 second.

Action Taken When the DTC Sets

- DTC P2728 is a Type B DTC.
- DTCs P2729 and P2730 are Type A DTCs.

Conditions for Clearing the DTC

- DTC P2728 is a Type B DTC.
- DTCs P2729 and P2730 are Type A DTCs.

Symptoms - Automatic Transmission

Note: Use the symptom tables only if the following conditions are met:

- Refer to [Diagnostic Starting Point - Vehicle](#) .
- There are no DTCs set.
- The control modules can communicate via the serial data link.
- Review the system operation in order to familiarise yourself with the system functions. Refer to [Transmission General Description](#) and [Transmission Component and System Description](#) .

[Visual/Physical Inspection](#)

Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

[Intermittent](#)

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

[Symptom List](#)

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Fluid Diagnosis
 - [Transmission Fluid Level and Condition Check](#)
 - [Fluid Leak Diagnosis](#)
- Noise and Vibration Diagnosis
 - [Whine/Growl Noise That Changes with Vehicle Speed](#)
 - [Noise in Drive or Reverse Gear](#)
 - [Vibration](#)
 - [Noise and Vibration Analysis](#)
- Range Performance Diagnosis
 - [No Park or Drive](#)

Drive Motor Generator Power Inverter Module Cable Inspection

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Note: This procedure is for inspection and repair of the 3 phase high voltage cable outer sheathing only.

Visual/Physical Inspection

Cable Construction

- Outer Jacket or Sheathing
- Braided Shield
- Insulated Conductor
- 3 Individual Cables per Cable Assembly (Motor A or Motor B)

1. Disconnect or remove the drive motor with generator control module cover to gain better visibility of 3 phase cables.
2. Determine if the exposure is limited to the braided shield or has penetrated to the insulated conductor.
3. If the conductor wire is exposed, the cable assembly should be replaced.

Note: If the 3 phase cable drive motor with generator control module connector is removed a new seal must be used.

4. Examine the cables for abrasion or damage. It may be necessary to disconnect the 3 phase cable from the drive motor with generator control module (TPIM) (1 bolt per connector) for proper examination.
5. If exposure is limited to the braided shield, the cable can be repaired using the instructions in this procedure.
6. If the damage (1) is within 100 mm of the end gate clamp on the cable then the cable should be replaced.
7. If the damage (1) is more than 25 mm in length then the cable should be replaced.
8. An example of a cable that can be repaired is shown above.

Cable Repair Process

Note: This procedure requires the use of Self-fusing Silicone Repair Tape.

1. If abrasion or damage is evident on the outer sheathing and a repair can be made please follow the procedure below closely.
2. Clean the cable area on either side of the abrasion or damage approximately 6 inches.
3. Before beginning to tape the cable, you must cut the Silicone Repair Tape to the length you expect to use.
4. You must also remove the Silicone Repair Tape from the backing material.

Note: Tape is pulled to half of it's original width during entire application (Very Important).

5. Wrap tape around cable twice while stretching tape.
6. Wrap tape along cable.
 - 6.1. Begin to spiral the tape along cable - Be sure to stretch tape while spiralling along cable.
 - 6.2. Tape must be overlapped on itself so that there are always 2 tape layers on cable.
7. Finish applying tape by ending spiral and then wrap the tape twice on itself (like step 5) and tear or cut remaining tape and smooth onto itself.
8. The Silicone Rescue Tape must wrap the cable to provide 1.25 in (A) of coverage from edge of damage on each side of the abrasion or damaged area.

9. You can see above the abrasion or damage "spot (1)" covered by Silicone Rescue Tape.
10. If connector/s to TPIM were removed install with new seal and torque to **9.5 N·m +/- 1.5 N·m (84 lb in +/- 1 1/2 lb in)**.
11. Install drive motor with generator control module cover.

Control Solenoid Valve and Transmission Control Module Assembly Inspection

1. Inspect the control solenoid valve assembly connectors and pins (1, 2, 4, 6) for the following conditions:

- Damage
- Bent pins
- Debris
- Broken retaining tab

- Contamination
2. Ensure no metallic debris is inside the connectors near the terminal pins.
 3. Inspect the control solenoid valve assembly solenoid leads (3) for contamination or metallic debris.
 4. Inspect the 4 control solenoid valve assembly filter plate retaining tabs (5) for cracks and ensure proper tension when filter plate is attached.

Control Solenoid Valve and Transmission Control Module Assembly Output Shaft Speed Input Test

Special Tools

EL 38522 Variable Signal Generator

The purpose of this test is to provide a simulated output speed sensor signal to the control solenoid valve assembly Transmission Output Shaft Speed Sensor input circuits in order to verify the control solenoid valve assembly is able to process the output speed sensor signal.

1. Vehicle OFF, remove the control valve body cover. Refer to [Control Valve Body Cover Removal](#) .
2. Connect the Q8 control solenoid valve assembly X1 harness connector.
3. Vehicle OFF, disconnect the OSS wiring harness connector X4 (1) from the Q8 control solenoid valve assembly.
4. Vehicle ON, test for 8.3-9.3 volts at terminal A and ground.
If not within the specified range, replace the Q8 control solenoid valve assembly.
5. Vehicle OFF, using the *EL 35616* terminal test kit , connect the *EL 38522* variable signal generator red lead to the OSS signal circuit terminal B on the TCM.
6. Connect the black lead from the *EL 38522* variable signal alternator to ground.
7. Set the *EL 38522* variable signal alternator to 8 volts, the frequency to 120 Hz, and the percent duty cycle to 50 or the normal position.
8. Vehicle ON, verify with a scan tool the Transmission OSS parameter is between 375-400 RPM.
If not within the specified range, replace the Q8 control solenoid valve assembly. Refer to [Control Solenoid Valve and Transmission Control Module Assembly Replacement](#) .
9. Test the output speed sensor harness for an open circuit, short to ground or short to voltage.
If all circuits test normal, test or replace the B14A Transmission Output Shaft Speed Sensor.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Perform the [Automatic Transmission Wiring Harness and Output Speed Sensor Removal](#) and [Automatic Transmission Wiring Harness and Output Speed Sensor Installation](#) for OSS replacement.
- [Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module Assembly replacement, programming, and setup.

Control Solenoid Valve and Transmission Control Module Assembly Solenoid Performance Test

Table 1: [Control Solenoid Valve Assembly Solenoid Performance Test Block to Component Identification](#)

Special Tools

- DT-47825 Control Solenoid Test Kit
- DT-47825-20 Adaptor Harness

The purpose of this procedure is to test the control solenoid valve assembly solenoids for a stuck open or stuck closed condition, or a faulty transmission fluid pressure switch. *DT-47825* test block is bolted to the control solenoid valve assembly on the valve body mounting surface. Pressurised air is passed into the aluminium test block, through the control solenoid valve assembly solenoid passage and back to the outlet port on the test block. A scan tool is used to command the solenoids ON and OFF. While observing the airflow, one can check the valve function. The recommended shop air pressure for this test is regulated to 90-100 psi.

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the control solenoid valve assembly from the transmission. Refer to [Control Solenoid Valve and Transmission Control Module Assembly Removal](#) .
3. Perform the [Control Solenoid Valve and Transmission Control Module Assembly Inspection](#) procedure.

Solenoid Testing Procedure

Caution: To avoid solenoid overheating and possible internal damage, do not continuously operate the solenoid for more than 2 minutes at a time. Drain the TCM of excess transmission fluid before attaching to test block and use caution when attaching air to test block air inlet.

Note: With the Vehicle in Service Mode and the engine OFF, the transmission control module will normally cycle some of the transmission solenoids On and Off to facilitate keeping the ports and solenoids clean and free of debris. This dither function is a normal activity and will cause the valves to cycle open and closed quickly when the TCM is powered up. This may cause some air to exit the ports where the pressure gauge is not connected as those solenoids cycle on and off.

1. Connect the *DT-47825-20* adaptor harness to the vehicle harness (3) and the control solenoid valve assembly.

2. If necessary, clean each side of the filter plate assembly and install the filter plate assembly back on the control solenoid valve assembly. Clean the mounting surface of the *DT-47825* test block .
3. Bolt the *DT-47825* test block to the control solenoid valve assembly mounting surface. Use the bolts and washers supplied with the tool to attach the test block. Tighten the bolts to **5 N·m (44 lb in)**.
4. Connect the *DT-47825-20* adaptor harness supplied with the *DT-47825* test kit to the vehicle harness and to the Q8 control solenoid valve assembly. Engage the connector locks.
5. Vehicle in Service Mode.
6. Cover the *DT-47825* test block ports (6) with a shop towel. Transmission fluid may exit these ports when the solenoids are commanded ON.
7. Connect regulated shop air (4) to the *DT-47825* test block air inlet. Do not exceed the recommended air pressure of 620.5-689.4 kPa (90-100 psi).
8. Vehicle in Service Mode and the scan tool (1) connected to the DLC connector (2) communicating with the vehicle, command the solenoid in question ON and OFF. Observe the airflow at the appropriate test port for a change as you command the solenoid. Refer to Control Solenoid Valve Assembly Solenoid Performance Test Block to Component Identification for correct solenoid function and test block port connections for the solenoid being tested.
9. The solenoid should allow air pressure to flow or prevent air pressure flow depending on the solenoid state. The test results are read on the pressure gauge (5).
10. Command the solenoid valve ON and OFF several times to determine the condition of the solenoid in question. Release the test air pressure from the pressure the gauge between solenoid tests.

Control Solenoid Valve Assembly Solenoid Performance Test Block to Component Identification

Commanded State	Port On Test Block	Expected Result
Vehicle OFF, no solenoids commanded and TCM not communicating	A, C, G	Air Flow
Vehicle in Service Mode, no solenoids commanded and TCM communicating	A, B, C, D, E, F, G, H	No air flow from any port and no control solenoid valve assembly air leaks. This may take up to 30 seconds after vehicle is On.
Shift Solenoid 1	D	Air Flow
Shift Solenoid 2	H	Air Flow
Pressure Control Solenoid 2	C	Air Flow
Pressure Control Solenoid 3	G	Air Flow
Pressure Control Solenoid 4	B	Air Flow
Pressure Control Solenoid 5 -- Command On	E	Air Flow
Line Pressure Control Solenoid -- Command Increase/Decrease	A	0 kPa = 0 psi 36.6 kPa = 20-30 psi 52.5 kPa = 32-56 psi 71.2 kPa = 44-74 psi 90 kPa = 70-90 psi

108 kPa = 90-100+psi

Greater than 108 kPa = Scan tool displays Device Control Not Allowed

Control Solenoid Valve Assembly

Callout	Component Name	DTC/Symptom Associated with Component
1	Transmission Fluid Pressure Switch 4	P0756, P0757
2	Shift Solenoid 2	P0756, P0757, P0976, P0977, Possible Engine Unavailable
3	Pressure Control Solenoid 3	P0796, P0797, P079A, P07A3, P0969, P0970, P0971
4	Pressure Control Solenoid 6 -- Not Used	No DTCs or symptoms associated with this component
5	Pressure Control Solenoid 5	P2728, P2729, P2730, Bump during engine start/stop transition
6	Shift Solenoid 1	P0751, P0752, P0973, P0974, Possible Engine Unavailable
7	Pressure Control Solenoid 2	P0776, P0777, P079B, P07A5, P0965, P0966, P0967
8	Pressure Control Solenoid 4	P079C, P07A7, P2714, P2715, P2719, P2720, P2721
9	Line Pressure Control Solenoid	P0961, P0962, P0963
10	Transmission Fluid Pressure Switch 1	P0751, P0752, P2714, P2715
11	Transmission Control Module	P0601-P0606, P060B, P062F, P0634, P0667, P0668, P0669, P06AC, P06AD, P06AE, P16F3, P16F7, P16F8, P179B
12	Transmission Fluid Pressure Switch 3	P0751, P0752, P0776, P0777
13	X1 20 Pin Connector	P2534, P2535
14	Transmission Fluid Pressure Switch 5	P0796, P0797

Transmission Fluid Pressure Switch Test Procedure

1. Remove the *DT-47825* test block from the Q8 control solenoid valve assembly.
2. With the Vehicle in Service Mode and the scan tool communicating with the vehicle, using a soft blunt object, depress each transmission fluid pressure switch port. The corresponding transmission fluid pressure switch parameter on the scan tool display should display HI when depressed and Low when released.
 - If the Q8 control solenoid valve assembly fails any of the above tests, replace the Q8 control solenoid valve assembly.
 - If the Q8 control solenoid valve assembly passes the above tests, the problem is internal to the transmission.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for Control Solenoid Valve Assembly and Transmission Control Module replacement, programming, and setup.

Control Valve Body Diagnostic Inspection

The purpose of this inspection procedure is to determine if the control valve body assembly is the cause of a transmission DTC or symptom. The table will assist you in identifying which component within the control valve body is associated with a particular DTC or symptom. The components within the control valve body are not serviced separately.

Component Testing

Warning: Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result.

Caution: After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component failure.

Caution: Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.

1. Remove the control valve body assembly . Refer to [Control Valve Body Replacement](#) .
2. Clean and inspect all control valve body assembly components for the following conditions listed below:
 - Stuck or scored control valve
 - Scored or damaged control valve body bore
 - Broken, weak, or damaged control valve return spring
 - Missing, damaged, or stuck check ball
 - Missing, restricted, or out of position modulated fluid pressure orifice
 - Missing or damaged control valve retainer
 - Debris or sediment

If a condition is found, and cannot be repaired by cleaning, replace the control valve body assembly.

Callout	Component Name	DTC/Symptom Associated with Component
1	Shift Solenoid Valve Train	P0751, P0752, Possible Engine Unavailable
2	Variable Hi and 2-3-4 Clutch and Drive Motor/Generator Stator Cooling Regulator Boost Valve Train	P0776, P0777, P079B
3	A/Trans Torque Damper Bypass Clutch Valve Train	Bump during engine start/stop transition
4	Actuator Feed Limit Valve Train	High or low line pressure, P079A, P079B, P079C
5	Cooler Feed Limit Valve Train	P0634, Transmission Overheating
6	1-3 Reverse Clutch and Generator/Drive Motor Stator Cooling Regulator Valve Train	P2714, P2715, P07A7, P079C
7	Variable Hi and 2-3-4 Clutch and Drive Motor/Generator Stator Cooling Regulator Valve Train	P0776, P0777, P07A5, P079B
8	Variable Low and 1-2 Reverse and 4th Clutch and Drive Motor/Generator Stator Cooling Regulator Valve Train	P0796, P0797, P07A3, P079A
9	Shift Solenoid Valve Train	P0756, P0757
10	1-2 Reverse and 4th Clutch Regulator Boost Valve Train	P0796, P0797, P079A
11	Control Valve Body Ball Check Valve	P2714, P2715, P079C
12	Modulated Fluid Pressure Orifice	High or low line pressure
13	Modulated Fluid Pressure Orifice	High or low line pressure

[Repair Instructions](#)

[Control Valve Body Replacement](#)

Transmission Fluid Level and Condition Check

1. Ensure vehicle is off.
2. Remove oil fill cap on top of transmission.

Note: The vehicles hood must be open or engine will NOT start.

3. Start vehicle.
4. Idle engine in Park (P) for 5 minutes (to ensure damper is full).
5. Move PRND to Park (P) and wait for transmission to heat up to **40-60 °C (104-140 °F)**.
6. Move PRND through Neutral (N), Drive (D), Park (P) and Reverse (R) 2 times.
7. Move PRND to Park (P).
8. Remove oil setting plug.
9. Allow oil to drain until it becomes a slow drip. If no oil drains add **.5 L (.52 qt)** until oil drips slowly from plug.
10. Reinstall oil setting plug.
11. Turn vehicle off.
12. Reinstall oil fill cap.
13. Grand total oil approximately **8.9 L (9.4 qt)**.

PROCEED WITH OIL FILL PROCEDURE IN ACCORDANCE WITH ALL HYBRID SAFETY MEASURES.

Fluid Condition Inspection

- Inspect the fluid colour. The fluid should be red in colour. The fluid may also turn brown form normal use, and does not always indicate contamination.

Note: Fluid that is very dark or black and has a burnt odour usually indicates contamination or overheating.

- If the fluid colour is very dark or black and has a burnt odour, inspect the fluid for excessive metal particles or other debris which may indicate transmission damage. Refer to [Road Test](#) to verify transmission operation. Change the transmission fluid if no other conditions are found.
- Fluid that is cloudy or milky or appears to be contaminated with water indicates engine coolant or water contamination. Refer to [Engine Coolant/Water in Transmission](#) .

Line Pressure Check

Special Tools

EN 21867-A Pressure Gauge

For equivalent regional tools refer to [Special Tools](#)

[Main Line Pressure Check](#)

Warning: Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

1. Install a scan tool.

Note: Depending on the hybrid/EV battery state of charge the engine may not start. To start or keep the engine running open the hood.

2. Start the engine.
3. If the engine will not start, refer to [Engine Cranks But Does Not Run](#) .
4. Inspect the transmission for the proper fluid level. Refer to [Transmission Fluid Level and Condition Check](#) .
5. Inspect the manual linkage at the transmission for proper function.
6. Turn the engine OFF.

Warning: When the transmission is at operating temperatures, take necessary precautions when removing the auxiliary pump pressure test hole plug, to avoid being burned by the catalytic converter.

Note: You may need to remove or disconnect components in order to gain access to the transmission line pressure test hole plug.

7. Remove the line pressure test hole plug.
8. Install the *EN 21867-A* pressure gauge .
9. Access the Scan Tool Transmission Output Controls for the Line Pressure Control Solenoid.
10. Start the engine.

Note: In order to achieve accurate line pressure readings, the following procedure must be performed at least 3 times in order to gather uniform pressure readings. Also if you do not have the hood open the engine may go in to AutoStop.

The scan tool is only able to control the line Pressure Control solenoid in PARK and NEUTRAL with engine speeds below 1500 RPM. This protects the clutches from extreme high or low line pressures.

11. Use the scan tool to increase and decrease the Line Pressure Control Solenoid in increments of approximately 100 kPa (15 psi). The scan tool commands the increment values automatically.
12. Allow the pressure to stabilise between increments.
13. Compare your pressure readings on the scan tool to those indicated on the *EN 21867-A* pressure gauge . Refer to [Solenoid Valve Pressure Specifications](#) .
14. If the pressure readings vary greatly, refer to [Main Fluid Pump Pressure High or Low](#)

[Auxiliary Transmission Fluid Pump Line Pressure Check](#)

1. Close the hood and wait for the engine to shut off.
2. Use the scan tool to increase and decrease the line pressure control solenoid in increments of approximately 100 kPa (15 psi). The scan tool commands the increment values automatically.
3. Allow the pressure to stabilise between increments.
4. Compare your pressure readings on the scan tool to those indicated on the *EN 21867-A* pressure gauge . Refer to [Solenoid Valve Pressure Specifications](#) .
5. If the pressure readings vary greatly, refer to [Auxiliary Fluid Pump Pressure High or Low](#) .

6. Turn the engine OFF.
7. Remove the *EN 21867-A* pressure gauge .

Caution: Refer to [Fastener Caution](#) in the Preface section.

8. Install the pressure test hole plug. Tighten the pressure plug to **11 N·m (97 lb in)**.

Road Test

Note: The Road Test Procedure should be performed only as part of the Symptom Diagnosis. Refer to [Symptoms - Automatic Transmission](#) .

The following test provides a method of evaluating the condition of the automatic transmission. The test is structured for two most common driving conditions, which are Electrically Variable Engine Off and Electrically Variable Engine On. The test is structured so that most driving conditions would be achieved. The test is divided into the following parts:

- Electrical Function Check
- Torque Control
- Part Throttle Torque Control
- Coasting

Note: Complete the test in the sequence given. Incomplete testing cannot guarantee an accurate evaluation.

Before the road test, ensure the following:

- The engine is performing properly.
- Transmission fluid level is correct. Refer to [Transmission Fluid Level and Condition Check](#) .
- Tire pressure is correct.

During the road test:

- Perform the test only when traffic conditions permit.
- Operate the vehicle in a controlled, safe manner.
- Observe all traffic regulations.
- View the scan tool data while conducting this test.
 - Take along qualified help in order to operate the vehicle safely.
- Observe any unusual sounds or smells.

After the road test, check the following:

- Inspect for proper transmission fluid level. Refer to [Transmission Fluid Level and Condition Check](#) .
- Inspect for any diagnostic trouble codes (DTCs) that may have set during the testing. Refer to the applicable DTC.
- Monitor the scan tool data for any abnormal readings or data.

- Inspect for fluid leaks. Refer to [Fluid Leak Diagnosis](#) .

[Electrical Function Check](#)

Perform this procedure first in order to ensure the electronic transmission components are functioning properly. If these components are not checked, a simple electrical condition could be misdiagnosed.

1. Connect the scan tool.
2. Ensure the gear selector is in PARK and set the parking brake.
3. Start the engine. To ensure the engine starts open the hood.

Note: Note that the engine may not start depending on the state of charge in the battery. For more information refer to [Hybrid Modes of Operation Description](#) .

4. Verify that the following scan tool data can be obtained and is functioning properly.

Refer to [Transmission Control Module Scan Tool Information](#) for typical data values. Data that is questionable may indicate cause for concern.

- Engine Torque
- Drvr Axle Torque Request
- Calc. Throttle Position
- Engine Speed
- Calc. Trans Input Speed
- Transmission OSS
- ISS/OSS Supply Voltage
- Replicated OSS CKT Status
- Vehicle Speed
- Output Shaft Direction
- Variable Low 1-2R Clutch Slip
- Variable High 2-3-4 Clutch Slip
- 4th Clutch Slip
- 1-3R Clutch Slip
- Variable Low 1-2R Clutch Status
- Variable High 2-3-4 Clutch Status
- 4th Clutch Status
- 1-3R Clutch Status
- IAT

- Brake Switch
 - Shift Solenoid 1
 - Shift Solenoid 2
 - Commanded Gear
 - Gear Ratio
 - Driver Shift Control
 - Driver Shift Request
 - IMS A/B/C/P
 - IMS
 - TFP Switch 1
 - TFP Switch 3
 - TFP Switch 4
 - TFP Switch 5
 - ECT
 - Trans. Fluid Temp.
 - TCM Power Up Temperature
 - TCM Temperature
 - PC Sol. 2 Pressure Cmd.
 - PC Sol. 3 Pressure Cmd.
 - PC Sol. 4 Pressure Cmd.
 - PC Sol. 5 Pressure Cmd.
 - Line PC Sol. Pressure Cmd.
 - Engine Run Time
 - EC Ignition Relay Feedback Signal
 - Ignition Voltage
 - Transfer Case Ratio
5. Check the garage shifts.
- 5.1. Apply the brake pedal and ensure the handbrake is set.
- 5.2. Move the gear selector through the following ranges:
- 5.2.1. PARK to REVERSE
 - 5.2.2. REVERSE to NEUTRAL
 - 5.2.3. NEUTRAL to DRIVE

- 5.3. Pause 2 to 3 seconds in each gear position.
- 5.4. Verify the gear engagements are immediate and not harsh.

Note: These shifts can not be felt when trans is functioning properly.

Note: Harsh engagement may be caused by any of the following conditions:

- High engine idle speed-Compare engine idle speed to desired idle speed.
- Commanded low pressure control (PC) solenoid current--Investigate PC Sol. Pressure Cmd. kPa (psi) for all solenoids. High pressure will cause harsh shifts.
- A default condition caused by certain DTCs that result in maximum line pressure to prevent clutch slippage.

Note: Soft or delayed engagement may be caused by any of the following conditions:

- Low idle speed--Compare engine idle speed to desired idle speed
- Low fluid level
- Commanded high PC solenoid current--Investigate PC Sol. Pressure Cmd. kPa (psi) for all solenoids. Low pressure will cause soft or delayed shifts
- Cold transmission fluid temperature (TFT)--Use the scan tool to determine TFT
- Selector linkage--Inspect and adjust as necessary

6. Monitor transmission range on the scan tool, trans data list.
 - 6.1. Apply the brake pedal and ensure the handbrake is set.
 - 6.2. Move the gear selector through all ranges.
 - 6.3. Pause 2 to 3 seconds in each range.
 - 6.4. Return gear selector to PARK.
 - 6.5. Verify that all selector positions match the scan tool display.
7. Check throttle position input.
 - 7.1. Apply the brake pedal and ensure the handbrake is set.
 - 7.2. Ensure the gear selector is in PARK.
 - 7.3. Monitor the scan tool Calc. Throttle Position while increasing and decreasing engine speed with the throttle pedal. The scan tool Calc. Throttle Position percentage should increase and decrease with engine speed.

If any of the above checks do not perform properly, record the result for reference after completion of the road test.

Torque Control

The TCM calculates the ratio points based primarily on 2 inputs: throttle position and vehicle speed.

Note: If in the above steps you opened the hood to start the engine make sure it is closed before driving the vehicle.

Perform the following steps:

1. Choose a throttle position of 12.5 percent or 25 percent. All throttle positions shown should be tested to cover the normal driving range.
2. Monitor the following scan tool parameters:
 - Calc. Throttle Position
 - Vehicle Speed
 - Engine Speed
 - Transmission OSS
 - Commanded Gear
 - TFP Switch 1
 - TFP Switch 3
 - TFP Switch 4
 - TFP Switch 5
 - PC Sol. 2 Pressure Cmd.
 - PC Sol. 3 Pressure Cmd.
 - PC Sol. 4 Pressure Cmd.
 - PC Sol. 5 Pressure Cmd.
 - Shift Solenoid 1 and 2
3. Place the gear selector in the DRIVE position.
4. Accelerate the vehicle using the chosen throttle position. Hold the throttle steady.
5. As the vehicle accelerates, there should be a noticeable shift feel. The vehicle should be able to accelerate to the desired throttle position or speed with no noticeable problems.

Note any noise or vibration.

Manual Gear Range Selection

This range is used to slow the vehicle more when the driver's foot is lifted from the throttle. This range will feel like "engine braking" with the engine on or off.

Reverse

Perform the following test using a 10-15 percent throttle position.

1. With the vehicle stopped, move the gear selector to REVERSE.
2. Slowly accelerate the vehicle.
3. Verify that there is no noticeable slip, noise or vibration.

Clutch Plate Diagnosis

Composition Plates

Dry the plates and inspect the plates for the following conditions:

- Pitting
- Flaking
- Delamination--splitting or separation of bonded clutch material
- Wear
- Glazing
- Cracking
- Charring
- Chips or metal particles embedded in the lining

Replace a composition plate which shows any of these conditions.

Steel Plates

Wipe the plates dry and check the plates for heat discoloration. If the surfaces are smooth, even if colour smear is indicated, you can reuse the plate. If the plate is discoloured with heat spots or if the surface is scuffed, replace the plate.

Causes of Burned Clutch Plates

The following conditions can result in a burned clutch plate:

- Incorrect usage of clutch or apply plates
- Engine coolant or water in the transmission fluid
- A cracked clutch piston
- Damaged or missing seals
- Low line pressure
- Valve body conditions
 - The valve body face is not flat.

- Porosity is between channels.
- The valve bush clips are improperly installed.
- The checkballs are misplaced.
- The Teflon® seal rings are worn or damaged.

Engine Coolant/Water in Transmission

Caution: The antifreeze or water will deteriorate the seals, gaskets and the glue that bonds the clutch material to the pressure plate. Both conditions may cause damage to the transmission.

If antifreeze or water has entered the transmission, perform the following:

1. Disassemble the transmission.
2. Replace all of the rubber type seals. The coolant will attack the seal material which will cause leakage.
3. Replace the composition-faced clutch plate assemblies. The facing material may separate from the steel centre portion.
4. Replace all of the nylon parts - washers.
5. Replace the torque converter.
6. Thoroughly clean and rebuild the transmission, using new gaskets and oil filter.
7. Flush the cooler lines after the transmission cooler has been properly repaired or replaced.

Automatic Transmission Overheating

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Cause	DTCs
Engine: <ul style="list-style-type: none"> • Engine coolant level low • Engine Overheating • Incorrect engine coolant • Old coolant or incorrect concentration level • Cooling system leak • Radiator hose kinked or pinched • Loose, missing, or damaged radiator air seals or deflector -- restricted air flow • The radiator and air conditioning condenser has air flow obstructions to include large amount of bent fins • The cooling fans do not operate • Inspect the engine mechanical for worn, leaking, cracked cylinder heads, or engine block 	P1258
Transmission: Vehicle Overload or Beyond Capacity Towing: <ul style="list-style-type: none"> • Vehicle is overloaded • Vehicle is towing beyond capacity • Vehicle modifications 	P0634
Heat Transfer: <ul style="list-style-type: none"> • Engine overheating • Cooler restrictions -- transmission fluid auxiliary cooler restricted flow or blockage 	

<ul style="list-style-type: none"> • Restricted air flow • Vehicle modifications • Aftermarket auxiliary cooler installed incorrectly, incorrect flow direction - reversed flow • Restricted, blocked, or pinched transmission cooler lines • Stuck closed transmission thermal bypass valve 	P0634

[Circuit/System Description](#)

The primary source of heat in the 4ET50 transmission is the drive motors. The drive motors are cooled by the transmission fluid. Hot fluid exits the drive motors and flows to the transmission oil cooler through the transmission cooler supply line and thermal bypass valve. The thermal bypass valve assembly is located near the lower left side of the

radiator. The cooled fluid returns to the transmission through the transmission fluid cooler pipe assembly and cools the control solenoid assembly. The transmission fluid temperature sensor is located in the control solenoid assembly and is not serviced separately. The Transmission Fluid Temperature parameter on the scan tool should rise steadily to a normal operating temperature, and then stabilise.

The thermal bypass valve is mechanically operated, based on the oil temperature of the transmission in order to maintain optimum transmission operating efficiency. The valve has an activating temperature of 82°C (176°F), with the range to move being 78-83°C (172-181°F). The full open temperature is 96°C (205°F). The thermal bypass valve assembly begins to open at 82°C (176°F) for optimum transmission operation and fuel economy. The valve has a typical oil flow rate of 9-10 lpm (2.4-2.6 gpm).

Cold Mode:

82°C (176°F) and below the thermal bypass valve bypasses the oil going to the cooler and sends the fluid back to the transmission.

Mixing Mode:

82-96°C (176-205°F) the thermal bypass valve is in mixing mode - some of the fluid flows back to the trans and some flows through the transmission oil cooler.

Hot Mode:

Above 96°C (205°F) The thermal bypass valve is fully open and transmission oil flows through the cooler then back to the transmission.

Special Tools

- *DT 24731* Tempil Stick
- *DT 45096* Transmission Oil Cooler System Flush and Flow Test Tool

For equivalent regional tools, refer to [Special Tools](#) .

Component Testing

1. Perform the [Fluid Leak Diagnosis](#) .
2. Verify airflow through the radiator is not obstructed. Refer to [Radiator Cleaning](#) .
3. Perform the [Transmission Fluid Level and Condition Check](#) procedure.
4. Perform the [Line Pressure Check](#) procedure.
5. Perform the [Main Fluid Pump Pressure High or Low](#) procedure.
6. Perform the [Transmission Fluid Cooler Flushing and Flow Test](#) .
7. With a hand held or infrared thermometer or *DT 24731* tempil stick , test for the transmission cooler supply line thermal bypass valve assembly opening at 96°C (205°F). The transmission cooler supply line temperature should be higher on the transmission side of the thermal bypass valve assembly than the cooler side until 96°C (205°F) is reached.
 - If the thermal bypass valve test indicates that the valve has stuck closed, replace the thermal bypass valve assembly.
 - If the thermal bypass valve functions correctly, inspect the transmission oil passages for a blockage.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Transmission Fluid Auxiliary Cooler Replacement](#)
- [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#)
- [Transmission Fluid Cooler Inlet Pipe Replacement](#)
- [Transmission Fluid Cooler Outlet Pipe Replacement](#)

Case Porosity Repair

Some external leaks are caused by case porosity in non-pressurised areas. You can usually repair these leaks with the transmission in the vehicle.

1. Thoroughly clean the area to be repaired with a cleaning solvent. Air dry the area.

Warning: Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

2. Using instructions from the manufacturer, mix a sufficient amount of an epoxy to make the repair.
3. While the transmission case is still hot, apply the epoxy. You can use a clean, dry soldering acid brush to clean the area and also to apply the epoxy cement. Make certain that the area to be repaired is fully covered.
4. Allow the epoxy cement to cure for three hours before starting the engine.
5. Repeat the fluid leak diagnosis procedures.

Transmission Fluid Cooler Flushing and Flow Test

GM studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases could have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

Note: Use the *DT 45096* flush and flow test tool or equivalent to flush and flow test the transmission oil cooler and the oil cooler pipes after the transaxle is removed for repairs.

Only GM Goodwrench DEXRON®VI automatic transmission fluid should be used when doing a repair on a GM transmission.

Time allowance for performing the cooler flow checking and flushing procedure has been included in the appropriate labor time guide operations since the 1987 model year. The service procedure steps for oil cooler flushing and flow testing are as follows:

Cooler Flow Check and Flushing Steps

1. Machine Set-up
2. Determine Minimum Flow Rate
3. Back Flush
4. Forward Flush
5. Flow Test
6. Code Recording Procedure
7. Clean-up

Special Tools

- *DT 45096* Transmission Oil Cooling System Flush and Flow Test Tool
- *DT 45096-50* Transmission Cooler Flush Adaptor
- *DT 45096-55* Transmission Cooler Flush Adaptor
- Shop air supply with water/oil filters, regulator and pressure gauge -- minimum 90 psi
- Eye protection
- Rubber gloves

For equivalent regional tools, refer to [Special Tools](#) .

Machine Set-up

1. Verify that the main power switch (1) is in the OFF position.
2. Place the main function switch (2) in the IDLE position.

3. Connect *DT 45096* flush and flow test tool to the vehicle 12V DC power source by connecting the red battery clip to the positive, +, battery post on the vehicle and connect the negative lead to a known good chassis ground.
4. Turn the main power switch to the ON position.

Caution: Do not overfill the supply vessel. Damage to the unit may result. To verify the fluid level, view the LCD screen display while filling the unit, to ensure the fluid level does not exceed 30 L (32 qt).

5. Fill the supply tank with Dexron®VI through the fill port.
6. Reinstall and tighten the fill cap.

7. Connect a shop air supply hose to the quick-disconnect on the rear panel marked SUPPLY AIR.

[Determine Minimum Flow Rate](#)

1. From the machine display, identify the temperature of the automatic transmission fluid that is stored in the supply vessel of *DT 45096* flush and flow test tool .

2. Determine whether the transmission oil cooler is steel or aluminium by using a magnet (1) at the cooler flange (2) at the radiator.
3. Refer to the table below. Using the temperature from step 1, locate on either the Steel MINIMUM Flow Rate table or the Aluminium MINIMUM Flow Rate table the minimum flow rate in gallons per minutes (GPM). Record the minimum flow rate in GPMs and the supply fluid temperature for further reference.

Example

- Fluid temperature: 75°F
- Cooler Type: Steel

The MINIMUM flow rate for this example would be 0.8 GPM.

4. Inspect transmission oil cooler lines for damage or kinks that could cause restricted oil flow. Repair as needed and refer to the appropriate GM service manual procedures.

Minimum Flow Rate in Gallons Per Minute (gpm)

Temperature Range	Steel	Aluminium
65 - 66°F	0.6 gpm	0.5 gpm
67 - 70°F	0.7 gpm	0.6 gpm
71 - 75°F	0.8 gpm	0.7 gpm
76 - 80°F	0.9 gpm	0.8 gpm
81 - 84°F	1.0 gpm	0.9 gpm
85 - 89°F	1.1 gpm	1.0 gpm
90 - 94°F	1.2 gpm	1.1 gpm
95 - 98°F	1.3 gpm	1.2 gpm
99 - 103°F	1.4 gpm	1.3 gpm
104 - 108°F	1.5 gpm	1.4 gpm
109 - 112°F	1.6 gpm	1.5 gpm
113 - 117°F	1.7 gpm	1.6 gpm
118 - 120°F	1.8 gpm	1.7 gpm

Bypass Valve Removal

- Remove the fluid cooler bypass valve. Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#) .
- Install the *DT 45096-55* cooler flush adaptor .

[Back Flush Procedure](#)

1. Connect the *DT 45096-50* flush adaptor (1) to the vehicle transmission oil cooler supply and return lines at the transmission.

2. Connect the black supply hose (1) to the return line, top connector of the transmission, and the clear waste hose (2) to the feed line, bottom connector of the transmission, to the vehicle cooler lines. This is the reverse flow - backflush direction.

3. Turn the main function switch to the FLUSH position. Allow the machine to operate for 30 seconds.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

IDLE

FLUID 16 QTS @ 075F

IMPORTANT: 32 quart maximum
capacity supply vessel.

4. Turn the main function switch to the IDLE position and allow the supply vessel pressure to dissipate.

[Forward Flush](#)

1. Disconnect the supply and waste hoses from the vehicle cooler lines. Reverse the supply and waste hoses to provide a normal flow direction.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLUSH

FLUID 18 QTS

IMPORTANT: 32 quart maximum
capacity supply vessel.

2. Turn the main function switch to the FLUSH position and allow machine to operate for 30 seconds.

Flow Test

Note: If the flow rate is less than 0.5 gpm, the LCD displays an error message. Refer to the Troubleshooting section of the operation manual.

1. Turn the main function switch to the FLOW position and allow the oil to flow for 15 seconds. Observe and note the flow rate; this is the TESTED flow rate.
2. Compare the TESTED flow rate to the MINIMUM flow rate information previously recorded.
 - If the TESTED flow rate is equal to or greater than the MINIMUM flow rate recorded, the oil cooling system is functioning properly. Perform Code Recording Procedure.
 - If the TESTED flow rate is less than the MINIMUM flow rate previously recorded, repeat the back flush and forward flush procedures.
3. If the TESTED flow rate is less than the MINIMUM flow rate after the second test, perform Code Recording Procedure.
 - 3.1. Replace the transmission oil cooler.
 - 3.2. Reconnect supply and waste hoses to the cooler lines in the normal flow direction. Perform Flow Test.
 - 3.3. Perform Code Recording Procedure.

Code Recording Procedure

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLOW 1.0 @ 75F CYCLE 6
A10DFB2

IMPORTANT: 32 quart maximum
capacity supply vessel.

1. Turn the main function switch to the CODE position.

Note:

- If power is interrupted prior to the recording of the seven-character code, the code will be lost and the flow rate test will need to be repeated.
- The flow test must run for a minimum of 8-10 seconds and be above 0.5 GPM for a code to be generated.

2. Record TESTED flow rate, temperature, cycle and seven-character flow code information on repair order.

Clean-up

1. Turn the main function switch (2) to the IDLE position and allow the supply vessel pressure to dissipate.
2. Turn the main power switch (1) to the OFF position.

Note: A small amount of water may drain from the bottom of the unit when the air supply is disconnected. This is a normal operation of the built-in water separator.

3. Disconnect the supply and waste hoses and the 12-volt power source from the vehicle.

4. Disconnect the air supply hose from *DT 45096* flush and flow test tool .
5. Remove *DT 45096-55* cooler flush adaptor and install the fluid cooler bypass valve.
6. Attach cooler lines to the transmission.
7. Dispose of the waste ATF in accordance with all applicable federal, state, and local requirements.

Bushing and Mating Shaft Inspection

Note: Proper bushing and corresponding mating shaft inspection should be performed before replacing the bushing, shaft, and in some cases, the component which houses the bushing. Thoroughly clean and dry the bushing and shaft surfaces before inspecting for damage.

Any of the following bushing conditions require replacement of the bushing and/or housing:

- Discolouration due to heat distress
- Misalignment or displacement of bushing as a result of spinning in housing
- Medium to heavy scoring that can be easily detected with fingernail. Light scoring is a normal condition.
- Debris embedded into the bushing lining material
- Obvious damage, including excessive and uneven wear
- Excessive polishing. Minor polishing of the bushing is an indication of normal wear and does not require replacement.

Any of the following conditions require replacement of the bushing's mating shaft:

- Discolouration due to heat distress
- Rough surface finish that can be easily detected with finger
- Obvious shaft abnormalities, including warping or uneven surfaces
- Obvious damage or cracking

Main Fluid Pump Pressure High or Low

Checks	Causes
Fluid Pump Assembly	<ul style="list-style-type: none"> • Inspect for loose fluid pump bolts • Inspect for leaking or damaged fluid pump outlet seals and oil filter seal • Inspect for improperly installed or damaged oil filter • Inspect for sticking line pressure blow off valve
Front Differential Drive Gear Support Assembly	<ul style="list-style-type: none"> • Inspect for leaking or damaged drive gear support torque damper seal assembly or fluid passage tube gasket • Inspect for leaking or damaged drive gear support fluid passage tube assembly
Upper Valve Body Assembly	<ul style="list-style-type: none"> • Inspect for leaking or damaged upper valve body assembly gasket • Inspect for worn, sticking or damaged pressure regulator valve or pressure regulator valve spring
Lower Valve Body Assembly	Inspect for leaking or damaged lower valve body assembly gasket
Control Valve (w/Body & TCM) Valve Assembly	Inspect for leaking or damaged filter plate assembly seals
Case Assembly	Inspect for missing lubrication oil circuit orifice or baffle

Auxiliary Fluid Pump Pressure High or Low

Checks	Causes
Auxiliary Fluid Pump Assembly	<ul style="list-style-type: none"> • Inspect for loose auxiliary fluid pump bolts • Inspect for leaking or damaged auxiliary fluid pump outlet seals and oil filter seal • Inspect for improperly installed or damaged oil filter • Inspect for sticking auxiliary pressure blow off valve
Front Differential Drive Gear Support Assembly	<ul style="list-style-type: none"> • Inspect for leaking or damaged drive gear support torque damper seal assembly or fluid passage tube gasket • Inspect for leaking or damaged drive gear support fluid passage tube assembly
Upper Valve Body Assembly	<ul style="list-style-type: none"> • Inspect for leaking or damaged upper valve body assembly gasket • Inspect for worn, sticking or damaged pressure regulator valve or pressure regulator valve spring
Lower Valve Body Assembly	Inspect for leaking or damaged lower valve body assembly gasket
Control Valve (w/Body & TCM) Valve Assembly	Inspect for leaking or damaged filter plate assembly seals
Case Assembly	Inspect for missing lubrication oil circuit orifice or baffle

Automatic Transmission Fluid Leaks

Checks	Causes
Torque Damper	Inspect for damage.
Case Assembly	<ul style="list-style-type: none"> • Inspect for porosity or damage on the sealing surfaces • Inspect for loose oil cooler line bolts or damaged oil cooler line seals • Inspect for damaged manual shift shaft seal • Inspect for damaged or worn axle seal or axle seal thrower on the axle shafts • Inspect for loose pressure test plug and fluid level plug
Torque Damper Housing Assembly	<ul style="list-style-type: none"> • Inspect for damaged torque damper housing assembly • Inspect for porosity or damage on the sealing surfaces • Inspect for damaged torque damper housing seal • Inspect for damaged or worn torque damper fluid seal • Inspect for loose torque damper and differential housing bolts • Inspect for damaged or worn axle seal or axle seal throwers on the axle shafts
Case Cover assembly	<ul style="list-style-type: none"> • Inspect for porosity or damage on the sealing surface • Inspect for damaged case cover gasket • Inspect for loose case cover assembly bolts • Inspect for loose, damaged or leaking case cover assembly bore plugs
Valve Body Cover Assembly	<ul style="list-style-type: none"> • Inspect for damaged or warped valve body cover assembly • Inspect for damaged valve body cover gasket • Inspect for loose valve body cover bolts and valve body cover studs • Inspect for damaged or improperly installed wire connector hole seal • Inspect for damaged or worn fluid level indicator seal • Inspect for plugged vent holes in the fluid level indicator

Fluid Leak Diagnosis

General Method

1. Verify that the leak is transmission fluid.

Caution: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushes.

2. Thoroughly clean the suspected leak area using a rag.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

Caution: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushes.

1. Thoroughly clean the suspected leak area using a rag.
2. Apply an aerosol type leak tracing powder to the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Operate the vehicle for 24 km (15 mi) or until normal operating temperatures are reached.
3. Detect the leak with the black light.
4. Make the necessary repairs.

Find the Cause of the Leak

Pinpoint the leak and trace the leak back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads
- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket
- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Damaged seal bore
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual shaft or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Transmission Case Cover and/or Valve Body Cover

- Incorrectly tightened bolts
- Improperly installed or damaged gasket/seal
- Damaged mounting face

- Incorrect gasket seal

Case Leak

- Damaged input speed sensor seal
- Damaged manual shaft seal
- Loose or damaged oil cooler lines/seals
- Worn or damaged axle shaft oil seal
- Loose line pressure pipe plug or fluid level pipe plug
- Porous casting
- Warped torque damper housing
- Damaged damper housing to case seal

Leak at the Torque Damper End

- Damper leak in the weld area
- Damper seal lip cut. Check the damper hub for damage
- Damper seal bushing moved forward and damaged
- Damper seal garter spring missing from the seal
- Porous casting of the torque damper housing

Leak at the Vent

- Overfilled system
- Water or coolant in the fluid; The fluid will appear milky
- Transmission case porous
- Incorrect fluid level indicator causing an overfilled system
- Plugged vent

Leak Inspection Points

-
- (1) Manual Shift Shaft Seal
 - (2) A/Trans Fluid Passage Plug
 - (3) Case Extension Assembly
 - (4) Auxiliary Pump Press Plug
 - (5) Control Valve Body Cover Wiring Connector Hole Seal
 - (6) Drive Motor/Generator Power Inverter Module Cable Assembly Seal - 3 Phase
 - (7) Filler Hole Plug

- (8) Auxiliary Fluid Motor Retainer
- (9) Torque Damper Housing Outer Seal
- (10) Wiring Connector Seal
- (11) A/Trans Vent Assembly
- (12) Front Wheel Drive Shaft Oil Seal Assembly (LHS)
- (13) Oil Level Plug
- (14) A/Trans Torque Damper Fluid Seal Assembly
- (15) A/Trans Torque Damper Assembly
- (16) Front Wheel Drive Shaft Oil Seal Assembly (RHS)
- (17) Control Valve Body Cover Gasket
- (18) Transmission Fluid Drain Plug
- (19) A/Trans Case Cover Gasket

Whine/Growl Noise That Changes with Vehicle Speed

Checks	Causes
Input Shaft Thrust Bearing Assembly	Inspect the bearing for wear or damage.
Sun Gear Carrier Thrust Bearing Assembly	<ul style="list-style-type: none"> Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. Inspect for a damaged centre support roller bearing assembly. Inspect for damaged thrust bearings. Inspect for damaged sun gears. Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured). Inspect for damaged or stripped splines on the output carrier assembly.
Internal Gear Thrust Bearing Assembly	Inspect the bearing for wear or damage.
Front Differential Carrier Assembly	Inspect for damaged gears and bearings.
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly	Inspect for damaged gears and bearings.
Variable High 2-3-4 Clutch Hub Thrust Bearing Assembly	Inspect the bearings for wear or damage.
Variable High 2-3-4 Clutch Housing Thrust Bearing Assembly	Inspect the washer for wear or damage.
Input Shaft Bushing	Inspect the bushing for wear or damage.
1-3R Clutch Housing Bushing	Inspect the bushing for wear or damage.
Internal Gear Thrust Washer	Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers.
Internal Gear Thrust Bearing Assembly	Inspect the bearing for wear or damage.
Output Shaft Thrust Bearing Assembly	Inspect the output carrier inner sun gear shaft bearing for damage or wear.
Variable High 2-3-4 Clutch Housing Thrust Bearing Assembly	<ul style="list-style-type: none"> Inspect for damaged or restricted fluid filter assembly. Inspect for damaged fluid filter seal assembly or improper sealing interface (leaks, fluid aeration).
Internal Gear Thrust Washer	Inspect the washer for wear or damage.

Noise in Drive or Reverse Gear

Checks	Causes
Variable Low 1-2R Clutch Assembly	<ul style="list-style-type: none"> • Inspect for damaged or worn VL1-2R clutch plates. • Inspect for damaged VL1-2R clutch backing plate. Inspect for worn splines on backing plate. • Inspect for damaged VL1-2R clutch backing plate retaining ring. • Inspect for damaged VL1-2R clutch piston assembly, spring, spring retaining ring, and centre support assembly.
Front Differential Carrier Assembly	Inspect for damaged gears and bearings.
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly	Inspect for damaged gears and bearings.

Vibration

Checks	Causes
Lug bolts for the Torque Damper	Inspect for loose torque damper lug bolts.
Sun Gear Thrust Washer	Inspect for wear or damage.
Input Shaft Thrust Bearing Assembly	Inspect for wear or damage.
Variable High 2-3-4 Clutch Hub Thrust Bearing Assembly	Inspect the bearing for wear or damage.
Sun Gear Carrier Assembly	<ul style="list-style-type: none"> Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. Inspect for a worn or damaged centre support roller bearing assembly. Inspect for damaged thrust bearings. Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured).
Front Differential Carrier Assembly	Inspect for damaged gears and bearings.
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly	Inspect for damaged gears and bearings.
Internal Gear Thrust Bearing Assembly - 2nd Position	Inspect the bearing for wear or damage.

Noise and Vibration Analysis

A noise or vibration that is noticeable when the vehicle is in motion MAY NOT be the result of the transmission.

If noise or vibration is noticeable in PARK and NEUTRAL with the engine at idle, but is less noticeable as RPM increases, the cause may be from poor engine performance.

- Vibration may also be caused by a small amount of water inside the torque damper.
- Inspect the tyres for the following conditions:
 - Uneven wear
 - Imbalance
 - Mixed sizes
 - Mixed radial and bias ply
- Inspect the suspension components for the following conditions:
 - Alignment wear or damage
 - Loose fasteners
 - Driveline damage or wear
- Inspect the engine and transmission mounts for damage and loose bolts.
- Inspect the transmission case mounting holes for the following conditions:
 - Missing bolts, nuts, and studs
 - Stripped threads
 - Cracks
- Inspect the flywheel for the following conditions:
 - Missing or loose bolts
 - Cracks
 - Imbalance
- Inspect the torque damper for the following conditions:
 - Missing or loose bolts or lugs
 - Missing or loose balance weights
 - Imbalance caused by heat distortion or fluid contamination

Volt

No Park or Drive

Checks	Causes
Front Differential Carrier Assembly	Inspect for damaged gears and bearings.
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly	Inspect for damaged gears and bearings.

No Drive in All Ranges

Checks	Causes
Carrier Assembly	<ul style="list-style-type: none"> • Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. • Inspect for damaged thrust bearings. • Inspect for damaged sun gears. • Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured).
Drive Motor with Generator Position B (2)	Motor Failure <ul style="list-style-type: none"> • Inspect 3 phase cables • Inspect connections at motor • Inspect motor end bearings
Thrust Bearing 1st, 2nd and 3rd Positions Assembly	Inspect the bearing for wear or damage.
Output Shaft Assembly	Inspect for damaged internal gears.
Front Differential Carrier Assembly	Inspect for damaged gears and bearings.
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly	Inspect for damaged gears and bearings.
Sun Gear	Inspect for spline wear or damage.
Fluid Filter Assembly	<ul style="list-style-type: none"> • Inspect for damaged or restricted fluid filter assembly. • Inspect for damaged fluid filter seal assembly or improper sealing interface, leaks, and fluid aeration.
Automatic Transmission Fluid Pump Seal	Inspect for worn or damaged seal.
Auxiliary Fluid Pump Seal	Inspect for worn or damaged seal.

No Reverse Gear

Checks	Causes
Carrier Assembly	<ul style="list-style-type: none"> • Inspect the carrier assembly for damaged pinion gears, thrust washers, pins, and rollers. • Inspect for damaged thrust bearings. • Inspect for damaged sun gears. • Inspect the carrier assembly for damaged output carrier rear sun gear thrust bearing (captured).
Drive Motor with Generator - Position B (2)	<p>Motor Failure</p> <ul style="list-style-type: none"> • Inspect 3 phase cables. • Inspect connections at motor. • Inspect motor end bearings.
Thrust Bearing 1st 2nd and 3rd Positions Assembly	Inspect the bearing for wear or damage.
Output Shaft Assembly	Inspect for damaged internal gears.
Front Differential Carrier Assembly	Inspect for damaged gears and bearings.
Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly	Inspect for damaged gears and bearings.
Sun Gear	Inspect for spline wear or damage.
Fluid Filter Assembly	<ul style="list-style-type: none"> • Inspect for damaged or restricted fluid filter assembly. • Inspect for damaged fluid filter seal assembly or improper sealing interface, leaks, and fluid aeration.
Automatic Transmission Fluid Pump Seal	Inspect for worn or damaged seal.
Auxiliary Fluid Pump Seal	Inspect for worn or damaged seal.

No Drive or Reverse Gear

Checks	Causes
Variable Low 1-2R Clutch Assembly	<ul style="list-style-type: none">• Inspect for damaged VL1-2R clutch housing assembly.• Inspect for damaged or distorted shaft.
Variable High 2-3-4 and 1-3R Clutch Hub Assembly	<ul style="list-style-type: none">• Inspect for damaged or distorted shaft on hub assembly.• Inspect the output carrier inner sun gear shaft bushings for damage or wear.

Harsh, Soft, Delayed or Slipping Drive or Reverse Gear

Checks	Causes
Variable Low 1-2R Clutch Assembly	<ul style="list-style-type: none">• Inspect for damaged or worn low and VL1-2R clutch plates.• Inspect for damaged VL1-2R clutch backing plate. Inspect for worn splines on backing plate.• Inspect for damaged VL1-2R clutch backing plate retaining ring.• Inspect for damaged VL1-2R clutch piston assembly, spring, spring retaining ring, and centre support assembly.

Stuck in Drive or Reverse Gear

Checks	Causes
Variable Low 1-2R Clutch Assembly	<ul style="list-style-type: none">• Inspect for damaged or worn VL1-2R clutch plates.• Inspect for damaged VL1-2R clutch backing plate. Inspect for worn splines on backing plate.• Inspect for damaged VL1-2R clutch backing plate retaining ring.• Inspect for damaged VL1-2R clutch piston assembly, spring, spring retaining ring, and centre support assembly.

Harsh Garage Shift

Checks	Causes
Variable Low 1-2R Clutch Assembly	Inspect for damaged or worn VL1-2R clutch plates.

Auxiliary Fluid Pump Control Module Replacement

The Auxiliary Fluid Pump Control Module is integrated into the Drive Motor Generator Power Inverter Module. If the Auxiliary Fluid Pump Control Module needs to be replaced, a new Drive Motor Generator Power Inverter Module must be installed. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .

Transmission Control Lever Knob Replacement

Callout	Component Name
1	<p data-bbox="263 1373 526 1419">Shift Control Knob</p> <p data-bbox="263 1455 424 1500">Procedure</p> <p data-bbox="263 1536 876 1581">Place the shift lever in the Neutral position.</p>

Tip

To remove the knob, pull upward with a twisting motion. Considerable effort may be required to remove the knob from the shift control lever.

Transmission Control Replacement

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the front floor console. Refer to [Front Floor Console Replacement](#) .

3. Slide the shift cable retaining clip (1) toward the front of the vehicle.
4. Disconnect the shift cable (2) from the shift control actuator pin (3).
5. Slide the shift cable (2) upward to remove from shift control base (4).

6. Disconnect the electrical connector (1) from the shift control assembly.
7. Disconnect the wiring harness retainers (2) from the shift control assembly.
8. Remove the inflatable restraint sensing and diagnostic module. Refer to [Inflatable Restraint Sensing and Diagnostic Module Replacement](#) .

9. Remove the four fasteners (1).
10. Remove the shift control assembly from the instrument panel tie bar assembly.

Installation Procedure

1. Install the shift control assembly to the instrument panel tie bar assembly.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the shift control assembly fasteners (1) and tighten to **10 N·m (89 lb in)**.

3. Install the electrical connector (1) to the shift control assembly.
4. Install the wiring harness retainers (2) to the shift control assembly.

5. Install the shift cable (2) in the shift control base (4).
6. Slide the shift cable retaining clip (1) toward the rear of the vehicle.
7. Connect the shift cable (2) to the shift control actuator pin (3).
8. Install the inflatable restraint sensing and diagnostic module. Refer to [Inflatable Restraint Sensing and Diagnostic Module Replacement](#) .
9. Install the front floor console. Refer to [Front Floor Console Replacement](#) .
10. Check transmission for proper operation. If necessary, adjust shift cable. Refer to [Range Selector Lever Cable Adjustment](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

11. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

Automatic Transmission Range Selector Lever Replacement

Removal Procedure

1. Set the park brake and chock the wheels.

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the hybrid high voltage system. Refer to [High Voltage Disabling](#) .

3. Disconnect the transmission range selector lever cable terminal (1) from the transmission manual gear shift lever pin.

Warning: Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position.

4. Press the locking tab (1) rearward in order to release the transmission range selector lever cable (2) from the cable bracket.

5. Remove the transmission range selector lever nut (1).
6. Remove the transmission range selector lever (2).

Installation Procedure

Warning: Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position.

1. Install the transmission range selector lever (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the transmission range selector lever nut (1) and tighten to **30 N·m (22 lb ft)**.

3. Install the transmission range selector lever cable (2) to the cable bracket.
4. Press the locking tab (1) forward in order to retain the transmission range selector lever cable (2) to the cable bracket (3).

5. Connect the transmission range selector lever cable terminal (1) to the transmission manual gear shift lever pin.
6. Check the range selector cable adjustment. Refer to [Range Selector Lever Cable Adjustment](#) .
7. Enable the hybrid high voltage system. Refer to [High Voltage Enabling](#) .

Range Selector Lever Cable Replacement

Removal Procedure

1. Set the park brake and chock the wheels.

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the hybrid high voltage system. Refer to [High Voltage Disabling](#) .

3. Disconnect the transmission range selector lever cable terminal (1) from the transmission manual gear shift lever pin.

4. Press the locking tab (1) rearward in order to release the transmission range selector lever cable (2) from the cable bracket.
5. Remove the front floor console extension - left. Refer to [Front Floor Console Extension Replacement - Left Side](#) .

6. Press the locking tab (1) forward in order to release the transmission range selector lever cable (2) from the shift control base (4).
7. Disconnect the transmission range selector lever cable terminal (3) from the transmission manual gear shift lever pin.
8. Remove the shift cable from shift control base.

9. Pull the insulation panel flap (1) down to gain access to the shift cable grommet.

10. Gently pry the grommet (1) out, then remove the shift cable from the vehicle.

Installation Procedure

1. Position the shift cable in the vehicle.

2. Install the shift cable grommet (1) into the panel.

3. Position the insulation panel flap (1) up to cover the shift cable grommet.
4. Position the shift cable in the shift control base.

5. Press the locking tab (1) rearward to retain the transmission range selector lever cable (2) in the shift control base (4).
6. Connect the transmission range selector lever cable terminal (3) to the shift control shift lever pin.
7. Install the front floor console extension - left. Refer to [Front Floor Console Extension Replacement - Left Side](#) .

8. Install the transmission range selector lever cable (2) to the cable bracket (3).
9. Press the locking tab (1) forward in order to retain the transmission range selector lever cable (2) to the cable bracket (3).

10. Connect the transmission range selector lever cable terminal (1) to the transmission manual gear shift lever pin.
11. Perform the range selector cable adjustment. Refer to [Range Selector Lever Cable Adjustment](#) .
12. Enable the hybrid high voltage system. Refer to [High Voltage Enabling](#) .

Range Selector Lever Cable Adjustment

Note: Adjust the automatic transmission range selector cable while the transmission and the gear selector are in the Park position only. Failure to do so may cause misadjustment.

1. Set the park brake and chock the wheels.

2. Pull the retaining collar (1) forward, then release the range select cable adjuster clip (2) by pushing out on the adjuster clip from the side.
3. Verify the transmission range select lever is in the park position.
4. Verify the transmission shift control lever is in the park position.

5. Depress the adjuster clip (2) locking the adjuster clip completely, then release the retaining collar.
6. Ensure that the cable adjuster is secured.
7. Check the transmission range select lever in all gear selections for proper operation.

Range Selector Lever Cable Bracket Replacement

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the hybrid high voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the drive motor generator power inverter module from the vehicle. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .

3. Disconnect the transmission range selector lever cable terminal (1) from the transmission manual gear shift lever pin.

4. Press the locking tab (1) rearward in order to release the transmission range selector lever cable (2) from the cable bracket.

5. Remove the shift control cable bracket bolts (1).
6. Remove the shift control cable bracket (2).

Installation Procedure

Caution: Refer to [Fastener Caution](#) in the Preface section.

1. Install the transaxle shift control bracket and bolts, then tighten the bolts to **22 N·m (16 lb ft)**.

2. Install the transmission range selector lever cable (2) to the cable bracket.
3. Press the locking tab (1) forward in order to retain the transmission range selector lever cable (2) to the cable bracket (3).

4. Connect the transmission range selector lever cable terminal (1) to the transmission manual gear shift lever pin.
5. Check the range selector cable adjustment. Refer to [Range Selector Lever Cable Adjustment](#) .
6. Install the drive motor generator power inverter module in the vehicle. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
7. Enable the hybrid high voltage system. Refer to [High Voltage Enabling](#) .

Transmission Fluid Replacement

Callout	Component Name
<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <p>Preliminary Procedure</p>	

Raise the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

1	<p>Fluid Drain Plug</p> <p>Caution: Refer to Component Fastener Tightening Caution in the Preface section.</p> <p>Note: Place a drain pan capable of containing more than 5 quarts of fluid under the transmission before removing the plug to drain the fluid.</p> <p>Tighten 12 N·m (106 lb in)</p>
2	<p>Fluid Filler Plug</p> <p>Note:</p> <ul style="list-style-type: none">• Transmission will require approximately 6.5-7 Litres 7-7.4 quarts of fluid.• Fill the transmission with fluid. Refer to Transmission Fluid Level and Condition Check . <p>Tighten 20 N·m (15 lb ft)</p>

Transmission Fluid Cooler Thermal Bypass Valve Replacement

Callout	Component Name
Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Preliminary Procedure	

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove the front bumper upper fascia. Refer to [Front Bumper Upper Fascia Replacement](#) : Volt → Ampera
3. Remove the transmission fluid cooler outlet pipe from thermal bypass valve. Refer to [Transmission Fluid Cooler Outlet Pipe Replacement](#)
4. Remove the transmission fluid cooler inlet pipe from thermal bypass valve. Refer to [Transmission Fluid Cooler Inlet Pipe Replacement](#)

1	<p>Transmission Fluid Cooler Thermal Bypass Valve Bolt</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Transmission Fluid Cooler Thermal Bypass Valve Quick Connect Fitting.</p> <p>Procedure</p> <p>Disconnect quick connect fittings from radiator. Refer Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection</p>
3	<p>Transmission Fluid Cooler Thermal Bypass Valve</p>

Transmission Fluid Cooler Pipe Connector Replacement - Radiator

For equivalent regional tools, Refer to [Special Tools](#)

Removal Procedure

1. Place a drain pan under vehicle.
2. Remove the transmission fluid cooler thermal bypass valve. Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#).

3. Remove the oil cooler fitting (1) from the radiator.

Installation Procedure

1. Inspect the new O-ring seals for cracks, cuts or damage. Replace if necessary.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: The correct thread engagement is critical. Cross-threaded fittings can achieve proper tightness and still leak.

2. Install the oil cooler fitting (1) to the radiator and tighten to **38 N·m (28 lb ft)**.
3. Install the transmission fluid cooler thermal bypass valve. Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#) .
4. Adjust the transmission fluid level.
5. Inspect for fluid leaks.

Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection

Special Tools

GE-41623 Cooler Quick Connect Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Removal Procedure](#)

1. Install the *GE-41623* cooler quick connect tool onto the transmission oil cooler (TOC) pipe.

2. Slide the *GE-41623* cooler quick connect tool toward the TOC pipe fitting.

Note: Rotate the *GE-41623* cooler quick connect tool to engage the TOC pipe fitting retainer slots.

The *GE-41623* cooler quick connect tool should be nearly flush with the fitting.

3. Connect the *GE-41623* cooler quick connect tool onto the TOC pipe fitting.

4. Rotate the *GE-41623* cooler quick connect tool until the retainer clip (1) rises above the fitting retainer seat.

5. Pull back on the TOC pipe to disengage the pipe from the TOC pipe fitting.
6. Remove the *GE-41623* cooler quick connect tool from the TOC pipe.

[Installation Procedure](#)

Note: Inspect the TOC pipe fitting and retaining clip for signs of wear or damage. Replace the components if necessary.

1. Install the TOC pipe into the TOC pipe fitting.

A distinct snap should be heard or felt when assembling the TOC pipe to the fitting.

2. To ensure the cooler line is properly installed, give the cooler pipe a gentle pull.

Transmission Fluid Auxiliary Cooler Replacement

Removal Procedure

1. Remove the air conditioning condenser. Refer to [Air Conditioning Condenser Replacement](#) .
2. Remove the transmission fluid cooler thermal bypass valve. Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#) .

3. Remove the air conditioning condenser bracket (1) from the radiator.

Note: Depress tabs to release transmission fluid auxiliary cooler from the air conditioning condenser bracket.

4. Remove the transmission fluid auxiliary cooler (1) from the air conditioning condenser bracket.

[Installation Procedure](#)

Note: Depress tabs to install transmission fluid auxiliary cooler to the air conditioning condenser bracket.

1. Install the transmission fluid auxiliary cooler (1) to the air conditioning condenser bracket.

2. Install the air conditioning condenser bracket (1) to the radiator.
3. Install the transmission fluid cooler thermal bypass valve. Refer to [Transmission Fluid Cooler Thermal Bypass Valve Replacement](#) .
4. Install the air conditioning condenser. Refer to [Air Conditioning Condenser Replacement](#) .

Transmission Fluid Cooler Outlet Pipe Replacement

Callout

Component Name

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedure

1. Disable hybrid high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Remove the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
3. Remove the front wheelhouse front liner on the driver side. Refer to [Front Wheelhouse Front Liner Replacement](#) .

1	<p>Transmission Fluid Cooler Outlet Pipe Bolt</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 22 N·m (16 lb ft)</p>
2	<p>Transmission Fluid Cooler Outlet Pipe Quick Connect Fitting</p> <p>Procedure</p> <p>Disconnect the transmission pipe from the transmission fluid cooler thermal bypass valve quick connect fitting. Refer to Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection .</p>
3	<p>Transmission Fluid Cooler Outlet Pipe</p>

Transmission Fluid Cooler Inlet Pipe Replacement

Callout

Component Name

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedure

1. Disable hybrid high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#)
2. Remove the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#)
3. Remove the front wheelhouse front liner on the driver side. Refer to [Front Wheelhouse Front Liner Replacement](#)

1	<p>Transmission Fluid Cooler Inlet Pipe Bolt</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 22 N·m (16 lb ft)</p>
2	<p>Transmission Fluid Cooler Inlet Pipe Quick Connect Fitting</p> <p>Procedure</p> <p>Disconnect the transmission pipe from the transmission fluid cooler thermal bypass valve quick connect fitting. Refer to Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection</p>

Automatic Transmission Fluid Pressure Test Hole Plug Replacement

Callout	Component Name
Preliminary Procedure	
Raise the vehicle. Refer to Lifting and Jacking the Vehicle .	
	Fluid Pressure Test Plug

1

Caution: Refer to [Fastener Caution](#) in the Preface section.

Tighten

12 N·m (106 lb in)

Front Wheel Drive Shaft Seal Replacement - Left Side

Callout

Component Name

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Preliminary Procedures

1. Raise the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the left wheel drive shaft. Refer to [Front Wheel Drive Shaft Replacement](#) .

Left Front Wheel Drive Shaft Oil Seal

Note:

- For seal removal use *GE-6125-1B* Slide Hammer with Adaptor. with *GE-23129* Universal Seal Remover .
- For seal installation use *GE-8092* Driver Handle with *DT-50301* Seal Installer .

1

Special Tools

- *DT-50301* Seal Installer
- *GE-6125-1B* Slide Hammer with Adaptor
- *GE-8092* Driver Handle
- *GE-23129* Universal Seal Remover

For equivalent regional tools, refer to [Special Tools](#) .

Front Wheel Drive Shaft Seal Replacement - Right Side

Callout

Component Name

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Preliminary Procedures

1. Raise the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the intermediate drive shaft. Refer to [Front Wheel Drive Intermediate Shaft Replacement](#) .

Right Front Wheel Drive Shaft Oil Seal

Note:

- For seal removal use *GE-6125-1B* Slide Hammer with Adaptor. with *GE-23129* Universal Seal Remover .
- For seal installation use *GE-8092* Driver Handle with *DT-50301* Seal Installer .

1

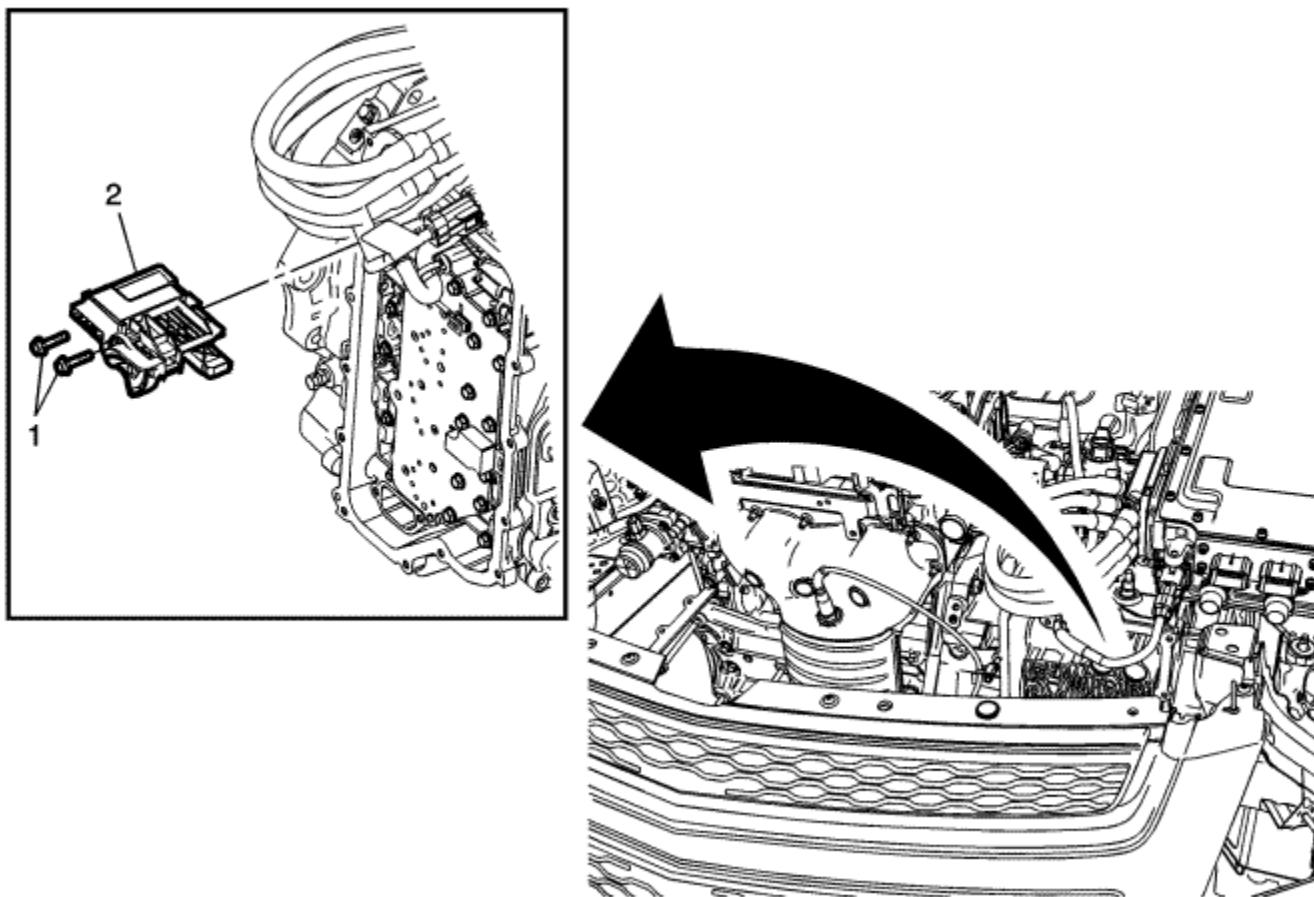

Special Tools

- *GE-6125-1B* Slide Hammer with Adaptor
- *GE-8092* Driver Handle
- *GE-23129* Universal Seal Remover
- *DT-50301* Seal Installer

For equivalent regional tools, refer to [Special Tools](#) .

Manual Shift Shaft Position Switch Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the control valve body cover. Refer to Control Valve Body Cover Replacement .2. Disconnect the neutral switch electrical and reposition harness as necessary.3. Adjust the switch as follows:	

- 3.1. Set the transmission range to Neutral.
- 3.2. Loosen position switch bolts, they are slotted.
- 3.3. Lock the switch in the Neutral position by engaging the switch locking lever. The lever will only engage if in the Neutral position.
- 3.4. Tighten the switch bolts.
- 3.5. Disengage the switch lock lever and place the transmission in Park.

1	<p>A/Trans Manual Shift Shaft Position Switch Bolt M6 x 25 mm (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	A/Trans Manual Shift Shaft Position Switch Assembly

Control Valve Body Cover Replacement

Removal Procedure

1. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

3. Remove the drive motor battery radiator surge tank. Refer to [Drive Motor Battery Radiator Surge Tank Replacement](#) .
4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Drain the transmission. Refer to [Transmission Fluid Replacement](#) .
6. Disconnect the transmission auxiliary fluid pump wire retainer from the upper retaining stud on the control valve body cover.

7. Remove the wire harness retainer (2) from the control valve body cover stud, if fitted.
8. Disconnect the control valve body transmission control module (TCM) electrical connector (1).

9. Disconnect the heated oxygen sensor wire retainer (1) from the control valve body cover stud.
10. Disconnect the heated oxygen sensor connectors (2, 3).
11. Remove the connector bracket retaining fasteners (4).
12. Position bracket away from the control valve body cover.

13. Remove the 14 control valve body cover fasteners (1,2).
14. Remove the control valve body cover.
15. Remove the control valve body cover gasket, if necessary.

Caution: Support the control solenoid valve assembly around the connector when removing the seal. Excessive pulling force can damage the internal electrical connections.

16. Remove the control valve body cover wiring connector hole seal, If necessary.
17. Remove all traces of the old gasket material. Clean the transmission case and control valve body cover gasket surfaces.

Installation Procedure

1. Install the control valve body cover wiring connector hole seal, if removed.
2. Install the control valve body cover gasket to the control valve body cover, if removed.
3. Install the control valve body cover.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Install all control valve body cover bolts and studs by hand then torque all bolts and studs in the sequence shown.

4. Tighten the 14 control valve body cover fasteners in the sequence shown to **9 N·m (80 lb in)**.

5. Connect the control valve body TCM electrical connector (1).
6. Install the wire harness retainer (2) to the control valve body cover stud.
7. Connect the transmission auxiliary fluid pump wire retainer to the upper retaining stud on the control valve body cover.

8. Connect the heated oxygen sensor wire retainer (1) to the control valve body cover stud.
9. Position bracket on the control valve body cover studs.
10. Install the connector bracket retaining fasteners (4), Then tighten the fasteners (4) to **9 N·m (80 lb in)**.
11. Connect the heated oxygen sensor connectors (2, 3).
12. Lower the vehicle.
13. Fill the transmission. Refer to [Transmission Fluid Replacement](#) .
14. Install the drive motor battery radiator surge tank. Refer to [Drive Motor Battery Radiator Surge Tank Replacement](#) .
15. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
16. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
17. Check for leaks.

Control Valve Body Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the control solenoid valve and transmission control module assembly. Refer to Control Solenoid Valve and Transmission Control Module Assembly Replacement . 2. For removal of the manual shift shaft position switch, refer to Manual Shift Shaft Position Switch and Fluid Level Control Valve Removal . 	

3. For installation of the manual shift shaft position switch, refer to [Manual Shift Shaft Position Switch and Fluid Level Control Valve Installation](#) .

1	<p>Control Valve Body Bolt M6 x 42 mm (Qty: 5)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Tighten the bolts in the sequence shown.</p> <p>Tighten 10 N·m (89 lb in)</p>
2	<p>Control Valve Body Bolt M6 x 48 mm (Qty: 12)</p> <p>Procedure</p> <p>Tighten the bolts in the sequence shown.</p> <p>Tighten 10 N·m (89 lb in)</p>

Control Solenoid Valve and Transmission Control Module Assembly Replacement

Callout

Component Name

Preliminary Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Remove the control valve body cover. Refer to [Control Valve Body Cover Replacement](#) .

1	Transmission Fluid Cooler Outlet Washer
2	Transmission Fluid Cooler Outlet Seal Tip Install a NEW seal. It is not reusable.
3	A/Trans Wiring Extension Harness Assembly Procedure Make sure you connect all four connectors on the wiring harness in the appropriate locations. Tip The wiring harness is attached to the fluid cooler outlet pipe and they will come out together.
4	Transmission Fluid Cooler Outlet Pipe Assembly
5	Fluid Cooler Outlet Pipe Assembly Bolt M5 x 16 mm (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 7.25 N·m (64.2 lb in)
6	Transmission Fluid Cooler Pipe Nut Tighten 9 N·m (80 lb in)
7	Control Valve Body Bolt M6 x 80 mm (Qty: 1) Tighten 9.5 N·m (84 lb in)
	Control Valve Body Bolt M6 x 65 mm (Qty: 5) Procedure

8	Tighten the bolt in sequence shown. Tighten 9.5 N·m (84 lb in)
9	Control Solenoid Valve Spring
10	Control Valve Body Bolt M6 x 75 mm (Qty: 4) Procedure Tighten the bolt in sequence shown. Tighten 9.5 N·m (84 lb in)
11	Control Valve Body Bolt M6 x 42 mm (Qty: 1) Tighten 9.5 N·m (84 lb in)
12	Control Solenoid (w/Body and TCM) TEHCM Valve Assembly Procedure Program the control solenoid valve and transmission control module assembly. Refer to <u>Control Solenoid Valve and Transmission Control Module Assembly Programming and Setup</u> : 4ET50 .

Transmission Mount Bracket Replacement - Rear

Callout	Component Name
Preliminary Procedure	
Remove the catalytic converter pipe. Refer to Catalytic Converter Replacement .	
1	Transmission Mount Bracket
	Fastener (Qty: 4)

2

Caution: Refer to [Component Fastener Tightening Caution](#) in the Preface section.

Tip

Tighten the bracket to transmission fasteners in the sequence as shown.

Tighten

100 N·m (74 lb ft)

Transmission Mount Transmission-Side Bracket Replacement

Callout

Component Name

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedures

1. Remove the left transmission mount from the vehicle. Refer to [Transmission Mount Replacement - Left Side](#) .
2. Remove the range selector lever cable bracket. Refer to [Range Selector Lever Cable Bracket Replacement](#) .

1	<p>Fastener (Qty: 5)</p> <p>Caution: Refer to Component Fastener Tightening Caution in the Preface section.</p> <p>Caution: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause damage to the vehicle or component.</p> <p>Procedure</p> <p>Tighten in the sequence shown.</p> <p>DO NOT reuse the bolts. Discard and replace with NEW bolts only.</p> <p>Tighten 50 N·m (37 lb ft) plus 50 degrees</p>

Transmission Replacement

Removal Procedure

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Place the vehicle on a hoist. Refer to [Lifting and Jacking the Vehicle](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

2. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
3. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
4. Remove the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
5. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
6. Using mechanic's wire, secure the radiator assembly to the radiator core support.

7. Remove the three upper bell housing fasteners (1).

8. Press the locking tab (1) rearward in order to release the transmission range selector lever cable (2) from the cable bracket.

9. Disconnect the transmission range selector lever cable terminal (1) from the transmission manual pin, then position the cable out of the way.

10. Remove the shift control cable bracket fasteners (1), then the bracket (2) from the transmission.

Warning: Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position.

11. Remove the transmission range selector lever nut (1).
12. Remove the transmission range selector lever (2).

13. Remove the transmission fluid cooler inlet pipe fastener (1), then disconnect the inlet pipe (2) from the transmission.
14. Inside the passenger compartment, disconnect the intermediate steering shaft from the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

15. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

16. Remove the catalytic converter assembly (4) from the vehicle. Refer to [Catalytic Converter Replacement](#) .
17. Drain the transmission fluid. Refer to [Transmission Fluid Replacement](#) .

18. Remove the heater inlet and outlet pipe to frame fasteners (1).
19. Remove the front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .

20. Remove the stabiliser link nuts (1) from the two front stabiliser links.
21. Disconnect the stabiliser links from the strut assemblies.
22. Disconnect the outer tie rod ends from the steering knuckles. Refer to [Steering Linkage Outer Track rod Replacement](#) .

Note: Do Not disconnect the brake hoses from the callipers.

23. Remove the front brake callipers from the calliper brackets, then suspend the callipers with mechanic's wire to the body.
24. Disconnect the front steering knuckles from the strut assemblies. Refer to [Steering Knuckle Replacement](#) .

25. Remove the heater water auxiliary pump fasteners (1), then position the pump out of the way.

26. Disconnect the front left and right wheel speed sensor connectors (1).
27. Disconnect the left wheel drive shaft from the transmission, then suspend the wheel drive shaft with mechanic's wire.
28. Disconnect the right wheel drive shaft from the front wheel drive intermediate shaft, then suspend the wheel drive shaft with mechanic's wire.
29. Disconnect the rear transmission mount from the rear transmission bracket.
30. Remove the rear transmission mount bracket from the transmission. Refer to [Transmission Mount Bracket Replacement - Rear](#) .
31. Remove the front wheel drive intermediate shaft. Refer to [Front Wheel Drive Intermediate Shaft Replacement](#) .
32. Lower the vehicle.
33. Install the engine support fixture. Refer to [Engine Support Fixture](#) .
34. Remove the transmission mount side bracket. Refer to [Transmission Mount Transmission-Side Bracket Replacement](#) .
35. Disconnect the transmission fluid cooler outlet pipe from the transmission. Refer to [Transmission Fluid Cooler Outlet Pipe Replacement](#) .
36. Using suitable chains or straps, secure the front of the vehicle to the hoist arms.
37. Disconnect the wiring harnesses from the drivetrain and front suspension frame as necessary.
38. Remove the drive motor battery coolant cooler inlet and outlet hose clip retainer bolt. Refer to [Drive Motor Battery Coolant Inlet Hose Replacement](#) .
39. Using a suitable engine support table or equivalent, lower the vehicle until the drivetrain and front suspension frame contacts the engine support table.

40. Remove the drivetrain and front suspension frame reinforcements (1) from the rear of the frame.
41. Remove the front drivetrain and front suspension retaining bolts.

Note: Slightly raise the vehicle, Do Not raise the vehicle too far or damage to Electrical Power Steering (EPS) wiring harness could occur.

42. Slightly raise the vehicle off of the frame to gain access to the EPS connectors.
43. Disconnect the EPS electrical connectors from the power steering gear assembly. Refer to [FEP Connectors : Steering Gear](#) .
44. Raise the vehicle off the drivetrain and front suspension frame.
45. Position a suitable transmission jack under the transmission.

Warning: Handle with care, the transmission assembly weighs over 90.7 kg (200 lbs). Bodily injury could occur if not handled properly.

46. Using a suitable straps or chains, secure the transmission to the transmission jack.
47. Disconnect the transmission electrical connectors from the transmission, then position the wiring harnesses out of the way.
48. Disconnect the ground strap from the rear of the transmission.
49. Remove the starter opening cover located below the intake manifold.
50. Remove the four torque damper to flywheel bolts.

51. Remove the six lower transmission to engine fasteners (1).
52. Remove the transmission to engine stud.
53. Lower the transmission assembly from the vehicle.

Installation Procedure

1. Position the transmission assembly in the vehicle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the six lower transmission to engine fasteners (1), then tighten to **80 N·m (59 lb ft)**.
3. Install the transmission to engine stud.
4. Install the four torque damper to flywheel bolts, then tighten to **62 N·m (46 lb ft)**.
5. Install the starter opening cover, then tighten to **20 N·m (15 lb ft)**.
6. Connect the ground strap to the rear of the transmission.
7. Connect the transmission electrical connectors to the transmission.
8. Connect the transmission cooler outlet pipe to the transmission. Refer to [Transmission Fluid Cooler Outlet Pipe Replacement](#) .
9. Remove the transmission jack from under the transmission.
10. Position the drivetrain and front suspension frame in the vehicle.

11. Install the four front drivetrain and front suspension frame retaining bolts, then tighten to the fasteners to **160 N·m (118 lb ft)**.
12. Install the drivetrain and front suspension frame reinforcements (1) to the rear of the frame, then tighten the reinforcement fasteners (2) to **22 N·m (16 lb ft)**.
13. Connect the EPS electrical connectors to the power steering gear assembly.
14. Connect the transmission fluid cooler outlet pipe to the transmission. Refer to [Transmission Fluid Cooler Outlet Pipe Replacement](#) .
15. Connect the wiring harnesses from the drivetrain and front suspension frame as necessary.
16. Install the drive motor battery coolant cooler inlet and outlet hose clip retainer bolt. Refer to [Drive Motor Battery Coolant Inlet Hose Replacement](#) .
17. Install the front wheel drive intermediate shaft. Refer to [Front Wheel Drive Intermediate Shaft Replacement](#) .

18. Install the catalytic converter assembly (4). Refer to [Catalytic Converter Replacement](#) .
19. Connect the front steering knuckles to the strut assemblies. Refer to [Steering Knuckle Replacement](#) .

20. Connect the stabiliser link (1) to the strut assemblies. Refer to [Stabiliser Shaft Link Replacement](#) .
21. Install the front brake callipers to the calliper brackets. Refer to Step 2 of the installation procedure. [Front Brake Calliper Replacement](#) .
22. Connect the outer tie rod ends to the steering knuckles. Refer to [Steering Linkage Outer Track rod Replacement](#) .

23. Connect the front left and right wheel speed sensor connectors (1).

24. Install the heater water auxiliary pump fasteners (1), then tighten to the fasteners to **9 N·m (80 lb in)**.

25. Install the heater inlet and outlet pipe to frame fasteners (1), then tighten to the fasteners to **17 N·m (13 lb ft)**.
26. Install the rear transmission mount bracket to the transmission. Refer to [Transmission Mount Bracket Replacement - Rear](#) .
27. Connect the rear transmission mount to the rear transmission bracket.
28. Connect the right wheel drive shaft to the transmission. Refer to [Transmission Rear Mount Replacement](#) .
29. Connect the left wheel drive shaft to the front wheel drive intermediate shaft.
30. Install the front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .
31. Lower the vehicle.
32. Remove the chains or straps, securing the front of the vehicle to the hoist arms.
33. Remove the engine support fixture.
34. Install the transmission mount side bracket. Refer to [Transmission Mount Transmission-Side Bracket Replacement](#) .
35. Remove the engine support fixture.

36. Install the three upper bell housing fasteners (1), then tighten to **80 N·m (59 lb ft)**.

37. Install the transmission fluid cooler inlet pipe to the transmission then tighten the fastener (1) to **22 N·m (16 lb ft)**.
38. Fill the transmission with transmission fluid. Refer to [Transmission Fluid Replacement](#) .

39. Install the shift control cable bracket to the transmission, then tighten the fasteners (1) to **22 N·m (16 lb ft)**.

Warning: Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position.

40. Install the transmission range selector lever (2).
41. Install the transmission range selector lever nut (1) and tighten to **22 N·m (16 lb ft)**.

42. Connect the transmission range selector lever cable terminal (1) to the transmission manual pin.

43. Press the locking tab (1) rearward in order to lock the transmission range selector lever cable (2) to the cable bracket.
44. Connect the intermediate steering shaft to the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .
45. Install the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
46. Install the front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .
47. Install the front tyre and wheels on the vehicle. Refer to [Tyre and Wheel Removal and Installation](#) .
48. Remove the mechanic's wire securing the radiator assembly to the radiator core support.
49. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
50. Install the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
51. Enable the high voltage system. Refer to [High Voltage Enabling](#) .
52. Connect the negative battery cable to the battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .
53. Program the control solenoid valve and transmission control module assembly. Refer to [Control Solenoid Valve and Transmission Control Module Assembly Programming and Setup](#) : [4ET50](#) .

Holding Fixture Installation

Callout	Component Name
	DT-46625 Transmission Holding Fixture
	Warning: Handle with care, the transmission assembly weighs over 183 Kg (403 lbs). Bodily injury could occur if not handled properly.
	Caution: Refer to Fastener Caution in the Preface section.
Tip	

1	<p>Adjust mounting block on fixture to match bosses on case, then tighten bolts to:</p> <p>Tighten 13 N·m (115 lb in)</p> <p>Special Tools</p> <p><i>DT-46625</i> Transmission Holding Fixture</p> <p>For equivalent regional tools, refer to Special Tools .</p>
2	<p>DT-42451-1 Engine Support Adaptor (Qty: 2)</p> <p>Special Tools</p> <p><i>DT-42451-1</i> Engine Support Adaptor</p> <p>For equivalent regional tools, refer to Special Tools .</p>

Torque Damper Removal

Callout	Component Name
Lock Pin	
	Warning: Lock pin must be secured into the bench fixture to hold the transmission and prevent bodily injury.
	Warning: Handle with care, the transmission assembly weighs over 183 Kg (403 lbs). Bodily injury could occur if not handled properly.
Tip	

1	<p>Ensure the <i>DT 3289-20</i> holding fixture is mounted to a bench that is properly supported and will support the weight of the transmission assembly without tipping. <i>DT 39890</i> adaptor and an engine stand can be used as an alternative method for supporting the transmission during repairs.</p> <p>Special Tools</p> <ul style="list-style-type: none"> • <i>DT 3289-20</i> Holding Fixture Base Assembly • <i>DT 39890</i> Transmission Holding Fixture Adaptor <p>For equivalent regional tools, refer to Special Tools .</p>
2	<p>Converter Holding Strap</p> <p>Special Tool</p> <p><i>DT 21366</i> Converter Holding Strap</p> <p>For equivalent regional tools, refer to Special Tools .</p>
3	<p>Automatic Transmission Torque Damper Assembly</p> <p>Caution: Failure to raise the torque damper assembly straight up could damage the torque damper clutch lip seal inside the torque damper clutch assembly.</p>

Control Valve Body Cover Removal

Callout	Component Name
1	Control Valve Body Cover Bolt M6 x 35 mm (Qty: 10)
2	Auxiliary Pump Motor Cable Retainer
3	Fluid Level Control Valve Stud M6 x 40 (Qty: 5)
4	Control Valve Body Cover Assembly
5	Control Valve Body Cover Gasket

6	Control Valve Body Cover Wiring Connector Hole Seal Tip Seal may stay with the cover.
7	Electrical Connector
8	Electrical Connector
9	A/Trans Manual Shift Shaft Position Switch Connector
10	Control Solenoid (w/Body and TCM) TEHCM Valve Assembly Connector
11	Fluid Cooler Outlet Pipe Assembly Bolt M5 x 16 mm (Qty: 2)
12	Variable Drive Pulley Retaining Nut
13	Control Valve Body Bolt M6 x 80 mm (Qty: 1)
14	A/Trans Wiring Extension Harness Assembly Tip The wiring harness is attached to the fluid cooler outlet pipe assembly and they will come out together.
15	Transmission Fluid Cooler Outlet Pipe Assembly
16	Nylon O-Ring
17	Transmission Fluid Cooler Outlet Seal Tip Discard seal, it is not reusable.

Control Solenoid Valve and Transmission Control Module Assembly Removal

Callout	Component Name
1	Control Valve Body Bolt M6 x 65 mm (Qty: 5)
2	Control Solenoid Valve Spring
3	Control Valve Body Bolt M6 x 75 mm (Qty: 4)
4	Control Valve Body Bolt M6 x 42 mm (Qty: 1)
5	Control Solenoid (w/Body and TCM) TEHCM Valve Assembly

Manual Shift Shaft Position Switch and Fluid Level Control Valve Removal

Callout	Component Name
1	A/Trans Fluid Level Control Valve Stud M6 x 40 mm (Qty: 2)
2	A/Trans Fluid Level Control Valve
3	A/Trans Manual Shift Shaft Position Switch Bolt M6 x 25 mm (Qty: 2)
	A/Trans Manual Shift Shaft Position Switch Assembly
<p>Caution: Both the vehicle and manual shift shaft position switch must be in the neutral position. The manual shift shaft position switch has a mechanical lock and</p>	

4

must be locked before removal. Failure to lock the switch in the neutral position may cause vehicle damage.

Procedure

Push down and turn to lock.

Control Valve Body and Channel Plate Removal

Callout	Component Name
1	Control Valve Body Bolt M6 x 42 mm (Qty: 5)
2	Control Valve Body Bolt M6 x 48 mm (Qty: 12)
3	Control Valve Channel Plate Assembly
4	Control Valve Body
5	Control Valve Body Ball Check Valve (Qty: 2)

Output Shaft Removal

Callout	Component Name
1	Front Wheel Drive Shaft Retaining Ring Tip Retaining ring is not reusable. Discard after removal.
	Output Shaft Assembly

2	Special Tools <ul style="list-style-type: none">• <i>GE 6125-1B</i> Slide Hammer With Adaptor• <i>DT 38868</i> Shaft Remover For equivalent regional tools, refer to Special Tools .
3	Front Wheel Drive Shaft Retaining Ring Tip Retaining ring is not reusable. Discard after removal.

Torque Damper and Differential Housing with Fluid Pump Removal

Callout	Component Name
1	Torque Damper and Differential Housing Bolt M10 x 35 mm (Qty: 17)
2	Torque Damper and Differential (w/Fluid Pump) Housing Assembly
3	Torque Damper Housing Outer Seal
4	A/Trans Fluid Outlet Seal Assembly

Front Differential Carrier Assembly Removal

Callout	Component Name
1	Front Differential Carrier Assembly (FWD)
2	Front Differential Carrier Baffle Bolt M6 x 20 mm (Qty: 3)
3	Front Differential Carrier Baffle (Case)

1-3-Reverse Clutch, Input Clutch Hub, and Hub Shaft Removal

Callout	Component Name
1	1-3 Reverse Clutch Thrust Bearing Assembly
2	1-3 Reverse Clutch Assembly
3	Input Carrier Thrust Bearing Assembly
4	Input Clutch Hub
5	Input Clutch Hub Shaft Assembly

6	Input Shaft Retainer
7	Generator/Drive Motor Rotor Hub Shaft
8	Input Clutch Hub Shaft

Drive Motor Generator Rotor and Stator Removal - Unit A

Callout	Component Name
1	Drive Motor/Generator Stator Bolt M6 x 20 mm (Qty: 4)
2	Generator/Drive Motor Stator Cooling Tube Assembly (RHS)
3	Drive Motor/Generator Stator Cooling Tube Seal (Qty: 2) Tip Discard seal, it is not reusable.

4	Drive Motor/Generator Power Inverter Module Cable Connector Bolt M6 x 25 mm (Qty: 3) - Internal
5	Auxiliary Pump Motor Cable Retainer - 3 Phase - Cable A/3-PH Motor
6	Drive Motor/Generator Power Inverter Module Cable Stud M6 x 20 mm (Qty: 3)
7	Drive Motor/Generator Power Inverter Module Cable Assembly - 3 Phase - A
8	Drive Motor/Generator Power Inverter Module Cable Assembly Seal - 3 Phase Tip Discard seal, it is not reusable.
9	Drive Motor/Generator Power Inverter Module Cable Housing Cover Seal Tip Discard seal, it is not reusable.
10	Temperature Sensor Connector
11	Generator/Drive Motor Rotor and Stator Assembly - Unit A Warning: The generator motor weighs approximately 23 kg (50 lbs). Personal injury may result if you lift the generator motor improperly.
12	Generator/Drive Motor Stator Cooling Tube Assembly (LHS) Tip This tube assembly may come out with the motor.

Automatic Transmission Wiring Harness and Output Speed Sensor Removal

Callout	Component Name
1	A/Trans Output Speed Sensor Bolt M6 x 30 mm (Qty: 1)
2	A/Trans Output Speed Sensor Assembly Tip Speed sensor can be disconnected from harness after removal.
	A/Trans Wiring Harness Assembly

3	Tip Use a 32 mm socket to release tabs.
4	Wiring Connector Seal Tip Discard seal, it is not reusable.
5	Front Differential Carrier Lubricant Pipe Bolt M5 x 16 mm (Qty: 1)
6	Front Differential Carrier Lubricant Pipe
7	Front Differential Carrier Lubricant Pipe Seal Tip Discard seal, it is not reusable.

Park Pawl and Manual Shift Shaft Removal

Callout	Component Name
1	Park Pawl Actuator Bolt M6 x 20 mm (Qty: 2)
2	Park Pawl Actuator Bracket
3	Wiring Harness Conduit Bracket
4	Park Pawl Shaft
	Tip

	Hold park pawl spring while removing the shaft.
5	Park Pawl Spring
6	Park Pawl
7	Park Pawl Actuator Guide Pin (Qty: 2) Tip Requires a magnet to remove.
8	Park Pawl Actuator Guide
9	Manual Shaft Detent Lever Hub Pin
10	Manual Shift Shaft Pin
11	Manual Shift Shaft
12	Manual Shift Shaft Detent Lever Assembly
13	Park Pawl Actuator Assembly

Front Differential Drive Pinion Gear with Transfer Gear Removal

Callout	Component Name
1	Front Differential Transfer Drive Gear Fluid Passage Tube Assembly
2	Front Drive Pinion Gear Shaft Thrust Bearing Assembly - Selective (RHS)
3	Front Differential Drive Pinion Gear Bearing Thrust Washer (RHS)
4	Front Differential Drive Pinion (w/Transfer Gear) Gear Assembly
5	Front Differential Drive Pinion Gear Bearing Thrust Washer - Selective

6	Front Drive Pinion Gear Shaft Thrust Bearing Assembly (LHS)
7	Front Differential Bearing Spacer
8	Stator Assembly - Unit B Connector Tip <ol style="list-style-type: none">1. Disconnect the wiring harness.2. For ease of disassembly push the connector through case hole.

Front Wheel Drive Shaft Seal Removal - Case Side

Callout	Component Name
1	<p>Front Wheel Drive Shaft Oil Seal Assembly (LHS)</p> <p>Special Tools</p> <ul style="list-style-type: none"> • GE 6125-1B Slide Hammer With Adaptor • GE 23129 Universal Seal Remover

For equivalent regional tools, refer to [Special Tools](#) .

Case Extension Assembly Removal

Callout	Component Name
1	<p>Case Extension Bolt M10 x 25 mm (Qty: 3)</p> <p>Tip May require <i>GE 23129</i> universal seal remover and <i>GE 6125-1B</i> slide hammer with adaptor to remove.</p> <p>Special Tools</p>

	<ul style="list-style-type: none">• <i>GE 6125-1B</i> Slide Hammer with Adaptor• <i>GE 23129</i> Universal Seal Remover
2	Case Extension Assembly
3	A/Trans Case Extension Seal Tip Discard seal, it is not reusable.

Case Cover Removal

Callout	Component Name
1	A/Trans Wiring Harness Shield Bolt M6 x 20 mm (Qty: 1) - External
2	A/Trans Case Cover Bolt M8 x 30 mm (Qty: 9)
3	Case Cover Stud M8 x 30 (Qty: 2)
4	A/Trans Case Cover Assembly
5	A/Trans Case Cover Gasket

Drive Motor Generator Rotor and Stator Removal - Unit B

Callout	Component Name
1	Drive Motor/Generator Power Inverter Module Cable Connector Bolt M6 x 20 mm (Qty: 3) - Internal
2	Auxiliary Pump Motor Cable Retainer - 3 Phase - Cable B/Resolver
3	Drive Motor/Generator Power Inverter Module Cable Stud M6 x 20 mm (Qty: 3) - External Tip Remove each cable individually after each bolt is removed.

4	Drive Motor/Generator Power Inverter Module Cable Assembly - 3 Phase - B
5	Drive Motor/Generator Power Inverter Module Cable Assembly Seal - 3 Phase (Qty: 3) Tip Discard seal, it is not reusable.
6	Drive Motor/Generator Power Inverter Module Cable Housing Cover Seal Tip Discard seal, it is not reusable.
7	Drive Motor/Generator Stator Bolt M6 x 20 mm (Qty: 4)
8	Drive Motor/Generator Stator Assembly - Unit B Warning: The generator motor weighs approximately 36 kg (80 lbs). Personal injury may result if you lift the generator motor improperly. Tip The shell and or gear set may slip out of the case while removing the drive motor. Special Tools <i>DT 50302 Rotor and Stator Lifter Assembly</i> For equivalent regional tools, refer to Special Tools .

Output Sun Gear, Sun Gear Shaft, Carrier, and Carrier Shell Removal

Callout	Component Name
1	Output Sun Gear Shaft Lubricant O-ring Seal Tip Discard seal, it is not reusable.
2	Output Sun Gear Shaft
3	Output Sun Gear

4	Output Carrier Assembly - C2
5	Output Carrier Shell

Variable High and 2-3-4 Clutch Hub and Clutch Removal

Callout	Component Name
1	Output Carrier Thrust Bearing Assembly
2	Variable Hi and 2-3-4 Clutch Hub
3	Variable Hi and 2-3-4 Clutch Hub Thrust Bearing Assembly
4	Variable Hi and 2-3-4 Clutch Assembly
5	Variable Hi and 2-3-4 Clutch Housing Thrust Bearing Assembly

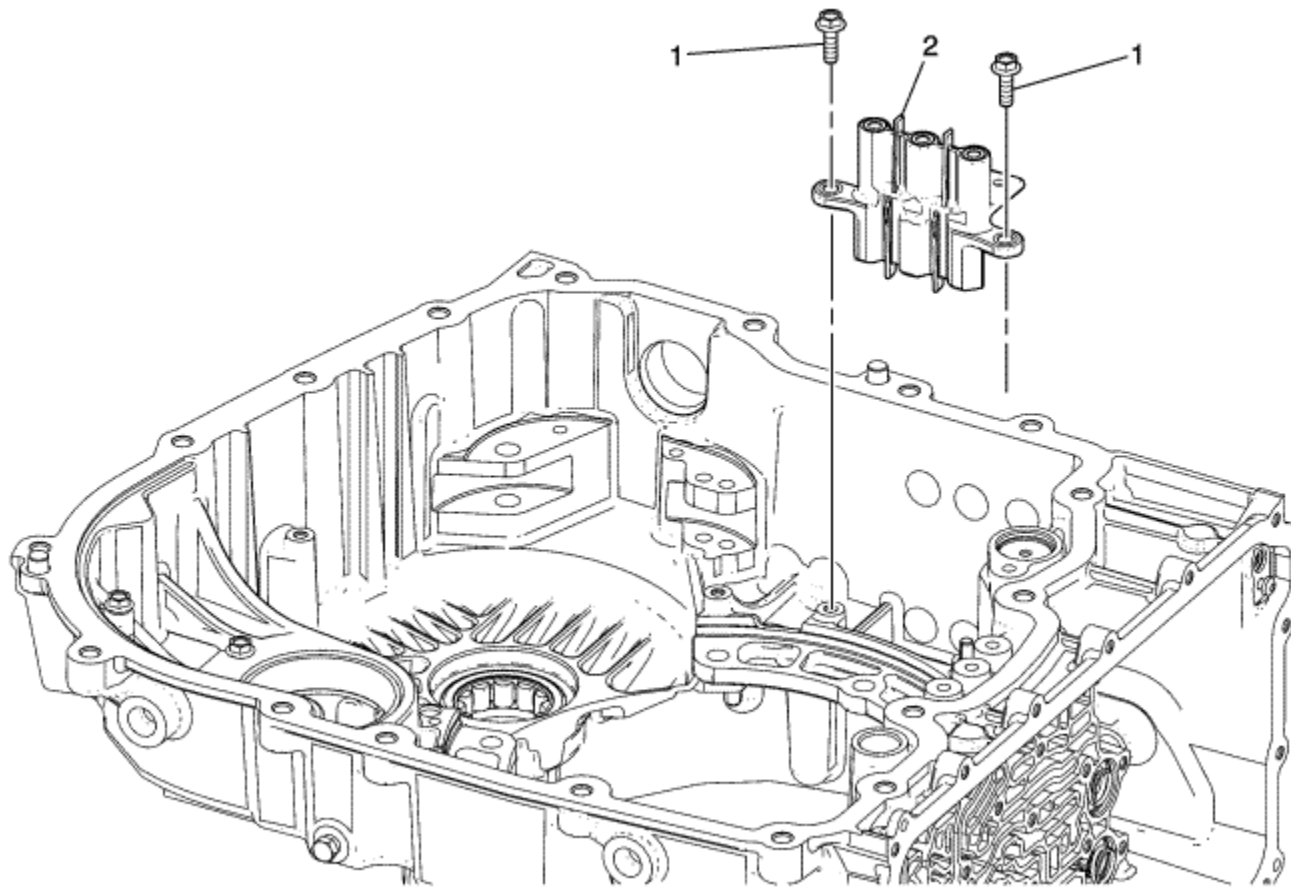

Centre Support Assembly Removal

Callout	Component Name
1	Centre Support Bolt M10 x 25 mm (Qty: 9)
2	Centre (w/Variable Low and 1-2 Reverse Clutch) Support Assembly
3	Centre Support Oil Passage Seal Tip May be stuck to the support assembly.

Drive Motor Power Inverter Module Cable Terminal Insulator Block Removal

Callout	Component Name
1	Drive Motor Generator Power Inverter Module Cable Terminal Insulator Block Bolt M6 x 20 mm (Qty: 2)
2	Drive Motor Generator Power Inverter Module Cable Terminal Insulator Block Assembly

Variable High and 2-3-4, Variable Low and 1-2 Reverse, and 1-3 Reverse Clutch Accumulator Piston Removal

Front Differential Drive Pinion Gear Bearing Cup Replacement - Case Side

Callout	Component Name
Front Differential Drive Pinion Gear Bearing Cup	
Caution: Support the back side of the torque damper housing while installing the bearing cup. Install the bearing cup until it stops moving. Applying excessive pressure to the bearing cup once it is seated could cause damage to the torque Damper housing casting.	
Caution: Failure to apply the lubricant will cause damage to the bolt and nut threads.	

Procedure

1

1. Tighten DT 49266 until it fits snugly on the bearing cup.
2. Adjust DT 45124 so it sits on the torque converter housing surface just beyond the bearing cup opening.
3. Apply the extreme pressure lubricant DT 23444-A to the puller bolt threads to prevent damage to the bolt threads during bearing cup removal.
4. Hold the puller bridge bolt and turn the nut to remove the bearing cup.
5. Use an bearing press with DT-49263 and GE 8092 to install.

Special Tools

- *DT 45124* Removal Bridge

Front Differential Drive Pinion Gear Bearing Cup Removal - Torque Damper Side

Callout	Component Name
Preliminary Procedure	
Do not install the bearing cup until after the selective washer measurement has been performed. Refer to Front Differential Drive Pinion Gear Bearing Thrust Washer and Front Differential Bearing Washer Measurement .	
Front Differential Drive Pinion Gear Bearing Cup	

Caution: Failure to apply the lubricant will cause damage to the bolt and nut threads.

Procedure

1

1. Tighten DT 47927-2 until it fits snugly on the bearing cup.
2. Adjust DT 45124 so it sits on the torque damper housing surface just beyond the bearing cup opening.
3. Apply the extreme pressure lubricant supplied with DT 23444-A to the puller bolt threads to prevent damage to the bolt threads during bearing cup removal.
4. Hold the puller bridge bolt and turn the nut to remove the bearing cup.

Special Tools

- *DT 45124* Removal Bridge
- *DT 47927-2* Bearing Cup Remover
- *DT 23444-A* Extreme Press Lubricant - 1/4 Ounce Tube

For equivalent regional tools, refer to [Special Tools](#) .

Front Differential Bearing Washer - Selective

Front Differential Drive Pinion Gear Roller Bearing and Lubricant Dam Removal - Torque Damper Side

Callout	Component Name
	Front Differential Drive Pinion Gear Roller Bearing Assembly (Differential Housing)
	Caution: Failure to apply the lubricant will cause damage to the bolt and nut threads.
Procedure	

1

1. Tighten DT 49230-1 until it fits snugly on the bearing.
2. Adjust so it sits on the torque damper housing surface just beyond the bearing opening.
3. Apply the extreme pressure lubricant DT 23444-A to the puller bolt threads to prevent damage to the bolt threads during bearing removal.
4. Hold the puller bridge bolt and turn the nut to remove the bearing.

Special Tools

- *DT 45124* Removal Bridge
- *DT 49230-1* Bearing Remover
- *DT 23444-A* Extreme Press Lubricant - 1/4 Ounce Tube

For equivalent regional tools, refer to [Special Tools](#) .

2

Front Differential Drive Pinion Gear Lubricant Dam

Procedure

Slide axle seal puller downward to penetrate lubricant dam. Turn counter clockwise to engage threads, then pull with seal puller.

Special Tools

- *DT 48055* Lubricant Dam Remover
- *GE 6125-1B* Slide Hammer With Adaptor

For equivalent regional tools, refer to [Special Tools](#) .

3	Variable Low and 1-2 Reverse Clutch Spring
4	Variable Low and 1-2 Reverse Clutch Piston Assembly

Variable Low and 1-2 Reverse Clutch Housing and Front Differential Transfer Drive Gear Disassemble

Callout	Component Name
1	Variable Low and 1-2 Reverse Clutch Housing Bolt M6 x 39.5 mm (Qty: 7)
2	Variable Low and 1-2 Reverse Clutch Housing Assembly
3	Variable Low and 1-2 Reverse Clutch Housing (O-ring) Seal
4	Variable Low and 1-2 Reverse Clutch Housing Fluid Passage Seal (Qty: 2)

Input Sun Gear Thrust Bearing Replacement

Callout	Component Name
1	Input Sun Gear Shaft Roller Bearing Assembly Special Tools <ul style="list-style-type: none"> • DT-49263 Bearing Installer • GE 8092 Driver Handle

- *DT 29369-2* Bushing and Bearing Remover 2-3 in
- *GE 23907-1* Slide Hammer and Shaft

For equivalent regional tools, refer to [Special Tools](#) .

Variable High and 2-3-4 Clutch Seal Installation

Callout	Component Name
1	Variable Hi and 2-3-4 Clutch Seal Tip A NEW seal must be installed.

Variable Low and 1-2 Reverse Clutch Housing and Front Differential Transfer Drive Gear Assemble

Callout	Component Name
<p>Preliminary Procedures</p> <ul style="list-style-type: none"> • Inspect the support assembly for damage or wear to the splines, bushings, machined surfaces and threaded holes. • Inspect the transfer drive gear for damage or wear. • Inspect the transfer drive gear bearing assembly for proper operation. 	

- The bearing should roll smoothly and quietly.

1	Variable Low and 1-2 Reverse Clutch Housing Fluid Passage Seal (Qty: 2)
2	Variable Low and 1-2 Reverse Clutch Housing (O-ring) Seal Tip Install a NEW seal. It is not reusable.
3	Variable Low and 1-2 Reverse Clutch Housing Assembly
4	Variable Low and 1-2 Reverse Clutch Housing Bolt M6 x 39.5 mm (Qty: 7) Caution: Refer to Fastener Caution in the Preface section. Procedure <ol style="list-style-type: none">1. Rotate centre support clockwise against clutch housing splines before tightening to specified torque.2. Tighten the bolts in sequence shown. Tighten 15 N·m (11 lb ft)

Variable Low and 1-2 Reverse Clutch Piston Installation

Callout	Component Name
Preliminary Procedure	
Clean and inspect all components for damage or wear.	
1	Variable Low and 1-2 Reverse Clutch Piston Assembly
2	Variable Low and 1-2 Reverse Clutch Spring

3	Variable Low and 1-2 Reverse Clutch Spring Retainer
4	<p>Variable Low and 1-2 Reverse Clutch Spring Retaining Washer Retaining Ring</p> <p>Tip</p> <ol style="list-style-type: none">1. Install a NEW retaining ring. It is not reusable.2. Use DT 21420-2, DT 23327-1 and DT 23327-2 which is part of DT 23327 to compress the Variable Low and 1-2 Reverse Clutch Piston Assembly. <p>Special Tools</p> <p><i>DT 23327</i> Clutch Spring Compressor</p> <p>For equivalent regional tools, refer to Special Tools .</p>

Centre Support Assembly Assemble

Callout	Component Name
Preliminary Procedure	
Clean and inspect all components for damage or wear.	
1	Variable Low and 1-2 Reverse Clutch Plate (Qty: 7)
2	Variable Low and 1-2 Reverse Clutch Plate Assembly (Qty: 7)

3	Variable Low and 1-2 Reverse Clutch Backing Plate
4	Variable Low and 1-2 Reverse Clutch Backing Plate Retaining Ring - Selective Tip Install a NEW retaining ring. It is not reusable.

Variable Low and 1-2 Reverse Clutch Piston Air Check

Callout	Component Name
1	<p>Centre (w/Variable Low and 1-2 Reverse Clutch) Support Assembly</p> <p>Caution: Regulate the air pressure to 40 psi maximum. High pressure could cause the piston to over travel and damage the piston seals.</p> <p>Procedure</p>

1. Plug one hole while applying air to the other.
2. Apply shop air to the low and 1-2 reverse clutch fluid passage. Observe the piston movement.

Tip

Minimal piston movement and excessive air leaking could indicate damage to the piston seals or improper assembly.

Drive Motor Generator Position Sensor Stator Installation

Callout	Component Name
Preliminary Procedures	
<ul style="list-style-type: none">• Inspect the support assembly for damage or wear to the splines, bushings, machined surfaces and threaded holes.• Inspect the transfer drive gear for damage or wear.• Inspect the transfer drive gear bearing assembly for proper operation.• The bearing should roll smoothly and quietly.	

1	Locating Pin
2	Generator/Drive Motor Position Sensor Stator Assembly
3	Drive Motor Generator Position Switch Sensor Bolt M5 x 16 mm (Qty: 3) Caution: Refer to Fastener Caution in the Preface section. Tighten 7.25 N·m (64.2 lb in)

Variable High and 2-3-4 Clutch Disassemble

Output Carrier Internal Gear and Variable Hi and 2-3-4 Clutch Plates Assemble

Callout	Component Name
Preliminary Procedure	
Clean and inspect all parts for damage or wear.	
1	Variable Hi and 2-3-4 Clutch Plate (Qty: 3)
2	Variable Hi and 2-3-4 Clutch Plate Assembly - Friction (Qty: 3)
3	Variable Hi and 2-3-4 Clutch Backing Plate
4	Variable Hi and 2-3-4 Clutch Backing Plate Retaining Ring - Selective Tip Install a NEW retaining ring. It is not reusable.
5	Output Carrier Internal Gear

Output Carrier Internal Gear Retaining Ring

Tip

Start the opposite side of the retaining ring gap first then work both ends evenly while pushing the internal gear down.

6

Special Tools

DT-49468 Retaining Ring Installer

For equivalent regional tools, refer to [Special Tools](#) .

Variable High and 2-3-4 Clutch Piston Air Check

Callout	Component Name
Preliminary Procedure	
Install the variable hi and 2-3-4 clutch housing assembly onto the centre support assembly.	
	Variable Hi and 2-3-4 Clutch Housing Assembly Caution: Regulate the air pressure to 40 psi maximum. High pressure could cause the piston to over travel and damage the piston seals.

1

Procedure

Apply shop air to the variable hi and 2-3-4 clutch housing. Observe the 2-3-4 clutch piston movement.

Centre Support Assembly Installation

Callout	Component Name
1	Centre Support Oil Passage Seal
2	Centre (w/Variable Low and 1-2 Reverse Clutch) Support Assembly
	Centre Support Bolt M10 x 25 mm (Qty: 9) Caution: Refer to Fastener Caution in the Preface section.

3

Procedure

Tighten bolts in sequence shown.

Tighten

58 N·m (43 lb ft)

Variable High and 2-3-4 Clutch and Hub Installation

Callout	Component Name
1	Variable Hi and 2-3-4 Clutch Housing Thrust Bearing Assembly
	Variable Hi and 2-3-4 Clutch Assembly Tip Use GE 34673 flat gauge bar to measure for correct installation height.

2	<p>Specification A = 31-38 mm (1.22-1.50 in)</p> <p>Special Tool</p> <p>GE 34673 Flat Gauge Bar</p> <p>For equivalent regional tools, refer to Special Tools .</p>
3	Variable Hi and 2-3-4 Clutch Hub Thrust Bearing Assembly

Front Differential Carrier Cleaning and Inspection

Callout	Component Name
<p>Caution: After cleaning the transmission components, allow to air dry. Do not use cloth or paper towels in order to dry any transmission components. Lint from the towels can cause component failure.</p>	
<p>Caution: Do not reuse cleaning solvents. Previously used solvents may deposit sediment which may damage the component.</p>	
<p>Caution: Keep the thrust washers with the gears to which they were matched. The thrust washers are selective sizes and it is difficult to identify the proper washer thickness.</p>	

Improper assembly can cause premature failure of the differential assembly.

Preliminary Procedure

Clean and inspect the differential assembly, pinion gears and thrust washers for scoring, wear or damage. The differential assembly is only serviced as an assembly.

1	Differential Carrier Locator Pin Tip <ul style="list-style-type: none">• 3/16 in (5 mm) 7 in Punch or equivalent• Discard and use a NEW retainer.

3	<p>Torque Damper and Differential (w/Fluid Pump) Housing Assembly</p> <p>Tip</p> <ul style="list-style-type: none">• Install 2 <i>DT-47800-10</i> thrust washer selection bolts, spacer and shims , into a case threaded hole at approximately 180 degrees apart.• Some alignment of DT-47800-1 and 2 which is part of <i>DT-47800</i> kit , may be required while lowering the housing onto the case.• Install DT-47800-3 which is part of <i>DT-47800</i> kit , spacer over DT-47800-6. <p>Special Tools</p> <ul style="list-style-type: none">• <i>DT-47800</i> Thrust Washer Selection Gauge Kit• <i>DT-47800-10</i> Thrust Washer Selection Bolts, Spacer and Shims <p>For equivalent regional tools, refer to Special Tools .</p>

[Torque Sequence](#)

Torque Sequence

Callout	Component Name
1	<p>Spacer Bolts M8 x 127 mm (Qty: 8)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Install the remaining spacers evenly at every other bolt hole. 2. Remove the <i>DT-47800-10</i> thrust washer selection bolts, spacer and shims , guide pins and install spacer bolts in all bolt holes at spacer locations. 3. Tighten the bolts in sequence shown. <p>Tighten 30 N·m (22 lb ft)</p>

Special Tools

- *DT-47800* Thrust Washer Selection Gauge Kit
- *DT-47800-10* Thrust Washer Selection Bolts, Spacer and Shims

For equivalent regional tools, refer to [Special Tools](#) .

Front Differential Carrier Assembly

Caution: If the bearings are not properly seated into the bearing cups, the washer selection will be inaccurate and the bearing pre-load will be set too low. Low bearing pre-load will cause premature failure of the front differential drive pinion gear.

Tip

2 *DT-47793* rotating tool can be used to rotate the differential from the case side.

Special Tools

DT-47793 Differential Rotating Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Differential Shim Selection](#)

Differential Shim Selection

Callout	Component Name
1	<p>Front Differential Bearing Washer</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Place DT-47800-7 in the gap in DT-47800-2 which are both part of <i>DT-47800</i> kit , to determine the proper thrust washer. Choose the correct thrust washer. Refer to Taper Bearing Preload Selective Specifications . 2. Continue trying different sizes of DT-47800-7 which is part of <i>DT-47800</i> kit , until the gauge will no longer fit into the gap. The correct thrust washer size is equal to the largest blade gauge that fits into the gap. 3. Match the size of the correct DT-47800-7 blade which is part of <i>DT-47800</i> kit , to the colour code in the thrust washer specification chart. The washer colour coding is on the outside diameter of the washer. 4. The gap in DT-47800-2 which is part of <i>DT-47800</i> kit , may not be even. Hold the top of the gauge and rotate the bottom of the gauge to even out the gap. Take two gap measurements 180 degrees apart. Average the two measurements and select the thrust washer that is closest to the average.

5. The washer colour coding is on the outside diameter of the washer.

Special Tools

DT-47800 Thrust Washer Selective Gauge Kit

For equivalent regional tools, refer to [Special Tools](#) .

Front Differential Drive Pinion Gear Bearing Thrust Washer

Procedure

- 2
1. Place *DT-47800-7* in the gap in *DT-47800-1* which are both part of *DT-47800* kit , to determine the proper thrust washer. Choose the correct thrust washer. Refer to [Taper Bearing Preload Selective Specifications](#) .
 2. Continue trying different sizes of *DT-47800-7* which is part of *DT-47800* kit , until the gauge will no longer fit into the gap. The correct thrust washer size is equal to the largest blade gauge that fits into the gap.
 3. Match the size of the correct *DT-47800-7* blade which is part of *DT-47800* kit , to the colour code in the thrust washer specification chart. The washer colour coding is on the outside diameter of the washer.
 4. The gap in *DT-47800-1* which is part of *DT-47800* kit , may not be even. Hold the top of the gauge and rotate the bottom of the gauge to even out the gap. Take two gap measurements 180 degrees apart. Average the two measurements and select the thrust washer that is closest to the average.
 5. The washer colour coding is on the outside diameter of the washer.

Special Tools

DT-47800 Thrust Washer Selection Gauge Kit

For equivalent regional tools, refer to [Special Tools](#) .

Torque Damper and Differential (w/Fluid Pump) Housing Assembly

Procedure

- 3
1. Remove the *DT-47800-3* which is part of *DT-47800* kit , bolts and spacers.
 2. Remove the torque damper housing.
 3. Remove the *DT-47800-1* and *DT-47800-2* which are both part of *DT-47800* kit .
 4. Remove the torque damper housing seal.
 5. Remove the pinion gear and differential bearing cups.
 6. Install the bearing cups and thrust washers into the torque damper housing according to the replacement procedures. Refer to [Front Differential Drive Pinion Gear Bearing Cup Removal - Torque Damper Side](#) and [Front Differential Drive Pinion Gear Roller Bearing and Lubricant Dam Replacement](#) .

Tip

DT-47800-1 and *DT-47800-2* which are both part of *DT-47800* kit , may stick in the torque damper housing. Be careful not to drop the gauges.

Special Tool

DT-47800 Thrust Washer Selection Gauge Kit

For equivalent regional tools, refer to [Special Tools](#) .

Front Differential Drive Pinion Gear Bearing Cup Installation - Torque Damper Side

Callout	Component Name
Preliminary Procedures	
<ul style="list-style-type: none">• Install the correct differential bearing washer as determined by the thrust washer measurement procedure. Refer to Front Differential Drive Pinion Gear Bearing Thrust Washer and Front Differential Bearing Washer Measurement .• Do not install the bearing cup until after the selective washer measurement has been performed. Refer to Front Differential Drive Pinion Gear Bearing Thrust Washer and Front Differential Bearing Washer Measurement .	

1	Front Differential Bearing Washer - Selective
	Front Differential Drive Pinion Gear Bearing Cup
	Caution: Support the back side of the torque damper housing while installing the bearing cup. Install the bearing cup until it stops moving. Applying excessive pressure to the bearing cup once it is seated could cause damage to the torque Damper housing casting.

1	DT-46625 Transmission Holding Fixture Tip Raise the transmission in order to remove the holding fixture. Special Tool

	<i>DT-46625</i> Transmission Holding Fixture For equivalent regional tools, refer to Special Tools .
2	<i>DT-42451-1</i> Engine Support Adaptor Special Tool <i>DT-42451-1</i> Engine Support Adaptor For equivalent regional tools, refer to Special Tools .

Definitions and Abbreviations

[Throttle Positions](#)

Engine Braking: A condition where the engine is used to slow the vehicle by manually downchanging during a zero throttle coastdown.

Full Throttle Downshift: A quick apply of the accelerator pedal to its full travel, forcing a downshift.

Heavy Throttle: Approximately 3/4 of accelerator pedal travel, 75 percent throttle position.

Light Throttle: Approximately 1/4 of accelerator pedal travel, 25 percent throttle position.

Medium Throttle: Approximately 1/2 of accelerator pedal travel, 50 percent throttle position.

Minimum Throttle: The least amount of throttle opening required for an upshift.

Wide Open Throttle (WOT): Full travel of the accelerator pedal, 100 percent throttle position.

Zero Throttle Coastdown: A full release of the accelerator pedal while the vehicle is in motion and in drive range.

[Shift Condition Definitions](#)

Bump: A sudden and forceful apply of a clutch or a band.

Chuggle: A bucking or jerking. This condition may be most noticeable when the converter clutch is engaged. It is similar to the feel of towing a trailer.

Delayed: A condition where a shift is expected but does not occur for a period of time. This could be described as a clutch or band engagement that does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or during manual downshifting to a lower range. This term is also defined as LATE or EXTENDED.

Double Bump - Double Feel: Two sudden and forceful applies of a clutch or a band.

Early: A condition where the shift occurs before the car has reached proper speed. This condition tends to labour the engine after the upshift.

End Bump: A firmer feel at the end of a shift than at the start of the shift. This is also defined as END FEEL or SLIP BUMP.

Firm: A noticeably quick apply of a clutch or band that is considered normal with a medium to heavy throttle. This apply should not be confused with HARSH or ROUGH.

Flare: A quick increase in engine RPM along with a momentary loss of torque. This most generally occurs during a shift. This condition is also defined as SLIPPING.

Harsh - Rough: A more noticeable apply of a clutch or band than FIRM. This condition is considered undesirable at any throttle position.

Hunting: A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM, such as a 4-3-4 shift pattern. This condition is also defined as BUSYNESS.

Initial Feel: A distinctly firmer feel at the start of a shift than at the finish of the shift.

Late: A shift that occurs when the engine RPM is higher than normal for a given amount of throttle.

Shudder: A repeating jerking condition similar to CHUGGLE but more severe and rapid. This condition may be most noticeable during certain ranges of vehicle speed.

Slipping: A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band apply.

Soft: A slow, almost unnoticeable clutch or band apply with very little shift feel.

Surge: A repeating engine related condition of acceleration and deceleration that is less intense than CHUGGLE.

Tie-Up: A condition where two opposing clutch and/or bands are attempting to apply at the same time causing the engine to labour with a noticeable loss of engine RPM.

Noise Conditions

Drive Link Noise: A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light throttle acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise: A hum related to vehicle speed which is most noticeable under a light throttle acceleration.

Planetary Gear Noise: A whine related to vehicle speed, which is most noticeable in FIRST gear, SECOND gear, FOURTH gear or REVERSE. The condition may become less noticeable, or go away, after an upshift.

Pump Noise: A high pitched whine that increases in intensity with engine RPM. This condition may also be noticeable in all operating ranges with the vehicle stationary or moving.

Driver Shift Control

Driver shift control (DSC) allows the driver to change gears similar to a manual transmission. Refer to the vehicle owner's manual for specific DSC operating instructions.

Transmission General Description

The MKA 4ET50 is a fully automatic, front wheel drive transaxle, variable-speed, electronic-controlled transmission. It consists primarily of a torque damper assembly, an integral main and auxiliary fluid pump and housing, 1 planetary gear set, 2 friction (rotating) and 1 mechanical (stationary) clutch assemblies, a hydraulic pressurisation and control system, and two internal electric motors. Drive motor with generator A (1) is 55 kW and drive motor with generator B (2) is 111 kW.

The torque damper contains internal torsional springs, fluid, input shaft and a clutch. The torque damper acts as a spring coupling to smoothly transmit power from the engine flexplate to the transmission. The damper provides a mechanical direct drive coupling of the engine to the transmission. The clutch is applied during engine starting and stopping events.

The planetary gear set provides the Electrically Variable forward mode ratios and reverse. Changing ratios is fully automatic and is accomplished through the use of a transmission control module (TCM) located inside the transmission and the drive motor generator power inverter module located under hood. Both the TCM and the drive motor generator power inverter module receives and monitors various electronic sensor inputs and uses this information to vary the torque output at the optimum time based on throttle position.

The TCM commands shift solenoids and variable bleed pressure control solenoids to control torque timing and feel. All the solenoids, including the TCM, are packaged into a self-contained control solenoid valve assembly.

The main hydraulic system primarily consists of a gerotor-type pump, control valve body assemblies, damper housing and case. The pump maintains the working pressures needed to stroke the clutch pistons that apply or release the friction components. These friction components, when applied or released, support the automatic ratios qualities of the transmission.

The hydraulic system also uses a secondary system and consists of an auxiliary pump located inside of the transmission. This is a gerotor-type pump, electric three phase High Voltage motor, electric harness, and control module. The control module is located inside of the drive motor generator power inverter module under the hood. This pump maintains working pressures when the engine is off.

The friction components used in this transmission consist of 3 multiple disc clutches. The multiple disc clutches combine with a planetary gear set and electric motor to deliver the different ratios, forward and reverse. The gear set then transfers torque through the final drive assembly.

The transmission may be operated in any of the following gear ranges:

P (PARK): This position locks the wheels and prevents the vehicle from rolling either forward or backward. PARK is the best position to use when starting the vehicle. Because the transmission utilises a selector lock control system, it is necessary to fully depress the brake pedal before shifting out of PARK. For safety reasons, use the parking brake in addition to the PARK position.

R (REVERSE): This position allows the vehicle to be operated in a rearward direction. This is done by the Drive Motor with Generator B and is electric.

N (NEUTRAL): In this position, the propulsion system does not connect with the wheels.

D (DRIVE): Drive range should be used for all normal driving conditions for maximum efficiency and fuel economy. Drive range allows the transmission to operate in electrically variable modes providing various ratios and output torque.

L (Low): This position is used for the "feel" of engine braking and can be used for the slowing of the vehicle once the throttle is lifted. While in the position the vehicle will slow more quickly and use the B motor to more aggressively collect energy during a regenerative braking event.

Transmission Component and System Description

The mechanical components of the Electric Range Extended Vehicle MKA 4ET50 Transmission are as follows:

- Torque damper assembly
- Gerotor-type main fluid pump assembly
- Gerotor type auxiliary fluid pump assembly
- Input shaft
- Drive motor with generator assembly A (1) and B (2) position
- Internal gear assembly
- Sun gear carrier assembly
- VL 1-2R, C2-3-4, and C1-3R clutch housing assembly
- Main shaft assembly
- Centre support assembly
- Output shaft assembly
- Control valve body assembly

The electrical components of the EREV MKA 4ET50 are as follows:

- Drive Motor with Generator A (1) 55kW
- Drive Motor with Generator B (2) 111kW
- Output speed sensor assembly
- Manual shift shaft position switch
- Control solenoid valve assembly, which contains the following components:
 - Transmission control module (TCM)
 - 6 variable bleed pressure control (PCS) solenoids
 - 4 transmission fluid pressure (TFP) switch assemblies
 - Torque damper clutch pressure control solenoid (PCS5)
 - 2 shift solenoids

For more information, refer to [Electronic Component Description](#) .

Hybrid Transmission Modes of Operation

Electric Only Engine Off (EV): Upon the driver removing their foot from the brake pedal and depressing the accelerator, the vehicle will launch in electric-only mode or electrically variable (EV). The vehicle operates in full-electric mode without starting the engine for approx 25 to 50 miles depending on ambient temperature, terrain and driving behaviour. DC power from the battery flows to the TPIM where it is converted into 3-phase AC power. Once the battery reaches a determined range the engine will start see Electric Only Engine On.

Electric Only Combined Engine Off (EV): Depending on driver demands and road conditions the vehicle can enter combined mode. If the required torque to propel the vehicle is low then drive motor A can supply the torque needed to move the vehicle. If the demands increase then the primary torque supplied comes from drive motor B.

Electric Only Engine On (EV) or Extended Range: Once the battery reaches a determined range the engine will start. After the engine is started the system operates in electrically variable (EV) mode utilising an input split configuration, where the engine drives motor A to generate electricity to provide power to drive motor B which provides torque to the wheels. The energy generated by drive motor A is either stored in the battery or provided to drive motor B delivering output torque depending on driving conditions. The engine will operate at an appropriate speed to optimise fuel consumption while maintaining output power requirements.

Electric Only Combined Engine On (EV): Depending on driver demands and road conditions the vehicle can enter combined engine on mode. During this mode the engine electrical power is combined with the battery electrical power to provide the output torque required to move the vehicle. The variable 1-3R clutch is locked as well as the variable 2-3-4 clutch.

Regenerative Braking: As the driver lifts their foot from the accelerator pedal and depresses the brake pedal the electric motors are used to decelerate the vehicle by applying negative torque to the output shaft and generate electricity thereby charging the battery. The 3-phase AC power generated by the motor is converted to high-voltage DC power in the HPCM and stored in the battery. The EREV operating system coordinates requests for negative torque requests from the electronic brake module with electric motor and engine control functions.

Engine Start: Once the predetermined state of charge is reached the engine is started by drive motor A. Drive motor A is used to start the engine while the Variable Low 1-2 Clutch remains locked and drive motor B simultaneously provides output power to the wheels. During the engine start event drive motor A also provides active damping to reduce torque disturbances from engine cylinder firing pulses, and drive motor B is used to damp driveline disturbances. During this event the inverter draws DC power from the battery and converts it to AC power for both motors. The drive motor generator power inverter control module controls each motor's speed and power independently. The drive motor generator power inverter control module determines when to stop the engine and when to restart based on vehicle operating conditions and optimal hybrid battery power and fuel consumption. The engine is stopped at idle and during deceleration manoeuvres to improve fuel economy.

Reverse: When the vehicle is placed in reverse the Variable Low 1-2 Clutch is locked and drive motor B spins backwards and provides output torque to the wheels. When needed the engine starts and drive motor A is used to charge the battery and DC power from the battery flows to the HPCM where it is converted into 3-phase AC power to drive motor B.

Transmission Adaptive Functions

The 4ET50 transmission utilises a line pressure control system during clutch fill to compensate for the normal wear of transmission components. As the apply components within the transmission wear or change over time, shift time (the time required to apply a clutch) increase or decreases. In order to compensate for these changes, the transmission control module (TCM) adjusts the pressure commands to the various PC solenoids, to maintain the originally calibrated shift timing. The automatic adjusting process is referred to as "adaptive learning" and it is used to ensure consistent shift feel plus increase transmission durability. The TCM monitors the A/T input speed and the A/T output speed sensor during commanded shifts to determine if a shift is occurring too fast, harsh, or too slow, soft, and adjusts the corresponding pressure control solenoid signal to maintain the set shift feel.

The purpose of the adapt function is to automatically compensate the shift quality for the various vehicle shift control systems. The adapt function is a continuous process that will help to maintain optimal shift quality throughout the life of the vehicle.

Transmission Indicators and Messages

No transmission-related indicators or messages are displayed on the instrument panel cluster (IPC). For a complete listing and description of all vehicle indicators and messages, refer to Indicator/Warning Message Description and Operation.

Electronic Component Description

[Electronic Components](#)

The 4ET50 transmission contains the electronic components listed below:

- A/Trans Manual Shaft Position Switch Assembly
- A/Trans Output Speed Sensor Assembly
- Control solenoid valve assembly
- Electric drive motor/generator assembly - unit A
- Electric drive motor/generator assembly - unit B
- Electric auxiliary pump drive motor assembly

This transmission operates in 4 electronically variable transmission modes. High voltage three phase cables connect the 2 motor/generators and the electric auxiliary pump drive motor assembly, to the drive motor generator control module. The high voltage electric auxiliary pump drive provides transmission fluid pressure during engine-off operation.

- (107) Generator/Drive Motor Stator Assembly -Unit A
- (108) Generator/Drive Motor Rotor Assembly -Unit A

The drive motor generator power inverter module assembly controls the three permanent magnet 3-phase electric motors that are internal to the transmission, and perform the following functions:

- Torque for vehicle propulsion
- Engine cranking
- Battery charging

- Regenerative Braking
- Transmission fluid pressure during engine-off operation

The Drive Motor/Generator Description

Drive motor/generator assembly - Unit A is a generator referred to as Motor 1 on the scan tool and consists of a permanent magnet rotor with a concentrated wound stator capable of producing 58 kW of peak electrical energy and 185 N·m (136 lb ft) of torque at 300V.

Drive motor/generator assembly - Unit B is a traction motor referred to as Motor 2 on the scan tool and consists of a permanent magnet rotor with a bar wound stator capable of producing 116 kW of peak electrical energy and 370 N·m (273 lb ft) of torque at 300V.

Both are actively cooled via transmission fluid. The drive motor/generator assembly - unit A is used to start the engine and maintain charge to the hybrid battery. The drive motor/generator assembly - unit B propels the vehicle. Motor speeds are controlled and monitored by resolver-type position sensors. The drive motor generator position sensors are monitored by the motor control modules. The motor control modules monitor the angular position, speed and direction of the drive motor generator based upon the signals of these position sensors. The position sensor, or resolver, contains a drive coil, 2 driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At ignition ON, the motor control module outputs a 5 volt ac, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the 2 driven coils and the irregular shaped rotor. The motor control module then monitors the 2 driven coil circuits for a return signal. The position of the irregular shaped metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the 2 driven coils signals allows the motor control module to determine the exact angle, speed and direction of the drive motor generator. For more information on the drive motor function and system interaction refer to [Drive Motor Generator Power Inverter Module Description and Operation](#) .

[Electric Auxiliary Pump Drive Motor Assembly](#)

The electric auxiliary pump drive motor assembly is driven by 300V alternating current which is controlled by the drive motor/generator power inverter module assembly. The purpose of the auxiliary pump drive motor is to supply oil pressure to the transmission for lubrication, cooling and clutch application during vehicle propulsion when the engine is off and the main transmission pump is not operating. The auxiliary pump drive motor is commanded on when propulsion is active and the internal combustion engine is Off.

Control Solenoid Valve Assembly

 - (10) Transmission Fluid Pressure Switch 1
 - (11) Transmission Control Module
 - (12) Transmission Fluid Pressure Switch 3
 - (13) X1 20 Pin Connector
 - (14) Transmission Fluid Pressure Switch 5

The control solenoid valve assembly contains the following components:

- Transmission control module
- Clutch pressure control solenoids
- Shift solenoids
- Line pressure control solenoid
- Transmission fluid temperature sensor
- Transmission fluid pressure switches

These components are not serviced separately. The control assembly utilizes a lead-frame system to connect these components electrically to the transmission control module. No wires are used for these components. The control solenoid assembly bolts directly to the valve body assembly within the transmission. The control solenoid assembly X1 connector connects to the engine harness.

[A/Trans Manual Shift Shaft Position Switch Assembly](#)

The A/Trans manual shift shaft position switch assembly is a dual sliding hall-effect switch attached to the control valve body within the transmission. The 9 outputs from the switch indicate which position is selected by the transmission manual shaft. Four outputs (A, B, C, P), are range selection inputs to the transmission control module. The five (R1, R2, D1, D2, S) direction selection inputs to the hybrid powertrain control module through the transmission X176 24-way connector. The input voltage at the modules is high when the switch is open and low when the switch is closed. The state of each input is displayed on the scan tool as Internal Mode Switch Range and Internal Mode Switch 2. The Internal Mode Switch Range input parameters represented are transmission range signal A, signal B, signal C and signal P. The Internal Mode Switch 2 parameters represented are transmission direction signal R1, signal R2, signal D1, signal D2 and signal S.

[Output Speed Sensor \(OSS\)](#)

The output speed sensor assembly has 2 internal hall-effect type sensors, and is capable of sensing both speed and direction. The output speed sensor mounts to the A/Trans case assembly and is connected to the control solenoid assembly through a wire harness and connector. The sensor faces the front differential drive pinion (w/transfer gear) gear assembly machined teeth surface. The sensor receives 8.3-9.3 volts on the OSS supply voltage circuit from the transmission control module. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft.

The 2 sensor elements in the output speed sensor assembly are spaced approximately 1/2 a tooth apart.

- When the vehicle is moving in a forward direction, sensor A detects a particular tooth before sensor B.
- When the vehicle is moving in a reverse direction, sensor B detects a particular tooth before sensor A.

The electronics in the sensor combine the 2 signals and send a signal with a different pulse width. This signal is interpreted by the transmission control module for speed and direction and is transmitted through the serial data circuits to the engine control module and the hybrid powertrain control module 1. The engine control module, hybrid powertrain control module 1, and transmission control module compare the output speed sensor signal with the anti-lock brake system wheel speed sensor signal. The hybrid powertrain control module 1 also compares the output shaft direction with the drive motor 1 and drive motor 2 direction.

Park Engine Off

When the gear selector lever is in the Park (P) position and the internal combustion engine is OFF, the auxiliary fluid pump is commanded ON and line pressure is directed to the pressure regulator valve.

[Fluid Pressure Directed in Preparation for a Shift](#)

Variable Low and 1-2 Reverse Clutch Regulator Valve

Line or auxiliary line fluid is routed through orifice #25 to the variable low and 1-2 reverse clutch regulator valve in preparation for a shift.

Variable Hi and 2-3-4 Clutch Regulator Valve

Line or auxiliary line fluid is routed through orifice #23 to the variable hi and 2-3-4 clutch regulator valve in preparation for a shift.

1-3 Reverse Clutch Regulator Valve

Line or auxiliary line fluid is routed through orifice #24 to the 1-3 reverse clutch regulator valve in preparation for a shift.

Damper Bypass Clutch Valve

Line or auxiliary line fluid is routed through orifice #29 to the damper bypass clutch valve in preparation for an apply of the torque damper clutch.

Damper Clutch Charge

Line or auxiliary line fluid is routed through orifices #42 and #43 into the damper clutch charge circuit. Damper clutch charge fluid fills the torque damper clutch assembly in preparation for an apply of the torque damper clutch.

Park Engine On

When the transmission is operating in Park (Engine OFF), and the HPCM determines that vehicle operating conditions (low state of battery charge) are appropriate, the internal combustion engine (ICE) is started, the auxiliary fluid pump is turned OFF, and the main fluid pump provides hydraulic fluid pressure (refer to [Engine Start](#)). After Engine Start, the following changes would occur to the transmission's hydraulic and electrical systems.

[1-3 Reverse Clutch Releases](#)

Pressure Control (PC) Solenoid 4

The PC solenoid 4 is commanded OFF, allowing PCS 4 signal fluid to exhaust from the 1-3 reverse clutch regulator valve.

Shift Solenoid 2

The shift solenoid 2 is commanded OFF, allowing solenoid 2 signal fluid to exhaust. When solenoid 2 signal fluid exhausts, the shift solenoid valve - mode A moves to the released position.

1-3 Reverse Clutch Assembly

13 reverse clutch fluid pressure is exhausted from the 1-3 reverse clutch housing assembly, allowing 1-3 reverse clutch spring force to move the 1-3 reverse clutch piston and release the 1-3 reverse clutch plates.

Shift Solenoid Valve - Mode A

13 reverse clutch fluid pressure exhausts at the shift solenoid valve - mode A.

#3 Ball Check Valve

13 reverse clutch feedback fluid pressure exhausts into the 13 reverse clutch/A cooling feed circuit, allowing actuator feed limit fluid to seat the ball.

1-3 Reverse Clutch Regulator Valve

1-3 reverse clutch regulator valve spring force moves the 1-3 reverse clutch regulator valve to the released position, allowing 13 reverse clutch/A cooling feed fluid pressure to

exhaust.

Torque Damper Clutch Releases

Pressure Control (PC) Solenoid 5

The PC solenoid 5 is de-energised (OFF) allowing PCS 5 signal fluid to exhaust from the damper bypass clutch valve.

Torque Damper Clutch Assembly

Damper clutch fluid exhausts from the torque damper clutch assembly to the damper bypass clutch valve allowing the torque damper clutch to release.

Damper Bypass Clutch Valve

Damper bypass clutch valve spring force moves the damper bypass clutch valve to the released position, allowing damper clutch fluid pressure to exhaust through the valve into the exhaust backfill circuit.

Transmission Fluid Temperature (TFT) Sensor

Damper clutch fluid pressure in the exhaust backfill circuit exhausts at the TFT sensor.

Shift Accumulation

1-3 Reverse Clutch Accumulator

13 reverse clutch fluid also exhausts from the 1-3 reverse clutch accumulator assembly. Accumulator spring force moves the 1-3 reverse clutch accumulator piston to the released position.

Neutral Engine Off

When the gear selector lever is moved to the Neutral (N) position, the hydraulic and electrical system operation is identical to Park (P) range. However, if Neutral is selected after the vehicle was operating in Reverse (R), the following changes would occur in the hydraulic system.

[1-3 Reverse Clutch Releases](#)

If the transmission is operating in Reverse, and the internal combustion engine is ON when a shift to Neutral occurs, the 1-3 reverse clutch is released.

Pressure Control (PC) Solenoid 4

The PC solenoid 4 is commanded OFF, allowing PCS 4 signal fluid to exhaust from the 1-3 reverse clutch regulator valve.

1-3 Reverse Clutch Assembly

13 reverse clutch fluid pressure is exhausted from the 1-3 reverse clutch housing assembly, allowing 1-3 reverse clutch spring force to move the 1-3 reverse clutch piston and release the 1-3 reverse clutch plates.

Shift Solenoid Valve - Mode A

13 reverse clutch fluid pressure exhausts at the shift solenoid valve - mode A.

#3 Ball Check Valve

13 reverse clutch feedback fluid pressure exhausts into the 13 reverse clutch/A cooling feed circuit, allowing actuator feed limit fluid to seat the ball.

1-3 Reverse Clutch Regulator Valve

1-3 reverse clutch regulator valve spring force moves the 1-3 reverse clutch regulator valve to the released position, allowing 13 reverse clutch/A cooling feed fluid pressure to exhaust.

[Variable Low and 1-2 Reverse Clutch Releases](#)

If the transmission is operating in Reverse - Series Mode when a shift to Neutral occurs, the variable low and 1-2 reverse clutch is released.

Pressure Control (PC) Solenoid 3

The PC solenoid 3 is de-energised (OFF) allowing PCS 3 signal fluid to exhaust from the variable low and 1-2 reverse clutch regulator valve; the variable low and 1-2 reverse clutch boost valve; and the shift solenoid valve -mode B.

Variable Low and 1-2 Reverse Clutch Assembly

VL 12 reverse clutch fluid exhausts from the variable low and 1-2 reverse clutch to the shift solenoid valve - mode B allowing the variable low and 1-2 reverse clutch to release.

Shift Solenoid Valve - Mode B

VL 12 reverse clutch fluid passes through the shift solenoid valve - mode B and into the VL 12 reverse clutch feed fluid circuit and is routed to the variable low and 1-2 reverse clutch regulator valve.

Variable Low and 1-2 Reverse Clutch Boost Valve

Variable low and 1-2 reverse clutch boost valve spring force moves the variable low and 1-2 reverse clutch boost valve to the released position, allowing VL 12 reverse clutch feedback fluid pressure to exhaust into the VL 12 reverse clutch feed circuit.

Variable Low and 1-2 Reverse Clutch Regulator Valve

Variable low and 1-2 reverse clutch regulator valve spring force moves the variable low and 1-2 reverse clutch regulator valve to the released position, allowing VL 12 reverse clutch feed fluid pressure to exhaust through the valve into the exhaust backfill circuit.

Transmission Fluid Temperature (TFT) Sensor

VL 12 reverse clutch fluid pressure in the exhaust backfill circuit exhausts at the TFT sensor.

[Variable Hi and 2-3-4 Clutch Releases](#)

If the transmission is operating in Reverse - Output Split when a shift to Neutral occurs, the variable hi and 2-3-4 clutch is released.

Pressure Control (PC) Solenoid 2

The PC solenoid 2 is commanded OFF, allowing PCS 2 signal fluid to exhaust from the variable hi and 2-3-4 clutch regulator valve and the variable hi and 2-3-4 clutch boost valve.

Variable Hi and 2-3-4 Clutch Assembly

VH 234 clutch fluid pressure is exhausted from the case assembly, allowing variable hi and 2-3-4 clutch spring force to move the variable hi and 2-3-4 clutch piston and release the variable hi and 2-3-4 clutch plates.

Shift Solenoid Valve - Mode B

Exhausting VH 234 clutch fluid pressure passes through the shift solenoid valve - mode B into the VH 234 clutch feed circuit.

Shift Solenoid Valve - Mode A

VH 234 clutch feed fluid pressure exhausts at the shift solenoid valve - mode A.

Variable Hi and 2-3-4 Clutch Regulator Valve

Variable hi and 2-3-4 clutch regulator valve spring force moves the variable hi and 2-3-4 clutch regulator valve to the released position, allowing VH 234 clutch/B cooling feed fluid pressure to exhaust.

[Shift Accumulation](#)

1-3 Reverse Clutch Accumulator

13 reverse clutch fluid also exhausts from the 1-3 reverse clutch accumulator assembly. Accumulator spring force moves the 1-3 reverse clutch accumulator piston to the released position.

Variable Low and 1-2 Reverse Clutch Accumulator

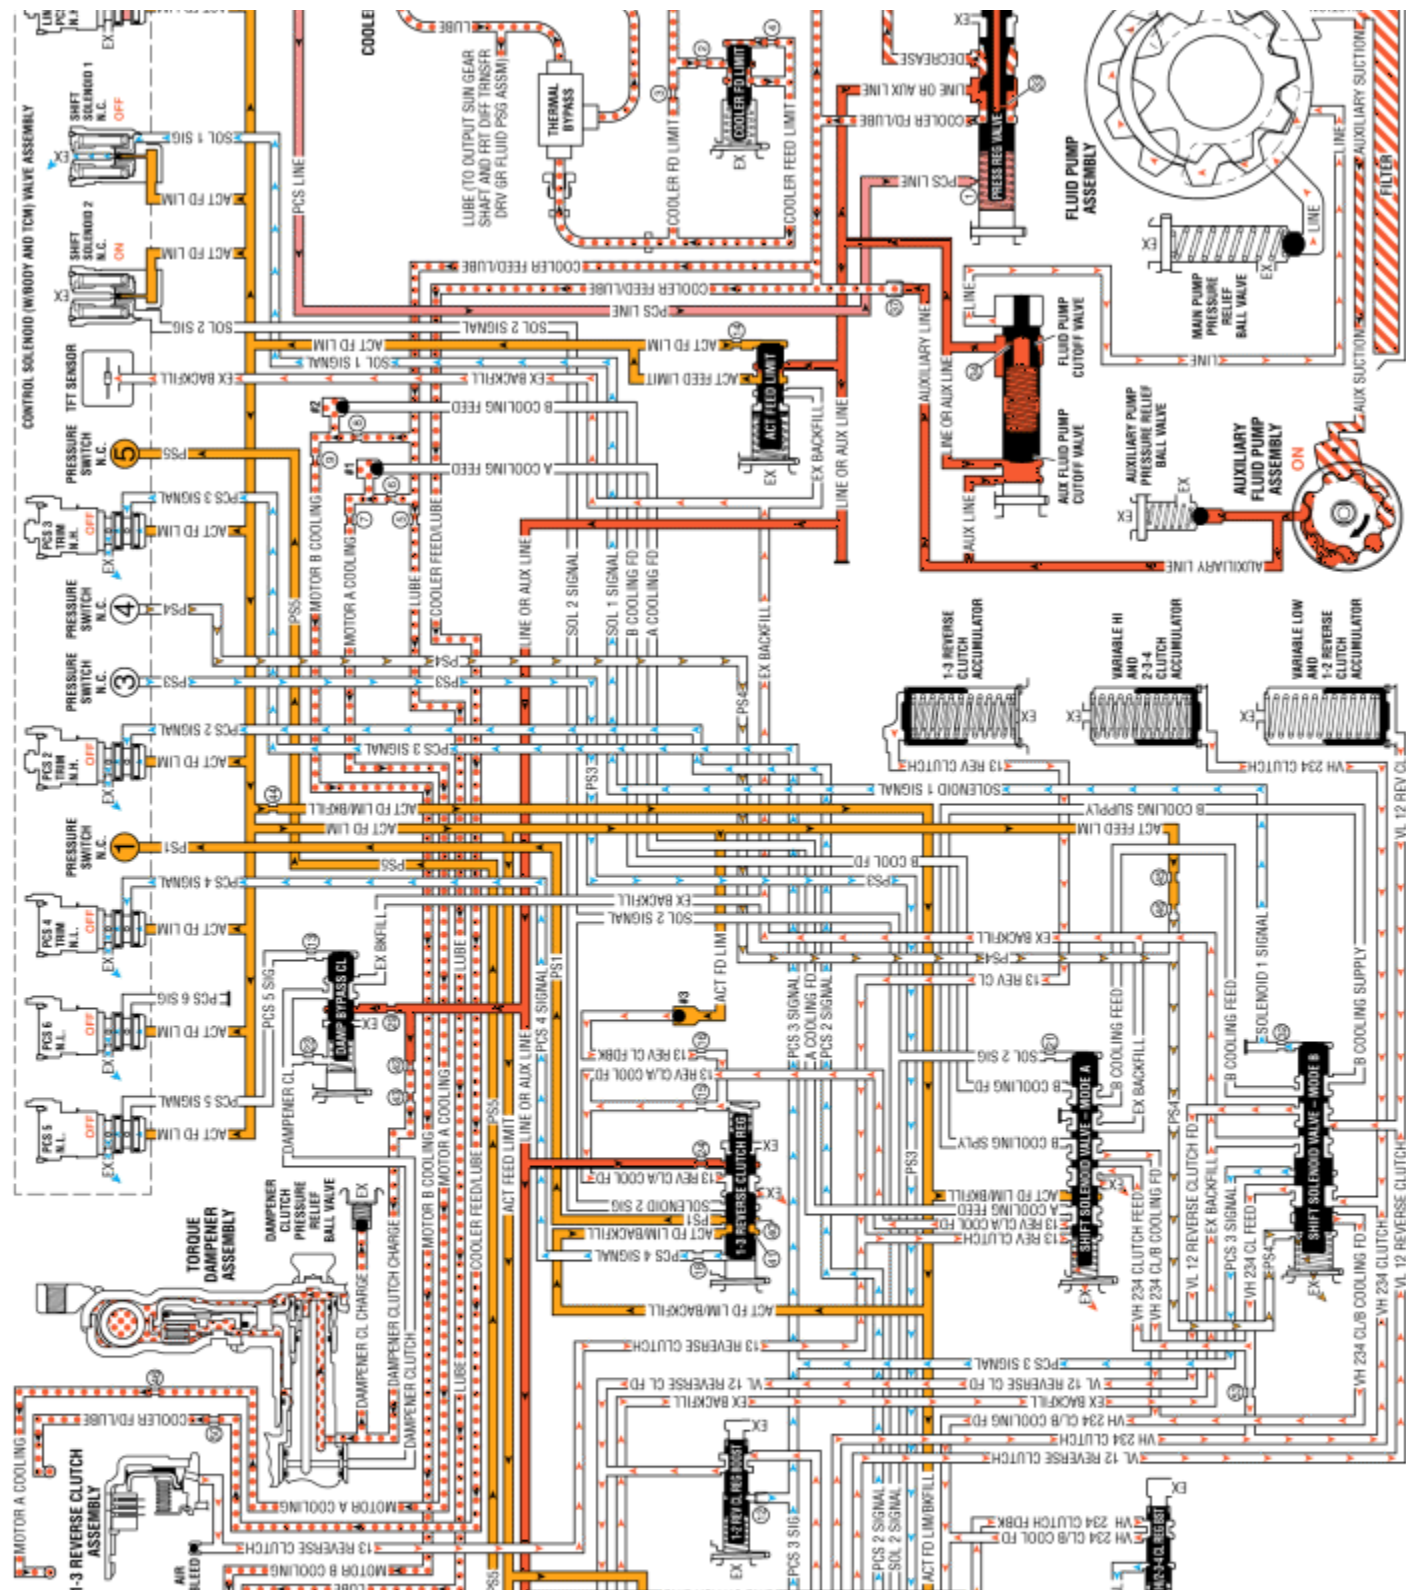

VL 12 reverse clutch fluid also exhausts from the variable low and 1-2 reverse clutch accumulator assembly. Accumulator spring force moves the variable low and 1-2 reverse clutch accumulator piston to the released position.

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid also exhausts from the variable hi and 2-3-4 clutch accumulator assembly. Accumulator spring force moves the variable hi and 2-3-4 clutch accumulator piston to the released position.

Engine Start

When the vehicle is operating with the internal combustion engine OFF and auxiliary fluid pump ON, and the HPCM determines that vehicle operating conditions (low state of battery charge) are appropriate for starting the internal combustion engine (ICE), it commands the following changes to the transmission's hydraulic and electrical systems.

Note: The illustration shown depicts an Engine Start event that occurs during vehicle operation in Park. However, Engine Start can occur in any transmission operating range.

[Torque Damper Clutch Applies](#)

Pressure Control (PC) Solenoid 5

The PC solenoid 5 is energised (ON) allowing actuator feed limit fluid to enter the PCS 5 signal circuit. PCS 5 signal fluid is then routed through orifice #13 to the damper bypass clutch valve.

Damper Bypass Clutch Valve

PCS 5 signal fluid, at the damper bypass clutch valve, opposes damper bypass clutch valve spring force and orificed damper clutch fluid pressure to regulate line or auxiliary line pressure into the damper clutch circuit. Damper clutch fluid is routed to the torque damper clutch.

Torque Damper Clutch Assembly

A feed hole in the input shaft allows fluid to enter the torque damper assembly behind the torque damper clutch piston. Damper clutch fluid pressure moves the damper clutch piston against spring force to apply the damper clutch plates. When fully applied, the damper clutch apply plate, the damper clutch plates, and the damper clutch plate assemblies are locked together, forming a direct mechanical connection between the engine flywheel and the transmission input shaft. With the engine flywheel and transmission input shaft locked together, the HPCM is able to use the generator/drive motor - unit A (107, 108) to start the ICE. The torque damper clutch may be applied in any range when the vehicle is operating with the internal combustion engine OFF.

[1-3 Reverse Clutch Applies](#)

Pressure Control (PC) Solenoid 4

The PC solenoid 4 is energised (ON) allowing actuator feed limit fluid to enter the PCS 4 signal circuit. PCS 4 signal fluid is then routed through orifice #18 to the 1-3 reverse clutch regulator valve.

1-3 Reverse Clutch Regulator Valve

PCS 4 signal fluid, at the 1-3 reverse clutch regulator valve, opposes 1-3 reverse clutch regulator valve spring force and 13 reverse clutch feedback fluid pressure to regulate line or auxiliary line pressure into the 13 reverse clutch/A cooling feed circuit.

#3 Ball Check Valve

13 reverse clutch feedback fluid unseats the #3 ball check valve, allowing excess pressure to pass into the actuator feed limit circuit. This helps to control clutch apply fluid pressure and clutch apply feel.

Shift Solenoid Valve - Mode A

13 reverse clutch/A cooling feed fluid passes through the shift solenoid valve - mode A and enters the 13 reverse clutch circuit.

1-3 Reverse Clutch Assembly

13 reverse clutch fluid passes through the case and the transmission fluid pump cover into the 1-3 reverse clutch housing and moves the 1-3 reverse clutch piston against spring force to apply the 1-3 reverse clutch plates.

#1 Pressure Switch

Solenoid 2 signal fluid passes through the 1-3 reverse clutch regulator valve into the PS1 fluid passage. PS1 fluid opens the normally closed #1 pressure switch, signalling the TCM that the transmission is in Engine Start.

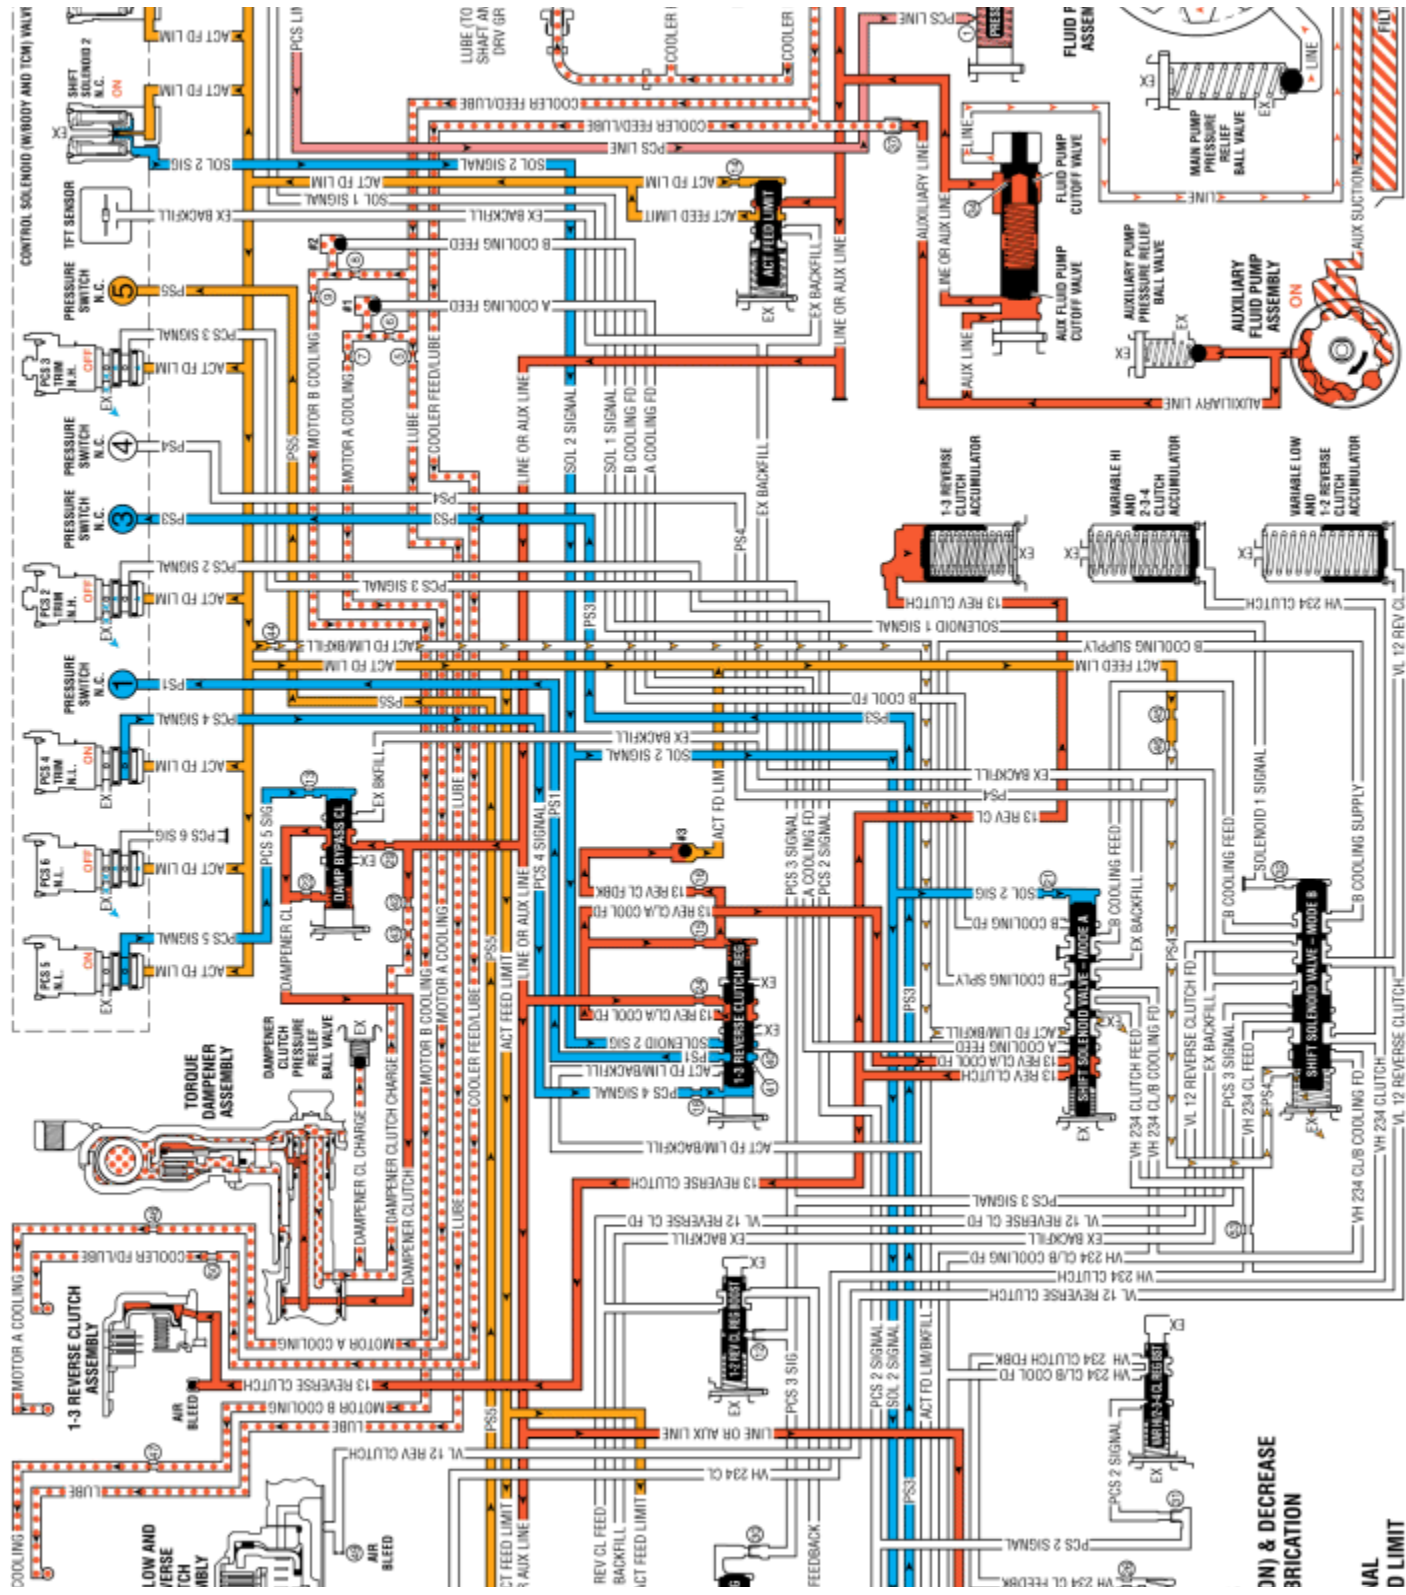

Shift Accumulation

1-3 Reverse Clutch Accumulator

13 reverse clutch fluid is also sent to the 1-3 reverse clutch accumulator assembly. 13 reverse clutch fluid moves the 1-3 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the 1-3 reverse clutch assembly.

Reverse Output Split Engine Off

When the gear selector lever is moved to the Reverse (R) position (from the Park position), and the internal combustion engine (ICE) is OFF, the following changes occur in the transmission's hydraulic and electrical systems.

[Variable Hi and 2-3-4 Clutch Applies](#)

Pressure Control (PC) Solenoid 2

The PC solenoid 2 is energised (ON) allowing actuator feed limit fluid to enter the PCS 2 signal circuit. PCS 2 signal fluid is then routed through orifice #20 to the variable hi and 2-3-4 clutch regulator valve.

Shift Solenoid 1

The shift solenoid 1 is energised (ON) allowing actuator feed limit fluid to enter the solenoid 1 signal fluid circuit. Solenoid 1 signal fluid is then routed through orifice #32 to the shift solenoid valve - mode B.

Variable Hi and 2-3-4 Clutch Regulator Valve

PCS 2 signal fluid, at the variable hi and 2-3-4 clutch regulator valve, opposes variable hi and 2-3-4 clutch regulator valve spring force and VH 234 clutch feedback fluid pressure to regulate line or auxiliary line pressure into the VH 234 clutch/B cooling feed circuit.

Variable Hi and 2-3-4 Clutch Boost Valve

PCS 2 signal fluid pressure acts on a differential area of the variable hi and 2-3-4 clutch boost valve, moving the valve against variable hi and 2-3-4 clutch boost valve spring force to regulate VH 234 clutch/B cooling feed fluid into the VH 234 clutch feedback circuit. As PCS 2 signal fluid pressure is increased to a given value, the variable hi and 2-3-4 clutch boost valve opens the VH 234 clutch feedback circuit to exhaust. This results in the variable hi and 2-3-4 clutch regulator valve moving to the full feed position, sending full VH 234 clutch feed pressure (full line pressure) to the variable hi and 2-3-4 clutch.

Shift Solenoid Valve - Mode A

VH 234 clutch/B cooling feed fluid passes through the shift solenoid valve - mode A into the B cooling supply circuit and is routed to the shift solenoid valve - mode B.

Shift Solenoid Valve - Mode B

Solenoid 1 signal fluid moves the shift solenoid valve - B, against spring force, to the applied position. VH 234 clutch/B cooling feed fluid passes through the valve into the VH 234 clutch circuit and is routed to the variable hi and 2-3-4 clutch assembly.

Variable Hi and 2-3-4 Clutch Assembly

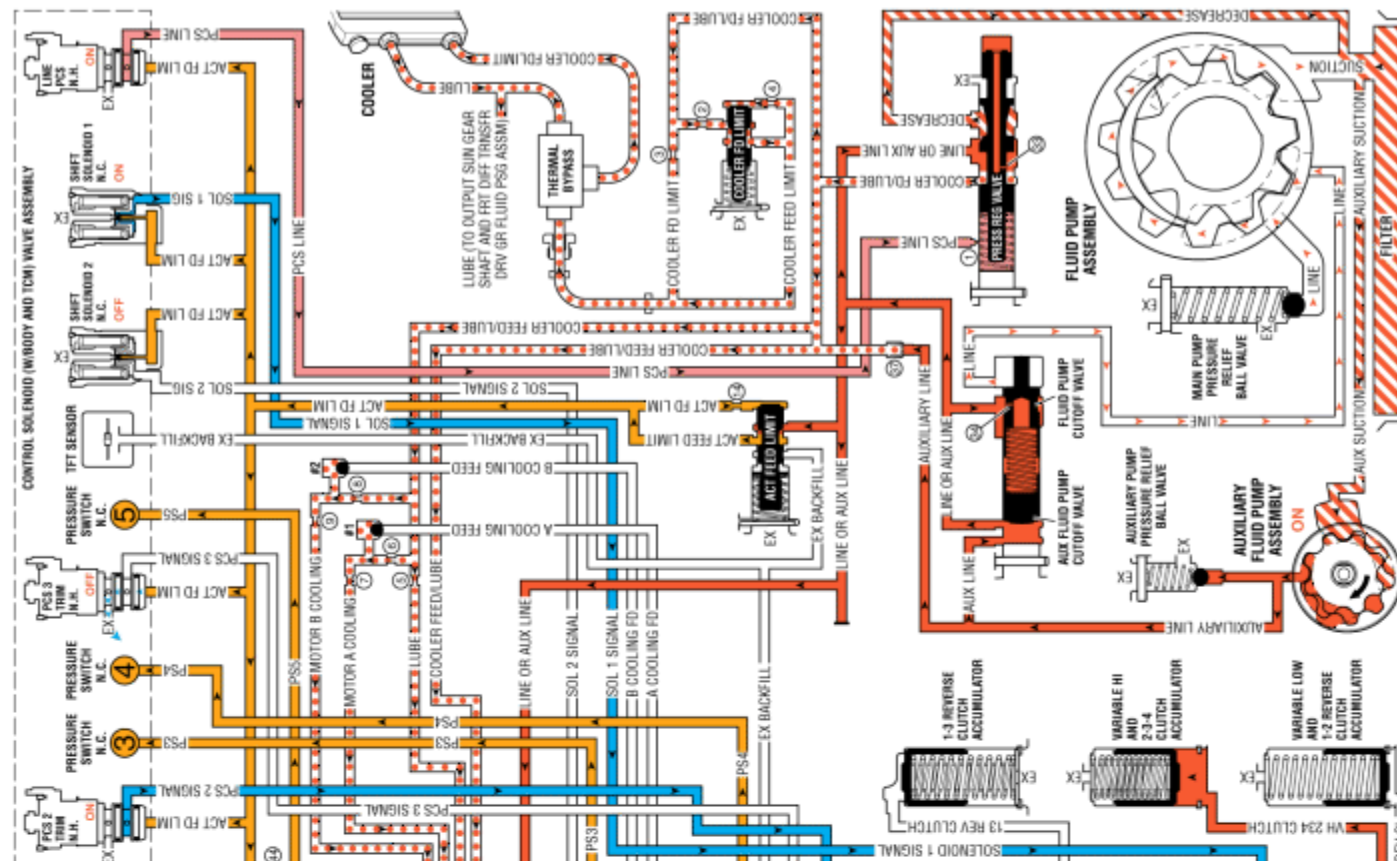

VH 234 clutch fluid is directed to the variable hi and 2-3-4 clutch piston to apply the variable hi and 2-3-4 clutch plates and achieve Reverse - Output Split.

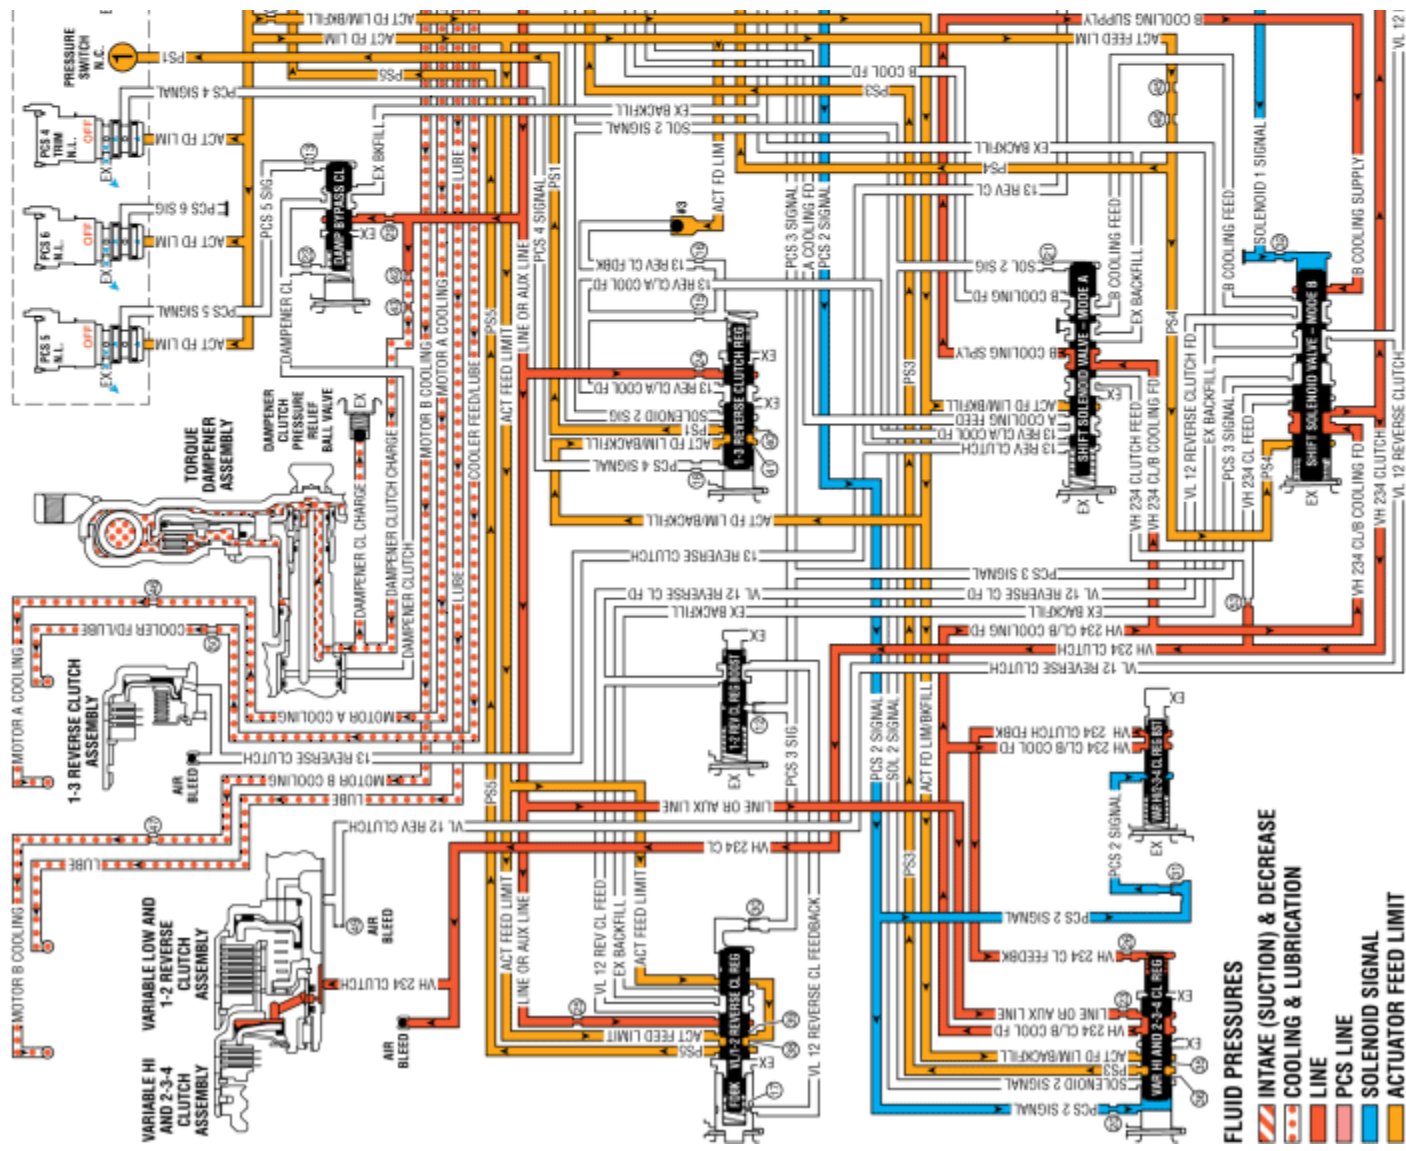

Shift Accumulation

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid is also sent to the variable hi and 2-3-4 clutch accumulator assembly. VH 234 clutch fluid moves the variable hi and 2-3-4 clutch accumulator piston against accumulator spring force to cushion the application of the variable hi and 2-3-4 clutch assembly.

Reverse Output Split Engine Off

Reverse Output Split Engine On

When the transmission is operating in Reverse - Output Split (R), and the HPCM determines that operating conditions are appropriate, the internal combustion engine (ICE) is started, the auxiliary fluid pump is turned OFF, and the main fluid pump provides hydraulic fluid pressure (refer to [Engine Start](#)). After Engine Start, the following changes would occur to the transmission's hydraulic and electrical systems.

[1-3 Reverse Clutch Remains Applied](#)

The 1-3 reverse clutch is applied for Engine Start, and remains applied for Reverse - Output Split (Engine ON).

Pressure Control (PC) Solenoid 4

The PC solenoid 4 is energised (ON) allowing actuator feed limit fluid to enter the PCS 4 signal circuit. PCS 4 signal fluid is then routed through orifice #18 to the 1-3 reverse clutch regulator valve.

Shift Solenoid 2

The shift solenoid 2 is energised (ON) allowing actuator feed limit fluid to enter the solenoid 2 signal fluid circuit. Solenoid 2 signal fluid is routed through orifice #21 to the shift solenoid valve - mode A. Solenoid 2 signal fluid is also routed to the variable hi and 2-3-4 clutch regulator valve, and to the 1-3 reverse clutch regulator valve where it enters the PS1 fluid circuit.

1-3 Reverse Clutch Regulator Valve

PCS 4 signal fluid, at the 1-3 reverse clutch regulator valve, opposes 1-3 reverse clutch regulator valve spring force and 13 reverse clutch feedback fluid pressure to regulate line or auxiliary line pressure into the 13 reverse clutch/A cooling feed circuit.

#3 Ball Check Valve

13 reverse clutch feedback fluid unseats the #3 ball check valve, allowing excess pressure to pass into the actuator feed limit circuit. This helps to control clutch apply fluid pressure and clutch apply feel.

Shift Solenoid Valve - Mode A

Solenoid 2 signal fluid moves the shift solenoid valve - A, against spring force, to the applied position. 13 reverse clutch/A cooling feed fluid passes through the shift solenoid

valve - mode A and enters the 13 reverse clutch circuit.

1-3 Reverse Clutch Assembly

13 reverse clutch fluid passes through the case and the transmission fluid pump cover into the 1-3 reverse clutch housing and moves the 1-3 reverse clutch piston against spring force to apply the 1-3 reverse clutch plates.

#1 Pressure Switch

Solenoid 2 signal fluid passes through the 1-3 reverse clutch regulator valve into the PS1 fluid passage. PS1 fluid opens the normally closed #1 pressure switch, signalling the TCM that the transmission is in Reverse - Output Split.

Torque Damper Clutch Releases

Pressure Control (PC) Solenoid 5

The PC solenoid 5 is de-energised (OFF) allowing PCS 5 signal fluid to exhaust from the damper bypass clutch valve.

Torque Damper Clutch Assembly

Damper clutch fluid exhausts from the torque damper clutch assembly to the damper bypass clutch valve allowing the torque damper clutch to release.

Damper Bypass Clutch Valve

Damper bypass clutch valve spring force moves the damper bypass clutch valve to the released position, allowing damper clutch fluid pressure to exhaust through the valve into the exhaust backfill circuit.

Transmission Fluid Temperature (TFT) Sensor

Damper clutch fluid pressure in the exhaust backfill circuit exhausts at the TFT sensor.

Variable Hi and 2-3-4 Clutch Remains Applied

Variable Hi and 2-3-4 Clutch Assembly

When the transmission is operating in Reverse - Output Split, and the engine is ON, the variable hi and 2-3-4 clutch remains applied. The routing of apply fluid to the variable hi and 2-3-4 clutch is similar to that described for Reverse - Output Split (Engine OFF), with the exception that VH 234 clutch/B cooling feed fluid passes through the applied shift solenoid valve - mode A into the VH 234 clutch feed circuit.

Shift Accumulation

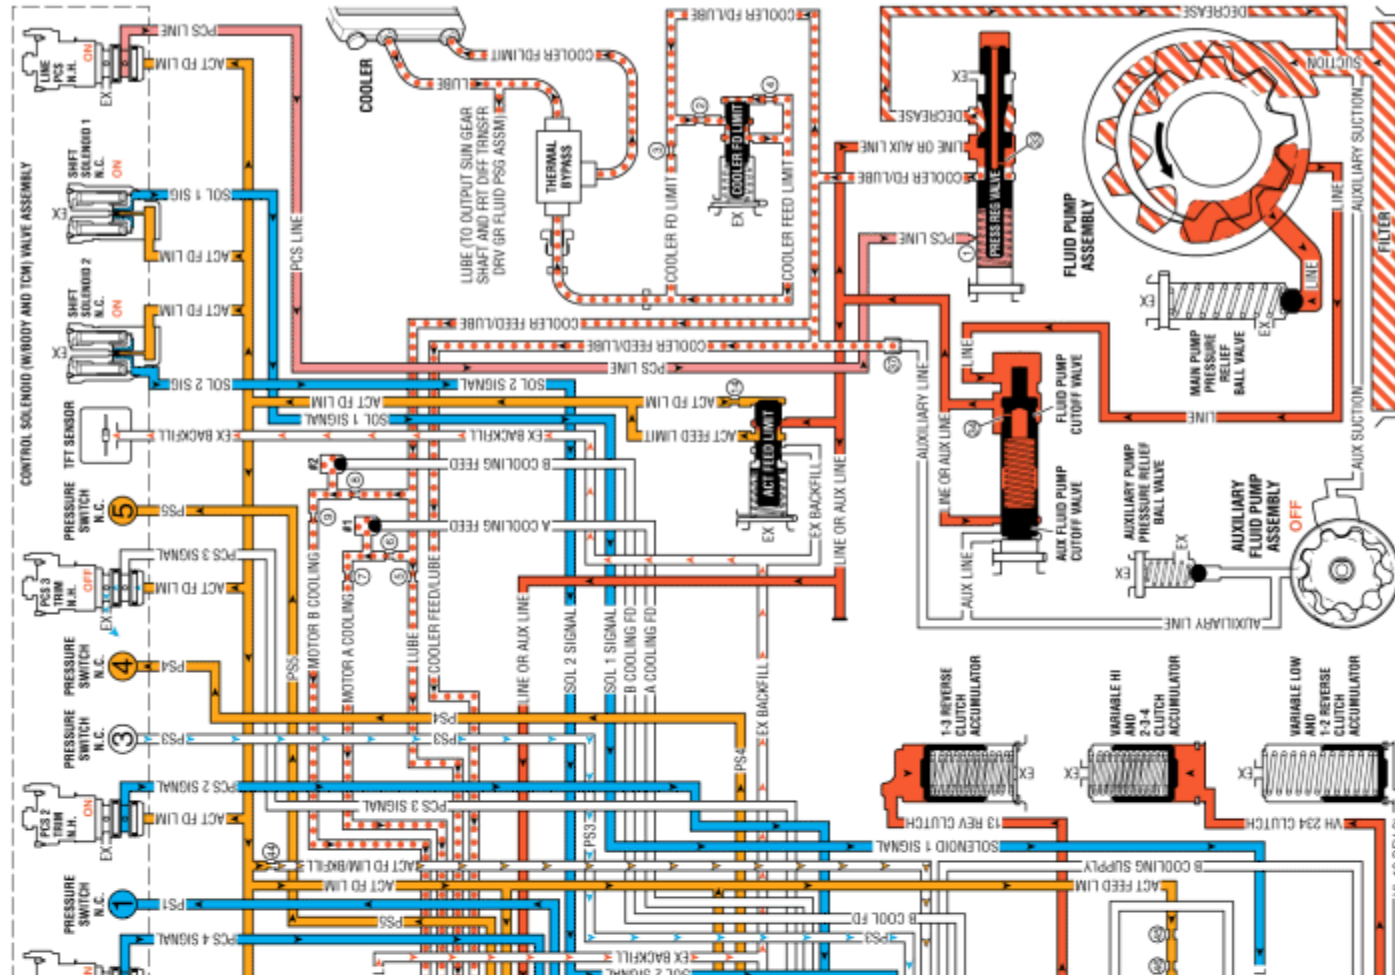

1-3 Reverse Clutch Accumulator

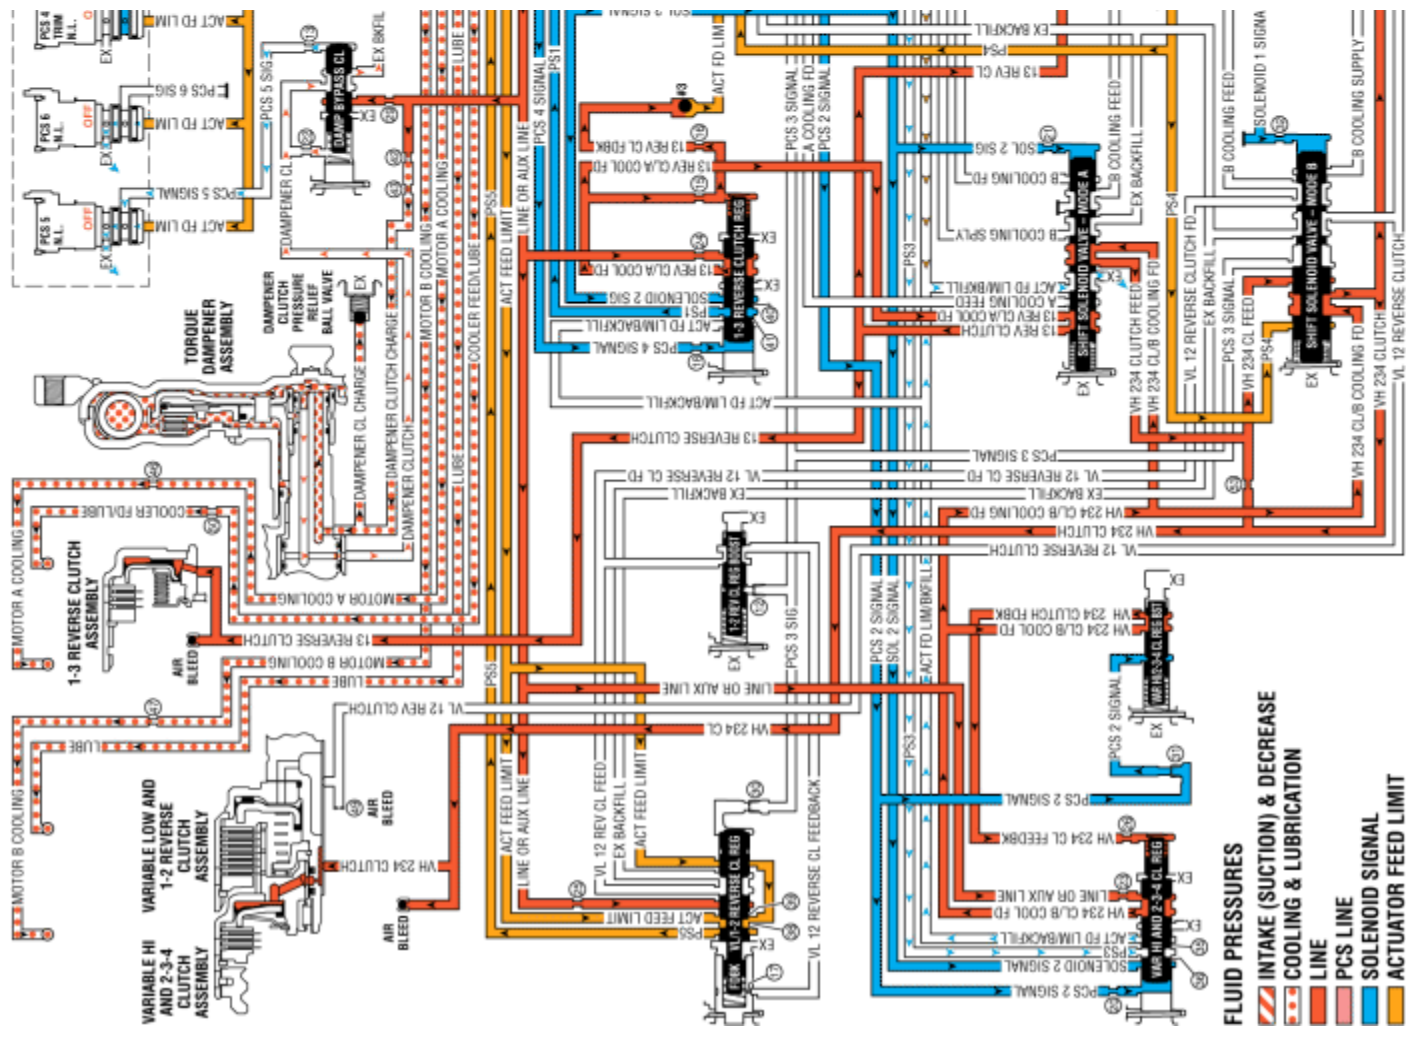

13 reverse clutch fluid is also sent to the 1-3 reverse clutch accumulator assembly. 13 reverse clutch fluid moves the 1-3 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the 1-3 reverse clutch assembly.

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid is also sent to the variable hi and 2-3-4 clutch accumulator assembly. VH 234 clutch fluid moves the variable hi and 2-3-4 clutch accumulator piston against accumulator spring force to cushion the application of the variable hi and 2-3-4 clutch assembly.

Reverse Series Mode Engine Off

When the transmission is operating in Reverse - Output Split (R) and the internal combustion engine is OFF, and the HPCM determines that operating conditions are appropriate, Reverse - Series Mode is commanded and the following changes occur in the transmission's hydraulic and electrical systems.

[Variable Low and 1-2 Reverse Clutch Applies](#)

Pressure Control (PC) Solenoid 3

The PC solenoid 3 is energised (ON) allowing actuator feed limit fluid to enter the PCS 3 signal circuit. PCS 3 signal fluid is then routed through orifice #30 to the variable low and 1-2 reverse clutch regulator valve; through orifice #12 to the variable low and 1-2 reverse clutch boost valve; and to the shift solenoid valve - mode B.

Shift Solenoid 1

The shift solenoid 1 is commanded OFF, allowing solenoid 1 signal fluid to exhaust. When solenoid 1 signal fluid exhausts, the shift solenoid valve - mode B moves to the released position.

Variable Low and 1-2 Reverse Clutch Regulator Valve

PCS 3 signal fluid, at the variable low and 1-2 reverse clutch regulator valve, opposes variable low and 1-2 reverse clutch regulator valve spring force and VL 12 reverse clutch feedback fluid pressure to regulate line or auxiliary line pressure into the VL 12 reverse clutch feed circuit.

Variable Low and 1-2 Reverse Clutch Boost Valve

PCS 3 signal fluid pressure acts on a differential area of the variable low and 1-2 reverse clutch boost valve, moving the valve against variable low and 1-2 reverse clutch boost valve spring force to regulate VL 12 reverse clutch feed fluid into the VL 12 reverse clutch feedback circuit. As PCS 3 signal fluid pressure is increased to a given value, the variable low and 1-2 reverse clutch boost valve opens the VL 1-2 reverse clutch feedback circuit to exhaust. This results in the variable low and 1-2 reverse clutch regulator valve moving to the full feed position, sending full VL 12 reverse clutch feed pressure (full line pressure) to the variable low and 1-2 reverse clutch.

Shift Solenoid Valve - Mode B

VL 12 reverse clutch feed fluid is routed to the shift solenoid valve - mode B, where it passes through the valve into the VL 12 reverse clutch circuit.

Variable Low and 1-2 Reverse Clutch Assembly

VL 12 reverse clutch fluid pressure enters the case assembly behind the variable low and 1-2 reverse clutch piston and moves the piston against spring force to apply the variable low and 1-2 reverse clutch plates.

Variable Hi and 2-3-4 Clutch Releases

Pressure Control (PC) Solenoid 2

The PC solenoid 2 is commanded OFF, allowing PCS 2 signal fluid to exhaust from the variable hi and 2-3-4 clutch regulator valve and the variable hi and 2-3-4 clutch boost valve.

Variable Hi and 2-3-4 Clutch Assembly

VH 234 clutch fluid pressure is exhausted from the case assembly, allowing variable hi and 2-3-4 clutch spring force to move the variable hi and 2-3-4 clutch piston and release the variable hi and 2-3-4 clutch plates.

Shift Solenoid Valve - Mode B

Exhausting VH 234 clutch fluid pressure passes through the shift solenoid valve - mode B into the 234 clutch feed circuit.

Shift Solenoid Valve - Mode A

Exhausting 234 clutch feed fluid pressure passes through the shift solenoid valve - mode A into the VH 234 clutch/B cooling feed circuit.

Variable Hi and 2-3-4 Clutch Regulator Valve

Variable hi and 2-3-4 clutch regulator valve spring force moves the variable hi and 2-3-4 clutch regulator valve to the released position, allowing VH 234 clutch/B cooling feed fluid pressure to exhaust.

Shift Accumulation

Variable Low and 1-2 Reverse Clutch Accumulator

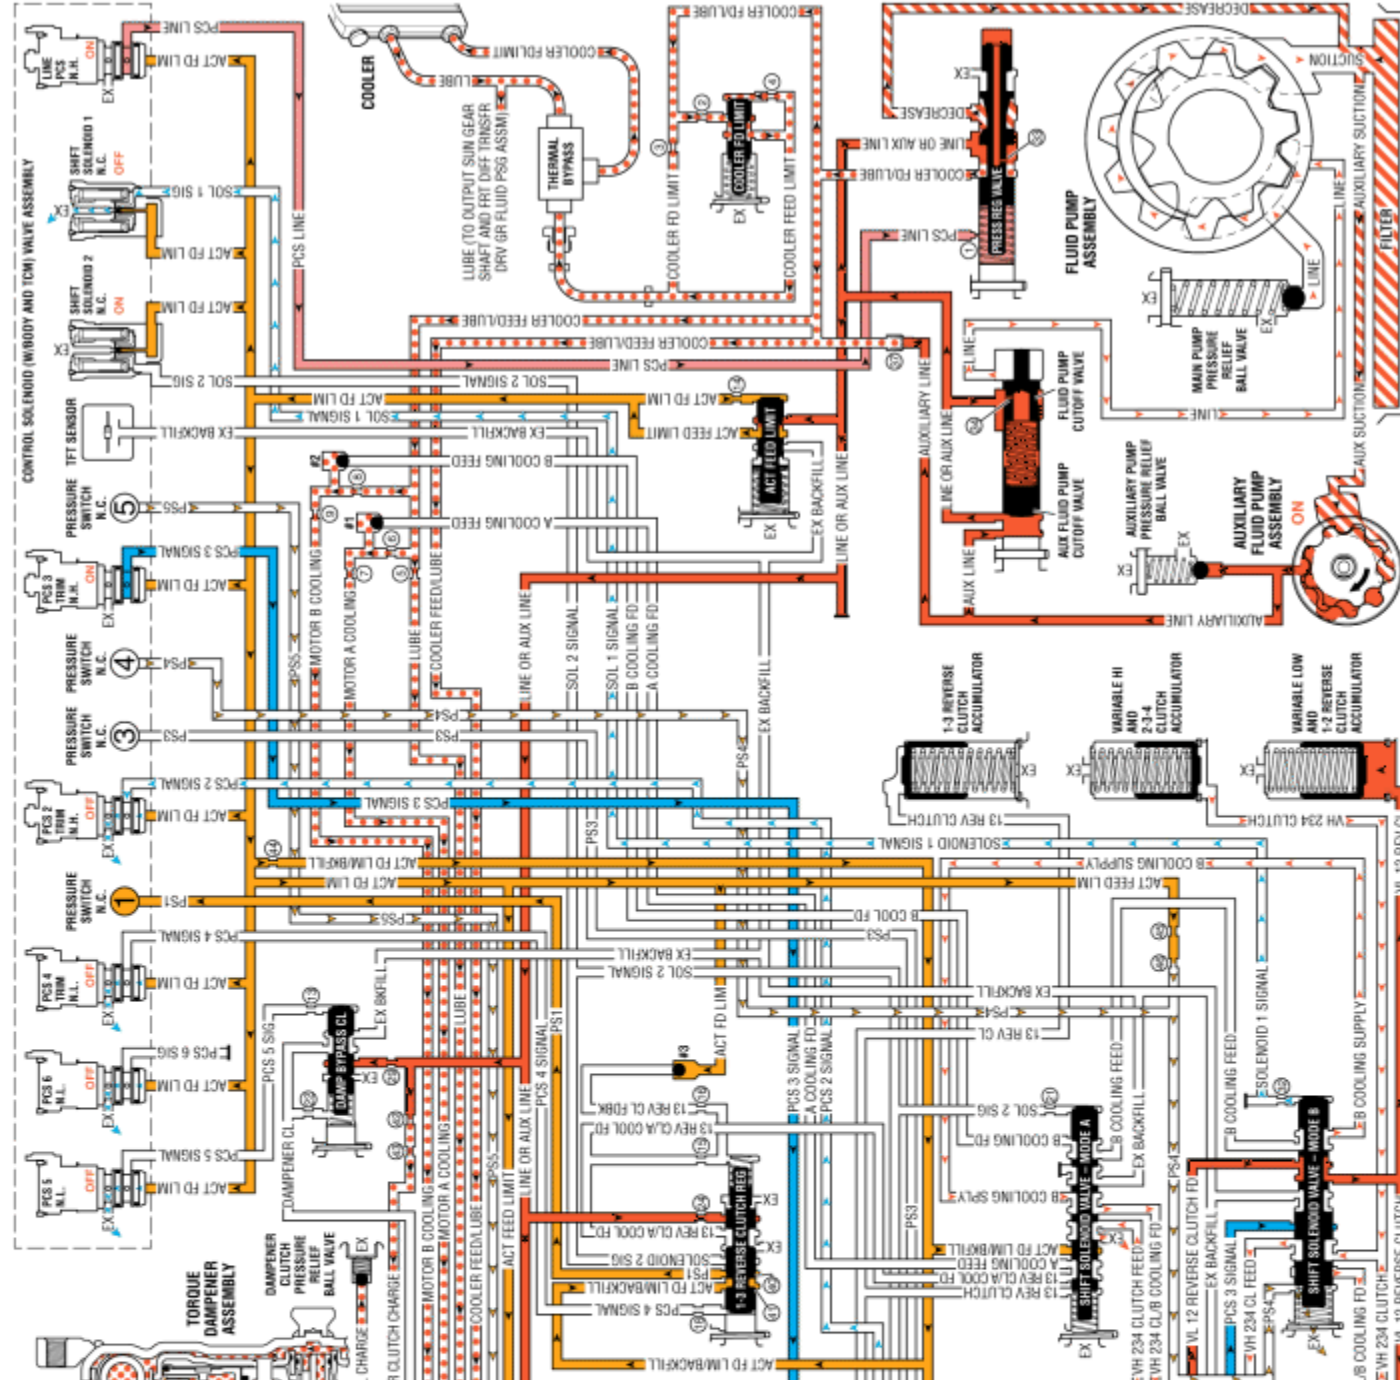

VL 12 reverse clutch fluid is also sent to the variable low and 1-2 reverse clutch accumulator assembly. VL 12 reverse clutch fluid moves the variable low and 1-2 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the variable low and 1-2 reverse clutch assembly.

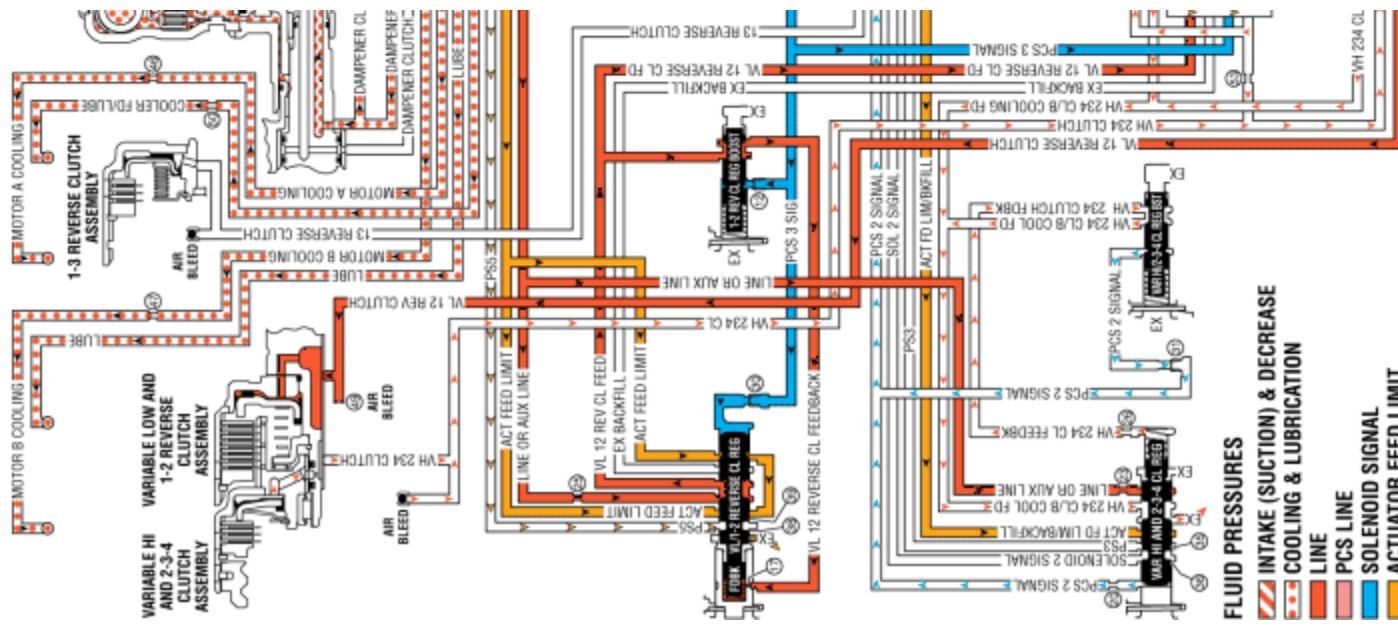

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid also exhausts from the variable hi and 2-3-4 clutch accumulator assembly. Accumulator spring force moves the variable hi and 2-3-4 clutch accumulator

piston to the released position.

Reverse Series Mode Engine On

When the transmission is operating in Reverse - Series Mode (R), and the HPCM determines that operating conditions are appropriate, the internal combustion engine (ICE) is started, the auxiliary fluid pump is turned OFF, and the main fluid pump provides hydraulic fluid pressure (refer to [Engine Start](#)). After Engine Start, the following changes would occur to the transmission's hydraulic and electrical systems.

[1-3 Reverse Clutch Remains Applied](#)

The 1-3 reverse clutch is applied for Engine Start, and remains applied for Reverse - Series Mode (Engine ON).

Pressure Control (PC) Solenoid 4

The PC solenoid 4 is energised (ON) allowing actuator feed limit fluid to enter the PCS 4 signal circuit. PCS 4 signal fluid is then routed through orifice #18 to the 1-3 reverse clutch regulator valve.

Shift Solenoid 2

The shift solenoid 2 is energised (ON) allowing actuator feed limit fluid to enter the solenoid 2 signal fluid circuit. Solenoid 2 signal fluid is routed through orifice #21 to the shift solenoid valve - mode A. Solenoid 2 signal fluid is also routed to the variable hi and 2-3-4 clutch regulator valve, and to the 1-3 reverse clutch regulator valve.

1-3 Reverse Clutch Regulator Valve

PCS 4 signal fluid, at the 1-3 reverse clutch regulator valve, opposes 1-3 reverse clutch regulator valve spring force and 13 reverse clutch feedback fluid pressure to regulate line or auxiliary line pressure into the 13 reverse clutch/A cooling feed circuit.

#3 Ball Check Valve

13 reverse clutch feedback fluid unseats the #3 ball check valve, allowing excess pressure to pass into the actuator feed limit circuit. This helps to control clutch apply fluid pressure and clutch apply feel.

Shift Solenoid Valve - Mode A

13 reverse clutch/A cooling feed fluid passes through the shift solenoid valve - mode A and enters the 13 reverse clutch circuit.

1-3 Reverse Clutch Assembly

1-3 reverse clutch fluid passes through the case and the transmission fluid pump cover into the 1-3 reverse clutch housing and moves the 1-3 reverse clutch piston against spring force to apply the 1-3 reverse clutch plates.

#1 Pressure Switch

Solenoid 2 signal fluid passes through the 1-3 reverse clutch regulator valve into the PS1 fluid passage. PS1 fluid opens the normally closed #1 pressure switch, signalling the TCM that the transmission is in Reverse - Series Mode.

#3 Pressure Switch

Solenoid 2 signal fluid passes through the variable hi and 2-3-4 clutch regulator valve into the PS3 fluid passage. PS3 fluid opens the normally closed #3 pressure switch, signalling the TCM that the transmission is in Reverse - Series Mode.

[Torque Damper Clutch Releases](#)

Pressure Control (PC) Solenoid 5

The PC solenoid 5 is de-energised (OFF) allowing PCS 5 signal fluid to exhaust from the damper bypass clutch valve.

Torque Damper Clutch Assembly

Damper clutch fluid exhausts from the torque damper clutch assembly to the damper bypass clutch valve allowing the torque damper clutch to release.

Damper Bypass Clutch Valve

Damper bypass clutch valve spring force moves the damper bypass clutch valve to the released position, allowing damper clutch fluid pressure to exhaust through the valve into the exhaust backfill circuit.

Transmission Fluid Temperature (TFT) Sensor

Damper clutch fluid pressure in the exhaust backfill circuit exhausts at the TFT sensor.

[Variable Low and 1-2 Reverse Clutch Remains Applied](#)

Variable Low and 1-2 Reverse Clutch Assembly

With the exception of the switch to line fluid pressure from the main fluid pump assembly, no other changes occur to the variable low and 1-2 reverse clutch fluid circuit and

the variable low and 1-2 reverse clutch remains applied.

Variable Hi and 2-3-4 Clutch Releases

Pressure Control (PC) Solenoid 2

The PC solenoid 2 is commanded OFF, allowing PCS 2 signal fluid to exhaust from the variable hi and 2-3-4 clutch regulator valve and the variable hi and 2-3-4 clutch boost valve.

Variable Hi and 2-3-4 Clutch Assembly

VH 234 clutch fluid pressure is exhausted from the case assembly, allowing variable hi and 2-3-4 clutch spring force to move the variable hi and 2-3-4 clutch piston and release the variable hi and 2-3-4 clutch plates.

Shift Solenoid Valve - Mode B

Exhausting VH 234 clutch fluid pressure passes through the shift solenoid valve - mode B into the 234 clutch feed circuit.

Shift Solenoid Valve - Mode A

Exhausting 234 clutch feed fluid pressure passes through the shift solenoid valve - mode A into the VH 234 clutch/B cooling feed circuit.

Variable Hi and 2-3-4 Clutch Regulator Valve

Variable hi and 2-3-4 clutch regulator valve spring force moves the variable hi and 2-3-4 clutch regulator valve to the released position, allowing VH 234 clutch/B cooling feed fluid pressure to exhaust.

Shift Accumulation

1-3 Reverse Clutch Accumulator

13 reverse clutch fluid is also sent to the 1-3 reverse clutch accumulator assembly. 13 reverse clutch fluid moves the 1-3 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the 1-3 reverse clutch assembly.

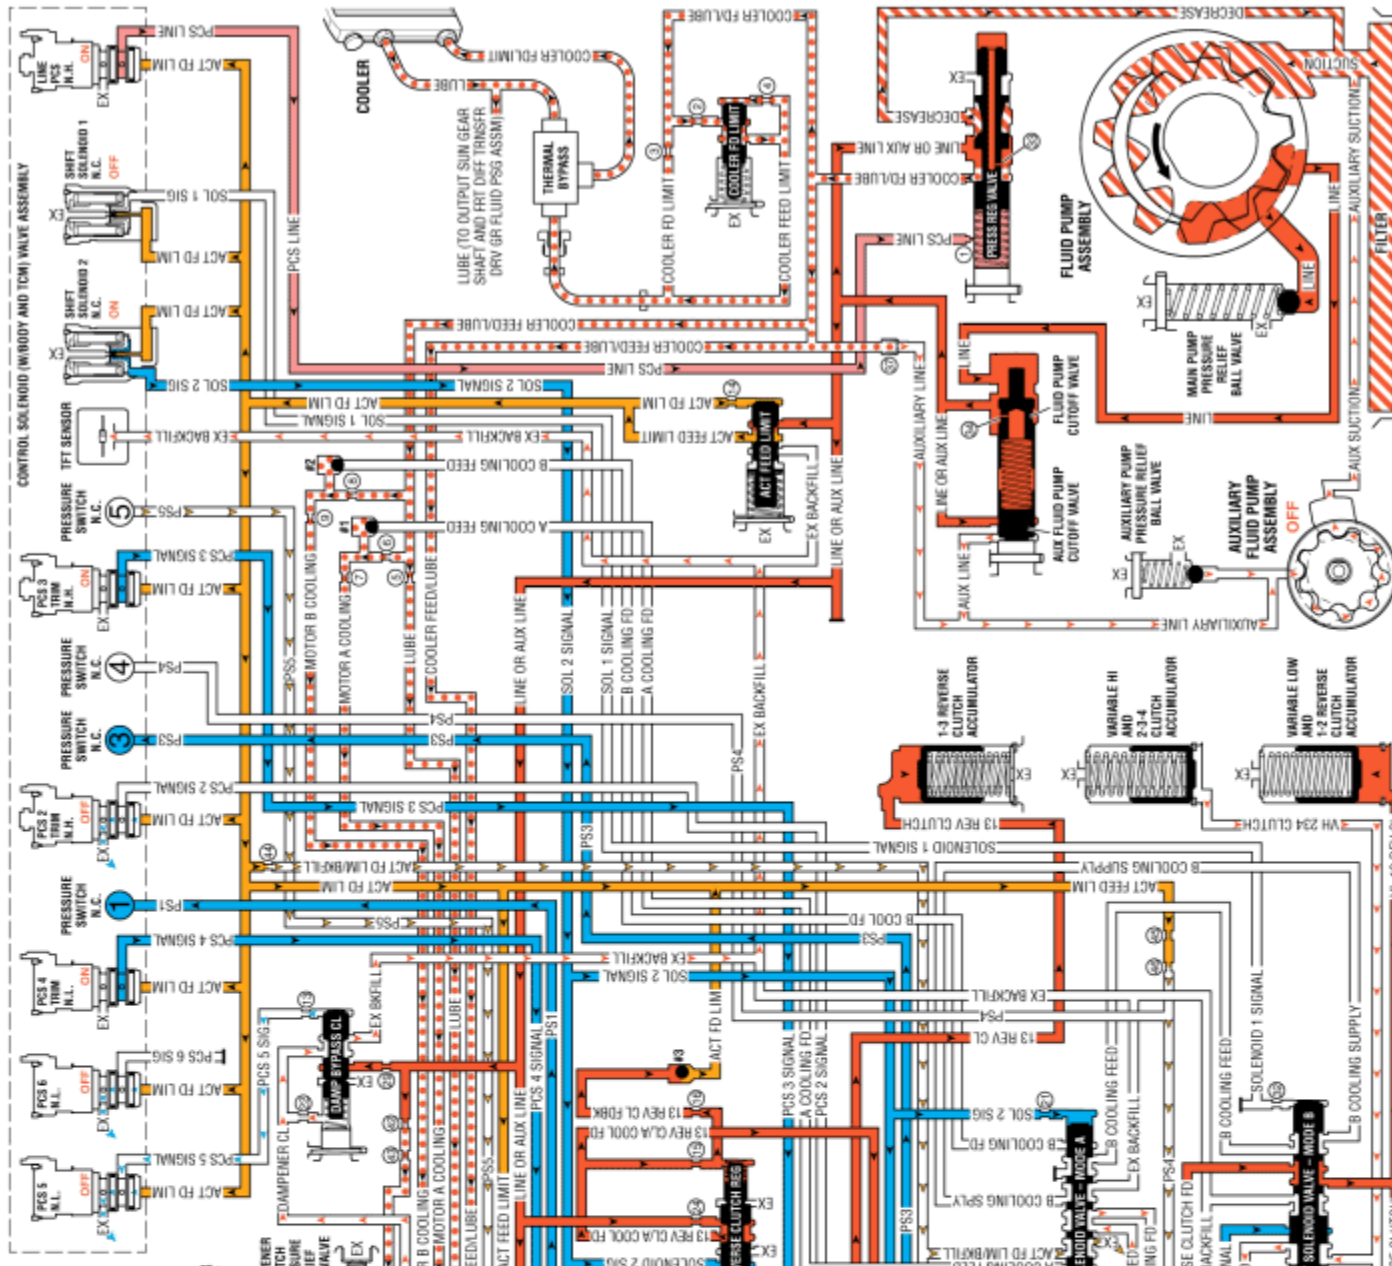

Variable Low and 1-2 Reverse Clutch Accumulator

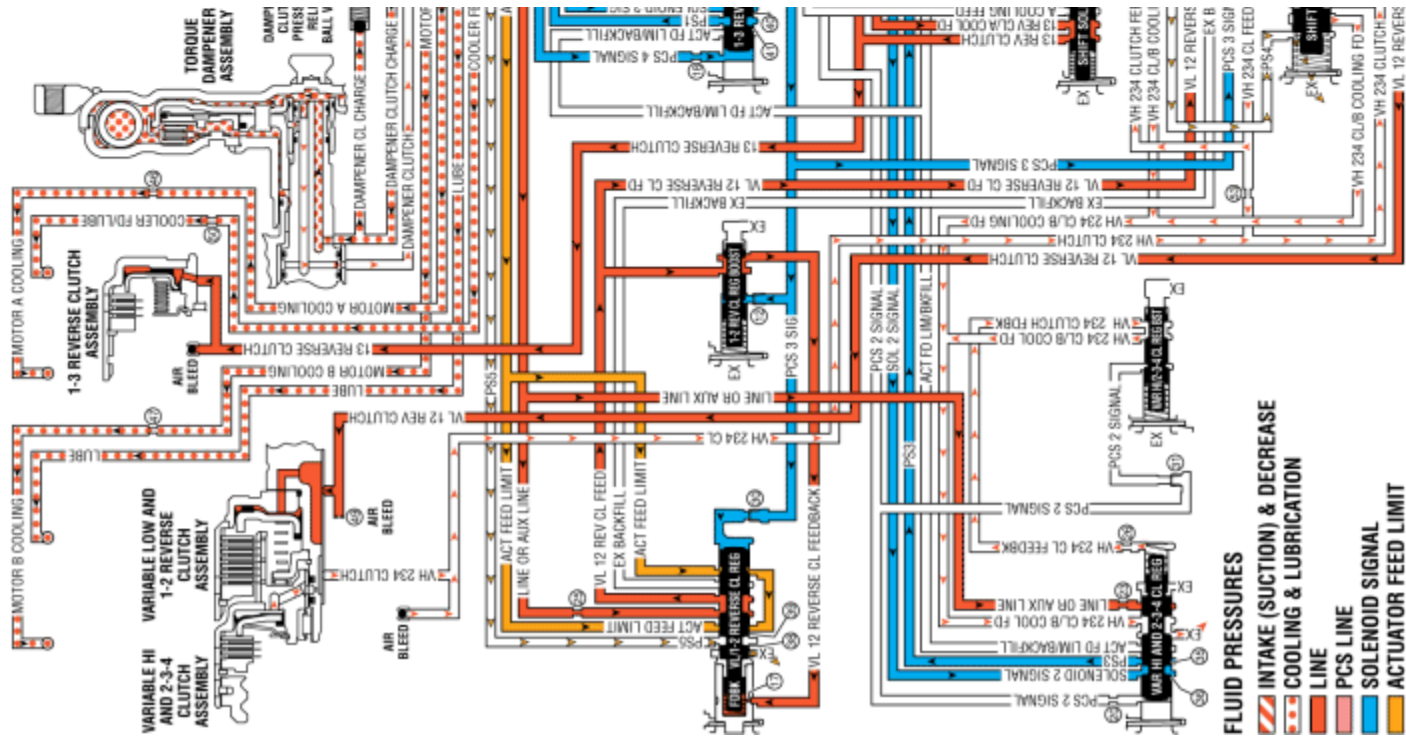

VL 12 reverse clutch fluid is also sent to the variable low and 1-2 reverse clutch accumulator assembly. VL 12 reverse clutch fluid moves the variable low and 1-2 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the variable low and 1-2 reverse clutch assembly.

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid also exhausts from the variable hi and 2-3-4 clutch accumulator assembly. Accumulator spring force moves the variable hi and 2-3-4 clutch accumulator piston to the released position.

Solenoid 2 signal fluid is also routed to the variable hi and 2-3-4 clutch regulator valve, and to the 1-3 reverse clutch regulator valve.

1-3 Reverse Clutch Regulator Valve

PCS 4 signal fluid, at the 1-3 reverse clutch regulator valve, opposes 1-3 reverse clutch regulator valve spring force and 13 reverse clutch feedback fluid pressure to regulate line or auxiliary line pressure into the 13 reverse clutch/A cooling feed circuit.

#3 Ball Check Valve

13 reverse clutch feedback fluid unseats the #3 ball check valve, allowing excess pressure to pass into the actuator feed limit circuit. This helps to control clutch apply fluid pressure and clutch apply feel.

Shift Solenoid Valve - Mode A

13 reverse clutch/A cooling feed fluid passes through the shift solenoid valve - mode A and enters the 13 reverse clutch circuit.

1-3 Reverse Clutch Assembly

1-3 reverse clutch fluid passes through the case and the transmission fluid pump cover into the 1-3 reverse clutch housing and moves the 1-3 reverse clutch piston against spring force to apply the 1-3 reverse clutch plates.

#1 Pressure Switch

Solenoid 2 signal fluid passes through the 1-3 reverse clutch regulator valve into the PS1 fluid passage. PS1 fluid opens the normally closed #1 pressure switch, signalling the TCM that the transmission is in Drive - Output Split.

Torque Damper Clutch Releases

Pressure Control (PC) Solenoid 5

The PC solenoid 5 is de-energised (OFF) allowing PCS 5 signal fluid to exhaust from the damper bypass clutch valve.

Torque Damper Clutch Assembly

Damper clutch fluid exhausts from the torque damper clutch assembly to the damper bypass clutch valve allowing the torque damper clutch to release.

Damper Bypass Clutch Valve

Damper bypass clutch valve spring force moves the damper bypass clutch valve to the released position, allowing damper clutch fluid pressure to exhaust through the valve into the exhaust backfill circuit.

Transmission Fluid Temperature (TFT) Sensor

Damper clutch fluid pressure in the exhaust backfill circuit exhausts at the TFT sensor.

Variable Hi and 2-3-4 Clutch Remains Applied

Variable Hi and 2-3-4 Clutch Assembly

With the exception of the switch to line fluid pressure from the main fluid pump assembly, no other changes occur to the variable hi and 2-3-4 clutch fluid circuit and the variable hi and 2-3-4 clutch remains applied.

Shift Accumulation

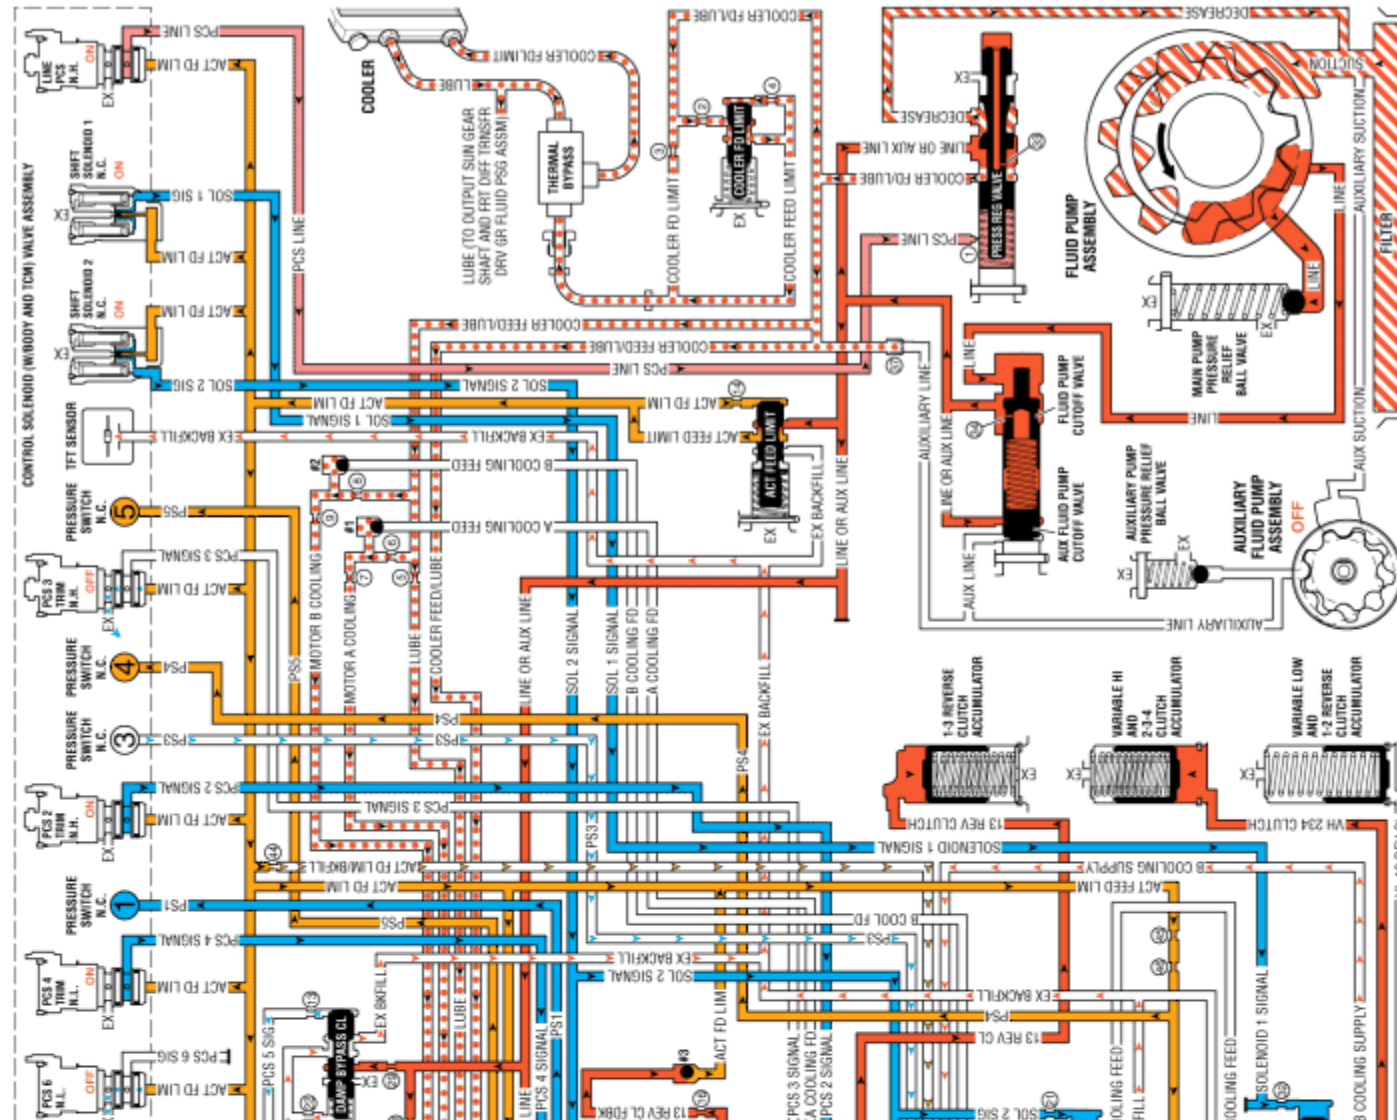

1-3 Reverse Clutch Accumulator

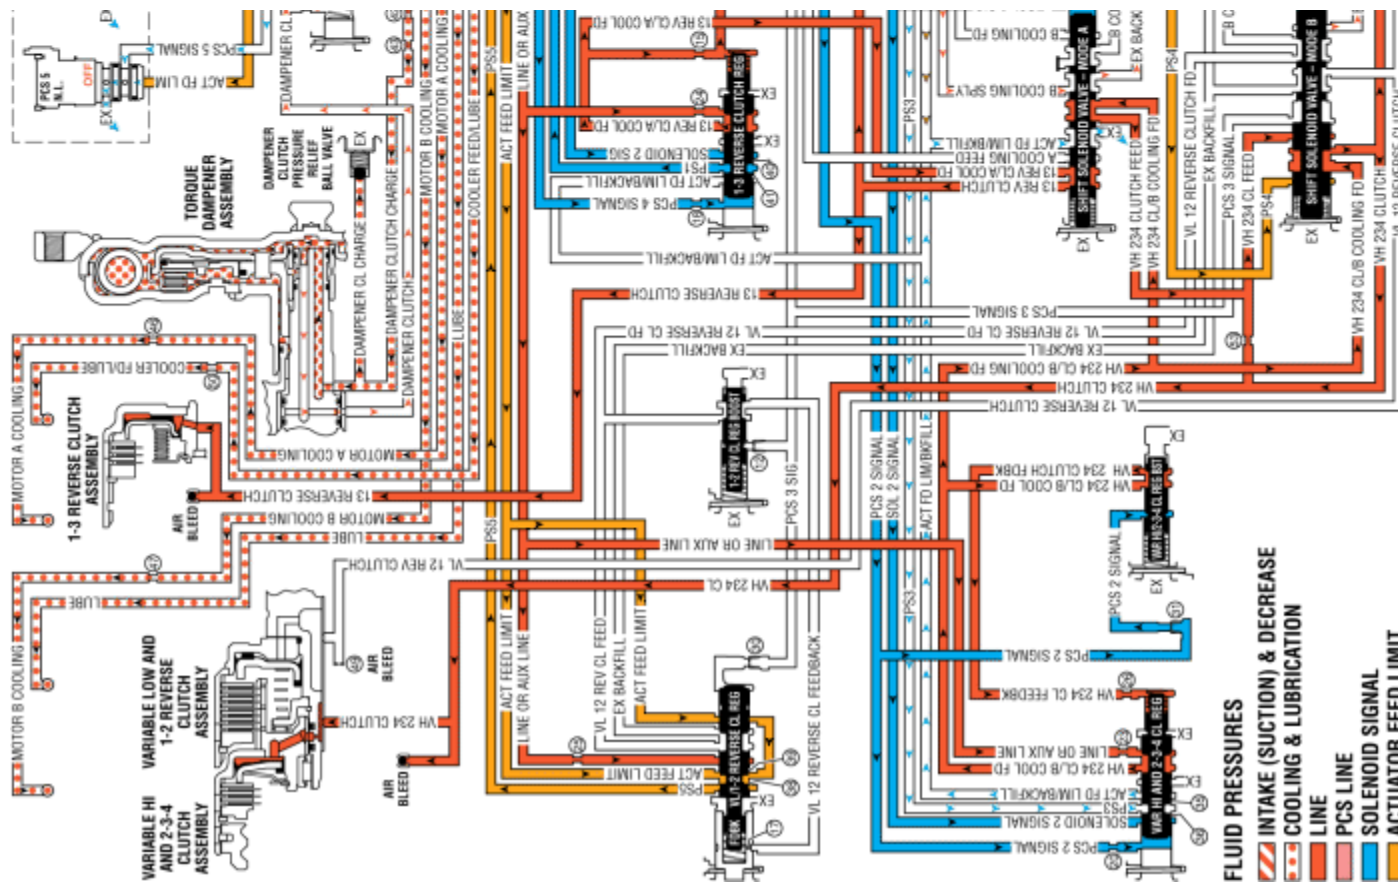

13 reverse clutch fluid is also sent to the 1-3 reverse clutch accumulator assembly. 13 reverse clutch fluid moves the 1-3 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the 1-3 reverse clutch assembly.

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid is also sent to the variable hi and 2-3-4 clutch accumulator assembly. VH 234 clutch fluid moves the variable hi and 2-3-4 clutch accumulator piston against accumulator spring force to cushion the application of the variable hi and 2-3-4 clutch assembly.

Drive Output Split Engine On

Power Off Default

If the transmission experiences an electrical component malfunction, all solenoids will default to their normal state. The transmission will operate in Default whenever the gear selector lever is a forward range. The transmission will remain in this default state until the condition is corrected. Reverse (R) range can also still be selected. This default action enables the vehicle to be safely driven to a service centre.

Variable Low and 1-2 Reverse Clutch Applied or Remains Applied

When an electrical malfunction occurs, the PC solenoid 3 defaults to its normally high state (ON). Depending on the operating mode of the transmission at the time of the malfunction, the variable low and 1-2 reverse clutch is either applied or remains applied.

Pressure Control (PC) Solenoid 3

The PC solenoid 3 defaults to its normally high state (ON) allowing actuator feed limit fluid to enter the PCS 3 signal circuit. PCS 3 signal fluid is then routed through orifice #30 to the variable low and 1-2 reverse clutch regulator valve; through orifice #12 to the variable low and 1-2 reverse clutch boost valve; and to the shift solenoid valve -mode B.

Variable Low and 1-2 Reverse Clutch Boost Valve

PCS 3 signal fluid pressure acts on a differential area of the variable low and 1-2 reverse clutch boost valve, moving the valve against variable low and 1-2 reverse clutch boost valve spring force to block VL 12 reverse clutch feed fluid from entering the VL 12 reverse clutch feedback circuit, and opening the VL 12 reverse clutch feedback circuit to exhaust. This results in the variable low and 1-2 reverse clutch regulator valve moving to the full feed position, sending full VL 12 reverse clutch feed pressure (full line pressure) to the variable low and 1-2 reverse clutch.

Variable Low and 1-2 Reverse Clutch Regulator Valve

PCS 3 signal fluid moves the variable low and 1-2 reverse clutch regulator valve, against variable low and 1-2 reverse clutch regulator valve spring force, to the applied position. This allows line or auxiliary line fluid to pass through the valve into the VL 12 reverse clutch feed circuit.

Shift Solenoid Valve - Mode B

VL 12 reverse clutch feed fluid is routed to the shift solenoid valve - mode B, where it passes through the valve into the VL 12 reverse clutch circuit.

Variable Low and 1-2 Reverse Clutch Assembly

VL 12 reverse clutch fluid pressure enters the case assembly behind the variable low and 1-2 reverse clutch piston and moves the piston against spring force to apply the variable low and 1-2 reverse clutch plates.

1-3 Reverse Clutch Releases

The normally low pressure control solenoid 4 and the normally closed shift solenoid 2 default to their normal states (OFF), and the 1-3 reverse clutch is released if it was applied at the time of the malfunction.

Pressure Control (PC) Solenoid 4

The PC solenoid 4 is commanded OFF, allowing PCS 4 signal fluid to exhaust from the 1-3 reverse clutch regulator valve.

Shift Solenoid 2

The shift solenoid 2 is commanded OFF, allowing solenoid 2 signal fluid to exhaust. When solenoid 2 signal fluid exhausts, the shift solenoid valve - mode A moves to the released position.

1-3 Reverse Clutch Assembly

13 reverse clutch fluid pressure is exhausted from the 1-3 reverse clutch housing assembly, allowing 1-3 reverse clutch spring force to move the 1-3 reverse clutch piston and release the 1-3 reverse clutch plates.

Shift Solenoid Valve - Mode A

13 reverse clutch fluid pressure exhausts at the shift solenoid valve - mode A.

#3 Ball Check Valve

13 reverse clutch feedback fluid pressure exhausts into the 13 reverse clutch/A cooling feed circuit, allowing actuator feed limit fluid to seat the ball.

1-3 Reverse Clutch Regulator Valve

1-3 reverse clutch regulator valve spring force moves the 1-3 reverse clutch regulator valve to the released position, allowing 13 reverse clutch/A cooling feed fluid pressure to exhaust.

Variable Hi and 2-3-4 Clutch Releases

The normally closed shift solenoid 1 and shift solenoid 2 default to their normal states (OFF), and the variable hi and 2-3-4 clutch is released if it was applied at the time of the malfunction.

Pressure Control (PC) Solenoid 2

The PC solenoid 2 is commanded OFF, allowing PCS 2 signal fluid to exhaust from the variable hi and 2-3-4 clutch regulator valve and the variable hi and 2-3-4 clutch boost valve.

Variable Hi and 2-3-4 Clutch Assembly

VH 234 clutch fluid pressure is exhausted from the case assembly, allowing variable hi and 2-3-4 clutch spring force to move the variable hi and 2-3-4 clutch piston and release the variable hi and 2-3-4 clutch plates.

Shift Solenoid Valve - Mode B

Exhausting VH 234 clutch fluid pressure passes through the shift solenoid valve - mode B into the VH 234 clutch feed circuit.

Shift Solenoid Valve - Mode A

VH 234 clutch feed fluid pressure exhausts at the shift solenoid valve - mode A.

Variable Hi and 2-3-4 Clutch Regulator Valve

Variable hi and 2-3-4 clutch regulator valve spring force moves the variable hi and 2-3-4 clutch regulator valve to the released position, allowing VH 234 clutch/B cooling feed fluid pressure to exhaust.

[Torque Damper Clutch Releases](#)

If the torque damper clutch is applied when an electrical malfunction occurs, the clutch will release when the PC solenoid 5 defaults to its normally low state (OFF).

Pressure Control (PC) Solenoid 5

The PC solenoid 5 is de-energised (OFF) allowing PCS 5 signal fluid to exhaust from the damper bypass clutch valve.

Torque Damper Clutch Assembly

Damper clutch fluid exhausts from the torque damper clutch assembly to the damper bypass clutch valve allowing the torque damper clutch to release.

Damper Bypass Clutch Valve

Damper bypass clutch valve spring force moves the damper bypass clutch valve to the released position, allowing damper clutch fluid pressure to exhaust through the valve

into the exhaust backfill circuit.

Transmission Fluid Temperature (TFT) Sensor

Damper clutch fluid pressure in the exhaust backfill circuit exhausts at the TFT sensor.

Shift Accumulation

Variable Low and 1-2 Reverse Clutch Accumulator

VL 12 reverse clutch fluid is also sent to the variable low and 1-2 reverse clutch accumulator assembly. VL 12 reverse clutch fluid moves the variable low and 1-2 reverse clutch accumulator piston against accumulator spring force to cushion the apply of the variable low and reverse clutch assembly.

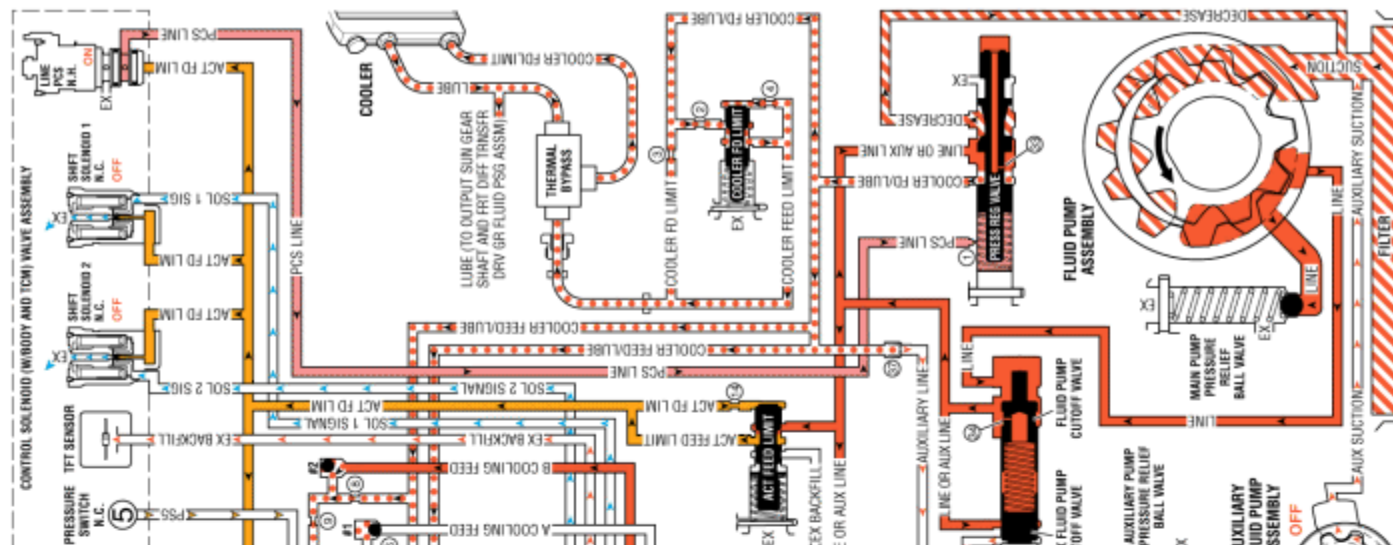

1-3 Reverse Clutch Accumulator

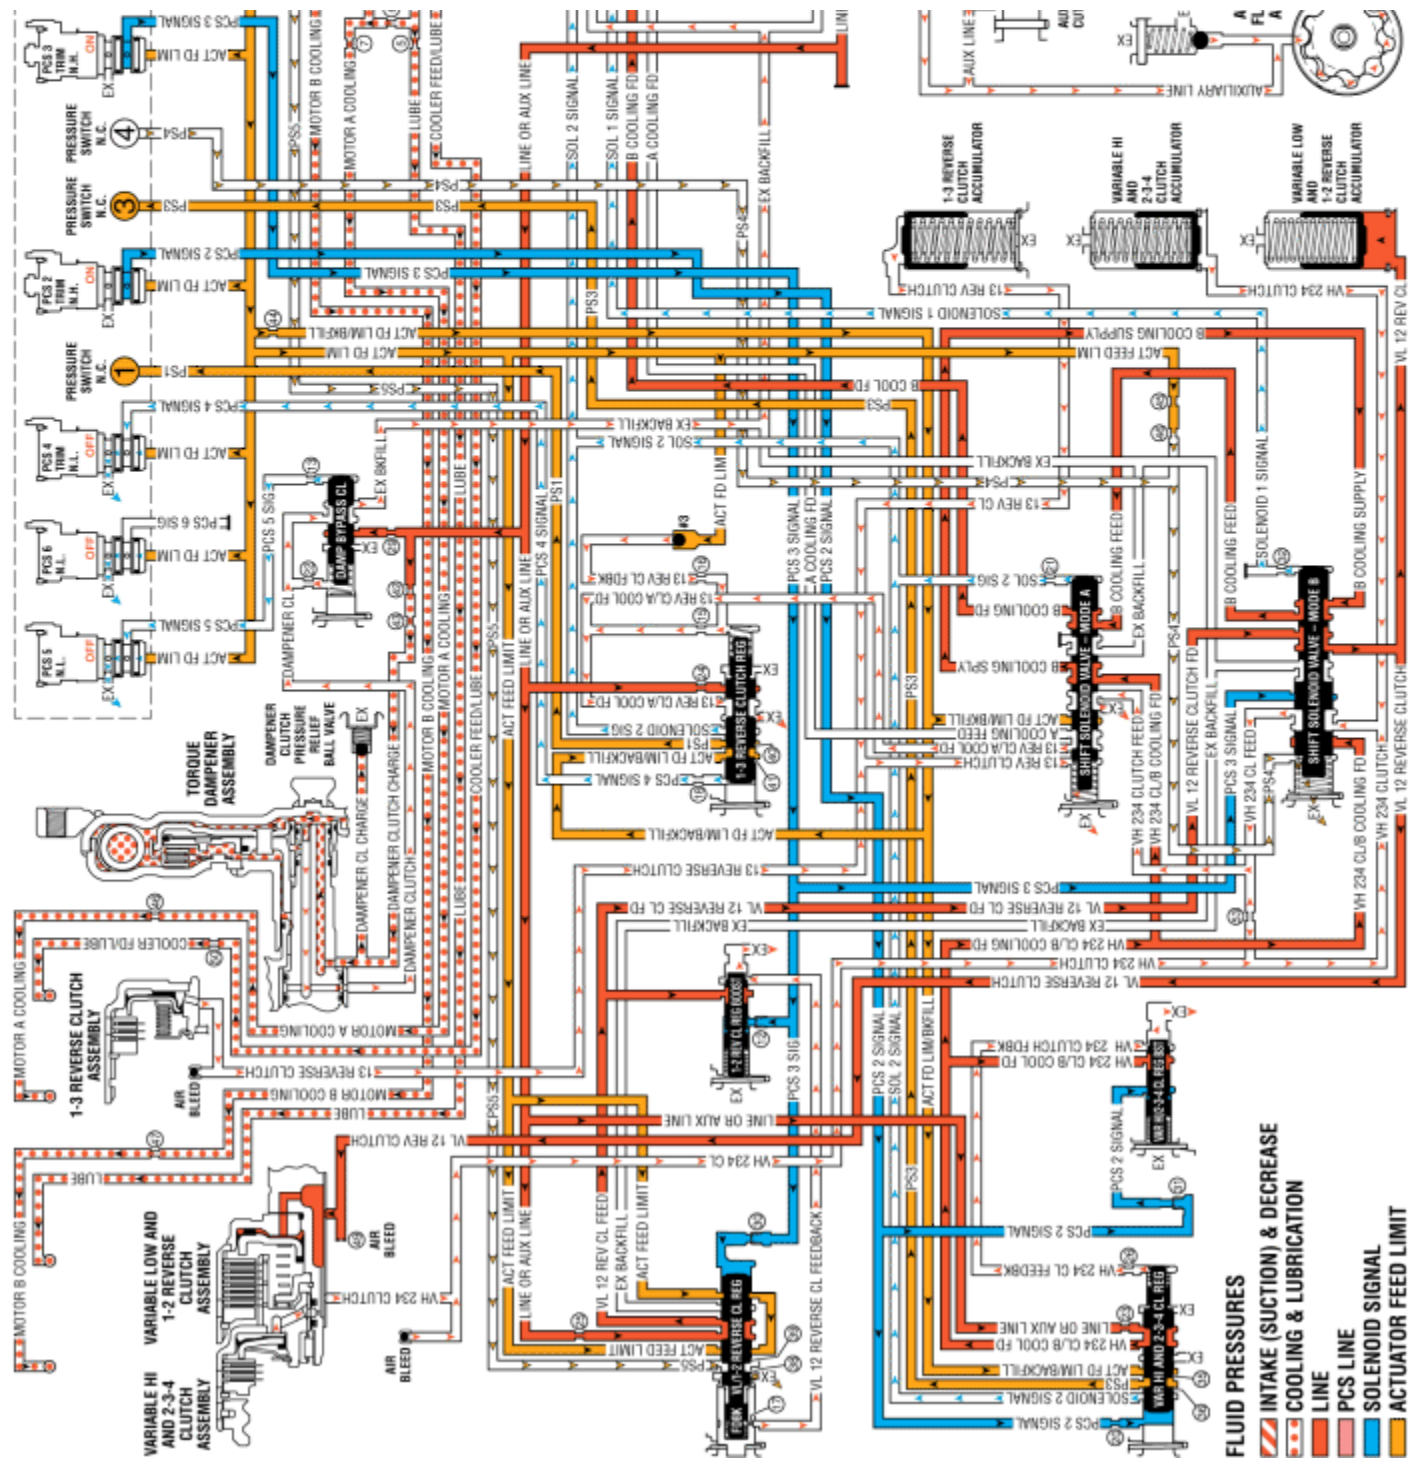

13 reverse clutch fluid also exhausts from the 1-3 reverse clutch accumulator assembly. Accumulator spring force moves the 1-3 reverse clutch accumulator piston to the released position.

Variable Hi and 2-3-4 Clutch Accumulator

VH 234 clutch fluid also exhausts from the variable hi and 2-3-4 clutch accumulator assembly. Accumulator spring force moves the variable hi and 2-3-4 clutch accumulator piston to the released position.

DTC B270A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B270A 01: Park Lock Solenoid Control Circuit Short to Voltage

DTC B270A 02: Park Lock Solenoid Control Circuit Short to Ground

DTC B270A 04: Park Lock Solenoid Control Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B270A 02, 1	B270A 04, 1	B270A 01, 2	-
Ground	--	B270A 04, 1	--	--

1. Transmission shift control lever will not move from PARK with the brake pedal applied.
2. Transmission shift control lever will move from PARK without the brake pedal applied.

[Circuit/System Description](#)

The body control module controls the transmission shift lock control solenoid actuator by providing a battery positive voltage to the solenoid when the brake pedal is applied. The BCM monitors the voltage and current flow of the control circuit.

[Conditions for Running the DTC](#)

- The ignition switch is in the ON position.
- The brake pedal is applied.
- The transmission is in the PARK position.
- The DTC runs continuously once the above conditions are met.

Conditions for Setting the DTC

B270A 01

The body control module detects a short to voltage in the transmission shift lock control solenoid actuator control circuit for 1 second.

B270A 02

The body control module detects a short to ground in the transmission shift lock control solenoid actuator control circuit for 1 second.

B270A 04

The body control module detects an open circuit in the transmission shift lock control solenoid actuator control circuit for 1 second.

Action Taken When the DTC Sets

The body control module will not attempt to enable the voltage supply circuit of the automatic transmission park lock control solenoid until the next power switch cycle.

Conditions for Clearing the DTC

- A current DTC B270A will clear when the malfunction is no longer present and the power switch is cycled.
- A history DTC will clear after 100 ignition cycles with no current DTC active during the 100 power switch cycles.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify the scan tool Brake Transmission Shift Interlock Solenoid Actuator Command parameter changes from Inactive to Active when the brake pedal is applied.
If the Brake Transmission Shift Interlock Solenoid Actuator Command does not change
Refer to [Stop Lamps Malfunction](#)
If the Brake Transmission Shift Interlock Solenoid Actuator Command changes
3. Verify the S3 transmission shift lever moves out of the PARK position when the brake pedal is applied.
If the S3 transmission shift lever does not move out of the PARK position
Refer to Circuit/System Testing.
If the S3 transmission shift lever does move out of the PARK position
All OK.

[Circuit/System Testing](#)

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S3 transmission shift lever. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF.
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.***If less than 10 Ω***

3. Vehicle in Service Mode, connect a test lamp between the control circuit terminal 4 and the ground circuit terminal 2.
4. Verify the test lamp turns ON and OFF when commanding the Brake Transmission Shift Interlock Solenoid Actuator ON and OFF with a scan tool.

If the test lamp is always OFF

- 4.1. Vehicle OFF, disconnect the harness connector at the K9 body control module.
- 4.2. Test for infinite resistance between the control circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 4.3. Test for less than 2 Ω in the control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω
- 4.4. Vehicle in Service Mode.
- 4.5. Verify a test lamp illuminates between each B+ and ignition circuit terminal at the control module harness connector.
If the test lamp does not illuminate, repair the circuit or fuse as necessary.
If the test lamp illuminates at each B+ and ignition circuit, replace the K9 body control module.

If the test lamp is always ON

- 4.1. Vehicle OFF, disconnect the harness connector at the K9 body control module, Vehicle in Service Mode.
- 4.2. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K9 body control module.

If the test lamp turns ON and OFF

5. Test or replace the S3 transmission shift lever.

Component Testing

Dynamic Test

1. Install a 10 A fused jumper wire between the control terminal 4 and 12 V. Momentarily install a jumper wire between the ground terminal 2 and ground.
2. Verify the solenoid turns on & off/clicks, etc.
If the solenoid does not turn on & off/clicks, etc.
Replace the S3 transmission shift lever.
If the solenoid does turn on & off/clicks, etc.
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Transmission Control Replacement](#)

- [Control Module References](#) for ECM replacement, programming, and setup.

Symptoms - Automatic Transmission Shift Lock Control

Important: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarise yourself with the system functions. Refer to [Automatic Transmission Shift Lock Control Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the automatic transmission shift lock control. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#)

Symptom List

Refer to a symptom diagnostic procedure in order to diagnose the symptom:

Replace the S3 transmission shift lever.
If the solenoid does turn on & off/clicks, etc.
3. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Transmission Control Replacement](#)

- [Control Module References](#) for ECM replacement, programming, and setup.

Automatic Transmission Shift Lock Control Description and Operation

The automatic transmission park lock control system is a safety device that prevents an inadvertent shift out of PARK. The driver must press the brake pedal before moving the park lever out of the PARK position. The system consists of the following components:

- The automatic transmission park lock solenoid (serviced as the automatic transmission shift lock actuator), is located within the floor shift control assembly.
- The body control module, which controls the voltage supply circuit of the park lock control solenoid.
- The engine control module.

The body control module controls the voltage to the park lock control solenoid through the park lock control solenoid controlled voltage circuit. The following conditions must be met before the body control module will supply voltage to the park lock solenoid:

- The ignition is in the ON position.
- The engine control module sends an input via GMLAN serial data to the body control module indicating the transmission is in the PARK position.
- The body control module determines the brake pedal is applied according the brake pedal position.

Since the park lock control solenoid is permanently grounded, the body control module supplies voltage to the automatic transmission park lock control solenoid, unlocking the park lever allowing the driver to move the park lever out of the PARK position as the solenoid energises. When the brake pedal is not applied, the body control module turns the control voltage output of the park lock control solenoid OFF, de-energizing the park lock control solenoid. The de-energised solenoid mechanically locks the park lever in the PARK position.

Rear Bumper Fascia Removal and Installation - Ampera

Callout

Component Name

Preliminary Procedures

1. Remove the underbody rear air deflector to fascia bolts. Refer to [Underbody Rear Air Deflector Replacement](#) .
2. Remove the rear screws from the wheelhouse liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .

1	<p>Rear Bumper Fascia Upper Screw (Qty: 2)</p> <p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Tighten 3 N·m (27 lb in)</p>
2	<p>Rear Bumper Fascia</p> <p>Procedure</p> <ol style="list-style-type: none">1. Reposition the lower liftgate weatherstrip to access the centre fascia guide.2. Insert a small flat-bladed tool into the fascia centre guide and depress the snaps one at a time and pull on the fascia working from one side to the other to remove the fascia from the rear fascia guides.3. Disconnect the electrical connectors.

Front Bumper Fascia Removal and Installation - Ampera

Callout

Component Name

Preliminary Procedures

1. Remove the front end panel outer deflector. Refer to [Front End Panel Outer Deflector Replacement](#) : [Volt](#) → [Ampera](#) .
2. Remove the front compartment front sight shield. Refer to [Front Compartment Front Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .
3. Remove the windscreen washer solvent container filler tube. Refer to [Windscreen Washer Solvent Container Filler Tube Replacement](#) .

4. Remove the side four front screws from the front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .
5. Loosen the 2 lower impact bar bolts. Refer to [Front Bumper Lower Impact Bar Replacement : Ampera](#) .

1	Front Bumper Fascia Upper Push-In Retainer (Qty: 2)
2	<p>Front Bumper Fascia Upper Screw (Qty: 4)</p> <p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Tighten 3 N·m (27 lb in)</p>
3	<p>Front Bumper Fascia Lower Screw (Qty: 2)</p> <p>Tighten 3 N·m (27 lb in)</p>
4	Front Bumper Fascia Lower Push-In Retainer (Qty: 4)
5	<p>Front Bumper Fascia</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Carefully push a small nylon wedge between the fascia and the front fascia retainers. Insert a small flat-bladed tool into the fascia slot and depress the snaps one at a time and pull on the fascia at the same time to gradually remove the fascia from the front fascia retainers of the wing. 2. Disconnect any electrical connectors. 3. Transfer any parts as needed.

Bonnet Primary and Secondary Catch Replacement - Ampera

Callout	Component Name
Preliminary Procedure	
Remove the front compartment front sight shield. Refer to Front Compartment Front Sight Shield Replacement : Volt → Ampera .	
	Bonnet Primary and Secondary Latch Bolt (Qty: 2)

1	Caution : Refer to Fastener Caution in the Preface section. Tighten 25 N·m (18 lb ft)
2	Bonnet Primary and Secondary Catch Procedure Disconnect the bonnet release cable and the electrical connector.

Front Compartment Side Sight Shield Replacement - Ampera

Callout	Component Name
1	Front Compartment Side Sight Shield Push-In Retainer
2	Front Compartment Side Sight Shield Procedure

1. Release the retainer on the bottom of the sight shield.
2. Slide the sight shield rearward and upward to remove the front compartment side sight shield.

Headlamp Replacement - Ampera

Callout

Component Name

Preliminary Procedures

1. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Remove the front compartment side sight shield. Refer to [Front Compartment Side Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .
3. Disconnect the headlamp electrical connection.

1	<p>Headlamp Screw (Qty: 4)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 2.5 N·m (22 lb in)</p>
2	<p>Headlamp Assembly</p> <p>Warning: Refer to Halogen Bulb Warning in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove the headlamp assembly from the vehicle.2. Transfer the headlamp bulb accessory cover and bulb socket as needed.3. Align the headlamps after replacement. Refer to Headlamp Alignment . <p>Note: The drive motor battery charger is below the right front headlamp assembly.</p>

Bonnet Replacement - Ampera

Callout	Component Name
1	<p>Bonnet Hinge Nut (Qty: 4)</p> <p>Caution : Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p>

Mark the location of the bonnet hinge fasteners to the bonnet hinges with a grease pencil to help with alignment.

Tighten

25 N·m (18 lb ft)

Bonnet

Procedure

2

1. Disconnect the wiper washer hoses from the bonnet.
2. Transfer parts as needed.
3. Adjust the hood. Refer to [Bonnet Adjustment](#) .

Front Compartment Front Sight Shield Replacement - Ampera

Callout	Component Name
1	Front Compartment Front Sight Shield Plastic Retainer (Qty: 10)
2	Front Compartment Front Sight Shield

Front End Panel Outer Deflector Replacement - Ampera

Callout	Component Name
1	Front End Panel Outer Deflector Bolt (Qty: 4) Caution : Refer to Fastener Caution in the Preface section. Tighten 3 N·m (27 lb in)

Front Bumper Lower Fascia Centre Grille Replacement - Ampera

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .2. Reposition the forward lamp harness from the topside of the lower grille assembly.	

1	Front Bumper Lower Fascia Centre Grille Retainer (Qty: 2)
2	<p>Front Bumper Lower Fascia Centre Grille</p> <p>Procedure</p> <ol style="list-style-type: none">1. Release the 18 grille tabs from the front bumper lower fascia centre grille.2. Pull the front bumper lower fascia centre grille from the rear of the front bumper fascia.

Rear Bumper Energy Absorber Replacement - Ampera

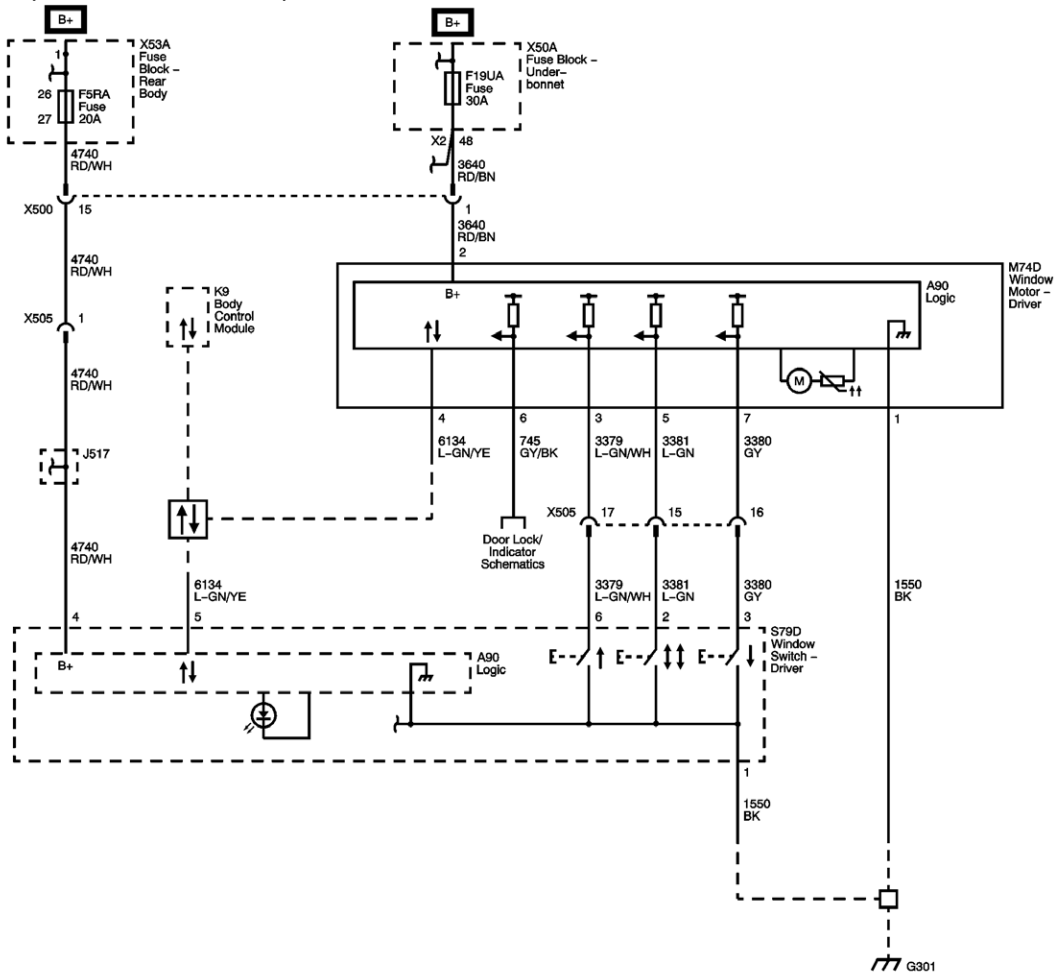

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the rear bumper fascia. Refer to Rear Bumper Fascia Removal and Installation : Volt → Ampera .2. Remove the back-up lamp. Refer to Reverse Lamp Replacement .	

1	Rear Bumper Energy Absorber Retainer (Qty: 4) Procedure 1. Disconnect the electrical connector/harness. 2. Disengage the retainers.
2	Rear Bumper Energy Absorber

Connector Part Information

Harness Type: Transmission
 OEM Connector: 15332128
 Service Connector: Service by Harness - See Part Catalog
 Description: 2-Way F GT 150 Series (BK)

Terminal Part Information

Terminated Lead: 13575735
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-2A (GY)

B14A Transmission Output Shaft Speed Sensor

Pin	Size	Colour	Circuit	Function	Option
A	0.5	RD	908	Output Speed High-Signal Output	-
B	0.5	VT	909	Output Speed Low Signal	-

B15 Transmission Internal Mode Switch X1

Connector Part Information

Harness Type: Transmission
 OEM Connector: AIT-2PB-1BH
 Service Connector: Service by Harness - See Part Catalog
 Description: 7-Way F AIT II Series (NA)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

B15 Transmission Internal Mode Switch X1

Pin	Size	Colour	Circuit	Function	Option
1	0.5	RD	901	12 Volt Reference	-
2	0.5	D-GN	902	Transmission IMS Mode Switch S bit Signal	--
3	0.5	YE	903	Transmission IMS Mode Switch R1 bit Signal	-

4	0.5	VT	904	Transmission IMS Mode Switch R2 bit Signal	--
5	0.5	L-BU	905	Transmission IMS Mode Switch D1 bit Signal	--
6	0.5	GY	906	Transmission IMS Mode Switch D2 bit Signal	-
7	0.5	BK	907	Signal Ground	-

B15 Transmission Internal Mode Switch X2

Connector Part Information

Harness Type: Transmission
 OEM Connector: AIT2PB-07-1FS
 Service Connector: Service by Harness - See Part Catalog
 Description: 7-Way F AIT II Series (NA)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

B15 Transmission Internal Mode Switch X2

Pin	Size	Colour	Circuit	Function	Option
1	--	--	--	Not Used	--
2	0.5	RD	910	12V Reference	--
3	0.5	YE	911	Transmission IMS Mode Switch P bit Signal	-

B78D Front Object Sensor - Right Middle

Connector Part Information

Harness Type: Front Fascia
 OEM Connector: 31404-3700
 Service Connector: 88988337
 Description: 3-Way F 64 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

B78D Front Object Sensor - Right Middle

Pin	Size	Colour	Circuit	Function	Option
1	0.5	RD/L-BU	5974	Park Assist Sensor Supply Voltage Park	-

2	0.5	BK/L-BU	5214	Low Reference	--
3	0.5	VT/GY	5218	Front Parking Right Mid Sensor	-

K9 Body Control Module X2

Connector Part Information

Harness Type: Instrument Panel
OEM Connector: HIT2PB-27-C-LE
Service Connector: 19151266
Description: 27-Way F 0.64 2.8 Series (L-BU)

Terminal Part Information

Pins: 1, 3, 4
Terminated Lead: 13327199
Release Tool: J-38125-12A
Diagnostic Test Probe: J-35616-35 (VT)

Pins: 2
Terminated Lead: Pending
Release Tool: J-38125-12A
Diagnostic Test Probe: J-35616-35 (VT)

Pins: 7-10, 13, 15-17, 19, 21, 22, 25-27

K20 Engine Control Module X3

Connector Part Information

Harness Type: Engine
 OEM Connector: 34566-0203
 Service Connector: 88988372
 Description: 73-Way F MX123 34566 Series (BK with GY Terminal Position Assurance Lock)

Terminal Part Information

Pins: 3-6, 10, 21, 27-30, 32, 34, 37, 39, 43, 45, 46, 57, 59, 63, 64, 67, 68

Terminated Lead: 13575575

Release Tool: J-38125-213

Diagnostic Test Probe: J-35616-64B (L-BU)

Pins: 73

Terminated Lead: 13576392

Release Tool: J-38125-11A

Diagnostic Test Probe: J-35616-35 (VT)

Connector Part Information

Harness Type: Body
 OEM Connector: 7283-9029-40
 Service Connector: 19115653
 Description: 8-Way F YESC Kaizen Series (L-GY)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K41 Parking Assist Control Module X2

Pin	Size	Colour	Circuit	Function	Option
1	0.5	YE/VT	2378	Right Rear Corner Object Sensor Signal	-

2	0.5	YE/WH	2377	Right Rear Middle Object Sensor Signal	--
3	0.5	YE/L-BU	2376	Left Rear Middle Object Sensor Signal	-
4	0.5	RD/VT	5974	Park Assist Sensor Supply Voltage Park	—
5	0.5	YE	2375	Left Rear Corner Object Sensor Signal	-
6-7	--	--	--	Not Used	--
8	0.5	BK/GY	2379	Low Reference	-

K41 Parking Assist Control Module X3

Connector Part Information

Harness Type: Body
 OEM Connector: 7283-9068-90
 Service Connector: 15127038
 Description: 14-Way F (BU)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K41 Parking Assist Control Module X3

Pin	Size	Colour	Circuit	Function	Option
1	0.35	RD/L-BU	5974	Park Assist Sensor Supply Voltage Park	-
2-3	--	--	--	Not Used	--
4	0.35	VT/WH	5215	Front Parking Left Corner Sensor	-
5	0.35	YE/GY	5216	Front Parking Left Mid Sensor	-

6-7	--	--	--	Not Used	--
8	0.35	BK/L-BU	5214	Low Reference	-
9	--	--	--	Not Used	--
10	0.35	VT/GY	5218	Front Parking Right Mid Sensor	--
11	0.35	WH/GY	5217	Front Parking Right Corner Sensor	-
12-14	--	--	--	Not Used	--

(1) K43 Power Steering Control Module

K43 Power Steering Control Module X1

Connector Part Information

Harness Type: Engine
 OEM Connector: 42123000
 Service Connector: 13574906
 Description: 5-Way F Micro II Timer Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - Pending
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

K43 Power Steering Control Module X1

Pin	Size	Colour	Circuit	Function	Option
1	0.5	WH/L-BU	5986	Serial Data Communication Enable	-
2	0.5	L-BU	2500	High Speed GMLAN Serial Data (+) (1)	--
3	0.5	L-BU	2500	High Speed GMLAN Serial Data (+) (1)	-

K43 Power Steering Control Module X2

Connector Part Information

Harness Type: Engine
OEM Connector: 13663324
Service Connector: 13577532
Description: 2-Way F DUCON 9.5 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - Pending
Release Tool: J-38125-11A
Diagnostic Test Probe: J-35616-31 (OG)

K43 Power Steering Control Module X2

Pin	Size	Colour	Circuit	Function	Option
1	10	BK	350	Ground	-
2	10	RD/L-GN	242	Battery Positive Voltage	-

K65 Tyre Pressure Indicator Module

Connector Part Information

Harness Type: Body
OEM Connector: 90484986
Service Connector: 90484986
Description: 4-Way F 64 MQS Series (BK)

Terminal Part Information

Terminated Lead: Pending
Release Tool: Pending
Diagnostic Test Probe: Pending

K65 Tyre Pressure Indicator Module

Pin	Size	Colour	Circuit	Function	Option
1	0.35	BK	650	Ground	--

2	0.35	VT/L-GN	439	Ignition Voltage	--
3	0.35	L-GN/L-BU	6133	Linear Interconnect Network 3	--
4	--	--	--	Not Used	--

K73 Telematics Communication Interface Module X1

Connector Part Information

Harness Type: Instrument Panel
OEM Connector: 1456601-1
Service Connector: 13316208
Description: 16-Way F Multilock 040 II Series (WH)

Terminal Part Information

Pins: 1, 7, 10-12, 15
Terminated Lead: Pending
Release Tool: J-38125-559
Diagnostic Test Probe: J-35616-16 (L-GN)

Pins: 2, 3, 6
Terminated Lead: Pending
Release Tool: J-38125-553
Diagnostic Test Probe: J-35616-65B (L-BU)

Pin	Size	Colour	Circuit	Function	Option
1	0.5	L-GN	5060	Low Speed GMLAN Serial Data	--
2	0.35	BN/WH	2517	Keypad Red LED	--
3	0.35	YE/VT	2516	Keypad Green LED	-
4-5	--	--	--	Not Used	--
6	0.35	L-GN/BK	2515	Keypad Supply Voltage	-
7	0.5	BK	2050	Ground	--
8-9	--	--	--	Not Used	--
10	0.5	L-BU	2500	High Speed GMLAN Serial Data (+) (1)	--
11	0.35	L-GN/WH	2514	Keypad Signal	-
12	0.5	WH	2501	High Speed GMLAN Serial Data (-) (1)	-
13-14	--	--	--	Not Used	--
15	0.5	RD/VT	2640	Battery Positive Voltage	-
16	--	--	--	Not Used	--

K73 Telematics Communication Interface Module X2

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 1456599-1
 Service Connector: 13316194
 Description: 12-Way F Multilock 040 II Series (WH)

Terminal Part Information

Terminated Lead: Pending
 Release Tool: J-38125-559
 Diagnostic Test Probe: J-35616-16 (L-GN)

K73 Telematics Communication Interface Module X2

Pin	Size	Colour	Circuit	Function	Option
1	0.5	YE	658	Mobile Telephone Voice Signal	-
2	0.5	BK/YE	659	Low Reference	--
3	0.5	L-BU	2500	High Speed GMLAN Serial Data (+) (1)	-

4	0.5	WH	2501	High Speed GMLAN Serial Data (-) (1)	-

K77 Remote Control Door Lock Receiver

Connector Part Information

Harness Type: Headliner
 OEM Connector: 968943-1
 Service Connector: Pending
 Description: 4-Way F 64 MQS Series (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - Pending
 Release Tool: J-38125-12A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K77 Remote Control Door Lock Receiver

Pin	Size	Colour	Circuit	Function	Option
1	0.5	GY	3273	Remote Function Actuator Return	-

2	0.5	YE/L-GN	3274	Remote Function Actuator Transmit Signal	--
3	0.5	L-BU/WH	3275	Remote Function Actuator Receive Signal	-
4	0.5	GY/WH	3272	Remote Function Actuator Supply Voltage	-

K83 Parking Brake Control Module

Connector Part Information

Harness Type: Body
OEM Connector: 15479301
Service Connector: 15306348
Description: 16-Way GT 150 280 (BK)

Terminal Part Information

Pins: A, H
Terminated Lead: 13575403
Release Tool: J-38125-553
Diagnostic Test Probe: J-35616-4A (PU)

Pins: B-G, K-R
Terminated Lead: Pins B-D, N and R - 13327112
Terminated Lead: Pins E-G, K-M and P - 13575413
Release Tool: J-38125-553
Diagnostic Test Probe: J-35616-2A (GY)

Pins: S
 Terminated Lead: 13575406
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-4A (PU)

K83 Parking Brake Control Module

Pin	Size	Colour	Circuit	Function	Option

K84 Keyless Entry Control Module X1

Connector Part Information

Harness Type: Body
 OEM Connector: 31410-1200
 Service Connector: 15126711
 Description: 20-Way F 64 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K84 Keyless Entry Control Module X1

Pin	Size	Colour	Circuit	Function	Option
1-2	--	--	--	Not Used	--

3	0.5	L-GN	5060	Low Speed GMLAN Serial Data	-
4-10	--	--	--	Not Used	--

K84 Keyless Entry Control Module X2

Connector Part Information

Harness Type: Body
OEM Connector: 7283-9749-30
Service Connector: 88988512
Description: 6-Way F YESC Kaizen Series (BK)

Terminal Part Information

Pins: 1-4
Terminated Lead: Service by Connector Assembly - 88988512
Release Tool: J-38125-553
Diagnostic Test Probe: J-35616-2A (GY)

Pins: 5, 6
Terminated Lead: Service by Connector Assembly - 88988512
Release Tool: J-38125-11A
Diagnostic Test Probe: J-35616-42 (RD)

K84 Keyless Entry Control Module X2

Pin	Size	Colour	Circuit	Function	Option
1	0.35	RD/WH	4042	Battery Positive Voltage	-
2	0.35	BK/BN	850	Ground	--
3	0.35	VT/YE	4	Accessory Voltage	--
4	0.35	VT/BK	3	Run/Crank Ignition 1 Voltage	--
5	0.5	RD/WH	4042	Battery Positive Voltage	--
6	0.5	BK	850	Ground	-

K85 Passenger Presence Detection Module

Connector Part Information

Harness Type: Passenger Seat
 OEM Connector: 6098-5519
 Service Connector: Service by Harness - See Part Catalog
 Description: 4-Way M Low Profile 1.5 Series (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-3 (GY)

K85 Passenger Presence Detection Module

Pin	Size	Colour	Circuit	Function	Option
1	0.35	D-GN	5060	Low Speed GMLAN Serial Data	-
2	--	--	--	Not Used	--
3	0.5	RD	40	Battery Positive Voltage	-
4	0.35	BK	2050	Ground	-

K89 Immobiliser Control Module

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 4-1718346-1
 Service Connector: 13576530
 Description: 3-Way F Micro Quadlok Series (PU)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13576530
 Release Tool: J-38125-12A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K89 Immobiliser Control Module

Pin	Size	Colour	Circuit	Function	Option
1	0.35	L-GN/GY	3277	Vehicle Anti-Theft System Immobiliser Return	-

2	0.35	L-GN/VT	7533	Linear Interconnect Network Bus 11	--
3	0.35	GY/BK	3276	Vehicle Anti-Theft System Immobiliser Supply Voltage	-

K112A Hybrid/EV Battery Interface Control Module 1 X1

Connector Part Information

Harness Type: Hybrid Battery
 OEM Connector: ATLPB-21-2AK
 Service Connector: Service by Harness - See Part Catalog
 Description: 21-Way F (BK)

Terminal Part Information

Terminated Lead: 13575867
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K112A Hybrid/EV Battery Interface Control Module 1 X1

Pin	Size	Colour	Circuit	Function	Option
1-8	--	--	--	Not Used	--
9	0.5	GY/RD	705	5 Volt Reference	--
10	0.5	L-BU/YE	6434	CAN Bus High #2 Serial Data	--

11	0.5	WH/YE	6435	CAN Bus Low #2 Serial Data	-

K112C Hybrid/EV Battery Interface Control Module 3 X1

Connector Part Information

Harness Type: Hybrid Battery
 OEM Connector: ATLPB-21-2AK
 Service Connector: Service by Harness - See Part Catalog
 Description: 21-Way F (BK)

Terminal Part Information

Terminated Lead: 13575867
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

K112C Hybrid/EV Battery Interface Control Module 3 X1

Q12 Evaporative Emissions Purge Solenoid Valve

Connector Part Information

Harness Type: Engine
 OEM Connector: 1928404072
 Service Connector: 88988586
 Description: 2-Way F 2.8 Junior Power Timer Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - Pending
 Release Tool: J-38125-561
 Diagnostic Test Probe: J-35616-35 (VT)

Q12 Evaporative Emissions Purge Solenoid Valve

Pin	Size	Colour	Circuit	Function	Option
1	0.5	VT/L-BU	5293	Powertrain Main Relay Fused Supply (4)	-

2	0.5	L-GN/L-BU	428	EVAP Canister Purge Solenoid Control	-
---	-----	-----------	-----	--------------------------------------	---

Q13 Evaporative Emission Vent Solenoid Valve

Connector Part Information

Harness Type: EVAP
 OEM Connector: 7283-5062-30
 Service Connector: Service by Harness - See Part Catalog
 Description: 2-Way F 090 Series, Sealed (BK)

Terminal Part Information

Terminated Lead:
 Release Tool: J-38125-552
 Diagnostic Test Probe: J-35616-18 (BK)

Q13 Evaporative Emission Vent Solenoid Valve

Pin	Size	Colour	Circuit	Function	Option
1	0.5	L-GN	3726	Evaporative Emission Vent Solenoid Valve Earth	--
2	0.5	RD/WH	1340	Battery Positive Voltage	-

Q17A Fuel Injector 1

Connector Part Information

Harness Type: Engine
 OEM Connector: PPI0001137
 Service Connector: 13577536
 Description: 2-Way F 2.8 DCS Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13577536
 Release Tool: J-38125-557
 Diagnostic Test Probe: J-35616-4A (PU)

Q17A Fuel Injector 1

Pin	Size	Colour	Circuit	Function	Option
1	0.5	VT/L-BU	5291	Powertrain Main Relay Fused Supply (2)	-
2	0.5	BN/VT	1744	Fuel Injector Control (1)	-

Q17B Fuel Injector 2

Connector Part Information

Harness Type: Engine
 OEM Connector: PPI0001137
 Service Connector: 13577536
 Description: 2-Way F 2.8 DCS Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13577536
 Release Tool: J-38125-557
 Diagnostic Test Probe: J-35616-4A (PU)

Q17B Fuel Injector 2

Pin	Size	Colour	Circuit	Function	Option
1	0.5	VT/L-BU	5291	Powertrain Main Relay Fused Supply (2)	-
2	0.5	YE/WH	1745	Fuel Injector Control (2)	-

Q17C Fuel Injector 3

Connector Part Information

Harness Type: Engine
 OEM Connector: PPI0001137
 Service Connector: 13577536
 Description: 2-Way F 2.8 DCS Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13577536
 Release Tool: J-38125-557
 Diagnostic Test Probe: J-35616-4A (PU)

Q17C Fuel Injector 3

Pin	Size	Colour	Circuit	Function	Option
1	0.5	VT/L-BU	5291	Powertrain Main Relay Fused Supply (2)	-
2	0.5	BN/VT	1746	Fuel Injector Control (3)	-

Q17D Fuel Injector 4

Connector Part Information

Harness Type: Engine
 OEM Connector: PPI0001137
 Service Connector: 13577536
 Description: 2-Way F 2.8 DCS Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13577536
 Release Tool: J-38125-557
 Diagnostic Test Probe: J-35616-4A (PU)

Q17D Fuel Injector 4

Pin	Size	Colour	Circuit	Function	Option
1	0.5	VT/L-BU	5291	Powertrain Main Relay Fused Supply (2)	-
2	0.5	BN/YE	844	Fuel Injector Control (4)	-

Q38 Throttle Body

Connector Part Information

Harness Type: Engine
 OEM Connector: 15418497
 Service Connector: 13504128
 Description: 6-Way F GT 150 Series Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13504128
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-2A (GY)

Q38 Throttle Body

Q63 Evaporative Emission System Leak Detection Pump Assembly

Connector Part Information

Harness Type: EVAP
 OEM Connector: 6189-1240
 Service Connector: Service by Harness - See Part Catalog
 Description: 8-Way F TS Series, Sealed (D-GY)

Terminal Part Information

Terminated Lead:
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-64B (L-BU)

Q63 Evaporative Emission System Leak Detection Pump Assembly

Pin	Size	Colour	Circuit	Function	Option

Q65 Hybrid Battery Pack Coolant Control Valve

Connector Part Information

Harness Type: Body
 OEM Connector: 33472-0611
 Service Connector: 19178087
 Description: 6-Way F MX150 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 19178087
 Release Tool: J-38125-217
 Diagnostic Test Probe: J-35616-14 (GN)

Q65 Hybrid Battery Pack Coolant Control Valve

Pin	Size	Colour	Circuit	Function	Option
1	0.5	L-BU/VT	3818	Rechargeable Energy Storage System Coolant HVAC Mode Motor High Control	-

S83 Vehicle On/Off Switch

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 7283-9029-40
 Service Connector: 19115653
 Description: 8-Way F YESC Kaizen Series (L-GY)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

 Terminated Lead: 13575380
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-3 (GY)

Terminated Lead: Pins 8, 15, 18-23 - 13327179

Release Tool: J-38125-560

Diagnostic Test Probe: J-35616-14 (GN)

Pins: 16, 17, 32, 33

Terminated Lead: Pins 16, 17 - 13327154

Terminated Lead: Pins 32, 33 - 13327156

Release Tool: J-38125-36

Diagnostic Test Probe: J-35616-35 (VT)

Pins: 4, 6-8, 18-30, 34-39

Terminated Lead: 13578882

Release Tool: J-38125-560

Diagnostic Test Probe: J-35616-3 (GY)

Pins: 16, 17, 32, 33

Terminated Lead: Pending

Release Tool: J-38125-36

Diagnostic Test Probe: J-35616-5 (PU)

X110 Forward Lamp Harness to Left Headlamp Assembly

Connector Part Information

Harness Type: Forward Lamp
 OEM Connector: PB625-08027
 Service Connector: 13577541
 Description: 8-Way F Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 13577541
 Release Tool: Not Available
 Diagnostic Test Probe: J-35616-33 (YE)

Connector Part Information

Harness Type: Left Headlamp Assembly
 OEM Connector: Not Available
 Service Connector: Service by Harness - See Part Catalog
 Description: 8-Way M (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog

X175 Engine Harness to Transmission Harness

Connector Part Information

Harness Type: Engine
 OEM Connector: 13603425
 Service Connector: 13503284
 Description: 20-Way F Micro-Pack 100 W Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Pending
 Release Tool: J-38125-33
 Diagnostic Test Probe: J-35616-6 (BN)

Connector Part Information

Harness Type: Transmission
 OEM Connector: 15443076
 Service Connector: Service by Harness - See Part Catalog
 Description: 20-Way M Micro-Pack 100 W Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: J-38125-33
 Diagnostic Test Probe: J-35616-7 (BN)

X190 Engine Harness to Body Harness

Connector Part Information

Harness Type: Engine
 OEM Connector: 13603186
 Service Connector: 13576550
 Description: 40-Way F 1.5/2.8 Series, Sealed (GY)

Terminal Part Information

Pins: 2-10, 12-15, 18-26, 28-31, 34-40
 Terminated Lead: 13327180
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Connector Part Information

Harness Type: Body
 OEM Connector: 13603206
 Service Connector: 13576553
 Description: 40-Way M 1.5/2.8 Series, Sealed (GY)

Terminal Part Information

Pins: 2-7, 27 and 34-38
 Terminated Lead: 13578882
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-3 (GY)

Pins: 11
 Terminated Lead: 13327181
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Pins: 16, 32
 Terminated Lead: 13327154
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

Pins: 8-15, 18-21, 23-26, 28-31, 39, 40
 Terminated Lead: 13575380
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-3 (GY)

Pins: 16, 32
 Terminated Lead: Pending
 Release Tool: J-38125-36

X225 Instrument Panel Harness to Body Harness

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 1355713-1
 Service Connector: 13574784
 Description: 102-Way F 1.5, 2.5, 9.5 Series (BK)

Terminal Part Information

Pins: 1-7, 10-14, 16-18, 20, 25-27, 30-43, 46, 47, 49-55, 58, 61, 64, 65
 Terminated Lead: Pins 21, 22, 30, 31, 33, 36, 54 - 13575589
 Terminated Lead: Pins 1-7, 10-14, 16-18, 20, 25-27, 32, 34, 35, 37-43, 46, 47, 49-53, 55, 58, 61, 64, 65 - 13575760

Connector Part Information

Harness Type: Body
 OEM Connector: 1670174-1
 Service Connector: 13577551
 Description: 102-Way M 1.6/2.8/8.0 Timer Series (BK)

Terminal Part Information

Pins: 1-7, 10-14, 16-18, 20-22, 25-27, 30-43, 46, 47, 49-55, 58, 61, 64, 65
 Terminated Lead: Pins 14, 16-18, 21, 22, 27, 30, 31, 33, 35, 36, 46, 49, 52-54, 58,

Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Pins: 89, 94, 95
 Terminated Lead: 13575860
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

Pins: 91
 Terminated Lead: 13575860
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

Pins: 100, 101
 Terminated Lead: 13575860
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

64, 65 - 13575593
 Terminated Lead: Pins 1-7, 10-13, 20, 25, 26, 32, 34, 37-43, 47, 50, 51, 55, 61 - 13575591

Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Pins: 89, 91, 94, 95
 Terminated Lead: 13575574
 Release Tool: J-38125-221
 Diagnostic Test Probe: J-35616-21 (RD)

Pins: 100, 101
 Terminated Lead: 13575593
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-5 (PU)

X250 Instrument Panel Top Pad Harness to Instrument Panel Harness

Connector Part Information

Harness Type: Instrument Panel Top Pad
 OEM Connector: 89047355
 Service Connector: 89047355
 Description: 10-Way F (BK)

Terminal Part Information

Terminated Lead: 13575845
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-64B (L-BU)

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 7282-9082-30
 Service Connector: 89047356
 Description: 10-Way M Kaizen YESC Series (BK)

Terminal Part Information

Terminated Lead: 13575827
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-65B (L-BU)

X252 Instrument Panel Harness to HVAC Harness

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 15332129
 Service Connector: 15306425
 Description: 2-Way F GT 150 Series (BK)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 15306425
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-2A (GY)

Connector Part Information

Harness Type: HVAC
 OEM Connector: 15332130
 Service Connector: 88986459
 Description: 2-Way M GT 150 Series (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: Service by Harness - See Part Catalog
 Diagnostic Test Probe: Service by Harness - See Part Catalog

X255 Instrument Panel Harness to Passenger Air Bag Harness

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: SNAPB-05UN-1FY5
 Service Connector: 19178096
 Description: 5-Way F 0.64 Series Unsealed (YE)

Terminal Part Information

Terminated Lead: Service by Connector Assembly - 19178096
 Release Tool: Pending
 Diagnostic Test Probe: J-35616-64B (L-BU)

Connector Part Information

Harness Type: Passenger Air Bag Jumper
 OEM Connector: 19153435
 Service Connector: Service by Harness - See Part Catalog
 Description: 5-Way M 0.64 Series (YE)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: Service by Harness - See Part Catalog
 Diagnostic Test Probe: Service by Harness - See Part Catalog

X275 Instrument Panel Harness to Body Harness

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 1355713-1
 Service Connector: 13574784
 Description: 102-Way F 1.5, 2.5, 9.5 Series (BK)

Terminal Part Information

Pins: 1-9, 12-35, 37-42, 44-73, 75-78
 Terminated Lead: Pins 8, 9, 24-27, 37, 54, 59, 60, 62, 63, 72, 73 - 13575589
 Terminated Lead: Pins 1-7, 12-23, 28-35, 38-42, 44-53, 55-58, 61, 64-71, 75-78 - 13575760

Connector Part Information

Harness Type: Body
 OEM Connector: 1670174-1
 Service Connector: 13577551
 Description: 102-Way M 1.6/2.8/8.0 Timer Series (BK)

Terminal Part Information

Pins: 1-9, 12-35, 37-42, 44-73, 75-78
 Terminated Lead: Pins 1, 4, 5, 7-9, 16, 21, 22, 24-31, 37, 38, 45-50, 54, 56-63, 67-73, 75-78 -

Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Pins: 90, 93, 95, 97, 98
 Terminated Lead: 13575860
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

Pins: 91, 92, 96
 Terminated Lead: 13575860
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

Pins: 99-101
 Terminated Lead: 13575860
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-35 (VT)

13575593
 Terminated Lead: Pins 2, 3, 6, 12-15, 17-20, 23, 32-35, 39-42, 44, 51-53, 55, 64-66 - 13575591
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Pins: 90, 92, 93, 95
 Terminated Lead: 13575574
 Release Tool: J-38125-221
 Diagnostic Test Probe: J-35616-21 (RD)

Pins: 91, 99-101
 Terminated Lead: Pins 91, 100, 101 - 13575574
 Terminated Lead: Pins 99 - Pending
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-5 (PU)

X310 Headliner Harness to Instrument Panel Harness

Connector Part Information

Harness Type: Headliner
 OEM Connector: 0-1420011-3
 Service Connector: 13577513
 Description: 22-Way F GET 0.64 Series (NA)

Terminal Part Information

Terminated Lead: Pins 4, 5, 7-13, 21, 22 - 13575571
 Terminated Lead: Pins 6, 14-20 - Pending
 Release Tool: J-38125-553

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 2-1419158-6
 Service Connector: 13577552
 Description: 22-Way M GET 0.64 Series (NA)

Terminal Part Information

Pins: 4, 5
 Terminated Lead: Pending
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-65B (L-BU)
 Pins: 6-22

X311 Headliner Harness to Instrument Panel Harness

Connector Part Information

Harness Type: Headliner
 OEM Connector: 1456989-5
 Service Connector: 13577514
 Description: 16-Way F (BK)

Terminal Part Information

Terminated Lead: Pins 1-4, 7, 12, 13 - 13575571
 Terminated Lead: Pins 5, 6, 8 - Pending
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-64B (L-BU)

Connector Part Information

Harness Type: Instrument Panel
 OEM Connector: 5-1419167-6
 Service Connector: 13577515
 Description: 16-Way M GET 0.64 Series (BK)

Terminal Part Information

Terminated Lead: Pending
 Release Tool: J-38125-553
 Diagnostic Test Probe: J-35616-65B (L-BU)

X450 Body Harness to Rear Fascia Harness (with UD5)

Connector Part Information

Harness Type: Body
 OEM Connector: 54241634N
 Service Connector: 13577516
 Description: 16-Way F (BK)

Terminal Part Information

Terminated Lead: 13579989
 Release Tool: Pending
 Diagnostic Test Probe: Pending

Connector Part Information

Harness Type: Rear Fascia
 OEM Connector: 54241610
 Service Connector: Service by Harness - See Part Catalog
 Description: 16-Way M (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: Service by Harness - See Part Catalog
 Diagnostic Test Probe: Pending

X800 Right Rear Door Harness to Body Harness

Connector Part Information

Harness Type: Right Rear Door
 OEM Connector: 13678789
 Service Connector: Service by Harness - See Part Catalog
 Description: 20-Way F (GY)

Terminal Part Information

Pins: 1, 2
 Terminated Lead: 13575858
 Release Tool: J-38125-36
 Diagnostic Test Probe: J-35616-42 (RD)

Pins: 3-6, 8, 10, 17-20

Connector Part Information

Harness Type: Body
 OEM Connector: 13680032
 Service Connector: 13577518
 Description: 20-Way M 1.5 2.8 DSQ Series (GY)

Terminal Part Information

Pins: 1, 2
 Terminated Lead: Pending
 Release Tool: J-38125-36
 Diagnostic Test Probe: NA

Pins: 3-6, 8, 10, 17-20

Terminated Lead: Pins 4-6, 19, 20 - 13575539
 Terminated Lead: Pins 3, 8, 10, 17, 18 - 13575538
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

Terminated Lead: Pins 3, 8 - 13575775
 Terminated Lead: Pins 4-6, 10, 17-20 - 13575776
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)

X50A Fuse Block - Underbonnet X3

Connector Part Information

Harness Type: Engine
OEM Connector: 13262029
Service Connector: 13505902
Description: 50-Way F DSQ 1.5 2.8 Metri-Pack 800 Series (BK)

Terminal Part Information

Pins: 1-3, 5, 47
Terminated Lead: 13575780
Release Tool: J-38125-36
Diagnostic Test Probe: J-35616-35 (VT)
Terminal/Tray: 2-964284-1/25
Core/Insulation Crimp: E/A

Pins: 4, 27
Terminated Lead: 13575541
Release Tool: J-38125-36
Diagnostic Test Probe: J-35616-35 (VT)

Terminal/Tray: Pending
 Core/Insulation Crimp: Pending

Pins: 6, 8, 11, 12, 17, 20, 21, 33, 37, 41, 44
 Terminated Lead: Pins 6, 8, 11, 12, 17, 20, 21, 33, 41, 44 - 13575538
 Terminated Lead: Pins 37 - 13575539
 Release Tool: J-38125-560
 Diagnostic Test Probe: J-35616-14 (GN)
 Terminal/Tray: 962943-5/16
 Core/Insulation Crimp: E/A

Pins: 22
 Terminated Lead: 13575718
 Release Tool: J-38125-558
 Diagnostic Test Probe: J-35616-44 (YE)
 Terminal/Tray: 12110127/19
 Core/Insulation Crimp: F/G

A24D Door Handle Assembly - Driver Exterior

Connector Part Information

Harness Type: Driver Door
 OEM Connector: 19153433
 Service Connector: 13578576
 Description: 4-Way M 0.64 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-65B (L-BU)

A24P Door Handle Assembly - Passenger Exterior

Connector Part Information

Harness Type: Passenger Door
 OEM Connector: 19153433
 Service Connector: 13578576
 Description: 4-Way M 0.64 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-65B (L-BU)

A24LR Door Handle Assembly - Left Rear Exterior

Connector Part Information

Harness Type: Left Rear Door
 OEM Connector: 19153433
 Service Connector: 13578576
 Description: 4-Way M 0.64 Series, Sealed (BK)

Terminal Part Information

Terminated Lead: Service by Harness - See Part Catalog
 Release Tool: J-38125-215A
 Diagnostic Test Probe: J-35616-65B (L-BU)

(429) Pressure Relief Ball Valve Spring
(430) Pressure Relief Ball Valve - Auxiliary Pump
(431) A/Trans Auxiliary Fluid Pump Bolt M8 x 51 mm Qty: 4
(432) A/Trans Torque Damper Bearing Seal
(433) A/Trans Torque Damper Bearing Assembly
(434) A/Trans Torque Damper Bearing Retaining Ring
(435) A/Trans Torque Damper Fluid Seal Assembly
(436) A/Trans Torque Damper Seal Retaining Ring
(437) A/Trans Fluid Pump Seal
(438) A/Trans Auxiliary Fluid Pump Bolt M5 x 16 Qty: 1
(439) A/Trans Fluid Pump (O-Ring) Seal
(440) A/Trans Auxiliary Fluid Pump Motor Seal

Control Valve Body Assembly (1 of 2)

(500) A/Trans Manual Shift Shaft Position Switch Mounting Bracket Assembly

(501) Control Valve Channel Plate Bolt M6 x 20 mm Qty: 3

(502) Control Valve Body Spacer (w/Gasket) Plate Assembly

(503) Control Valve Body Spacer Retainer Qty: 2

(504) Control Valve Body Locator Pin Qty: 4

(505) Control Valve Body Assembly

(506) Manual Shift Shaft Detent Spring Retaining Pin

(507) Manual Shift Shaft Detent Assembly

(508) Manual Shift Shaft

(509) Manual Shift Shaft Detent Spring Pin

(510) Detent Lever

(511) Detent Lever Spring

(512) A/Trans Manual Shift Shaft Position Switch Bolt M6 x 25 mm Qty: 2

(513) A/Trans Manual Shift Shaft Position Switch Assembly

Control Valve Body Assembly (2 of 2)

(521) Valve Retaining Clip

(522) Shift Solenoid Valve Spring

(523) Shift Solenoid Valve

(524) Variable Hi and 2-3-4 Clutch and Drive Motor/Generator Stator Cooling Regulator Boost Valve Spring

(525) Variable Hi and 2-3-4 Clutch and Drive Motor/Generator Stator Cooling Regulator Boost Valve

(526) Valve Bore Plug

(527) A/Trans Torque Damper Bypass Clutch Spring

(528) A/Trans Torque Damper Bypass Clutch Valve
(529) Actuator Feed Limit Valve Spring - Outer
(530) Actuator Feed Limit Valve Spring - Inner
(531) Actuator Feed Limit Valve
(532) Control Valve Body Ball Check Valve
(533) Control Valve Body
(534) Cooler Feed Limit Valve
(535) Cooler Feed Limit Valve Spring
(536) 1-3 Reverse Clutch and Generator/Drive Motor Stator Cooling Regulator Valve Spring
(537) 1-3 Reverse Clutch and Generator/Drive Motor Stator Cooling Regulator Valve
(538) Variable Hi and 2-3-4 Clutch and Drive Motor/Generator Stator Cooling Regulator Valve Spring
(539) Variable Hi and 2-3-4 Clutch and Drive Motor/Generator Stator Cooling Regulator Valve
(540) Variable Low and 1-2 Reverse and 4th Clutch and Drive Motor/Generator Stator Cooling Regulator Valve
(541) Variable Low and 1-2 Reverse and 4th Clutch and Drive Motor/Generator Stator Cooling Regulator Feedback Valve Retainer
(542) Variable Low and 1-2 Reverse and 4th Clutch and Drive Motor/Generator Stator Cooling Regulator Feedback Valve
(543) Variable Low and 1-2 Reverse and 4th Clutch and Drive Motor/Generator Stator Cooling Regulator Valve Spring
(544) Variable Low and 1-2 Reverse and 4th Clutch and Drive Motor/Generator Stator Cooling Regulator Feedback Valve Bushing
(545) Valve Retaining Clip
(546) Shift Solenoid Valve
(547) Shift Solenoid Valve Spring
(548) 1-2 Reverse and 4th Clutch Regulator Boost Valve
(549) 1-2 Reverse and 4th Clutch Regulator Boost Valve Spring
(550) Modulated Fluid Pressure Orifice

Case Cover Assembly

(600) A/Trans Control Wiring Harness Shield Bolt M6 x 16 mm Qty: 3 External

(601) A/Trans Control Wiring Harness Shield

(602) A/Transfer case Cover

(603) Drive Motor/Generator Position Sensor Pin

(604) Drive Motor/Generator Rotor Lubricant Seal Sleeve

(605) Drive Motor/Generator Position Sensor Stator Assembly

(606) Generator/Drive Motor Position Sensor Bolt M5 x 16 mm Qty: 3

(607) Wiring Harness Clip Qty: 2

Front Bumper Upper Fascia Replacement - Ampera

Callout	Component Name
Preliminary Procedures	
Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .	
Front Bumper Upper Fascia	

Procedure

1

1. Carefully push a small nylon wedge between the lower fascia and the upper fascia. Insert a small flat-bladed tool into the fascia slot and depress the tabs one at a time and pull on the upper fascia at the same time to gradually remove the upper fascia from the lower fascia.
2. Transfer parts as needed.

Front Bumper Lower Impact Bar Replacement - Ampera

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .	
1	Front Bumper Lower Impact Bar Fastener (Qty: 2)

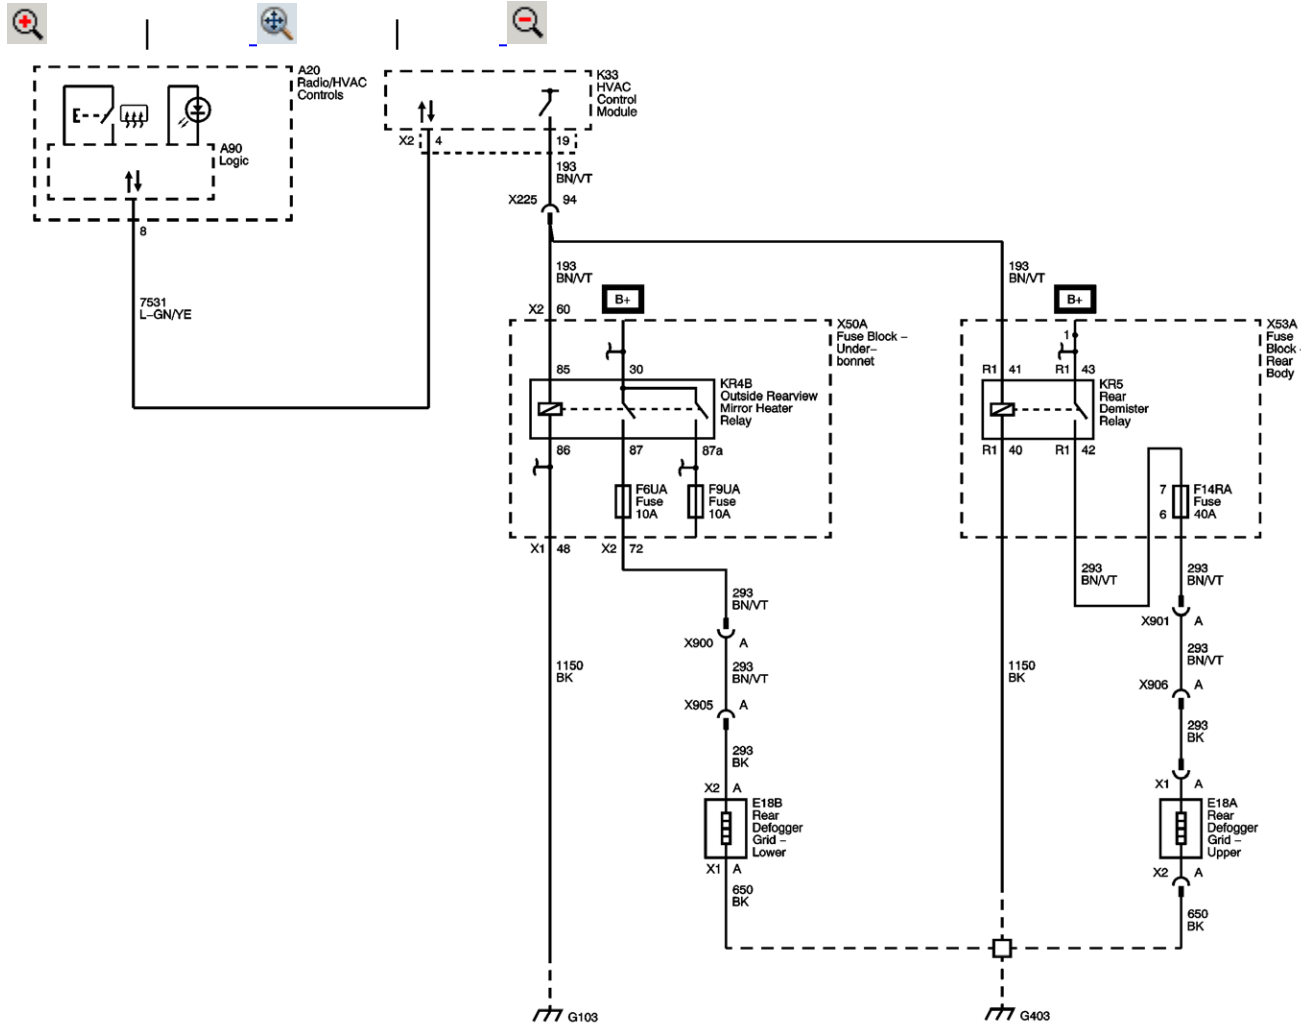

Caution : Refer to [Fastener Caution](#) in the Preface section.

2

Front Bumper Lower Impact Bar
