If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 8-10k Ω between the signal circuit terminal B and earth.
If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
5. If all circuits test normal, test or replace the S15 hybrid battery pack high-voltage manual disconnect.

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

P0651, P0652, and P0653

Note: The charger high-voltage interlock circuit is routed through several in-line connectors.

1. Ignition OFF, disable high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal C of the S15 hybrid battery pack high- voltage manual disconnect housing and earth.

If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.

If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.

4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 8-10k Ω between the signal circuit terminal D and earth.

If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.

If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.

5. If all circuits test normal, test or replace the S15 hybrid battery pack high-voltage manual disconnect.

Component Testing

Test for 35-45 Ω between the following terminals of the S15 hybrid battery pack high-voltage manual disconnect:

- Terminal A and terminal B
- Terminal C and terminal D

If not within the specified range, replace the S15 hybrid battery pack high-voltage manual disconnect.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)
- [Control Module References](#) for hybrid powertrain control module 2, 14 V power module, power inverter module, air conditioning compressor control module and coolant heater control module replacement, programming and set-up

DTC P0A0C or P0A0D

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0A0C: High-Voltage System Interlock Circuit Low Voltage

DTC P0A0D: High-Voltage System Interlock Circuit High Voltage

[Circuit/System Description](#)

The main high-voltage interlock circuit is utilised to verify high-voltage component integrity. The main high-voltage interlock circuit is used to determine if access to high-voltage components is being attempted. The opening of these high-voltage components causes the main high-voltage interlock circuit to open. The hybrid powertrain control module 2 sources about 12 mA of current on the 5 V main high-voltage interlock circuit loop. The hybrid powertrain control module 2 monitors both the main high-voltage interlock 5 V reference circuit current and the main high-voltage interlock signal circuit current in order to detect circuit faults. When the hybrid powertrain control module 2 detects a loss of main high-voltage interlock circuit current, the high-voltage contactors are commanded open.

[Conditions for Running the DTC](#)

P0A0C

- The 12 V battery voltage is greater than 9 V.
- The high-voltage contactors are closed.

P0A0D

- The 12 V battery voltage is greater than 9 V.

- The hybrid powertrain control module 2 is awake and communicating.

Conditions for Setting the DTC

P0A0C

- The hybrid powertrain control module 2 detects main high-voltage interlock circuit 5 V reference current is between 5-18 mA and high-voltage interlock circuit signal current is less than 5 mA.
- DTC P0A0C sets within 1 second when the above condition is met.

P0A0D

- The hybrid powertrain control module 2 detects main high-voltage interlock circuit 5 V reference current is less than 5 mA and high-voltage interlock circuit signal current is greater than 35 mA.
- DTC P0A0D sets within 1 second when the above condition is met.

Action Taken When the DTC Sets

- DTCs P0A0C and P0A0D are Type A DTCs.
- The hybrid powertrain control module 2 opens the main high- voltage contactors when vehicle speed is less than 5 km/h (3 mph).

Conditions for Clearing the DTC

DTCs P0A0C and P0A0D are Type A DTCs.

Diagnostic Aids

- Test for a fully engaged hybrid battery pack high voltage manual disconnect whenever an open high-voltage interlock circuit condition is observed. The hybrid battery pack high-voltage manual disconnect must be pressed down fully in order to engage the high-voltage interlock circuit terminals.
- The main high-voltage interlock circuit is also routed through several in-line connectors.
- With the ignition in the OFF position, the hybrid powertrain control module 2 will source 12 mA on the main high-voltage interlock circuit for 5 minutes every time a vehicle door is opened.

Note: The following diagnostic aid applies for both current and history DTCs.

- Tapping or wiggling the F115 Hybrid/EV Battery Pack Fuse Cover may duplicate the condition.

DTC P0A80: Replace Hybrid/EV Battery Pack

[Circuit/System Description](#)

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

[Conditions for Running the DTC](#)

- Vehicle in Service Mode.
- Hybrid battery temperature is greater than -7°C (19.4°F)
- Hybrid battery state of charge is between 20% and 90%
- Battery voltage and current is varying. Requires more than 10 minutes of city driving.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0ABB, P0ABC, P0ABD, P0AC1, P0AC2, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0AF8, P0B13, P0B10, P0B11, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C7D, P0C7E, P0C7F, P0C82, P0C83, P0C84, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, P0CBA, P1A07, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, P1EBA, P1EBB, U2401, U2603, U2604, U2605, U2606, U0111 and U185A

[Conditions for Setting the DTC](#)

- Battery voltage and current is varying. Requires more than 10 minutes of city driving.

DTC P1EC4: Hybrid/EV Battery Pack Heater Transistor Stuck Off

DTC P1EC5: Hybrid/EV Battery Pack Heater Transistor Stuck On

Circuit/System Description

The hybrid/EV battery contains 5 high-voltage contactors and 2 transistors. The high-voltage contactors allow the high-voltage DC batteries to be connected to the vehicle or safely contain the high-voltage DC within the hybrid/EV battery assembly. The 5 high-voltage contactors are a main positive high-voltage contactor, main negative high-voltage contactor, charge positive high-voltage contactor, charge negative high-voltage contactor and multi-function high-voltage contactor. The 2 transistors are the precharge transistor and heater transistor. These contactors/transistors close and open in sequence and are controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high-voltage contactors/transistors. Earth is provided through the case earth.

Conditions for Running the DTC

P0AA1

- Is run once during a precharge event.
- The 12 V battery voltage is greater than 9 V.
- The main negative contactor is closed.
- The bus voltage reading at the hybrid/EV powertrain control module 2 is less than 15% of battery voltage before the negative contactor closes.
- None of the following DTCs are set; P0ABC, P0ABD, P1A07, P0ABB, P0AF8, P1AE8, P1AE9 or P1AEC

P0AD9, P0ADD, P0AE4, P0D0A, P0D11 and P1EBC

The 12 V battery voltage is greater than 10 V.

P0AE2

- During precharge mode.
- The multi-function contactor and negative contactor are closed.
- None of the following DTCs are set; P0AA1, P0ABC, P0ABD, P1A07, P0ABB, P0AF8, P1AE8, P1AE9 or P1AEC

P1EBD or P1EBE

- Runs once at the beginning of each charge cycle.
- The 12 V battery voltage is greater than 9 V.

- The vehicle is in charge mode.
- Charge mode is not in heat only mode.
- The heater transistor is commanded on for 2 seconds.
- None of the following DTCs are set; P0AC1, P0AC2, P0B10, P0B11, P0B13, P0D53, P0D54, P1EBA or P1EBB.

P1EBF

CHARGE MODE

- Runs once during charger precharge.
 - The 12 V battery voltage is greater than 9 V.
 - The battery charger negative and positive contactors are closed.
 - None of the following DTCs are set; P0AC1, P0AC2, P0B10, P0B11, P0B13, P0D53, P0D54, P1EBA or P1EBB.
- OR

BATTERY HEATING ONLY MODE

- The 12 V battery voltage is greater than 9 V.
- The battery charger is in heating only mode.
- Battery current is greater than 1 A.
- None of the following DTCs are set; P0AC1, P0AC2, P0B10, P0B11, P0B13, P0D53, P0D54, P1EBA or P1EBB.

P1EC0

- The 12 V battery voltage is greater than 9 V.
- The main positive and negative contactors are closed for more than 1 second.
- None of the following DTCs are set; P1AE8, P1AE9 or P1AEC.

P1EC3

- The hybrid/EV powertrain control module is awake and communicating.
- The 12 V battery voltage is greater than 9 V.

P1EC4

- Runs once at the beginning of each charge cycle.
- The 12 V battery voltage is greater than 9 V.
- The vehicle is in charge mode.
- Charge mode is not in heat only mode.

- None of the following DTCs are set; P0AC1, P0AC2, P0B10, P0B11, P0B13, P0D53, P0D54, P1EBA or P1EBB.

P1EC5

- The 12 V battery voltage is greater than 9 V.
- During battery charger precharge mode.
- The battery charger negative and positive contactors are closed.
- The multi-function contactor is open.
- The heater transistor duty cycle is less than 5 %.
- None of the following DTCs are set; P0D53 or P0D54.

Conditions for Setting the DTC

P0AA1 and P0AE2

The bus voltage is measured to be greater than 80% of battery voltage.

P0AD9, P0ADD, P0AE4, P0D0A, P0D11 and P1EBC

The hybrid/EV powertrain control module 2 has detected an open or short-circuit to voltage in the control circuit for the corresponding contactor.

P1EBD

- The heater transistor is commanded on for 2 seconds.
- The charger commanded output current is greater than 1 A and the charger output current is less than 1 A.

P1EBE

The Accumulated Battery Current greater than 100 A has been detected for 4 seconds.

P1EBF

CHARGE MODE

The charger high-voltage output is greater than 130 V for the first 300 ms of the charger precharge mode.

OR

BATTERY HEATING ONLY MODE

Battery current of more than 1 A is detected at the charger during battery heater only mode.

P1EC0

The main bus voltage is less than 80% of battery voltage.

P1EC3

The hybrid/EV powertrain control module 2 has detected a fault in the heater transistor control circuit.

P1EC4

The total Accumulated Battery Current difference between the battery charger output current and the battery charging current after 4 seconds is less than 200 A.

P1EC5

The battery charger sensed current is greater than 0.4 A during the battery charger precharge mode with the multi-function and heater transistor commanded OFF.

Action Taken When the DTC Sets

- DTCs P0AA1, P0AD9, P0AE2, P0AE4, P0D0A, P0D11, P1EBD, P1EBE, P1EC0 or P1EC5 are type A DTCs.
- The contactors will be opened.
- Battery charging mode will not be available.
- OR
- DTCs P0ADD, P1EBC or P1EBF, P1EC3, or P1EC4 are type B DTCs.
- OR
- DTC P1EC3 is a type B DTC.
- The hybrid/EV battery heater will be disabled.

Conditions for Clearing the DTC

- DTCs P0AA1, P0AD9, P0AE2, P0AE4, P0D0A, P0D11, P1EBD, P1EBE, P1EC0 or P1EC5 are type A DTCs.
- OR
- DTCs P0ADD, P1EBC or P1EBF, P1EC3, or P1EC4 are type B DTCs.

Diagnostic Aids

- P1EC5 may cause a overheat condition and set a P0C4A.

- P0ADD will result in precharge too long and set a P0C78.
- P1EC3 or P1EC4 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25°C (-13°F).

Note: If the high-voltage contactors opened while under high-current load, replace the drive motor battery wire junction block relay. The following conditions could cause the high-voltage contactors to open while under high-current load:

- A collision resulting in supplemental inflatable restraint deployment.
- A loss of power or earth to the hybrid/EV powertrain control module 2 while the vehicle is moving.

Circuit/System Verification

1. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Vehicle in Service Mode, verify that DTC P0AE2, P0AE4, P1EC3, P1EC4 or P1EC5 is not set.
If DTC P0AE2 or P0AE4 is set, refer to Hybrid/EV Battery Precharge Transistor Diagnosis.
If DTC P1EC3, P1EC4 or P1EC5 is set, refer to Hybrid/EV Battery Pack Heater Transistor Diagnosis.
4. Command the Hybrid/EV Battery Negative Contactor OPEN and CLOSED with a scan tool while listening for the contactor to open and close. The Hybrid/EV Battery Negative Contactor should be heard opening and closing.
If the Hybrid/EV Battery Negative Contactor does not open and close, refer to Hybrid/EV Battery Negative Contactor Diagnosis.
5. Command the Hybrid/EV Battery Positive Contactor OPEN and CLOSED with a scan tool while listening for the contactor to open and close. The Hybrid/EV Battery Positive Contactor should be heard opening and closing.
If the Hybrid/EV Battery Positive Contactor does not open and close, refer to Hybrid/EV Battery Positive Contactor Diagnosis.
6. Command the Battery Charging System Negative Contactor OPEN and CLOSED with a scan tool while listening for the contactor to open and close. The Battery Charging System Negative Contactor should be heard opening and closing.
If the Hybrid/EV Battery Negative Contactor does not open and close, refer to Battery Charging System Negative Contactor Diagnosis.
7. Command the Battery Charging System Positive Contactor OPEN and CLOSED with a scan tool while listening for the contactor to open and close. The Battery Charging System Positive Contactor should be heard opening and closing.
If the Battery Charging System Positive Contactor does not open and close, refer to Battery Charging System Positive Contactor Diagnosis.
8. Command the Hybrid/EV Battery Multifunction Contactor OPEN and CLOSED with a scan tool while listening for the contactor to open and close. The Hybrid/EV Battery Multifunction Contactor should be heard opening and closing.
If the Hybrid/EV Battery Multi-function Contactor does not open and close, refer to Hybrid/EV Battery Multifunction Contactor Diagnosis.

Circuit/System Testing

P0AE2 or P0AE4 - Hybrid/EV Battery Precharge Transistor Diagnosis

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Disconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
5. Verify that a test lamp illuminates between the B+ circuit terminal 9 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the A4 hybrid/EV battery pack.
6. Reconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.

Note: If connectors X1 and X2 were disconnected during the disabling procedure, reconnect X1 before commanding the contactor closed.

7. Vehicle in Service Mode, command the Hybrid/EV Battery Pack Precharge Transistor CLOSED.

Note: Ignore DTC P0AD9, P0ADD, P0AE4, P0D0A, P0D11, P1EBC or P1EC3 when disconnecting the X1 connector with the Vehicle in Service Mode.

8. Disconnect the X1 harness connector at the A28 hybrid/EV battery contactor assembly.
9. Connect a test lamp between control circuit terminal 11 and earth.
10. Vehicle in Service Mode, command the Hybrid/EV Battery Pack Precharge Transistor OPEN and CLOSED with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the hybrid powertrain control module 2.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the hybrid powertrain control module 2.
11. If all circuits test normal, replace the A4 hybrid/EV battery pack.

P1EC3, P1EC4, or P1EC5 - Hybrid/EV Battery Pack Heater Transistor Diagnosis

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. 1. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Disconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
5. Verify that a test lamp illuminates between the B+ circuit terminal 9 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the A4 hybrid/EV battery pack.
6. Vehicle in Service Mode, test for less than 1 V between the control circuit terminal 2 harness connector at the A28 hybrid battery contactor assembly and earth.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
7. Vehicle OFF, test for infinite resistance between control circuit terminal 2 harness connector at the A28 hybrid battery contactor assembly and earth.
If less than the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
8. Disconnect the X2 harness connector at the K114B hybrid powertrain control module 2.
9. Test for less than 2 Ω in the control circuit end to end between terminal 2 X2 harness connector at the A28 hybrid battery contactor assembly and terminal 54 X2 harness connector at the K114B hybrid powertrain control module 2.
If greater than the specified range, test the control circuit for an open/high resistance.
10. If all circuits test normal, replace the K114B hybrid/EV powertrain control module 2. If the DTC resets, replace the A4 hybrid/EV battery pack.

P1EC0 - Hybrid/EV Battery System Contactors Stuck Open Diagnosis

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Disconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.

4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

5. Verify that a test lamp illuminates between the B+ circuit terminal 9 and ground.

If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the A4 hybrid/EV battery pack.

6. Reconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.

Note: If connectors X1 and X2 were disconnected during the disabling procedure, reconnect X1 before commanding the contactor closed.

7. Vehicle in Service Mode, command the Hybrid/EV Battery Negative Contactor CLOSED.

Note: Ignore DTC P0AD9, P0ADD, P0AE4, P0D0A, P0D11, P1EBC or P1EC3 when disconnecting the X1 connector with the Vehicle in Service Mode.

8. Disconnect the X1 harness connector at the A28 hybrid/EV battery contactor assembly.

9. Connect a test lamp between control circuit terminal 4 and ground.

10. Vehicle in Service Mode, command the Hybrid/EV Battery Negative Contactor OPEN and CLOSED with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the hybrid powertrain control module 2.

If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the hybrid powertrain control module 2.

11. Connect a test lamp between control circuit terminal 2 and ground.

12. Command the Hybrid/EV Battery Positive Contactor OPEN and CLOSED with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the hybrid powertrain control module 2.

If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the hybrid powertrain control module 2.

13. If all circuits test normal, replace the A4 hybrid/EV battery pack.

P0ADD - Hybrid/EV Battery Negative Contactor Diagnosis

DTC P0AA6, P1AE6 or P1F0E

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0AA6: Hybrid/EV Battery Voltage System Isolation Lost

DTC P1AE6: Battery Energy Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit

DTC P1F0E: Battery Charging Voltage System Isolation Lost

[Circuit/System Description](#)

The vehicle is equipped with a high-voltage isolation monitor feature. The purpose of the battery energy control module high-voltage isolation monitor circuit is to test the resistance between the high-voltage positive and negative direct current (DC) bus and chassis earth. The battery energy control module isolation monitoring system measures the resistance between the high-voltage system and chassis earth in the following way. The battery energy control module places an AC signal on the high-voltage system and monitors its amplitude. A reduced amplitude return signal indicates a loss of resistance to chassis earth. This isolation monitor method is sometimes referred to as the active isolation monitor. The hpcm2 requests the BECM to perform this test. Measurement values are reported to the hpcm2, which makes the determination of an isolation fault.

The isolation check for P0AA6 Hybrid Battery Voltage System Isolation Lost runs when all the contactors (main positive, main negative contactor, multi-purpose contactor, charger positive contactor and charger negative contactor) are open. This check monitors isolation in the drive motor battery system. This check runs only once during the time that the hpcm2 is awake and runs after the contactors have been open for 10 seconds. This monitor typically runs when the vehicle is turned off after a drive. It could also run when the vehicle is first started, if there is a long enough period between the hpcm2 waking up and the main contactors closing.

The isolation check for P1F0E Battery Charging Voltage System Isolation Lost runs when the main contactors and the multi-purpose contactor are open and the charger contactors are closed. This check monitors for isolation in the charger system along with the drive motor battery system. This check runs once during the time that the hpcm2 is awake and requires that the contactors main and multi-purpose contactors be open and the charger contactors be closed for 10 seconds.

The battery energy control module runs an internal self check of this sensor circuit. When this test fails, DTC P1AE6 will be set.

Conditions for Running the DTC

P0AA6

- The hybrid powertrain control module 2 and battery energy control module are awake and communicating
- All the contactors (main positive, main negative contactor, multi-purpose contactor, charger positive contactor and charger negative contactor) transition to open for 10 seconds.

P1AE6

- The 12 V battery voltage is greater than 11 V.
- The hybrid powertrain control module 2 and battery energy control module are awake and communicating.
- The hybrid powertrain control module 2 has requested the battery energy control module to run the isolation test.
- The main contactors are open.
- DTC U185B is not set.

P1F0E

- The hybrid powertrain control module 2 and battery energy control module are awake and communicating
- The vehicle is in Charge Mode Only for 10 seconds. Heating or cooling modes are not active.

Conditions for Setting the DTC

P0AA6

- The battery energy control module has detected active isolation resistance is less than 325k Ω .
- 5 Vehicle ON and Vehicle OFF cycles have occurred.

P1AE6

The battery energy control module has detected no return AC signal, thus indicating a fault with the active isolation sensing circuits.

P1F0E

- During charge mode the battery energy control module has detected active isolation resistance of less than 325k Ω after 10 seconds.
- 5 Vehicle ON and Vehicle OFF cycles have occurred.

Action Taken When the DTC Sets

DTCs P0AA6, P1AE6 and P1F0E are Type A DTCs.

Conditions for Clearing the DTC

- DTCs P0AA6, P1AE6 and P1F0E are Type A DTCs.
- P0AA6 and P1F0E require one Vehicle ON and Vehicle OFF cycle
- P0AA6 and P1F0E require a minimum resistance of 400K Ω .

Diagnostic Aids

- A single high-voltage contactor stuck closed can set this DTC.
- An open charger fuse may cause a P1AE6 or P1F0E.
- Condensation or water intrusion into the hybrid/EV battery pack may cause P0AA6, P1AE6 or P1F0E to set.
- Low or no coolant in the hybrid/EV battery cooling system may cause P0AA6, P1AE6 or P1F0E to set.

Circuit/System Verification

1. Verify that the vehicle hybrid/EV battery cooling system is full.
If the hybrid/EV battery cooling system is low, refer to [Hybrid/EV Battery Cooling Diagnostic](#) .
2. Observe the scan tool hybrid powertrain control module 2, Isolation Test Resistance parameter. The reading should display greater than 500k Ω .

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Vehicle in Service Mode, verify that DTC P0A7E, P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0C32, P0D0A, P0D11, P1EBC-P1EBF, P1EC0 or P1EC3-P1EC5 is not set.
If any DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
4. Vehicle OFF, disconnect the 12 V battery.

Note: The following continuity tests must be performed using an Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.

5. With the Insulation Multimeter, set on the Isolation test setting, test for greater than 400k Ω between the A28 hybrid battery contactor assembly harness connector terminals listed below and chassis earth:
 - Battery charger negative harness side terminal B X5
 - Battery charger positive harness side terminal A X5

If less than the specified range, disconnect the X4 connector at the T18 battery charger. Test for greater than 400k Ω between the circuit terminals and chassis earth. If the test result is greater than the specified value, replace the T18 battery charger. If the test result is less than the specified range, replace the 300 V DC cables and test or replace the charger fuse.
6. Remove the fuse cover and battery protector (Insulator). Refer to [Battery Charger and 14 V Power Module Maxi 20 A Fuse Replacement](#) .
7. With the Insulation Multimeter, set on Ohm setting, test for less than 1 Ω across the battery charger fuse.

If greater than the specified range, replace the battery charger fuse.
8. If all the circuit tests normal, replace the A4 hybrid/EV battery pack.

Repair Instructions

DTC P0ABB, P0ABC or P0ABD

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0ABB: Hybrid/EV Battery Voltage Sensor Circuit Performance

DTC P0ABC: Hybrid/EV Battery Voltage Sensor Circuit Low Voltage

DTC P0ABD: Hybrid/EV Battery Voltage Sensor Circuit High Voltage

[Circuit/System Description](#)

The hybrid powertrain control module 2 monitors individual cell voltage readings from the battery energy control module. The battery energy control module monitors the voltage of the 96 battery cell groups. Voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A serviceable voltage sense harness joins this connector to a drive motor battery high-voltage interface control module, also located on the top surface of the battery section. The drive motor battery high-voltage interface control module encodes the voltage reading and transmits it to the battery energy control module through the battery control harness. There is one drive motor battery high-voltage interface control module located on battery sections one and two, and two drive motor battery high-voltage interface control modules associated with battery section three. The drive motor battery high-voltage interface control module, voltage sense harnesses, battery control harness and battery energy control module are all considered serviceable components.

[Conditions for Running the DTC](#)

P0ABB

- The hybrid powertrain control module 2 and battery energy control module is awake and communicating.
- DTC U0111 or U185A is not set.

P0ABC and P0ABD

- The hybrid powertrain control module 2 and battery energy control module is awake and communicating.
- The 12 V battery voltage is greater than or equal to 9 V.
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0ABB

The hybrid powertrain control module 2 detects difference of 10 V between the average cell group voltage multiplied by 96 and the voltage measured at battery side of the main contactors.

P0ABC

The battery energy control module detects the terminal voltage is less than 24 V on the battery side of the main contactors.

P0ABD

The battery energy control module detects the terminal voltage is greater than 456 V on the battery side of the main contactors.

Action Taken When the DTC Sets

DTCs P0ABB, P0ABC and P0ABD are type B DTCs.

Conditions for Clearing the DTC

DTCs P0ABB, P0ABC and P0ABD are type B DTCs.

Diagnostic Aids

The hybrid/EV battery pack high-voltage manual service disconnect is out, not installed correctly, or a blown manual service disconnect fuse will cause P0ABB and/or P0ABC to set.

Circuit/System Verification

Ignition ON, engine OFF, observe the battery energy control module scan tool Hybrid Battery Pack Terminal 1 Voltage, Hybrid Battery Pack Terminal 2 Voltage parameters, and the hybrid powertrain control module 2 Hybrid Battery Pack Voltage parameter. The readings should be between 288-393.6 V, and should be within 10 V of each other.

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified

Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Verify that no other DTCs are set.

If any other DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

2. If DTC P0ABB, P0ABC or P0ABD is set, replace the A4 hybrid/EV battery pack. If DTC P0ABB resets, replace the K114B hybrid powertrain control module 2.

DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA or P1EBB

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0AC1: Hybrid/EV Battery Low Resolution Current Sensor Circuit Low Voltage

DTC P0AC2: Hybrid/EV Battery Low Resolution Current Sensor Circuit High Voltage

DTC P0B10: Hybrid/EV Battery High Resolution Current Sensor Circuit Low Voltage

DTC P0B11: Hybrid/EV Battery High Resolution Current Sensor Circuit High Voltage

DTC P0B13: Hybrid/EV Battery Low Resolution Current Sensor High Resolution Current Sensor Not Plausible

DTC P1EBA: Hybrid/EV Battery Low Resolution Current Sensor Exceeded Learning Limit

DTC P1EBB: Hybrid/EV Battery High Resolution Current Sensor Exceeded Learning Limit

[Circuit/System Description](#)

The hybrid/EV battery current sensor is mounted inside the hybrid/EV battery pack. The positive high-voltage cable that goes to the positive contactor relay passes through the hybrid/EV battery pack current sensor. The hybrid/EV battery pack current sensor detects the amperage that flows in and out of the hybrid/EV batteries. The battery energy control module supplies and monitors a 5 V reference signal to the hybrid/EV battery pack current sensor. The hybrid/EV battery pack current sensor returns a signal between 0 and 5 V to the battery energy control module. The hybrid/EV battery pack current sensor signal is in proportion to the amperage going in and out of the hybrid/EV battery pack. A signal voltage of the hybrid/EV battery pack current sensor greater than 2.5 V indicates that the hybrid/EV battery is being charged and a signal voltage less than 2.5 V indicates discharging. The hybrid/EV battery pack current sensor has 2 measurement ranges in order to maintain accuracy. The ranges are low resolution and high resolution. The measurement ranges of the hybrid/EV battery pack current sensor have some overlap with each other. The high resolution measures from -23 to +23 A. The

low resolution measures from -470 to +280 A.

Conditions for Running the DTC

P0AC1, P0AC2, P0B10 and P0B11

- The 12 V battery voltage is greater than or equal to 9 V.
- The battery energy control module is awake and communicating.
- DTC P1A07 is not set.

P0B13

- The hybrid/EV battery low-resolution current sensor or the hybrid/EV battery high-resolution current sensor value is between -20 and +20 A.
- None of the following DTCs are set: P0AC1, P0AC2, P1EBA and P1A07, P0B10, P0B11, P1EBB.

P1EBA and P1EBB

- Runs during battery energy control module initialisation.
- The 12 V battery voltage is greater than or equal to 9 V.
- The high-voltage main and charger contactors are open (during wake-up).
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0AC1

The battery energy control module detects that the hybrid/EV battery pack current sensor low resolution is less than -470 A.

P0AC2

The battery energy control module detects that the hybrid/EV battery pack current sensor low resolution is greater than +280 A.

P0B10

The battery energy control module detects that the hybrid/EV battery pack current sensor high resolution is less than -23 A.

P0B11

The battery energy control module detects that the hybrid/EV battery pack current sensor high resolution is greater than +23 A.

P0B13

The difference between the Hybrid/EV Battery's low-resolution current sensor value and its high-resolution current sensor value is greater than 10 A.

P1EBA

The battery energy control module detects that the Pack Current Low-Resolution Offset is greater than the calibration Low- Resolution Offset of 8 A.

P1EBB

The battery energy control module detects that the Pack Current High-Resolution Offset is greater than the calibration High- Resolution Offset of 2.5 A.

Action Taken When the DTC Sets

- DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA and P1EBB are type A DTCs.
- The driver information centre (DIC) displays the SERVICE HYBRID SYSTEM message.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and electric only engine ON.
- The contactors may open at any time.

Conditions for Clearing the DTC

DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA and P1EBB are type A DTCs.

Circuit/System Verification

Ignition ON, observe the scan tool Hybrid/EV Battery Pack Low Resolution Current Sensor parameter. The reading should be between -470 and +280 A, and change with the amount of current draw on the hybrid/EV battery pack. Observe the scan tool Hybrid/EV Battery Pack High-Resolution Current Sensor parameter. The reading should be between -23 and +23 A, and change with the amount of current draw on the hybrid/EV battery pack. Typical current sensor reading in a parked vehicle with the ignition ON and all accessories OFF, is between 1 and 10 A.

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

DTC P0AF8

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0AF8: Hybrid System Voltage

[Circuit/System Description](#)

The drive motor battery contains 288 cells. Groups of three cells are welded together in parallel. There are a total of 96 cell groups in the drive motor battery assembly. These cell groups are electrically connected in-series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cells are also grouped together into three sections. The first 90 cells/30 cell groups make up battery section one. This section is adjacent to the cowl and contains batteries 67 through to 96. Battery section two is located behind section one. It is made up of 72 cells/24 cell groups and contains batteries 43 through to 66. The transverse battery section is section number three, it is made up of the remaining 126 cells/42 cell groups and contains batteries 1 through to 42. The three battery sections are individually serviceable components.

The battery energy control module monitors the voltage of the 96 battery cell groups through the four drive motor battery high-voltage interface controllers. Voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A serviceable voltage sense harness joins this connector to a drive motor battery high-voltage interface control module, also located on the top surface of the battery section. The drive motor battery high-voltage interface control module encodes the voltage reading and transmits it to the battery energy control module through the battery control harness. There is one drive motor battery high-voltage interface control module located on battery sections one and two, and two drive motor battery high-voltage interface control modules associated with battery section three. The drive motor battery high-voltage interface control module, voltage sense harnesses, battery control harness and battery energy control module are all considered serviceable components.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

[Conditions for Running the DTC](#)

- The hybrid/EV battery main contactors are closed.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P1A07, P1AE8, P1AE9, P1AEA, P1AEB, P1AEC, P1AED, P1AE20 P1AE27 or P1E28.

OR

- The hybrid/EV battery main contactors are open.
- The charger contactors are closed.
- The multi-function contactor is closed.
- None of the following DTCs are set; P0ABB, P0ABC, P0ABD, P0D4E, P0D4F, P0D5C, P16C5, P1A07, P1EEB, P1EEC or P1ECE.

Conditions for Setting the DTC

- The difference between the Hybrid/EV Battery pack voltage and the hybrid powertrain control module bus voltage is greater than 12 V.
OR
- The difference between the Hybrid/EV Battery pack voltage and the charger module's bus voltage is greater than 12 V.

Action Taken When the DTC Sets

DTC P0AF8 is a type A DTC.

Conditions for Clearing the DTC

- DTC P0AF8 is a type A DTC.
- The [Clear Secured High-Voltage DTCs](#) reset function must be performed to prevent resetting the DTC.

Diagnostic Aids

An open charger fuse may cause P0AF8 to set.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

Battery Charger Bus Diagnostics

1. Ignition OFF, disable the high voltage at the T18 Battery Charger. Refer to [High Voltage Disabling](#) .
2. Disconnect the X7 harness connector at the A28 hybrid/EV battery contactor assembly.
3. Disconnect the X5 harness connector at the A28 hybrid/EV battery contactor assembly.
4. Test for infinite resistance between the terminals listed below:
 - High-voltage DC (-360 V) negative terminal B X5 harness connector at the A28 hybrid/EV battery contactor assembly to vehicle chassis earth.
 - High-voltage DC (+360 V) positive terminal A X5 harness connector at the A28 hybrid/EV battery contactor assembly to vehicle chassis earth.
 - High-voltage DC (+360 V) positive terminal A X5 harness connector at the A28 hybrid/EV battery contactor assembly and the high-voltage DC (-360 V) negative terminal B X5 harness connector at the A28 hybrid/EV battery contactor assembly.If less than the specified value, replace the high-voltage DC cables. After the repair is complete with a scan tool, the [Clear Secured High-Voltage DTCs](#) reset function must be performed.
5. Test for less than 10 Ω between the terminals listed below:
 - High-voltage DC (-360 V) negative terminal B X4 harness connector at the T18 Battery Charger and the high voltage DC (-360 V) negative terminal B X5 harness connector at the A28 hybrid/EV battery contactor assembly.
 - High-voltage DC (+360 V) positive terminal A X4 harness connector at the T18 Battery Charger and the high- voltage DC (+360 V) negative terminal A X5 harness connector at the A28 hybrid/EV battery contactor assembly.If greater than the specified value, replace the high-voltage DC cables. After the repair is complete with a scan tool, the [Clear Secured High-Voltage DTCs](#) reset function must be performed.
6. If all circuits test normal, replace the T18 Battery Charger. If the DTC resets, replace the A4 hybrid/EV battery pack assembly.

Battery Main Bus Diagnostics

1. Ignition OFF, disable the high voltage at the T6 Power Inverter Module Assembly. Refer to [High Voltage Disabling](#) .
2. Disconnect the F118 hybrid battery pack connector jumper connector at the A28 hybrid/EV battery contactor assembly.
3. Disconnect the X3 harness connector at the A28 hybrid/EV battery contactor assembly.
4. Test for infinite resistance between the terminals listed below:
 - High-voltage DC (-360 V) negative terminal B X3 harness connector at the A28 hybrid/EV battery contactor assembly to vehicle chassis earth.

- High-voltage DC (+360 V) positive terminal A X3 harness connector at the A28 hybrid/EV battery contactor assembly to vehicle chassis earth.
 - High-voltage DC (+360 V) positive terminal A X3 harness connector at the A28 hybrid/EV battery contactor assembly and the high-voltage DC (-360 V) negative terminal B X3 harness connector at the A28 hybrid/EV battery contactor assembly.
If less than the specified value, replace the high-voltage DC cables. After the repair is complete with a scan tool, the [Clear Secured High-Voltage DTCs](#) reset function must be performed.
5. Test for less than 10 Ω between the terminals listed below:
- High-voltage DC (-360 V) negative terminal B X3 harness connector at the A28 hybrid/EV battery contactor assembly and the high-voltage DC (-360 V) negative terminal B X3 harness connector at the T6 Power Inverter Module Assembly.
 - High-voltage DC (+360 V) positive terminal A X3 harness connector at the A28 hybrid/EV battery contactor assembly and the high-voltage DC (+360 V) negative terminal A X3 harness connector at the T6 Power Inverter Module Assembly.
If greater than the specified value, replace the high-voltage DC cables. After the repair is complete with a scan tool, the [Clear Secured High-Voltage DTCs](#) reset function must be performed.
6. If all circuits test normal, replace the T6 Power Inverter Module Assembly. If the DTC resets, replace the A4 hybrid/EV battery pack assembly.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)
- [Control Module References](#) for battery energy control module replacement, programming and set-up for the hybrid/EV battery pack replacement.

DTC P0AFA or P0AFB

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0AFA: Hybrid/EV Battery System Voltage Low

DTC P0AFB: Hybrid/EV Battery System Voltage High

[Circuit/System Description](#)

The battery energy control module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code (DTC) information. The battery energy control module monitors the hybrid/EV battery voltage at the battery side of the high-voltage main contactors.

[Conditions for Running the DTC](#)

- The battery energy control module is awake and communicating.
- The system voltage is 9 V.
- None of the following DTCs are set; P0ABC, P0ABD, P1A07, P0AF8, P0ABB, P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B49, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02, P1E05, P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5,

P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8, P1BFB, P1BFE, P1E03, P1E06, P1E90, P1E8F, P1E91, P1E8E, P1E93, P1E96, P1E95, P1E97, P1E94, P1E99, P1E9C, P1E9B, P1E9D, P1E9A, P1E9F, P1EA2, P1EA1, P1EA3, P1EA0, P1EA5, P1EB1, P1EB5, P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E86, P1E87, P1E88, P1E89, P1E8A, P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B16, P1B19, P1B1C, P1B1F, P1B22, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01 and P1E04

Conditions for Setting the DTC

P0AFA

The Hybrid Battery Pack Voltage is less than 205 V.

OR

The Minimum Hybrid Battery Cell Group Voltage in the hybrid battery is less than 2.05 V.

P0AFB

The Hybrid Battery Pack Voltage is greater than 419 V.

OR

The Maximum Hybrid Battery Cell Group Voltage in the hybrid battery is greater than 4.4 V.

Action Taken When the DTC Sets

- DTCs P0AFA and P0AFB are type A DTCs.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and charge sustaining mode.
- Once Vehicle Power has been turned OFF all of the contactors will be prevented from closing.

Conditions for Clearing the DTC

P0AFA and P0AFB

- DTCs P0AFA and P0AFB are type A DTCs.
- The [Clear Secured High-Voltage DTCs](#) reset function must be performed with a scan tool before clear codes.

Circuit/System Verification

1. Verify that DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0B3B, P0B3C, P0B3D, P0B3E, P0B40, P0B41, P0B42, P0B43, P0B45, P0B46, P0B47, P0B48, P0B4A, P0B4B, P0B4D, P0B4C, P0B4F, P0B50, P0B51, P0B52, P0B54, P0B55, P0B56, P0B57, P0B59, P0B5A, P0B5B, P0B5C, P0B5E, P0B60, P0B5F, P0B61, P0B63, P0B64, P0B65, P0B66, P0B69, P0B68, P0B6A, P0B6D, P0B6B, P0B6E, P0B70, P0B6F, P0B72, P0B74, P0B73, P0B75, P0B77, P0B78, P0B79, P0B7A, P0B7D, P0B7C, P0B7E, P0B7F, P0B81, P0B82, P0B83, P0B84, P0B86, P0B87, P0B88, P0B89, P0B8B, P0B8C, P0B8D, P0B8E, P0B90, P0B91, P0B92, P0B93, P0B95, P0B96, P0B97, P0B98, P0B9A, P0B9B, P0B9C, P0B9D, P0B9F, P0BA1, P0BA0, P0BA2, P0BA4, P0BA5, P0BA6, P0BA7, P0BA9, P0BAA, P0BAB, P0BAC, P0BAE, P0BAF, P0BB0, P0BB1, P0BB3, P0BB4, P0BB5, P0BB6, P0BB8, P0BB9, P0BBA, P0BBB, P0D0A, P0D11, P1B16, P1B17, P1B18, P1B19, P1B1A, P1B1B, P1B1C, P1B1D, P1B1E, P1B1F, P1B20, P1B21, P1B22, P1B23, P1B24, P1B25, P1B26, P1B27, P1B28, P1B29, P1B2B, P1B2A, P1B2C, P1B2D, P1B45, P1B46, P1B47, P1B48, P1B49, P1B4A, P1B4B, P1B4C, P1B4D, P1B4E, P1B4F, P1B50, P1B51, P1B52, P1B53, P1B54, P1B55, P1B56, P1B57, P1B58, P1B59, P1B5A, P1B5B, P1B5C, P1B5D, P1B5E, P1B5F, P1B60, P1B61, P1B62, P1B63, P1B64, P1B65, P1B66, P1B67, P1B68, P1B69, P1B6A, P1B6B, P1B6C, P1B6D, P1B6E, P1B6F, P1B70, P1B71, P1B72, P1B73, P1B74, P1B75, P1B76, P1B77, P1B78, P1B79, P1B7A, P1B7B, P1B7C, P1B7D, P1B7F, P1B7E, P1B80, P1B81, P1B82, P1B83, P1B84, P1B85, P1B86, P1B87, P1B88, P1B89, P1B8A, P1B8B, P1B8C, P1B8D, P1B8E, P1B8F, P1B90, P1B91, P1B92, P1B93, P1B94, P1B95, P1B97, P1B96, P1B98, P1B99, P1B9A, P1B9B, P1B9C, P1B9D, P1B9E, P1B9F, P1BA0, P1BA1, P1BA2, P1BA3, P1BA4, P1BA5, P1BA6, P1BA7, P1BA8, P1BA9, P1BAB, P1BAA, P1BAC, P1BAD, P1BAE, P1BAF, P1BB0, P1BB1, P1BB2, P1BB3, P1BB4, P1BB5, P1BB6, P1BB7, P1BB8, P1BB9, P1BBA, P1BBB, P1BBC, P1BBD, P1BBE, P1BBF, P1BC0, P1BC1, P1BC2, P1BC3, P1BC4, P1BC5, P1BC6, P1BC7, P1BC8, P1BC9, P1BCA, P1BCB, P1BCC, P1BCE, P1BCD, P1BCF, P1BD0, P1BD2, P1BD1, P1BD3, P1BD4, P1BD5, P1BD6, P1BD7, P1BD8, P1BD9, P1BDA, P1BDB, P1BDD, P1BDC, P1BDE, P1BDF, P1BE1, P1BE0, P1BE3, P1BE2, P1BE4, P1BE5, P1BE6, P1BE7, P1BE8, P1BE9, P1BEA, P1BEB, P1BEC, P1BED, P1BEE, P1BF0, P1BEF, P1BF1, P1BF2, P1BF4, P1BF3, P1BF5, P1BF4, P1BF7, P1BF8, P1BF9, P1BFA, P1BFB, P1BFC, P1BFD, P1BFE, P1E01, P1E02, P1E03, P1E04, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E62, P1E61, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6D, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E76, P1E75, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1EBC, P1EBD, P1EBF, P1EC0, P1EC3, P1EC4, P1EC5, U2603, U2604, U2605, U2606 or U2401 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

2. Ignition ON, engine OFF, verify that the scan tool Hybrid Battery Pack Terminal 1 Voltage parameter is between 205-419 V.
3. Observe the scan tool Hybrid Battery 1-96 voltage parameters. Each reading should be between 3.0-4.1 V and all readings should be within 0.1 V of each other.

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Verify that no other DTCs are set.

If any other DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

2. If DTC P0AFA or P0AFB is set, replace the A4 hybrid/EV battery pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)
- [Control Module References](#) for battery energy control module and hybrid interface control battery module 1-4 replacement, programming and set-up for the hybrid/EV battery pack replacement.

DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8A

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0B3B: Hybrid/EV Battery 1 Circuit

DTC P0B3C: Hybrid/EV Battery 1 Circuit Performance

DTC P0B3D: Hybrid/EV Battery 1 Circuit Low Voltage

DTC P0B3E: Hybrid/EV Battery 1 Circuit High Voltage

DTC P0B40: Hybrid/EV Battery 2 Circuit

DTC P0B41: Hybrid/EV Battery 2 Circuit Performance

DTC P0B42: Hybrid/EV Battery 2 Circuit Low Voltage

DTC P0B43: Hybrid/EV Battery 2 Circuit High Voltage

DTC P0B45: Hybrid/EV Battery 3 Circuit

DTC P0B46: Hybrid/EV Battery 3 Circuit Performance

DTC P0B47: Hybrid/EV Battery 3 Circuit Performance

DTC P0B48: Hybrid/EV Battery 3 Circuit High Voltage

DTC P0B4A: Hybrid/EV Battery 4 Circuit

DTC P0B4B: Hybrid/EV Battery 4 Circuit Performance

DTC P0B4C: Hybrid/EV Battery 4 Circuit Low Voltage

DTC P0B4D: Hybrid/EV Battery 4 Circuit High Voltage

DTC P0B4F: Hybrid/EV Battery 5 Circuit

DTC P0B50: Hybrid/EV Battery 5 Circuit Performance

DTC P0B51: Hybrid/EV Battery 5 Circuit Low Voltage

DTC P0B52: Hybrid/EV Battery 5 Circuit High Voltage

DTC P0B54: Hybrid/EV Battery 6 Circuit

DTC P0B55: Hybrid/EV Battery 6 Circuit Performance

DTC P0B56: Hybrid/EV Battery 6 Circuit Low Voltage

DTC P0B57: Hybrid/EV Battery 6 Circuit High Voltage

DTC P0B59: Hybrid/EV Battery 7 Circuit

DTC P0B5A: Hybrid/EV Battery 7 Circuit Performance

DTC P0B5B: Hybrid/EV Battery 7 Circuit Low Voltage

DTC P0B5C: Hybrid/EV Battery 7 Circuit High Voltage

DTC P0B5E: Hybrid/EV Battery 8 Circuit

DTC P0B5F: Hybrid/EV Battery 8 Circuit Performance

DTC P0B60: Hybrid/EV Battery 8 Circuit Low Voltage

DTC P0B61: Hybrid/EV Battery 8 Circuit High Voltage

DTC P0B63: Hybrid/EV Battery 9 Circuit

DTC P0B64: Hybrid/EV Battery 9 Circuit Performance

DTC P0B65: Hybrid/EV Battery 9 Circuit Low Voltage

DTC P0B66: Hybrid/EV Battery 9 Circuit High Voltage

DTC P0B68: Hybrid/EV Battery 10 Circuit

DTC P0B69: Hybrid/EV Battery 10 Circuit Performance

DTC P0B6A: Hybrid/EV Battery 10 Circuit Low Voltage

DTC P0B6B: Hybrid/EV Battery 10 Circuit High Voltage

DTC P0B6D: Hybrid/EV Battery 11 Circuit

DTC P0B6E: Hybrid/EV Battery 11 Circuit Performance

DTC P0B6F: Hybrid/EV Battery 11 Circuit Low Voltage

DTC P0B70: Hybrid/EV Battery 11 Circuit High Voltage

DTC P0B72: Hybrid/EV Battery 12 Circuit

DTC P0B73: Hybrid/EV Battery 12 Circuit Performance

DTC P0B74: Hybrid/EV Battery 12 Circuit Low Voltage

DTC P0B75: Hybrid/EV Battery 12 Circuit High Voltage

DTC P0B77: Hybrid/EV Battery 13 Circuit

DTC P0B78: Hybrid/EV Battery 13 Circuit Performance

DTC P0B79: Hybrid/EV Battery 13 Circuit Low Voltage

DTC P0B7A: Hybrid/EV Battery 13 Circuit High Voltage

DTC P0B7C: Hybrid/EV Battery 14 Circuit

DTC P0B7D: Hybrid/EV Battery 14 Circuit Performance

DTC P0B7E: Hybrid/EV Battery 14 Circuit Low Voltage

DTC P0B7F: Hybrid/EV Battery 14 Circuit High Voltage

DTC P0B81: Hybrid/EV Battery 15 Circuit

DTC P0B82: Hybrid/EV Battery 15 Circuit Performance

DTC P0B83: Hybrid/EV Battery 15 Circuit Low Voltage

DTC P0B84: Hybrid/EV Battery 15 Circuit High Voltage

DTC P0B86: Hybrid/EV Battery 16 Circuit

DTC P0B87: Hybrid/EV Battery 16 Circuit Performance

DTC P0B88: Hybrid/EV Battery 16 Circuit Low Voltage

DTC P0B89: Hybrid/EV Battery 16 Circuit High Voltage

DTC P0B8B: Hybrid/EV Battery 17 Circuit

DTC P0B8C: Hybrid/EV Battery 17 Circuit Performance

DTC P0B8D: Hybrid/EV Battery 17 Circuit Low Voltage

DTC P0B8E: Hybrid/EV Battery 17 Circuit High Voltage

DTC P0B90: Hybrid/EV Battery 18 Circuit

DTC P0B91: Hybrid/EV Battery 18 Circuit Performance

DTC P0B92: Hybrid/EV Battery 18 Circuit Low Voltage

DTC P0B93: Hybrid/EV Battery 18 Circuit High Voltage

DTC P0B95: Hybrid/EV Battery 19 Circuit

DTC P0B96: Hybrid/EV Battery 19 Circuit Performance

DTC P0B97: Hybrid/EV Battery 19 Circuit Low Voltage

DTC P0B98: Hybrid/EV Battery 19 Circuit High Voltage

DTC P0B9A: Hybrid/EV Battery 20 Circuit

DTC P0B9B: Hybrid/EV Battery 20 Circuit Performance

DTC P0B9C: Hybrid/EV Battery 20 Circuit Low Voltage

DTC P0B9D: Hybrid/EV Battery 20 Circuit High Voltage

DTC P0B9F: Hybrid/EV Battery 21 Circuit

DTC P0BA0: Hybrid/EV Battery 21 Circuit Performance

DTC P0BA1: Hybrid/EV Battery 21 Circuit Low Voltage

DTC P0BA2: Hybrid/EV Battery 21 Circuit High Voltage

DTC P0BA4: Hybrid/EV Battery 22 Circuit

DTC P0BA5: Hybrid/EV Battery 22 Circuit Performance

DTC P0BA6: Hybrid/EV Battery 22 Circuit Low Voltage

DTC P0BA7: Hybrid/EV Battery 22 Circuit High Voltage

DTC P0BA9: Hybrid/EV Battery 23 Circuit

DTC P0BAA: Hybrid/EV Battery 23 Circuit Performance

DTC P0BAB: Hybrid/EV Battery 23 Circuit Low Voltage

DTC P0BAC: Hybrid/EV Battery 23 Circuit High Voltage

DTC P0BAE: Hybrid/EV Battery 24 Circuit

DTC P0BAF: Hybrid/EV Battery 24 Circuit Performance

DTC P0BB0: Hybrid/EV Battery 24 Circuit Low Voltage

DTC P0BB1: Hybrid/EV Battery 24 Circuit High Voltage

DTC P0BB3: Hybrid/EV Battery 25 Circuit

DTC P0BB4: Hybrid/EV Battery 25 Circuit Performance

DTC P0BB5: Hybrid/EV Battery 25 Circuit Low Voltage

DTC P0BB6: Hybrid/EV Battery 25 Circuit High Voltage

Circuit/System Description

The hybrid/EV battery pack contains 288 cells. Groups of three cells are welded together in parallel. There are a total of 96 cell groups in the hybrid/EV battery pack assembly. These cell groups are electrically connected in-series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cells are also grouped together into three sections. The first 90 cells/30 cell groups make up battery section one. This section is adjacent to the cowl and contains batteries 67 through to 96. Battery section two is located behind section one. It is made up of 72 cells/24 cell groups and contains batteries 43 through to 66. The transverse battery section is section number three, it is made up of the remaining 126 cells/42 cell groups and contains batteries 1 through to 42. The three battery sections are individually serviceable components.

The battery energy control module monitors the voltage of the 96 battery cell groups through the four hybrid/EV battery interface control modules. Voltage sense circuits are attached to each individual cell group, and these sense circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness joins this connector to a hybrid/EV battery interface control module, also located on the top surface of the battery section. The hybrid/EV battery interface control module encodes the voltage reading and transmits it to the battery energy control module through the battery control harness. There is one hybrid/EV battery interface control module located on battery sections one and two, and two hybrid/EV battery interface control modules associated with battery section three. The hybrid/EV battery interface control module, battery energy control module wiring harness, auxiliary battery wiring harness and battery energy control module are all considered serviceable components.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code information.

All of the following conditions exist:

- Ignition in any position.
- The battery energy control module is awake and communicating.
- None of the following DTCs are set; P1A07, P1E8E, P1E8F, P1E90, P1E91, P1E92, P1E93, P1E94, P1E95, P1E96, P1E97, P1E98, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9E, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA4, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, U2402, U2603, U2604, U2605 and U2606.

DTC P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B19, P1B1F, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01 and P1E04

All of the following conditions exist:

- Ignition in ON/RUN.
- Vehicle speed is greater than 0.
- There is a change in the Voltage and Current readings.
- DTC U185A is not set.

Conditions for Setting the DTC

- The battery energy control module detects high resistance on the circuit.

Circuit Performance

- P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B19, P1B1F, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01 and P1E04 are type B DTCs.

- The faulted cell group does not change voltage.

Low Voltage

- P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02 and P1E05 are type B DTCs.
- Any hybrid/EV battery voltage signal is less than 0.2 V.

High Voltage

- P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5, P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8, P1BFB, P1BFE, P1E03 and P1E06 are type B DTCs.
- Any hybrid/EV battery voltage signal is greater than 4.8 V.

Action Taken When the DTC Sets

- DTC P0B3B-P0BBB, P1B16-1B27, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8A are type B DTCs.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and electric only engine ON mode.
- If additional fault conditions occur, this may cause the contactors to open at anytime.

Conditions for Clearing the DTC

- DTC P0B3B-P0BBB, P1B16-1B27, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8A are type B DTCs.
- No hybrid/EV battery voltage signal is less than 0.2 V or greater than 4.8 V.
- Ignition must be cycled from ON to OFF.

[DTC Descriptor](#)

DTC P0BBE: Hybrid/EV Battery Pack Voltage

[Circuit/System Description](#)

The drive motor battery contains 288 cells. Groups of three cells are welded together in parallel. There are a total of 96 cell groups in the drive motor battery assembly. These cell groups are electrically connected in-series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cells are also grouped together into three sections. The first 90 cells/30 cell groups make up battery section one. This section is adjacent to the cowl and contains batteries 67 through to 96. Battery section two is located behind section one. It is made up of 72 cells/24 cell groups and contains batteries 43 through to 66. The transverse battery section is section number three, it is made up of the remaining 126 cells/42 cell groups and contains batteries 1 through to 42. The three battery sections are individually serviceable components.

The battery energy control module monitors the voltage of the 96 battery triplets. Voltage sense lines are attached to each individual triplet, and these sense lines terminate at a connector located on the top surface of the battery section. A serviceable voltage sense harness joins this connector to a drive motor battery high-voltage interface control module, also located on the top surface of the battery section. The drive motor battery high-voltage interface control module encodes the voltage reading and transmits it to the battery energy control module through the battery control harness. There is one drive motor battery high-voltage interface control module located on battery sections one and two, and two drive motor battery high-voltage interface control modules associated with battery section three. The drive motor battery high-voltage interface control module, voltage sense harnesses, battery control harness and battery energy control module are all considered serviceable components.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code information.

[Conditions for Running the DTC](#)

- None of the following DTCs are set: P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B49, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02, P1E05, P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5, P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8, P1BFB, P1BFE, P1E03, P1E06, P1E90, P1E8F, P1E91, P1E8E, P1E93, P1E96, P1E95, P1E97, P1E94, P1E99, P1E9C, P1E9B, P1E9D, P1E9A, P1E9F, P1EA2, P1EA1, P1EA3, P1EA0, P1EA5, P1EB1, P1EB5, P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E86, P1E87, P1E88, P1E89, P1E8A, P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B16, P1B19, P1B1C, P1B1F, P1B22, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01 or P1E04
- The hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating.

Conditions for Setting the DTC

The difference between the maximum cell voltage in the Hybrid/EV Battery and the minimum cell voltage in the Hybrid/EV Battery is greater than 0.3 V.

Action Taken When the DTC Sets

- DTC P0BBE is a type B DTC.
- The vehicle will operate in a reduced power mode and electric only engine ON.
- If additional fault conditions occur, this may cause the contactors to open at anytime.

Conditions for Clearing the DTC

- DTC P0BBE is a type B DTC.
- The [Clear Secured High-Voltage DTCs](#) reset function must be performed to prevent resetting the DTC.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0C77: Hybrid/EV Battery System Precharge Time Too Short

DTC P0C78: Hybrid/EV Battery System Precharge Time Too Long

Circuit/System Description

The battery energy control module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery energy control module to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code (DTC) information.

The hybrid/EV battery contains 5 high-voltage contactors and 2 transistors. The high-voltage contactors allow the high-voltage DC batteries to be connected to the vehicle or safely contain the high-voltage DC within the hybrid/EV battery pack assembly. The 5 high-voltage contactors are a main positive high-voltage contactor, main negative high-voltage contactor, charge positive high-voltage contactor, charge negative high-voltage contactor and multi-function high-voltage contactor. The 2 transistors are the precharge transistor and heater transistor. These contactors/transistors close and open in sequence and are controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high-voltage contactors and precharge transistors. Earth is provided through the case earth. The hybrid/EV powertrain control module 2 supplies earth for the heater transistor through the hybrid/EV powertrain control module 2 case earth.

Conditions for Running the DTC

P0C77

- The main contactors are in precharge mode.
- Battery current sensor has not failed.

- High Voltage bus voltage less than 40 V before the start of precharge.
- Bus voltage sensor has not failed.

P0C78

- Battery voltage sensor has not failed.
- Bus voltage sensor has not failed.

Conditions for Setting the DTC

P0C77

The bus voltage is above 80% of battery voltage in less than 50ms.

P0C78

The bus voltage has not reached 95% of battery voltage in 700 ms.

Action Taken When the DTC Sets

- DTC P0C77 and P0C78 are type A DTCs.
- The contactors will be opened.

Conditions for Clearing the DTC

DTC P0C77 and P0C78 are type A DTCs.

Diagnostic Aids

Note: If the high-voltage contactors opened while under high-current load, replace the drive motor battery wire junction block relay. The following conditions could cause the high-voltage contactors to open while under high-current load:

- A collision resulting in supplemental inflatable restraint (SIR) deployment.
- A loss of power or earth to the hybrid/EV powertrain control module 2 while the vehicle is moving.

The precharge time can be affected by the following:

- A long precharge time may be caused by a stuck open hybrid/EV battery negative or hybrid/EV battery multi-function contactor.
- A long precharge time may be caused by a stuck ON hybrid/EV battery precharge transistor.
- A long precharge time may be caused by a short-circuit on the propulsion bus preventing the main bus from reaching its target voltage.

- A short precharge time may be caused by a hybrid/EV battery positive high-voltage contactor being stuck.
- A short precharge time may be caused by a positive high-voltage contactor being stuck.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disable the high voltage at the T6 power inverter module. Refer to [High Voltage Disabling](#) .
2. Test for less than 5 Ω between terminal 5 and terminal 6 of the S15 hybrid/EV battery pack high-voltage manual disconnect lever.
If greater than the specified range, replace the S15 hybrid/EV battery pack high-voltage manual disconnect lever.
3. Reconnect the S15 hybrid/EV battery pack high-voltage manual disconnect lever.
4. Connect the 12 V battery.
5. Ignition ON, verify that DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0AFA, P0D0A, P0D11, P1EBC-P1EBF, P1EC0 or P1EC3-P1EC5 is not set.
If any DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
6. With a scan tool, verify the Hybrid Battery Pack Voltage parameter is greater than 205 V at 21°C (69.8° F).
If the test result is less than the specified range, replace the A4 hybrid/EV battery pack.
7. Disconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.
8. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
9. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 9 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the A4 hybrid/EV battery pack.
10. Ignition OFF, disconnect the X1 harness connector at the A28 hybrid/EV battery contactor assembly and the X1 harness connector at the K114B hybrid/EV powertrain control module 2.
11. Ignition ON, test for less than 1 V between the control circuit terminal 11 and earth.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
12. Ignition OFF, test for infinite resistance between control circuit terminal 11 and earth.
If less than the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
13. Disconnect the X1 harness connector at the K114B hybrid/EV powertrain control module 2.
14. Test for less than 2 Ω in the control circuit end to end between terminal 11 X1 harness connector at the A28 hybrid/EV battery contactor assembly and terminal 8 X1 harness connector at the K114B hybrid/EV powertrain control module 2.
If greater than the specified range, test the control circuit for or open-circuit/high resistance.
15. If all circuits test normal, replace the K114B hybrid/EV powertrain control module 2. If the DTC resets, replace the A4 hybrid/EV battery pack.

DTC Descriptors

DTC P0D17: Battery Charging System High-Voltage Interlock Circuit Low Voltage

DTC P0D18: Battery Charging System High-Voltage Interlock Circuit High Voltage

Circuit/System Description

The energy management high-voltage interlock circuit is utilised to verify high-voltage component integrity. The energy management high-voltage interlock circuit is used to determine if access to high-voltage components is being attempted. The opening of these high-voltage components causes high-voltage interlock circuit to open. The hybrid powertrain control module 2 sources about 12 mA of current on the 5 V energy management high-voltage interlock circuit loop. The hybrid powertrain control module 2 monitors both the energy management high-voltage interlock 5 V reference circuit current and the energy management high-voltage interlock signal circuit current in order to detect circuit faults. When the hybrid powertrain control module 2 detects a loss of energy management high-voltage interlock circuit current, the high voltage contactors are commanded open.

Conditions for Running the DTC

P0D17

- The 12 V battery voltage is greater than 9 V.
- The charger contactors are closed.

P0D18

- The 12 V battery voltage is greater than 9 V.
- The hybrid powertrain control module 2 is awake and communicating.

Conditions for Setting the DTC

P0D17

The hybrid powertrain control module 2 detects energy management high-voltage interlock circuit 5 V reference voltage is less than 1.5 V.

P0D18

The hybrid powertrain control module 2 detects energy management high-voltage interlock circuit 5 V reference voltage is greater than 1.2 V before applying 5 V or the signal voltage is greater than 2.2 V after applying 5 V.

Action Taken When the DTC Sets

- DTCs P0D17 and P0D18 are Type A DTCs.
- The hybrid powertrain control module 2 opens the high-voltage charger contactors.

Conditions for Clearing the DTC

DTCs P0D17 and P0D18 are Type A DTCs.

Diagnostic Aids

- Test for a fully engaged hybrid battery pack high voltage manual disconnect whenever an open high-voltage interlock circuit condition is observed. The hybrid battery pack high-voltage manual disconnect must be pressed down fully in order to engage the high-voltage interlock circuit terminals.
- The high-voltage interlock circuit is also routed through several in-line connectors and modules.
- The hybrid powertrain control module 2 will source 12 mA on the charge high-voltage interlock circuit anytime the charge cord is plugged in.

Note: The following diagnostic aid applies for both current and history DTCs.

- Tapping or wiggling the F115 Hybrid/EV Battery Pack Fuse Cover may duplicate the condition.

Circuit/System Verification

Ignition ON, observe the hybrid powertrain control module 2 Battery Charging System High-Voltage Interlock Circuit Status parameter.

The parameter should indicate a PASS condition.

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified

Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

Note: The charger high-voltage interlock circuit is routed through several in-line connectors.

1. Ignition OFF, disable high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal C at the S15 hybrid battery pack high- voltage manual disconnect housing and earth.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 8-10k Ω between the signal circuit terminal D and earth.
If less than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
5. If all circuits test normal, test or replace the S15 hybrid battery pack high-voltage manual disconnect.

[Component Testing](#)

Test for 35-45 Ω between the following terminals of the S15 hybrid battery pack high-voltage manual disconnect:

- Terminal A and terminal B
- Terminal C and terminal D

If not within the specified range, replace the S15 hybrid battery pack high-voltage manual disconnect.

DTC P0D5E

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0D5E: Charger Bus Discharge Too Long

[Circuit/System Description](#)

The battery energy control module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery energy control module to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code (DTC) information.

The hybrid/EV battery contains 5 high-voltage contactors and 2 transistors. The high-voltage contactors allow the high-voltage DC batteries to be connected to the vehicle or safely contain the high-voltage DC within the hybrid/EV battery assembly. The 5 high-voltage contactors are a main positive high-voltage contactor, main negative high-voltage contactor, charge positive high-voltage contactor, charge negative high-voltage contactor and multi-function high-voltage contactor. The 2 transistors are the precharge transistor and heater transistor. These contactors/transistors close and open in sequence and are controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high-voltage contactors/transistors. Earth is provided through the case earth.

[Conditions for Running the DTC](#)

P0D5E

- The charger contactors are commanded open.
- Runs once per charger contacts discharge event.
- None of the following DTCs are set: P0D4E or P0D4F.

OR

- No confirmed charger bus discharge test pass or fail received by the hybrid/EV powertrain control module 2 from the battery charger control module.
- This test runs every 10 seconds after charger discharge event if no confirmed charger bus discharge result is received by the hybrid/EV powertrain control module 2 from the battery charger control module.

Conditions for Setting the DTC

P0D5E

- High-voltage bus does not discharge to below 60 V within 1.5 seconds of the charger contactors being commanded open.
OR
- With the charger contactors commanded open, current flowing to battery is greater than 2.5 A with the heater transistor enabled.

Action Taken When the DTC Sets

- DTC P0D5E is a type A DTC.
- All of the contactors will be prevented from closing.

Conditions for Clearing the DTC

- DTC P0D5E is a type A DTC.
- The [Clear Secured High-Voltage DTCs](#) reset function must be performed with a scan tool before clear codes.

Diagnostic Aids

Note: If the high-voltage contactors opened while under high-current load, replace the drive motor battery wire junction block relay. The following conditions could cause the high-voltage contactors to open while under high-current load:

- A collision resulting in supplemental inflatable restraint (SIR) deployment.
- A loss of power or earth to the hybrid/EV powertrain control module 2 while the vehicle is moving.

The precharge time can be affected by the following:

- A long precharge time may be caused by a stuck open hybrid/EV battery negative or hybrid/EV battery multi-function contactor.
- A long precharge time may be caused by a stuck ON hybrid/EV battery precharge transistor.
- A long precharge time may be caused by a short-circuit on the propulsion bus preventing the main bus from reaching its target voltage.
- A short precharge time may be caused by a hybrid/EV battery positive high-voltage contactor being stuck.
- A short precharge time may be caused by a positive high-voltage contactor being stuck.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as

current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Disconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
5. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 9 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the A4 hybrid/EV battery pack.
6. Ignition OFF, disconnect the X1 harness connector at the A28 hybrid/EV battery contactor assembly.
7. Ignition ON, test for less than 1 V between the following control circuit terminals and earth.
 - Terminal 6
 - Terminal 7
 - Terminal 9If greater than the specified range, test the appropriate control circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
8. Ignition OFF, test for infinite resistance between the following control circuit terminals and earth.
 - Terminal 6
 - Terminal 7
 - Terminal 9If less than the specified value, test the appropriate control circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
9. Disconnect the X1 harness connector at the K114B hybrid/EV powertrain control module 2.
10. Test for less than 2 Ω in the control circuit end to end between the following terminals:
 - Terminal 6 X1 harness connector at the A28 hybrid/EV battery contactor assembly and terminal 10 X1 harness connector at the K114B hybrid/EV powertrain control module 2.
 - Terminal 7 X1 harness connector at the A28 hybrid/EV battery contactor assembly and terminal 3 X1 harness connector at the K114B hybrid/EV powertrain control module 2.
 - Terminal 9 X1 harness connector at the A28 hybrid/EV battery contactor assembly and terminal 5 X1 harness connector at the K114B hybrid/EV powertrain control module 2.If greater than the specified range, test the appropriate control circuit for an open-circuit/high resistance.
11. If all circuits test normal, replace the A4 hybrid/EV battery pack.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1A07: Battery Energy Control Module 5 V Reference Circuit

DTC P1E93: Hybrid/EV Battery Interface Control Module 1 5 V Reference Circuit

DTC P1E99: Hybrid/EV Battery Interface Control Module 2 5 V Reference Circuit

DTC P1E9F: Hybrid/EV Battery Interface Control Module 3 5 V Reference Circuit

DTC P1EA5: Hybrid/EV Battery Interface Control Module 4 5 V Reference Circuit

[Circuit/System Description](#)

The drive motor battery contains 288 cells. Groups of three cells are welded together in parallel. There are a total of 96 cell groups in the drive motor battery assembly. These cell groups are electrically connected in-series. Each individual cell group is rated at 3.7 volts, for a nominal system voltage of 355 volts direct current. The battery cells are also grouped together into three sections. The first 90 cells/30 cell groups make up battery section one. This section is adjacent to the cowl and contains batteries 67 through to 96. Battery section two is located behind section one. It is made up of 72 cells/24 cell groups and contains batteries 43 through to 66. The transverse battery section is section number three, it is made up of the remaining 126 cells/42 cell groups and contains batteries 1 through to 42. The three battery sections are individually serviceable components.

The battery energy control module monitors the voltage of the 96 cell groups. Voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A serviceable voltage sense harness joins this connector to a drive motor battery high-voltage interface control module, also located on the top surface of the battery section. The drive motor battery high-voltage interface control module encodes the voltage reading and transmits it to the battery energy control module through the battery control harness. There is one drive motor battery high-voltage interface control module located on battery sections one

and two, and two drive motor battery high-voltage interface control modules associated with battery section three. The drive motor battery high-voltage interface control module, voltage sense harnesses, battery control harness and battery energy control module are all considered serviceable components.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

P1A07

- The battery energy control module is awake and communicating.
- The 12 V battery voltage greater than or equal to 9 V.

P1E93, P1E99, P1E9F, P1EA5

- Ignition cycles from ON to OFF.
- The battery energy control module is awake and communicating.
- No loss of communications between the battery energy control module and any of the hybrid/EV battery interface control modules.
- The 2nd protection circuit diagnostic is not running.

Conditions for Setting the DTC

P1A07

The battery energy control module has detected a fault on the internal 5 V reference circuit.

P1E93, P1E99, P1E9F, P1EA5

- The 2nd protection circuit diagnostic is not running.
- A hybrid/EV battery interface control module has detected a fault on the internal 5 V reference circuit.

Action Taken When the DTC Sets

- DTCs P1A07 P1E93, P1E99, P1E9F, or P1EA5 are type B DTCs.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and electric only engine ON.

Conditions for Clearing the DTC

DTCs P1A07 P1E93, P1E99, P1E9F, or P1EA5 are type B DTCs.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1E3D: Control Module Calculated Hybrid/EV Battery Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 performs internal calculations multiple times and compares the results of these calculations to verify proper operation of the internal controller. The result of these calculations is a voltage. This voltage value is an internal value and cannot be measured externally.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 9 V.
- The hybrid/EV powertrain control module 2 is awake.

Conditions for Setting the DTC

If the results of these calculations differ by more than one volt.

Action Taken When the DTC Sets

- DTC P1E3D is a type A DTC.
- The contactors will be opened.

Conditions for Clearing the DTC

DTC P1E3D is a type A DTC.

[DTC Descriptors](#)

DTC P1E92: Hybrid/EV Battery Interface Control Module 1 Cell Balancing Circuit

DTC P1E98: Hybrid/EV Battery Interface Control Module 2 Cell Balancing Circuit

DTC P1E9E: Hybrid/EV Battery Interface Control Module 3 Cell Balancing Circuit

DTC P1EA4: Hybrid/EV Battery Interface Control Module 4 Cell Balancing Circuit

[Circuit/System Description](#)

To maintain a similar state of charge on the cell groups, the hybrid/EV powertrain control module 2 looks at the cell group voltages and determines which cell groups need energy removed in order to maintain the battery groups at a similar state of charge. This is known as cell balancing. There is a resistor wired in parallel with the cell group and a transistor switch in series with the resistor internal to the drive motor battery high-voltage interface control module. The hybrid/EV powertrain control module 2 sends a command to the battery energy control module to begin cell balancing through the drive motor battery high-voltage interface control modules.

[Conditions for Running the DTC](#)

- The battery energy control module is awake and communicating.
- The high-voltage fault circuit diagnostic is not running.
- None of the following DTCs are set, P1E8E, P1E94, P1E9A, P1EA0, U2401, U2603, U2604, U2605 or U2606.

[Conditions for Setting the DTC](#)

The hybrid/EV battery interface control module has detected an internal cell balancing switch fault.

Action Taken When the DTC Sets

- DTCs P1E92, P1E98, P1E9E, and P1EA4 are type B DTCs.
- Cell balancing is disabled.

Conditions for Clearing the DTC

DTCs P1E92, P1E98, P1E9E, and P1EA4 are type B DTCs.

If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Verify that DTC P0B3B, P0B3C, P0B3D, P0B3E, P0B40, P0B41, P0B42, P0B43, P0B45, P0B46, P0B47, P0B48, P0B4A, P0B4B, P0B4D, P0B4C, P0B4F, P0B50, P0B51, P0B52, P0B54, P0B55, P0B56, P0B57, P0B59, P0B5A, P0B5B, P0B5C, P0B5E, P0B60, P0B5F, P0B61, P0B63, P0B64, P0B65, P0B66, P0B69, P0B68, P0B6A, P0B6D, P0B6B, P0B6E, P0B70, P0B6F, P0B72, P0B74, P0B73, P0B75, P0B77, P0B78, P0B79, P0B7A, P0B7D, P0B7C, P0B7E, P0B7F, P0B81, P0B82, P0B83, P0B84, P0B86, P0B87, P0B88, P0B89, P0B8B, P0B8C, P0B8D, P0B8E, P0B90, P0B91, P0B92, P0B93, P0B95, P0B96, P0B97, P0B98, P0B9A, P0B9B, P0B9C, P0B9D, P0B9F, P0BA1, P0BA0, P0BA2, P0BA4, P0BA5, P0BA6, P0BA7, P0BA9, P0BAA, P0BAB, P0BAC, P0BAE, P0BAF, P0BB0 ,P0BB1, P0BB3, P0BB4, P0BB5, P0BB6, P0BB8, P0BB9, P0BBA, P0BBB, P1B16, P1B17, P1B18, P1B19, P1B1A, P1B1B, P1B1C, P1B1D, P1B1E, P1B1F, P1B20, P1B21, P1B22, P1B23, P1B24, P1B25, P1B26, P1B27, P1B28, P1B29, P1B2B, P1B2A, P1B2C, P1B2D, P1B45, P1B46, P1B47, P1B48, P1B49, P1B4A, P1B4B, P1B4C, P1B4D, P1B4E, P1B4F, P1B50, P1B51, P1B52, P1B53, P1B54, P1B55, P1B56, P1B57, P1B58, P1B59, P1B5A, P1B5B, P1B5C, P1B5D, P1B5E, P1B5F, P1B60 ,P1B61 ,P1B62, P1B63, P1B64, P1B65, P1B66, P1B67, P1B68, P1B69, P1B6A, P1B6B, P1B6C, P1B6D, P1B6E, P1B6F, P1B70, P1B71, P1B72, P1B73, P1B74, P1B75, P1B76, P1B77, P1B78, P1B79, P1B7A, P1B7B, P1B7C, P1B7D, P1B7F, P1B7E, P1B80, P1B81, P1B82, P1B83, P1B84, P1B85, P1B86, P1B87, P1B88, P1B89, P1B8A, P1B8B, P1B8C, P1B8D, P1B8E, P1B8F, P1B90, P1B91, P1B92, P1B93, P1B94, P1B95, P1B97, P1B96, P1B98, P1B99, P1B9A, P1B9B, P1B9C, P1B9D, P1B9E, P1B9F, P1BA0, P1BA1, P1BA2, P1BA3, P1BA4, P1BA5, P1BA6, P1BA7, P1BA8, P1BA9 ,P1BAB, P1BAA, P1BAC, P1BAD, P1BAE, P1BAF, P1BB0, P1BB1, P1BB2, P1BB3, P1BB4, P1BB5, P1BB6, P1BB7, P1BB8, P1BB9, P1BBA, P1BBB, P1BBC, P1BBD, P1BBE, P1BBF, P1BC0, P1BC1, P1BC2, P1BC3, P1BC4, P1BC5, P1BC6, P1BC7, P1BC8, P1BC9, P1BCA, P1BCB, P1BCC, P1BCE, P1BCD, P1BCF, P1BD0, P1BD2, P1BD1, P1BD3, P1BD4, P1BD5, P1BD6, P1BD7, P1BD8, P1BD9, P1BDA, P1BDB, P1BDD, P1BDC, P1BDE, P1BDF, P1BE1, P1BE0, P1BE3, P1BE2, P1BE4, P1BE5, P1BE6, P1BE7, P1BE8, P1BE9, P1BEA, P1BEB, P1BEC, P1BED, P1BEE, P1BF0, P1BEF, P1BF1, P1BF2, P1BF4, P1BF3, P1BF5, P1BF4, P1BF7, P1BF8, P1BF9, P1BFA, P1BFB, P1BFC, P1BFD, P1BFE, P1E01, P1E02, P1E03, P1E04, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E62, P1E61, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6D, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E76, P1E75, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83,

P1E84, P1E85, P1E86, P1E87, P1E88, P1E89 or P1E8A is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

2. If DTC P1E92, P1E98, P1E9E, or P1EA4 is set, replace the A4 hybrid/EV battery pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)
- [Control Module References](#) for battery energy control module replacement and hybrid battery interface control modules 1-4, programming and set-up for the hybrid/EV battery pack replacement.

DTC P1EAB or P1EAC

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1EAB: Battery Energy Control Module Hybrid/EV Battery Cell High Voltage

DTC P1EAC: Hybrid/EV Battery Cell Over-voltage Signal Circuit Performance

Circuit/System Description

The 2nd protection is a redundant method to monitor cell group overvoltage. The four hybrid/EV battery interface control modules independently read and test each cell group. The 2nd protection circuit fault is the actual hardwire signal from the four hybrid/EV battery interface control modules to the battery energy control module and terminating in the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 diagnoses this line to determine when a cell group over-voltage condition exists.

The 2nd protection self test diagnostic is used to check the signal circuit. The battery energy control module performs this test once every power down cycle. When run/crank input signal transitions low and after a calibrated delay, the battery energy control module informs the hybrid/EV powertrain control module 2, via serial data communication bus that it is about to run the diagnostics on the 2nd protection circuit. The battery energy control module then proceeds to command, via internal serial data, each hybrid/EV battery interface control module to run the check on its hardwire output. Each of the four hybrid/EV battery interface control modules pulls the signal circuit low and releases it, in sequence. If any pulses are missing, the battery energy control module is able to diagnose which hybrid/EV battery interface control module(s) has a fault, and sets a related fault, and sends this information to the hybrid/EV powertrain control module 2 on the serial data

Conditions for Running the DTC

P1EAB

- The battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- DTC P1EAC or U185A is not set

P1EAC

- The battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- Ignition cycles from ON to OFF.
- Ignition is OFF for 500 ms.
- The 12 V battery voltage greater than or equal to 9 V.
- None of the following DTCs are set; P1E8E, P1E94, P1E9A or P1EA0.
- No loss of communications between the battery energy control module and any of the hybrid/EV battery interface control modules.

Conditions for Setting the DTC

P1EAB

A cell over-voltage is detected.

P1EAC

The hybrid/EV powertrain control module 2 has detected a fault with the 2nd protection fault flag.

Action Taken When the DTC Sets

- DTCs P1EAB and P1EAC are type A DTCs.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and electric only engine ON.
- Once Vehicle Power has been turned OFF all of the contactors will be prevented from closing.

Conditions for Clearing the DTC

- DTCs P1EAB and P1EAC are type A DTCs.
- After the repair, with a scan tool, perform the [Clear Secured High-Voltage DTCs](#) to prevent DTCs from resetting.
- Vehicle Power cycled from ON to OFF after code clear

Circuit/System Verification

Verify that DTC P0B3B, P0B3D, P0B3E, P0B40, P0B42, P0B43, P0B45, P0B47, P0B48, P0B4A, P0B4C, P0B4D, P0B4F, P0B51, P0B54, P0B52, P0B56, P0B57, P0B59, P0B5B, P0B5C, P0B5E, P0B60, P0B61, P0B63, P0B65, P0B66, P0B68, P0B6A, P0B6B, P0B6D, P0B6F, P0B70, P0B72, P0B74, P0B75, P0B77, P0B79, P0B7A, P0B7C, P0B7E, P0B7F, P0B81, P0B83, P0B84, P0B86, P0B88, P0B89, P0B8B, P0B8D, P0B8E, P0B90, P0B92, P0B93, P0B95, P0B97, P0B98, P0B9A, P0B9C, P0B9D, P0B9F, P0BA1, P0BA2, P0BA4, P0BA6, P0BA7, P0BA9, P0BAB, P0BAC, P0BAE, P0BB0, P0BB1, P0BB3, P0BB5, P0BB6, P0BB8, P0BBA, P0BBB, P1B17, P1B18, P1B1A, P1B1B, P1B1D, P1B1E, P1B20, P1B21, P1B23, P1B24, P1B26, P1B27, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1B46, P1B47, P1B4A, P1B4C, P1B4D, P1B4F, P1B50, P1B52, P1B53, P1B55, P1B56, P1B58, P1B59, P1B5B, P1B5C, P1B5E, P1B5F, P1B61, P1B64, P1B62, P1B65, P1B67, P1B68, P1B6A, P1B6B, P1B6D, P1B6E, P1B70, P1B71, P1B73, P1B74, P1B76, P1B77, P1B79, P1B7A, P1B7C, P1B7D, P1B7F, P1B80, P1B82, P1B83, P1B85, P1B86, P1B88, P1B89, P1B8B, P1B8C, P1B8E, P1B8F, P1B91, P1B92, P1B94, P1B95, P1B97, P1B98, P1B9A, P1B9B, P1B9D, P1B9E, P1BA0, P1BA1, P1BA3, P1BA4, P1BA6, P1BA7, P1BA9, P1BAA, P1BAC, P1BAD, P1BAF, P1BB0, P1BB2, P1BB3, P1BB5, P1BB6, P1BB8, P1BB9, P1BBB, P1BBC, P1BBE, P1BBF, P1BC1, P1BC2, P1BC4, P1BC5, P1BC7, P1BC8, P1BCA, P1BCB,

P1BCD, P1BCE, P1BD0, P1BD1, P1BD3, P1BD4, P1BD6, P1BD7, P1BD9, P1BDA, P1BDC, P1BDD, P1BDF, P1BE0, P1BE2, P1BE3, P1BE5, P1BE6, P1BE8, P1BE9, P1BEB, P1BEC, P1BEE, P1BEF, P1BF1, P1BF2, P1BF4, P1BF5, P1BF7, P1BF8, P1BFA, P1BFB, P1BFD, P1BFE, P1E02, P1E03, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, U2603, U2604, U2605 or U2606 is not set.

If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#)
2. Connect the 12 V battery.
3. Disconnect the X2 harness connector at the A28 hybrid/EV battery contactor assembly.
4. Ignition ON, test for 4.8-5.2 V between the over-voltage signal circuit terminal 6 and earth.
If less than the specified range, test the over-voltage signal circuit for a short-circuit to earth or an open/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Clear Secured High-Voltage DTCs](#) .
If greater than the specified range, test the over-voltage signal circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Clear Secured High-Voltage DTCs](#) .
5. If all circuits test normal, replace the A4 hybrid/EV battery pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)
- [Control Module References](#) for battery energy control module replacement and hybrid battery interface control modules 1-4, programming and set-up for the hybrid/EV battery pack replacement.

DTC P1F17

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1F17: System Isolation/Impact Sensor Fault - Hybrid/EV Battery System Contactors Open

Circuit/System Description

The hybrid/EV powertrain control module 2 will set DTC P1F17 if the hybrid/EV powertrain control module has detected a passive loss of isolation, the supplemental inflatable restraint sensors are not working or has lost communication with the hybrid/EV powertrain control module or the supplemental inflatable restraint module.

Conditions for Running the DTC

- Vehicle ON.
- The 12 V battery voltage is greater than 9 V.

Conditions for Setting the DTC

- P0AA6 is set in the hybrid/EV powertrain control module.
- DTCs B0083-B0088 are set in the supplemental inflatable restraint module.
OR
- P0AA6 is set in the hybrid/EV powertrain control module.
- DTC U184E is set.
OR
- The hybrid/EV powertrain control module 2 has lost communication with the hybrid/EV powertrain control module.
- DTC U184E is set.

OR

- The hybrid/EV powertrain control module 2 has lost communication with the hybrid/EV powertrain control module.
- DTCs B0083-B0088 are set in the supplemental inflatable restraint module.

Action Taken When the DTC Sets

- DTC P1F17 is a type A DTC.
- All of the contactors will be prevented from closing.

Conditions for Clearing the DTC

- DTC P1F17 is a type A DTC.
- The [Clear Secured High-Voltage DTCs](#) reset function must be performed with a scan tool before clear codes.

Circuit/System Verification

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Verify that no other DTCs are set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Verify that the K36 inflatable restraint sensing and diagnostic module is programmed with the correct software calibration.
If the correct software is not installed, program the K36 inflatable restraint sensing and diagnostic module.
3. Vehicle in Service Mode, observe the scan tool Crash Event Detected parameter. The reading should be No.
If the reading is yes, perform the [Clear Secured High-Voltage DTCs](#) function.
4. Perform the [Clear Secured High-Voltage DTCs](#) function. If DTC P1F17 resets and no other DTCs are set, replace the K114B hybrid/EV powertrain control module 2.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for hybrid/EV powertrain control module 2 and inflatable restraint sensing and diagnostic module replacement, programming and set-up

Loss of Isolation on the High-Voltage Main Bus

Danger: Ensure all High-Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

Danger: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1,000 V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high- voltage battery assembly, whether the system is energised or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

Danger: This vehicle is equipped with a high-voltage battery that is completely isolated from the chassis earth. Never utilise AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high-voltage system is earthed through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#) .

Loss of Isolation on the High-Voltage Main Bus

Note: Wear your High-Voltage Insulation gloves until you have determined that a high-voltage exposure risk is no longer present.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to [High Voltage Disabling](#) .
2. Connect the 12 V battery.
3. Ignition ON, verify that DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0D0A, P0D11, P1EBC-P1EBF, P1EC0 or P1EC3-P1EC5 is not set.

If any DTC is set, diagnose them first. Refer to [DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0D0A, P0D11, P1EBC-P1EBF, P1EC0 or P1EC3-P1EC5](#) .

4. Ignition OFF, disconnect the 12 V battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Note: The following continuity tests must be performed using an Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.

5. Using the Insulation Multimeter, test for greater than 750k Ω between the circuit terminals listed below and ground.

- A28 Hybrid battery contactor assembly harness connector terminal A +300 V X4.
- A28 Hybrid battery contactor assembly harness connector terminal B -300 V X4.

If the test result is less than the specified value, disconnect the X356A connector at the K1 14 V power module. Test for greater than 750k Ω . If the test result is greater than the specified value, replace the K1 14 V power module. If the test result is less than the specified value, replace the 300 V DC cables.

6. Test for greater than 750k Ω between the circuit terminals listed below and earth.

- T6 Power inverter module harness connector terminal A -300 V X3.
- T6 Power inverter module harness connector terminal B +300 V X3.

If the test result is less than the specified value, replace the 300 V DC cables.

7. Disconnect the X4 harness connector at the T6 power inverter module.

Note: The following continuity tests require both the air conditioning control module and cabin heater control module circuits to be isolated by performing the following test up to 3 times if a fault is detected.

8. Test for greater than 750k Ω between the circuit terminals listed below and earth.

- Terminal A +300 V X4.
- Terminal B -300 V X4.

If the test result is less than the specified value, disconnect the X2 connector at the G1 air conditioning control module. Test for greater than 750k Ω between the circuit terminal and earth. If the test result is greater than the specified value, replace the G1 air conditioning control module.

If the test result is less than the specified value, with the X2 connector at the G1 air conditioning control module disconnected. Disconnect the X2 connector at the K10 cabin heater control module. Test for greater than 750k Ω between the circuit terminal and earth. If the test result is greater than the specified value, replace the K10 cabin heater control module. If the test result is less than the specified value, replace the 300 V DC cables.

9. Disconnect the X5 harness connector at the at the T6 power inverter module

Note: There may be up to a 5 second delay for proper test results to be displayed.

10. Test for greater than 750k Ω between the 3-phase cable circuit terminals listed below and earth.

- Terminal 1 300 V X5.
- Terminal 2 300 V X5.
- Terminal 3 300 V X5.

If the test result is less than the specified value, disconnect the X2 connector at the M15A Drive Motor 1. Test for greater than 750k Ω between the circuit terminal X2 at the M15A Drive Motor 1 and earth. If the test result is greater than the specified value, replace the 3- phase cables. If the test result is less than the specified value, replace the M15A Drive Motor 1.

11. Disconnect the X6 harness connector at the T6 power inverter module.

12. Test for greater than 750k Ω between the 3-phase cable circuit terminals listed below and earth.

- Terminal 1 300 V X6.
- Terminal 2 300 V X6.
- Terminal 3 300 V X6.

If the test result is less than the specified value, disconnect the X2 connector at the M15A Drive Motor 1. Test for greater than 750k Ω between the circuit terminal X2 at the M15B Drive Motor 2 and earth. If the test result is greater than the specified value, replace the 3- phase cables. If the test result is less than the specified value, replace the M15B Drive Motor 2.

13. Disconnect the X8 harness connector at the power inverter module.

14. Test for greater than 1.0M Ω between the 3-phase cable circuit terminals listed below and earth.

- Terminal 1 300 V X8.
- Terminal 2 300 V X8.
- Terminal 3 300 V X8.

If the test result is less than the specified value, replace the G5 transmission fluid pump - auxiliary.

15. Test for greater than 750k Ω between the T6 power inverter module circuit terminals listed below and earth.

- Terminal A +300 V X3.
- Terminal B -300 V X3.
- Terminal A +300 V X4.
- Terminal B -300 V X4.
- Terminal 1 300 V X5.
- Terminal 2 300 V X5.
- Terminal 3 300 V X5.
- Terminal 1 300 V X6.
- Terminal 2 300 V X6.
- Terminal 3 300 V X6.
- Terminal 1 300 V X8.
- Terminal 2 300 V X8.
- Terminal 3 300 V X8.

If the test result is less than the specified value, replace the T6 power inverter module.

16. If all circuits test normal, replace the A4 hybrid battery pack.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)

- [300 Volt Battery Positive and Negative Cable Replacement Link to 207100](#)

Hybrid\EV Battery Voltage Present

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: This vehicle is equipped with a high-voltage battery that is completely isolated from the chassis earth. Never utilise AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high-voltage system is earthed through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

Special Tools

- *EL-50209* High-Voltage Terminal Cover
- *EL-48900* HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#) .

1. Review the high-voltage safety information prior to performing the High-Voltage Disabling procedure. Refer to [High Voltage Safety](#) .
2. The Servicing the A4 Battery Pack Assembly or 360 V DC Cables procedure has been performed.
The procedure has not been performed. Refer to [High Voltage Disabling](#) before continuing to the next step.
3. Disconnect the X1 and X2 harness connectors at the A28 hybrid battery contactor assembly.
4. Vehicle in Service Mode, using the DMM, verify that the voltage measures less than 1 V at the following points and earth:
 - Terminal 2 X1.
 - Terminal 4 X1.
 - Terminal 6 X1.

- Terminal 7 X1.
- Terminal 9 X1.
- Terminal 11 X1.

If greater than the specified range, test the appropriate control circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

5. Vehicle OFF, test for infinite resistance between control circuit terminal 2 X2 harness connector at the A28 hybrid/EV battery contactor assembly and earth.
If less than the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

Note:

- Wear your High-Voltage Insulation gloves until you have determined that a high-voltage exposure risk is no longer present.
- A 9 V battery can be used to test the DMM.

6. Test the DMM by measuring a 12 V battery.

If the DMM does not properly measure a 12 V battery, repair or replace the DMM and repeat all voltage measurements.

7. Using the DMM, verify the voltage measures less than 1 V at the following points and earth:

If the DMM does not properly measure a 12 V battery, repair or replace the DMM and repeat all voltage measurements.

8. Disconnect the high-voltage interlock harness connector listed below at the A28 hybrid/EV battery contactor assembly if not already disconnected.

- F118 hybrid/EV battery pack connector jumper connector.
- X6 14 V power module jumper connector.
- X7 battery charger jumper connector.

9. Disconnect the X4 harness connector at the A28 hybrid/EV battery contactor assembly.

10. Verify that the voltage has been disabled at the X4 harness connector at the A28 hybrid/EV battery contactor assembly. Using the DMM, verify that the voltage measures less than 3 V at the following points:

- High-voltage DC (-360 V) negative terminal B to vehicle chassis earth.
- High-voltage DC (+360 V) positive terminal A to vehicle chassis earth.
- High-voltage DC (+360 V) positive terminal A and high-voltage DC (-360 V) negative terminal B

If greater than the specified range, leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high-voltage capacitors to discharge.

Continue to the next step once the voltage is below 3 V.

11. Disconnect the X5 harness connector at the A28 hybrid/EV battery contactor assembly.

12. Verify that the voltage has been disabled at the X5 harness connector at the A28 hybrid/EV battery contactor assembly. Using the DMM, verify that the voltage measures less than 3 V at the following points:

- High-voltage DC (-360 V) negative terminal B to vehicle chassis earth.
- High-voltage DC (+360 V) positive terminal A to vehicle chassis earth.
- High-voltage DC (+360 V) positive terminal A and high-voltage DC (-360 V) negative terminal B

If greater than the specified range, leave the DMM connected to the terminals until the voltage drops below 3 V to allow the high-voltage capacitors to discharge.

Continue to the next step once the voltage is below 3 V.

Note: Wear your High-Voltage Insulation gloves until you have determined that a high-voltage exposure risk is no longer present.

Danger: The Hybrid/EV battery has exposed high-voltage and the installation of EL-5029 is required to completely isolate the voltage during the Hybrid/EV battery removal. Failure to follow the procedure exactly as written may result in serious injury or death.

13. Disconnect the X1 harness connector at the A28 hybrid/EV battery contactor assembly.

Note: Wear your High-Voltage Insulation gloves until you have determined that a high-voltage exposure risk is no longer present.

Note: Lowering the battery slightly will assist with the installation of the EL-50209.

14. Install the EL-50209.

15. Lower the battery from the vehicle with the EL-50209 installed. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

16. There is a stuck-closed contactor and a loss of isolation within the A4 hybrid/EV battery pack assembly. Replace the A4 hybrid/EV pack assembly.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Drive Motor Battery Replacement and Shipping Preparation](#)

High-Voltage System Inspection

Vehicle Collision Detection

The Supplemental Inflatable Restraint (SIR) sensors are designed to identify the severity of a collision and from what direction a collision has occurred. The SIR sensors typically detect collision conditions for occupant impact-protection reasons. The hybrid powertrain control module 2 will open the high-voltage contactor relays and disable the vehicle whenever an SIR deployment occurs.

The supplemental inflatable restraint module transmits through serial data to the hybrid powertrain control module 2 whenever a sensor fault is detected or a collision event has been detected. The hybrid powertrain control module 2 will set a Crash Event Detected event and enter into a disable condition.

A complete inspection of the high-voltage system and components must be performed if the vehicle has been involved in a collision. The Crash Event Detected condition will remain active until cleared by the hybrid powertrain control module 2 Clear Secured High Voltage DTCs output control function of the scan tool.

Special Tools

- *EL-48900* HEV Safety Kit
- *EL-50211* Low-Voltage Jumper Harness Extension

For equivalent regional tools, refer to [Special Tools](#) .

Inspection Procedure

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: High-voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: This vehicle is equipped with a high-voltage battery that is completely isolated from the chassis earth. Never utilise AC powered test equipment to probe the high

voltage system. Serious injury, death and component damage could occur if the high-voltage system is earthed through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. The vehicle has been involved in a collision with body damage.

If vehicle damage does not allow for repair, remove the A4 hybrid/EV battery pack from the vehicle. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#) . Refer to www.recyclemybattery.com for recycling information.

2. Have the air bags been deployed?

If the air bags have been deployed, refer to Air Bags Deployed Inspection.

3. Does the vehicle have right front end damage?

If the vehicle has right front end damage, perform the high voltage disable procedure at the T18 battery charger. Refer to [High Voltage Disabling](#) . Perform a visual inspection of the T18 battery charger. Remove any covers or shields to gain access. Inspect the assembly for cracks, dents, pinched, cut or frayed high-voltage DC 300V cables, low-voltage cables or other physical damage.

4. Vehicle OFF, perform a visual inspection of the following high voltage components listed. Remove any covers or shields to gain access. Inspect the assembly for cracks, dents, pinched, cut or frayed high-voltage DC 300V cables, low-voltage cables or other physical damage.

- A4 hybrid/EV battery pack (exterior only -- includes tray and A28 hybrid/EV battery contactor assembly)
- T18 battery charger (if not done in previous step).
- G1 air conditioning compressor.
- K10 coolant heater control module.
- K1 14 V accessory power module.
- T6 power inverter module.
- T12 automatic transmission assembly.
- The high-voltage DC 300 V cable between the A4 hybrid/EV battery pack and the T18 battery charger.
- The high-voltage DC 300 V cable between the T6 power inverter module and the A4 hybrid/EV battery pack.
- The high-voltage DC 300 V cable between the T6 power inverter module and the G1 air conditioning compressor.
- The high-voltage DC 300 V cable between the T6 power inverter module and the K10 coolant heater control module.
- The high-voltage DC 300 V cable between the T6 power inverter module and the K1 14 V accessory power module.
- The high-voltage DC 300 V cable between the T6 power inverter module and the K107A drive motor 1 control module.
- The high-voltage DC 300 V cable between the T6 power inverter module and the K107B drive motor 2 control module.
- The high-voltage DC 300 V cable between the T6 power inverter module and the K6 transmission fluid pump control module-auxiliary.

Perform the appropriate high-voltage disable procedure. Refer to [High Voltage Disabling](#) . Replace all components and cables identified as damaged. Continue to

next step after repairs.

5. Vehicle in Service Mode, verify that no DTCs are set.

If any DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

6. With a scan tool clear the hybrid powertrain control module 2 Crash Event Detected disable condition only after all high-voltage components identified as damaged have been replaced. Refer to [Clear Secured High-Voltage DTCs](#) .
7. Perform the required body repairs as per the approved service procedures.

[Air Bags Deployed Inspection](#)

1. Perform the high-voltage disable procedure at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) . If vehicle damage does not allow for access to the S15 hybrid/EV battery pack high-voltage manual disconnect lever, disconnect the 12V battery and remove the damaged portion of the vehicle until such time as the S15 hybrid/EV battery pack high-voltage manual disconnect lever can be removed and the [High Voltage Disabling](#) procedure can be completed. Remove the A4 hybrid/EV battery pack from the vehicle. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#) .
2. Perform a visual inspection of the A4 hybrid/EV battery pack for cracks, dents or other physical external damage.
If physical damage is observed, replace all components identified as damaged. Continue to next step after repairs.
3. Perform a visual inspection of the following high-voltage components listed. Remove any covers or shields to gain access. Inspect the assembly for cracks, dents, pinched, cut or frayed high-voltage DC 300V cables, low-voltage cables or other physical damage.
 - T18 battery charger.
 - G1 air conditioning compressor.
 - K10 coolant heater control module.
 - K1 14 V accessory power module.
 - T6 power inverter module.
 - T12 automatic transmission assembly.
 - The high-voltage DC 300 V cable between the A4 hybrid/EV battery pack and the T18 battery charger.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the A4 hybrid/EV battery pack.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the G1 air conditioning compressor.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the K10 coolant heater control module.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the K1 14 V accessory power module.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the K107A drive motor 1 control module.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the K107B drive motor 2 control module.
 - The high-voltage DC 300 V cable between the T6 power inverter module and the K6 transmission fluid pump control module-auxiliary.Replace all components and cables identified as damaged. Continue to next step after repairs.

Note: Ignore DTCs P0A0C, P0A0D, P0D17 and P0D18. These will set with the S15 hybrid/EV battery pack high voltage manual disconnect lever removed, the 12 V battery connected and the Vehicle in Service Mode.

4. Install the EL-50211 low-voltage jumper harness extension.
5. Connect the 12 V battery.
6. Vehicle in Service Mode, verify that no DTCs are set.
If any DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
7. Perform the required body repairs as per the approved service procedures.

Battery Charger and 14 V Power Module Maxi 20 A Fuse Replacement

Removal Procedure

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .

2. Remove the multi-use relay and fuse cover screws (1) from the drive motor battery.
3. Remove the multi-use relay and fuse cover (2).

4. Remove the battery protector (Insulator) (1).
5. Remove the 14 V power module 20 amp maxi-fuse (2).
6. Remove the battery charger 20 amp maxi-fuse (3).

[Installation Procedure](#)

1. Install the 14 V power module 20 amp maxi-fuse (2).
2. Install the battery charger 20 amp maxi-fuse (3).
3. Install the battery protector (Insulator) (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the multi-use relay and fuse cover (2) with screws (1). Tighten to **6 N·m (53 lb in)**.

300 Volt Battery Positive and Negative Cable Replacement - Drive Motor Battery-to-Inverter

[Removal Procedure](#)

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the exhaust pipe front heat shield. Refer to [Exhaust Pipe Heat Shield Replacement](#) : [Rear](#) → [Center](#) → [Front](#) .

3. Remove the bolt (2) holding the 300 V battery positive and negative cable connector (1), to the drive motor generator power inverter module.

Note: Replace the 300 V battery positive and negative connector seal.

4. Drain the drive motor battery cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#) .

5. Remove the drive motor battery coolant cooler inlet hose fitting (1) and set aside the drive motor battery coolant cooler hose (2).

6. Remove the high-voltage interlock loop connector (1) and the bolt (2) holding the connector (3) to the drive motor battery.

7. Disconnect the 300 V battery positive and negative cable retainers (1) from the studs.

8. Remove the 300 V battery positive and negative cable retainers (2) from the heater coolant shut-off valve bracket (1).

9. Remove the 300 V battery positive and negative cable (1) from the vehicle.

[Installation Procedure](#)

1. Position the 300 V battery positive and negative cable (1) in the engine compartment.

2. Connect the 300 V battery positive and negative cable retainers (2) to the heater coolant shut-off valve bracket (1).

3. Install the 300 V battery positive and negative cable retainers (1) to the tunnel studs.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the 300 V battery positive and negative connector bolt (2) and tighten to **8 N·m (71 lb in)**.
5. Connect the high voltage interlock loop connector (1) to the 300 V battery positive and negative cable connector (3).

6. Install the drive motor battery coolant cooler inlet hose fitting (1).
7. Fill the drive motor battery cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#) .
8. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .

300 Volt Battery Positive and Negative Cable Replacement - Inverter-to-Compressor/Heater Module

Removal Procedure

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
3. Remove the throttle body. Refer to [Throttle Body Assembly Replacement](#) .

4. Remove the inverter-to-compressor/heater module cable (1) from the power inverter module (2).

Note: Replace the 300 V battery positive and negative connector seal.

5. Locate the connectors (1) to the heater coolant heater module.

6. Detach the high-voltage inter-lock loop connector (1) and the 300 V battery positive and negative cable (2), from the heater coolant heater module (3).

7. Disconnect the 300 V battery positive and negative cable retainers (1) from the A/C compressor hose.

8. Remove the 300 V battery positive and negative cable (1) from the vehicle.

[Installation Procedure](#)

1. Position the 300 V battery positive and negative cable (1) in the engine compartment.

2. Connect the 300 V battery positive and negative cable connector (2) to the heater coolant heater module (3).
3. Connect the high-voltage inter-lock loop connector (1) to the heater coolant heater module (3).

4. Install the 300 V battery positive and negative cable retainers (1) to the A/C compressor hose.

5. Install the 300 V battery positive and negative connector (2) to the A/C and drive motor battery cooling compressor.
6. Connect the 300 V battery positive and negative cable retainers (1) to the A/C compressor hose.

Caution: Refer to [Fastener Caution](#) in the Preface section.

7. Connect the 300 V battery positive and negative cable connector (1) to the drive motor generator power inverter module. Tighten to **8 N·m (71 lb in)**.
8. Install the throttle body. Refer to [Throttle Body Assembly Replacement](#) .
9. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
10. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .

300 Volt Battery Positive and Negative Cable Replacement - Drive Motor Battery-to-Charger

Removal Procedure

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the drivetrain and front suspension frame. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .
3. Remove the drive motor battery coolant cooler inlet hose assembly. Refer to [Drive Motor Battery Coolant Cooler Inlet Hose Assembly Replacement](#) .

4. Disconnect the high-voltage inter-lock loop connector (3) from the drive motor battery charger.
5. Remove the 300 V battery positive/negative cable retaining nut (1) and the 300V battery positive/negative connector (2).

6. Remove the 300 V battery positive/negative cable retainer nut (1) from the underbody stud.

7. Remove the 300 V battery positive/negative cable retainer nuts (1) from the chassis frame.

8. Remove the drive motor battery coolant cooler inlet hose fitting (1) and set aside the drive motor battery coolant cooler hose (2).
9. Remove the drive motor battery coolant outlet hose, if necessary. Refer to [Drive Motor Battery Coolant Outlet Hose Replacement](#) .

10. Remove the high-voltage inter-lock loop connector (1).
11. Remove the bolt (2) and set aside the connector (3).

12. Remove the high-voltage inter-lock loop connector (2) and the 300 V battery positive/negative connector (1), from the drive motor battery.
13. Remove the 300 V battery positive/negative cable from the vehicle.

[Installation Procedure](#)

1. Connect the 300 V battery positive/negative cable connector (1) and the high-voltage inter-lock loop connector (2), to the drive motor battery.
2. Install the drive motor battery coolant outlet hose, if necessary. Refer to [Drive Motor Battery Coolant Outlet Hose Replacement](#) .

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Connect the high-voltage connector (3) and tighten bolt (2) to **8 N·m (71 lb in)**.

4. Install the drive motor battery coolant cooler inlet hose fitting (1).

5. Install the 300 V battery positive/negative retainers (2) and nuts (1) to the chassis frame studs and tighten to **8 N·m (71 lb in)**.

6. Connect the 300 V battery positive/negative cable retainer (2) and nut (1), to the panel stud, and tighten to **8 N·m (71 lb in)**.

7. Install the 300 V battery positive/negative cable into the fuel line retainer with clip (1).

8. Connect the 300 V battery positive/negative cable connector (2) and the high-voltage inter-lock loop connector (3), to the drive motor battery charger.
9. Install the 300 V battery positive/negative cable retainer (4) and nut (1) and tighten to **8 N·m (71 lb in)**.
10. Install the 300 V battery positive/negative cable retainer to the stud and tighten nut (1) to **8 N·m (71 lb in)**.
11. Install the drive motor battery coolant cooler inlet hose assembly. Refer to [Drive Motor Battery Coolant Cooler Inlet Hose Assembly Replacement](#) .
12. Install the drivetrain and front suspension frame. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .
13. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .

300 Volt Battery Positive and Negative Cable Replacement - Drive Motor Battery-to-APM Module

Removal Procedure

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the drive motor battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#) .
3. Support the fuel tank with an appropriate jack.

4. Remove the nuts (1) and the bolts (2) securing the floor panel bar (3) to the frame.
5. Remove the floor panel bar (3).

6. Remove the 300 V battery positive/negative cable retainer nut (1).

7. Detach the 300 V battery positive/negative cable (3) from the fuel rail fasteners (1).
8. Swing the individual fuel line clips (2) open.

9. Working towards the rear of the vehicle, detach the fuel line clip (1) and cables ties (2).

10. Unclip the fuel line clip (1) and the cable ties (2).

11. Disconnect the high-voltage inter-lock loop connector (1) and the 300 V battery positive/negative cable connector (2).
12. Remove the 300 V battery positive/negative cable fastener nut (3).

13. Remove the 300 V battery positive/negative cable (1) from the vehicle.

[Installation Procedure](#)

1. Position the 300 V battery positive/negative cable (1) below the vehicle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Connect the 300 V battery positive/negative retainer and nut (3) to the bracket stud. Tighten to **8 N·m (71 lb in)**.
3. Connect the 300 V battery positive/negative cable connector (2) to the accessory DC power control module.
4. Connect the high-voltage inter-lock loop connector (1) to the accessory DC power control module.

5. Install the 300 V battery positive/negative cable into the fuel line retainer with clip (1).

6. Install the 300 V battery positive/negative cable into the fuel line retainer with clip (1).

7. Install the floor panel bar (3) to the frame mounts. Tighten the following:
- Floor panel bar nuts (1) to **22 N·m (16 lb ft)**.
 - Floor panel bar bolts (2) to **58 N·m (43 lb ft)**.

8. Connect the 300 V battery positive/negative cable into the fuel line retainer clips (1).
9. Install the drive motor battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#) .

10. Install the 300 V battery positive/negative cable retainer to the stud and tighten nut (1) to **8 N·m (71 lb in)**.

11. Connect the 300 V battery positive/negative cable connector (3) to the drive motor battery (3).
12. Connect the high-voltage inter-lock loop connector (1).

13. Connect the high-voltage inter-lock loop connector (1).
14. Install the connector (3) and tighten the bolt (1) to **8 N·m (71 lb in)**.

15. Connect the drive motor battery coolant cooler inlet hose fitting (1).
16. Fill the drive motor battery cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#) .
17. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .
18. Clear the secure high-voltage DTCs. Refer to [Clear Secured High-Voltage DTCs](#) .
19. Rest the Hybrid/EV battery pack data. Refer to [Hybrid/EV Battery Pack Data Reset](#) .
20. Perform a Hybrid/EV battery pack capacity learn procedure. Refer to [Hybrid/EV Battery Pack Capacity Learn](#) .

Drive Motor Battery Replacement and Shipping Preparation

Special Tool

1. *EL 49976* Battery Pack Lifting Fixture
2. *EL 50209* Battery Terminal Covers

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the rear heat shields. Refer to [Exhaust Pipe Heat Shield Replacement](#) : [Rear](#) → [Center](#) → [Front](#) .
3. Remove the right underbody air deflectors. Refer to [Underbody Front Air Deflector Replacement - Right Side](#) .

Note: Not necessary to remove the underbody battery shield.

4. Remove the drive motor generator radiator surge tank cap.

5. Using a drain pan to collect any fluid, remove the drain plug (1) and drain the drive motor battery of fluid.

Note: Document the colour of the fluid and the quantity of fluid drained. Replace the drain plug with a NEW drain plug.

6. Using a drain pan to collect any coolant, remove the metal coolant pipe retainers (1) and disconnect the inlet and outlet coolant pipes (2).

7. Disconnect the following from the drive motor battery:
- Body Harness Connector X5 (1).
 - Interlock Loop Connectors X3, X4 (2).
 - Connectors X1 and X2 (3).

8. Remove the 300 V positive and negative cable connector mounting bolt (2).
9. Remove the 300 V positive and negative cable connector (3).

10. Remove connectors X4 and X5 (1).

11. Remove the 300 volt cable connector fastener (1).

12. Remove the earth strap fasteners (1), from the body side.

13. Support the battery (1) using the *EL 49976* lifting fixture, in conjunction with a suitable lift table. The battery mass is approximately 204 kg (450 lbs).

14. Remove the battery tray fasteners (1) and (2).
15. Remove the drive motor generator battery and the *EL-49976* battery lifting fixture from the lift table and set aside.
16. Remove the replacement drive motor generator battery and the replacement *EL-49976* battery lifting fixture from the container and mount to the lift table.
17. If the drive motor generator battery is to be out of the vehicle for an extended period of time, place the drive motor generator battery in a safe location with the appropriate safety cones and protocols. Install *EL50209* protective terminal covers on connection points.
18. Ensure that tape covers the manual disconnect terminals on the drive motor generator battery.
19. If the drive motor generator battery is being returned, prepare the drive motor generator battery for safe shipping by performing the following:
 - Install coolant plugs (2) in the coolant lines. Coolant plugs can be removed from the new service battery assembly and installed in the returned battery. Additional coolant plugs (GM p/n 22770854) can be ordered if they are needed.

Note: As part of the battery removal process, all coolant should be drained from the battery pack.

- Install the Manual Service Disconnect (MSD) Cover. The MSD cover can be removed from the new service battery assembly and installed in the returned battery. Additional MSD covers (GM p/n 22770856) can be ordered if they are needed.

Note: The MSD lever should remain with the vehicle and not be returned with the battery assembly.

- Install the High-Voltage Connector Cover. The high-voltage connector cover can be removed from the service battery and installed on the returned battery. If the service battery assembly did not come with a high-voltage connector cover, additional covers can be ordered by calling 1-800 GM TOOLS. Reference tool # EL-50209 when placing your order.

Note: The failed battery must be removed and returned with a battery assembly lifting fixture (GM Special Tool EL-49976). This lifting fixture will be attached to the failed battery and placed in the shipping container. Each new service battery will come with a battery assembly lifting fixture for use during installation. You will keep this fixture for servicing future battery removals.

Installation Procedure

1. Using the *EL 49976* lifting fixture , in conjunction with a suitable lift table, raise the generator drive motor battery to the vehicle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Tighten the battery tray fasteners (1) to **58 N·m (43 lb ft)** and tighten the battery tray fasteners (2) to **22 N·m (16 lb ft)**.

3. Install the earth strap fasteners (1) and tighten to **9 N·m (80 lb in)**.

4. Install the X4 and X5 connectors (1).

5. Connect the 300 V Cable (3) to the drive motor generator battery and tighten bolt (2) to **8 N·m (71 lb in)**.

6. Connect the following to the drive motor generator battery:
- Body Harness Connector X5 (1).
 - Interlock Loop Connectors X3, X4 (2).
 - Connectors X1 and X2 (3).

7. Connect the inlet and outlet coolant pipes (2) and install the metal coolant pipe retainers (1).
8. Install the rear heat shields. Refer to [Exhaust Pipe Heat Shield Replacement : Rear → Center → Front](#) .
9. Install the right underbody air deflectors. Refer to [Underbody Front Air Deflector Replacement - Right Side](#) .
10. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .
11. Check the battery pack cooling system for leaks. Refer to [Hybrid Cooling System Leak Test](#) .
12. Clear the secured high voltage DTC's. Refer to [Clear Secured High-Voltage DTCs](#) .
13. Reset the Hybrid/EV battery pack data. Refer to [Hybrid/EV Battery Pack Data Reset](#) .
14. Program the battery energy control module. Refer to [Electronic Brake Control Module Programming and Setup](#) .
15. Perform the Hybrid/EV battery pack capacity learn procedure. Refer to [Hybrid/EV Battery Pack Capacity Learn](#) .

Clear Secured High-Voltage DTCs

[Clear Secured High-Voltage DTCs](#)

The Hybrid/EV Battery Pack Clear Secured High Voltage DTCs procedure must be completed when the following components are replaced:

- Hybrid/EV Powertrain Control Module 2
- Hybrid/EV Battery Energy Control Module
- Hybrid/EV Battery Interface Control Module
- Hybrid/EV Battery Pack

The Hybrid/EV Powertrain Control Module 2 Clear Secured High Voltage DTCs procedure can be completed with a scan tool using the following steps:

1. Install the scan tool to the data link connector.

Note: A command reject may appear on the scan tool after the first Hybrid/EV Battery Pack Clear Secured High Voltage DTCs request. Ignore this command reject.

2. Vehicle in Service Mode, select Hybrid/EV Battery Pack Clear Secured High-Voltage DTCs in the Hybrid/EV Powertrain Control Module 2 Control Functions list.
3. Follow the scan tool directions to complete the procedure.
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Vehicle in Service Modeselect Hybrid/EV Battery Pack Clear Secured High Voltage DTCs in the Hybrid/EV Powertrain Control Module 2 Control Functions list.
6. Follow the scan tool directions to complete the procedure.
7. Clear any DTCs that may be set.

Hybrid/EV Battery Pack Data Reset

[Hybrid/EV Battery Pack Data Reset](#)

The Hybrid/EV Powertrain Control Module 2 Data Reset procedure must be completed when the following components are replaced:

- Hybrid/EV Powertrain Control Module 2
- Hybrid/EV Battery Energy Control Module
- Hybrid/EV Battery Interface Control Module
- Hybrid/EV Battery Pack

The Hybrid/EV Powertrain Control Module 2 Data Reset procedure can be completed with a scan tool using the following steps:

1. Install the scan tool to the data link connector.
2. Ignition ON, engine OFF.
3. Select Hybrid/EV Battery Pack Data Reset in the Hybrid/EV Powertrain Control Module 2 Control Functions list
4. Follow the scan tool directions to complete the procedure.
5. Clear any DTCs that may be set.

Hybrid/EV Battery Pack Capacity Learn

[Hybrid/EV Battery Pack Capacity Learn](#)

The Hybrid/EV Battery Pack Capacity Learn procedure must be completed when the following components are replaced:

- Hybrid/EV Powertrain Control Module 2
- Hybrid/EV Battery Energy Control Module
- Hybrid/EV Battery Interface Control Module
- Hybrid/EV Battery Pack

The Hybrid/EV Powertrain Control Module 2 Capacity Learn procedure can be completed with a scan tool using the following steps:

1. Install the scan tool to the data link connector.
2. Ignition ON, engine OFF.
3. Select Hybrid/EV Battery Pack Capacity Reset in the Hybrid/EV Powertrain Control Module 2 Control Functions list
4. Follow the scan tool directions to complete the procedure.
5. Select Hybrid/EV Battery Pack Capacity Learn in the Hybrid/EV Powertrain Control Module 2 Control Functions list
6. Follow the scan tool directions to complete the procedure.
7. Clear any DTCs that may be set.

Drive Motor Battery System Description

[Overview](#)

The hybrid battery contains 288 cells. Groups of three cells are welded together in-parallel called cell groups. There are a total of 96 cell groups in the hybrid battery assembly. These cell groups are electrically connected in-series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cell groups are joined to form 3 distinct sections. The first 30 battery cell groups make up battery section 1. This section is adjacent to the cowl and contains battery cell groups 67 through to 96. The next 24 battery cell groups make up battery section 2. This section is located behind section 1 and contains battery cell groups 43 through to 66. The transverse battery section is section number 3 and it contains the remaining battery cell groups 1 through to 42. The 3 battery sections are individually serviceable components.

The battery energy control module monitors the voltage of the 96 battery cell groups through 4 hybrid battery interface control modules. There is one hybrid battery interface control module for section 1 and 2, with section 3 having two modules. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A serviceable voltage sense harness joins this connector to the hybrid battery interface control modules, located on the top surface of the battery section. The hybrid battery interface control module encodes the voltage reading and transmits it to the battery energy control module through the battery energy control module harness. The hybrid battery interface control modules 1-4, voltage sense harnesses, generator battery control harness and battery energy control module are all considered serviceable components.

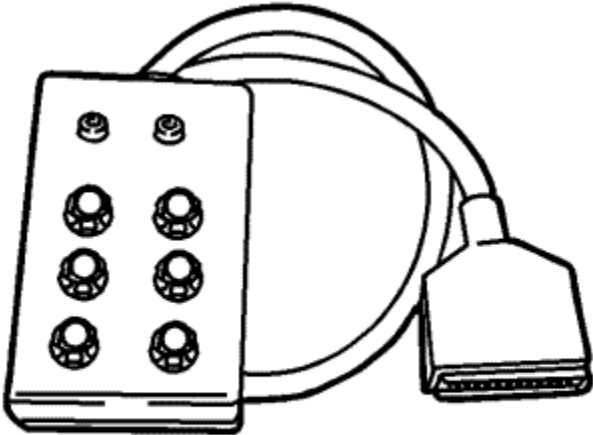

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

[Location](#)

The hybrid battery is located beneath the vehicle. The battery energy control module, hybrid battery interface control modules 1-4, current sensor, and high-voltage contactors are located within the hybrid battery assembly. The hybrid powertrain control module 2 is located under the front passenger seat.

Special Tools

Illustration	Tool Number/ Description
 A technical illustration of a high-voltage battery pin out box. It consists of a rectangular base with eight circular pins arranged in two columns of four. DTC Descriptors

DTC P0CF4: Control Pilot Circuit Performance

DTC P0CF5: Control Pilot Circuit Low Voltage

DTC P0CF6: Control Pilot Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors a pilot signal from the drive motor battery charger cable. The hybrid/EV powertrain control module 2 utilises this signal to manage the charging process between the drive motor battery charger cable and the hybrid/EV powertrain control module 2.

Under normal charging conditions the control pilot signal is generated by the drive motor battery charger cable. This diagnostic runs with the drive motor battery charger cable disconnected to verify the vehicle side circuit integrity. The diagnostic signal is generated internally by the hybrid/EV powertrain control module 2.

Conditions for Running the DTC

DTC P0CF4

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- Vehicle in Service Mode
- The vehicle needs to be driven above 25 km/h (16 mph) for more than 10 seconds.

DTC P0CF5

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- Vehicle needs to be driven above 25 km/h (16 mph) for more than 10 seconds.

DTC P0CF6

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- Vehicle in Service Mode.
- Vehicle needs to be driven above 25 km/h (16 mph) for more than 10 seconds.

Conditions for Setting the DTC

DTC P0CF4

The control pilot circuit is not meeting its internal range requirements for 1 second. This can only be set internal to the hybrid/EV powertrain control module 2. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

DTC P0CF5

The control pilot circuit voltage divided by the system voltage is less than 0.03 for 1 second. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

DTC P0CF6

The control pilot circuit voltage divided by the system voltage is greater than 0.58 for 1 second. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

Action Taken When the DTC Sets

- DTC P0CF4-P0CF6 are type A DTCs
- Disables high-voltage battery charging.

Conditions for Clearing the DTC

DTC P0CF4-P0CF6 are type A DTCs.

[Circuit/System Testing](#)

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T18 battery charger. Refer to [High Voltage Disabling](#) . Disconnect the X3 harness connector at the T18 battery charger and the X2 harness connector at the K114B hybrid/EV powertrain control module 2.

Note: The following tests should be conducted at the hybrid battery charger receptacle pins behind the charge port door, not the hybrid battery charger receptacle harness connector.

2. Test for infinite resistance between control pilot signal 1 circuit X98 hybrid battery charger receptacle terminal B and the terminals listed below:
 - X98 hybrid battery charger receptacle terminal A
 - X98 hybrid battery charger receptacle terminal C
 - X98 hybrid battery charger receptacle terminal D
 - X98 hybrid battery charger receptacle terminal E

If less than the specified range, repair the control pilot signal 1 circuit for a short-circuit between the circuits.

3. If all circuits test normal, replace the K114B hybrid/EV powertrain control module 2.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0CF9: Control Pilot Charging Switch Performance

DTC P0D01: Control Pilot Charging Ventilation Switch Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 has two internal switches used to modify the control pilot signal. The first internal switch modifies the control pilot signal to indicate to the drive motor battery charger cable that the vehicle is either ready or not ready to accept energy. The second internal switch modifies the control pilot signal to indicate to the drive motor battery charger cable whether indoor ventilation is required.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- Vehicle in Service Mode.
- The diagnostics for DTC P0CF4-P0CF6 must have passed before these will run.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 measures a pilot signal voltage out of range for 10 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

Action Taken When the DTC Sets

- DTC P0CF9 and P0D01 are type A DTCs
- Disables the high-voltage battery charging.

Conditions for Clearing the DTC

DTC P0CF9 and P0D01 are type A DTCs.

DTC Descriptor

DTC P0D1F: Control Module Date/Time Synchronization Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the date and time data it receives from the radio. This time information is used to ensure the module's internal clock is synchronised to the customer's local time. The Time of Day Charging feature utilises this internal clock to keep track of time and alarms for delayed charging modes. If this radio time data is received during a drive cycle, the system is considered synchronised.

Conditions for Running the DTC

The vehicle needs to go from Vehicle OFF to Vehicle in Service Mode to start the diagnostic.

Conditions for Setting the DTC

The vehicle is driven for more than 5 consecutive drive cycles where trip distance exceeds 15 Kilometres, and the date and time were unavailable from the Radio.

Action Taken When the DTC Sets

- DTC P0D1F is a type C DTC.
- On the Navigation screen "Default Charge Mode: Immediately" is displayed.
- The battery charger Time Of Day charging option is disabled, and charging mode is set to IMMEDIATE.

Conditions for Clearing the DTC

DTC P0D1F is a type C DTC.

DTC P0D20, P0D22, P1EFA or P1EFB

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0D20: Battery Charger Output Voltage Performance

DTC P0D22: Battery Charger Output Current Performance

DTC P1EFA: Battery Charger High-Voltage Converter 1 Input Current Too High

DTC P1EFB: Battery Charger High-Voltage Converter 2 Input Current Too High

[Circuit/System Description](#)

The hybrid/EV powertrain control module 2 monitors the battery charger high-voltage output and current output and ensures they are within the proper range. The battery charger operates in either a constant current mode or a constant voltage mode. Whichever mode you are in will determine which diagnostic will be run. The battery charger runs constant voltage mode at the beginning and end of the charge cycle and runs constant current mode most of the charging cycle.

[Conditions for Running the DTC](#)

P0D20

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Battery charger is charging and in constant voltage mode which only occurs under the following conditions:
 - During charging bus precharge.
 - When the hybrid/EV battery pack is close to being fully charged.

- When the hybrid/EV battery pack is hot and the hybrid/EV battery pack cooling system is activated.

P0D22

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Battery charger is charging and not in constant voltage mode
- The hybrid/EV powertrain control module 2 measures a current output of greater than about 0.5 A

P1EFA

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The vehicle is connected to a 120 V AC supply and battery charging is charging the high-voltage battery supply.

P1EFB

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The vehicle is connected to a 240 V AC supply and battery charging is charging the high-voltage battery supply.

Conditions for Setting the DTC

P0D20

The hybrid/EV powertrain control module 2 measures that the battery charging bus voltage is not within about 15 % of the commanded voltage for about 5 seconds.

P0D22

The hybrid/EV powertrain control module 2 measures that the battery charging bus current is not within an acceptable percentage of the commanded current for about 40 seconds.

P1EFA, P1EFB

The battery charger detects an internal over-current condition. This is an internal measurement to the battery charger.

Action Taken When the DTC Sets

- DTC P0D20 and P0D22 are type A DTCs.
- DTC P1EFA and P1EFB are type C DTCs.
- Disables the vehicle high-voltage battery charging.

Conditions for Clearing the DTC

- DTC P0D20 and P0D22 are type A DTCs.
- DTC P1EFA and P1EFB are type C DTCs.

[Circuit/System Testing](#)

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify no other battery-related DTCs are set.

If any battery-related DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for hybrid battery diagnostics.

2. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack and the T18 battery charger. Refer to [High Voltage Disabling](#) .

3. Disconnect the X4 connector at the T18 battery charger and at the X5 connector at the A4 hybrid/EV battery pack.

4. Test for infinite resistance between the 300 V circuit terminals listed below and earth:

- Terminal A X4
- Terminal B X4

If less than the specified range, test the 300 V circuit for a short-circuit to earth.

5. Test for less than 10 Ω between the 300 V circuit terminals listed below:

- T18 battery charger terminal A X4 and A4 hybrid/EV battery pack A X5
- T18 battery charger terminal B X4 and A4 hybrid/EV battery pack B X5

If greater than the specified range, test the 300 V circuit for an open-circuit/high resistance.

6. Test for infinite resistance between the 300 V circuit terminal A X4 and B X4.

If less than the specified range, test the 300 V circuits for a short-circuit between the circuits.

7. If all circuits test normal, replace the T18 battery charger.

DTC P0D21, P0D23, P1EF0 or P1EF1

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0D21: Battery Charger Output Voltage Too Low

DTC P0D23: Battery Charger Output Shorted

DTC P1EF0: Battery Charger High-Voltage Converter 1 Output Power Regulation Performance

DTC P1EF1: Battery Charger High-Voltage Converter 2 Output Power Regulation Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 and battery charger control module monitor the battery charger high-voltage output and current output and ensures it is in the proper range and there is not a resistive short in the charging bus.

Conditions for Running the DTC

P0D21

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Battery charger in heating mode ONLY:
 - Multi-function contactor must be commanded Open.
 - Battery charging contactors must be commanded Closed.
 - Commanded high-voltage current must be greater than 0.5 A.

- High-voltage battery heater duty cycle must be greater than 5%.
- Drive motor battery charger cable must be connected and vehicle receiving power.
- All other battery charging modes:
 - Multi-function contactor and battery charging contactors must be commanded Closed.
 - Drive motor battery charger cable must be connected and vehicle receiving power.

P0D23

- The vehicle 12 V battery system voltage needs to be above 9 V.
- There can not be any high voltage or current sensor faults present.
- The battery charge system must be in the pre-charge state, and the multi-function contactor must be commanded Open.
- There can not be any high-voltage battery heating or cooling requests active.
- drive motor battery charger cable must be connected and vehicle receiving power.

P1EF0

- P0D53, P0D54, P0D4E, P0D4F, P1EEB or P1EEC should not be set.
- The vehicle 12 V battery system voltage needs to be above 9 V
- The vehicle is connected to a 120 V AC supply and the battery charger is converting power.

P1EF1

- P0D53, P0D54, P0D4E, P0D4F, P1EEB or P1EEC should not be set.
- The vehicle 12 V battery system voltage needs to be above 9 V
- The vehicle is connected to a 240 V AC supply and the battery charger is converting power.

Conditions for Setting the DTC

P0D21

Battery charger high-voltage output voltage is less than 150 V for about 1 second.

P0D23

The battery charger high-voltage output current exceeds 0.1 A for about 3 seconds.

P1EF0 or P1EF1

The battery charger actual high-voltage output voltage or current is not within the allowable tolerance compared with the commanded output voltage or current. This is measured internal to the battery charger.

[Action Taken When the DTC Sets](#)

P0D21

- DTC P0D21 is a type B DTC.
- Disables the high-voltage battery heating and/or charging.

P0D23, P1EF0, or P1EF1

- DTC P0D23 is a type A DTC.
- Disables the high-voltage battery charging.

[Conditions for Clearing the DTC](#)

P0D21

DTC P0D21 is a type B DTC.

P0D23, P1EF0, or P1EF1

DTC P0D23 is a type A DTC.

[Diagnostic Aids](#)

Low or unstable household voltage supply can cause this DTC to set. Verify with customer that domestic voltage was not fluctuating during charge attempt and that they are using a dedicated circuit. Voltage fluctuations can be indicated by intermittent red LEDs on the drive motor battery charger cable.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.

- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify no battery-related DTCs are set.

If any battery-related DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for hybrid battery diagnostics.

2. Clear DTC, connect the drive motor battery charger cable to vehicle and known good domestic supply voltage.

3. Verify DTC P0D21, P0D23, P1EF0 or P1EF1 is set.

If DTC is not set, the vehicle owner will have to attempt charge at home again. If the vehicle will not charge, they will need electrical supply serviced.

4. Vehicle OFF, disable the high voltage at the A4 hybrid/EV battery pack and the T18 battery charger. Refer to [High Voltage Disabling](#) .

5. Disconnect the X4 connector at the T18 battery charger and at the X5 connector at the A4 hybrid/EV battery pack.

6. Test for infinite resistance between the 300 V circuit terminals listed below and earth:

- Terminal A X4
- Terminal B X4

If less than the specified range, test the 300 V circuit for a short-circuit to earth.

7. Test for less than 10 Ω between the 300 V circuit terminals listed below:

- T18 battery charger terminal A X4 and A4 hybrid/EV battery pack A X5
- T18 battery charger terminal B X4 and A4 hybrid/EV battery pack B X5

If greater than the specified range, test the 300 V circuit for an open-circuit/high resistance.

8. Test for infinite resistance between the 300 V circuit terminal A X4 and B X4.

If less than the specified range, test the 300 V circuits for a short-circuit between the circuits.

9. If all circuits test normal, replace the T18 battery charger.

DTC P0D26

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0D26: Battery Charger System Precharge Time Too Long

Circuit/System Description

Before connecting the battery charger to the hybrid/EV battery pack it is necessary to raise the voltage level of the battery charger output to match the hybrid/EV battery pack voltage. This is called the precharge of the battery charger. During precharge the charging contactors are closed, but the multi-function contactor is open. Also the drive motor battery charger cable needs to be plugged into the hybrid battery charge receptacle and utility power needs to be enabled to the vehicle. The hybrid/EV powertrain control module 2 monitors the amount of time it takes to achieve the proper pre-charge voltage.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Battery charger must go from disconnected to connected.
- Drive motor battery charger cable must be connected and vehicle receiving power.
- The multi-function contactor must be commanded Open.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 determines the battery charger does not reach its pre-charge voltage within about 10 seconds.

Action Taken When the DTC Sets

- DTC P0D26 is a type A DTC.
- Disables the high-voltage battery charging.

Conditions for Clearing the DTC

DTC P0D26 is a type A DTC.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0D2A: Battery Charger Input High Current

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the battery charger AC current and verifies that it does not exceed its normal limit.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage needs to be above 9 V.
- There can not be any high voltage or current sensor faults present.
- Drive motor battery charger cable must be connected and vehicle receiving power.

Conditions for Setting the DTC

120 V AC Supply

Exceeds 13 A for about 1 second.

240 V AC Supply

Exceeds 17 A for about 1 second.

Action Taken When the DTC Sets

- DTC P0D2A is a type A DTC.
- Disables the high-voltage battery charging.

Conditions for Clearing the DTC

DTC P0D2A is a type A DTC.

DTC Descriptors

DTC P0D2B: Control Pilot Indicator Control Circuit

DTC P0D2C: Charge Status Indicator Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Pilot Indicator Control	P0D2B	P0D2B	P0D2B	-
Charge Status Indicator Control	P0D2C	1	P0D2C	-
Charge Complete Indicator Control	1	1	1	--
Low Reference	--	P0D2C, P0D2B	--	--
1. Plug In Charging Indicator Malfunction				

Circuit/System Description

The status of charging events (including delays) is communicated to the user through a charge status indicator and audio tones. The battery state of charge indicator, located at the top middle of the instrument panel, will be permanently lit green when the vehicle is charging under automatic control. It will have a fast flash green if the charging is delayed and will begin later. It will have a slow flash green when charging is complete. A permanently lit yellow indicator means the vehicle is not able to accept a charge. And if there is no indicator lit, it means the electronic vehicle supply equipment is not working properly or is not connected.

Conditions for Running the DTC

Both conditions need to run for diagnostics to pass.

Condition 1

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Vehicle in Service Mode.
- The drive motor battery charger cable is disconnected (LEDs commanded OFF).

Condition 2

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Vehicle in Service Mode.
- The vehicle is connected to an AC supply and the battery charger is charging the vehicle (LEDs commanded ON).

Conditions for Setting the DTC

- LED Commanded OFF, the hybrid/EV powertrain control module 2 detects a short-circuit to battery for about 4 seconds.
- LED Commanded ON, the hybrid/EV powertrain control module 2 detects a short-circuit to earth or an open-circuit/high resistance for about 4 seconds.

Action Taken When the DTC Sets

DTC P0D2B and P0D2C are type B DTCs.

Conditions for Clearing the DTC

DTC P0D2B and P0D2C are type B DTCs.

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Vehicle OFF, disconnect the harness connector at the P36 battery state of charge indicator.
2. Test for less than 10 Ω between the low reference terminal C and earth.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
3. Disconnect the drive motor battery charger cable for at least 10 seconds. Connect a test lamp between the signal terminal A and earth. Verify that the test lamp does not illuminate.
If the test lamp does illuminate, test the signal circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
4. While connecting the drive motor battery charger cable, verify that the test lamp illuminates in the first 5 seconds of connecting the drive motor battery charger cable.
If the test lamp does not illuminate, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
5. Disconnect the drive motor battery charger cable for at least 10 seconds. Connect a test lamp between the signal terminal B and earth. Verify that the test lamp does not illuminate.
If the test lamp does illuminate, test the signal circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
6. While connecting the drive motor battery charger cable verify that the test lamp illuminates within 25 seconds of connecting the drive motor battery charger cable.
If the test lamp does not illuminate, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
7. If all circuits test normal, replace the P36 battery state of charge indicator.

Circuit/System Description

The battery charger will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery charger to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for DTC information.

The DTCs listed above for the battery charger are internal measurements that verify the charger is performing properly. The battery charger measures internal voltages, currents, and temperatures and verifies they are within the proper range.

Conditions for Running the DTC

These DTCs are internal faults of the battery charger. The vehicle needs to be connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

These DTCs are internal faults of the battery charger.

Action Taken When the DTC Sets

- DTC P0D39-P0D3B, P0D49-P0D54, P1ECB-P1ECD, P1ED0-P1ED9, P1ED9, P1EDB, P1EDC, P1EDE-P1EED or P1EFF-P1F02 are type A and B DTCs.

- Disables high-voltage battery charging.

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Verify that DTC P0D39-P0D3B, P0D49-P0D54, P1ECB-P1ECD, P1ED0-P1ED9, P1ED9, P1EDB, P1EDC, P1EDE-P1EED or P1EFF-P1F02 is not set.

If DTC is set, disable the high voltage at the T18 battery charger. Refer to [High Voltage Disabling](#) . Replace the T18 battery charger.

DTC Descriptors

DTC P0D3E: Battery Charger Input Voltage Sensor Performance

DTC P0D3F: Battery Charger Input Voltage Sensor Circuit Low Voltage

Circuit/System Description

The battery charger will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery charger to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for DTC information.

The DTCs listed above for the battery charger are internal measurements that verify the charger is performing properly. The battery charger measures voltages, currents, and temperatures and verifies they are within the proper range.

Conditions for Running the DTC

The vehicle needs to be connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

The battery charger detects low (less than 85V) or unstable supply voltage during charging.

Action Taken When the DTC Sets

- DTC P0D3E and P0D3F are type A and B DTCs.

- Disables high-voltage battery charging.

[Conditions for Clearing the DTC](#)

DTC P0D3E and P0D3F are type A and B DTCs.

[Diagnostic Aids](#)

Charging the vehicle with a wet drive motor battery charger cable can cause this DTC to set. Verify that the customer did not attempt to charge vehicle in the rain or extremely wet environment.

Low or unstable household voltage supply can cause this DTC to set. Verify with customer that domestic voltage was not fluctuating during charge attempt and that they are using a dedicated circuit.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Clear DTC, connect the drive motor battery charger cable to vehicle and known good domestic supply voltage.
2. Verify that DTC P0D3E or P0D3F is set.
 - If DTC is not set, the vehicle owner will have to attempt charge at home again. If the vehicle will not charge, they will need electrical supply serviced.
3. Verify that drive motor battery charger cable LEDs are not flickering.
 - If drive motor battery charger cable LEDs are flickering, replace drive motor battery charger cable.
4. Test for infinite resistance between the 110/220 V AC circuit terminals listed below and earth:
 - T18 battery charger terminal A X3
 - T18 battery charger terminal CX3
 - If less than the specified range, test the 110/220 V AC circuit for a short to ground.
5. Test for less than 10 Ω between the 110/220 V AC circuit terminals listed below:
 - T18 battery charger terminal A X3 and X98 hybrid battery charger receptacle E

- T18 battery charger terminal C X3 and X98 hybrid battery charger receptacle A

If greater than the specified range, test the 110/220 V AC circuit for an open-circuit/high resistance.

6. Test for infinite resistance between the 110/220 V AC circuit at the T18 battery charger terminal A X3 and C X3.

If less than the specified range, test the 110/220 V AC circuits for a short-circuit between the circuits.

7. If all circuits test normal, replace the T18 battery charger.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0D40: Battery Charger Input Voltage Sensor Circuit High Voltage

DTC P1EDA: Battery Charger Converter Input Voltage Sensor 1 Circuit High Voltage

DTC P1EDD: Battery Charger Converter Input Voltage Sensor 2 Circuit High Voltage

DTC P1F03: Battery Charger Control Module Supply Voltage Performance

Circuit/System Description

The battery charger contains several internal sensor diagnostics that require the vehicle AC supply to be in the proper range. These diagnostics are internal battery charger diagnostics, but need the correct AC voltage to run properly.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The vehicle is connected to an AC supply.

Conditions for Setting the DTC

P0D40

The vehicle AC volt supply is greater 422 V AC.

P1EDA and P1EDD

The battery charger internal bulk voltage is greater than about 464 V DC. This is an internal measurement to the battery charger.

P1F03

The battery charger detects internal PBIAS voltage is greater than about 15 V DC. This is an internal measurement to the battery charger.

Action Taken When the DTC Sets

- DTC P0D40, P1EDA, P1EDD or P1F03-P1F05 are type A DTCs.
- Disables the vehicle high-voltage battery charging.

Conditions for Clearing the DTC

DTC P0D40, P1EDA, P1EDD or P1F03-P1F05 are type A DTCs.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0D43: Battery Charger 14 V Output Voltage Sensor Performance

DTC P0D44: Battery Charger 14 V Output Voltage Sensor Circuit Low Voltage

DTC P0D45: Battery Charger 14 V Output Voltage Sensor Circuit High Voltage

Circuit/System Description

The battery charger will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery charger to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for DTC information.

The battery charger takes internal measurements that verify the charger is performing properly. The battery charger measures internal voltages, currents, and temperatures and verifies they are within the proper range.

Conditions for Running the DTC

The vehicle needs to be connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

The battery charger output voltage is outside expected range.

Action Taken When the DTC Sets

- DTC P0D43-P0D44 are type A DTCs.
- Disables high-voltage battery charging.

Conditions for Clearing the DTC

DTC P0D43-P0D44 are type A DTCs.

Diagnostic Aids

External battery chargers can cause this DTC to set. Ensure customer did not have an external battery charger connected to vehicle during plug-in charging attempt.

1. Plug In Charging Indicator Malfunction				

[Circuit/System Description](#)

This diagnostic runs with the drive motor battery charger cable disconnected to verify the vehicle side circuit integrity. The hybrid/EV powertrain control module 2 uses a 5 V regulated signal through a 2,700 Ω resistor to a low reference circuit in the battery charger to detect if the drive motor battery charger cable is attached.

[Conditions for Running the DTC](#)

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The charge port door is closed.
- Vehicle in Service Mode.
- No charge port door DTCs are set.

Or

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The vehicle needs to be driven above 20 kph (15 mph) for more than 10 seconds.
- No vehicle speed DTCs are set.

[Conditions for Setting the DTC](#)

DTC P0D58

The hybrid/EV powertrain control module 2 measures a voltage less than 4.2 V for 1 second.

DTC P0D59

The hybrid/EV powertrain control module 2 measures a voltage greater than 4.8 V for 1 second.

[Action Taken When the DTC Sets](#)

- DTCs P0D58 and P0D59 are type A DTCs.
- Disable the high-voltage battery charging.

[Conditions for Clearing the DTC](#)

DTCs P0D58 and P0D59 are type A DTCs.

DTC P0D5B, P0D5C, P1ECE or P1EFD

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0D5B: Battery Charger 14 V Output Power Performance

DTC P0D5C: Battery Charger Hybrid/EV Battery Output Power Performance

DTC P1ECE: Battery Charger Total Output Power Performance

DTC P1EFD: Battery Charger Power Efficiency

Circuit/System Description

The battery charger will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery charger to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for DTC information.

Conditions for Running the DTC

P0D5B, P0D5C, P1ECE and P1EFD

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The vehicle is connected to an AC supply and the battery charger is charging.
- No out of range DTCs are present on any of the battery charger current or voltage sensors.

P1EFD

The battery charger needs to be charging at a minimum of 3 A high-voltage DC current.

Conditions for Setting the DTC

The battery charger calculates a power output not within the proper range for 2 seconds.

Action Taken When the DTC Sets

- DTC P0D5B, P0D5C and P1ECE are type A DTCs.
- DTC P1EFD is a type B DTC.
- Disables the high-voltage battery charging.

Conditions for Clearing the DTC

- DTC P0D5B, P0D5C and P1ECE are type A DTCs.
- DTC P1EFD is a type B DTC.

Diagnostic Aids

A possible cause of this DTC could be a faulty 14 V power module.

DTC Descriptor

DTC P0D5E: Battery Charger System High Voltage Present

Circuit/System Description

The battery charger will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery charger to the hybrid/EV powertrain control module 2 through serial data. The hybrid/EV powertrain control module 2 is the host controller for DTC information.

Conditions for Running the DTC

Condition 1

The battery charger receives a discharge command from the hybrid/EV powertrain control module 2.

OR

Condition 2

The battery charger loses communication with the hybrid/EV powertrain control module 2.

Conditions for Setting the DTC

Condition 1

The battery charger control module measures a high voltage charging bus voltage greater than 60 V 1.5 seconds after receiving the discharge command from the hybrid/EV powertrain control module 2.

OR

Condition 2

The battery charger control module measures a high voltage charging bus voltage greater than 60 V 5 seconds after losing communication with the hybrid/EV powertrain control module 2.

Action Taken When the DTC Sets

DTC P0D5E is a type A DTC.

Conditions for Clearing the DTC

DTC P0D5E is a type A DTC.

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Verify that DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0D0A, P0D11, P1EBC-P1EBF, P1EC0 or P1EC3-P1EC5 is not set.
If the DTC is set, refer to [DTC P0AA1, P0AD9, P0ADD, P0AE2, P0AE4, P0D0A, P0D11, P1EBC-P1EBF, P1EC0 or P1EC3-P1EC5](#)

Note: The A4 hybrid/EV battery pack must not be at full charge to perform next test step.

2. Connect the drive motor battery charger cable. Vehicle ON, with a scan tool verify that the Battery Charger High Output parameter drops below 60 V after disconnecting the drive motor battery charger cable
If not the specified range, disable the high voltage at the A4 hybrid/EV battery pack, refer to [High Voltage Disabling](#) . Replace the A4 hybrid/EV battery pack.
3. Disable the high voltage at the T18 battery charger, refer to [High Voltage Disabling](#) . Replace the T18 battery charger.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T18 battery charger. Refer to [High Voltage Disabling](#) .
2. Disconnect the X3 harness connector at the T18 battery charger and harness connector at the X98 hybrid battery charger receptacle.
3. Test for infinite resistance between the 110/220 V AC circuit terminals listed below and earth:
 - T18 battery charger terminal A X3
 - T18 battery charger terminal CX3If less than the specified range, test the 110/220 V AC circuit for a short to ground.
4. Test for less than 10 Ω between the 110/220 V AC circuit terminals listed below:
 - T18 battery charger terminal A X3 and X98 hybrid battery charger receptacle E
 - T18 battery charger terminal C X3 and X98 hybrid battery charger receptacle A

If greater than the specified range, test the 110/220 V AC circuit for an open-circuit/high resistance.

5. Test for infinite resistance between the 110/220 V AC circuit at the T18 battery charger terminal A X3 and C X3.

If less than the specified range, test the 110/220 V AC circuits for a short-circuit between the circuits.

6. If all circuits tests normal, replace X98 hybrid battery charger receptacle. If the DTC resets, replace the T18 battery charger.

DTC Descriptors

DTC P1EEF: Battery Charger 14 V Converter Output Power Regulation Performance

DTC P1EFE: Battery Charger Reverse Polarity Protection Circuit Performance

Circuit/System Description

The battery charger 14 V output circuit is connected to the vehicle 12 V system. The battery charger monitors the 14 V output for proper current and voltage conditions. The battery charger has the ability to drive the voltage to 14 V.

Conditions for Running the DTC

P1EEF

- The vehicle 12 V battery system voltage needs to be above 9 V.
- P0D44, P0D45, P0D49, P0D4A, P1EE9 or P1EEA should not be set.
- The vehicle is connected to an AC supply and the battery charger is charging.

P1EFE

- The vehicle 12 V battery system voltage needs to be above 9 V.
- Vehicle in Service Mode or the vehicle is connected to an AC supply.

Conditions for Setting the DTC

P1EEF

The battery charger actual 14 V output voltage or current is out of the allowable tolerance compared with the commanded output voltage or current. This is measured internal to the battery charger.

P1EFE

The battery charger 14 V reverse polarity protection relay state does not match the commanded state. This internal to the battery charger.

Action Taken When the DTC Sets

- DTC P1EEF and P1EFE are type A DTCs.
- Disables the high-voltage battery charging.

Conditions for Clearing the DTC

DTC P1EEE, P1EEF and P1EFE are type A DTCs.

Diagnostic Aids

Connecting an external battery charger to vehicle while charging with drive motor battery charger cable can cause this DTC to set. Ensure customer did not have an external battery charger connected during plug-in charging attempt before proceeding with this diagnostic procedure

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify DTC P0D44, P0D45, P0D49, P0D4A, P1EE9 or P1EEA is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle OFF, measure and record the battery voltage at the battery terminals. The battery voltage should stabilise between 12.4-12.8 V within a few minutes of turning the Vehicle OFF.
If not within the specified range, refer to [Battery Inspection/Test](#) .
3. Vehicle OFF, disable the high voltage at the T18 battery charger. Refer to [High Voltage Disabling](#) . Disconnect the X2 harness connector at the T18 battery charger.
4. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
5. Test for B+ between the B+ circuit terminal 2 and earth.
If less than the specified range, test the B+ circuit for a short to ground or an open/high resistance.
6. If all circuits test normal, replace the T18 battery charger.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1EF3: Battery Charger High-Voltage Converter 1 Temperature Too High

DTC P1EF4: Battery Charger High Voltage Converter 2 Temperature Too High

DTC P1EF5: Battery Charger Input Voltage Conditioner Temperature Too High

Circuit/System Description

The battery charger uses a liquid cooled cooling system which is cooled from the front of the vehicle. The hybrid electronic cooling system needs to be functioning properly for the battery charger to be able to meet its temperature requirements.

The hybrid/EV powertrain control module 2 monitors the battery charger temperature and verifies it is within its proper operating range. There is a temperature sensor that measures the overall temperature of the battery charger. Also, there are battery charger internal temperatures sensors that monitor for over-temperature conditions, that are for the voltage converter 1, voltage converter 2 and the voltage conditioner within the battery charger.

Conditions for Running the DTC

- The vehicle 12 V battery system voltage needs to be above 9 V.
- The vehicle is connected to an AC supply and the battery charger is charging.

Conditions for Setting the DTC

The battery charger voltage converter 1, voltage converter 2 or voltage conditioner temperature sensors measures a temperature greater than 100 °C (212°C).

Action Taken When the DTC Sets

- DTC P1EF3-P1EF5 are type A DTCs.
- Disables the vehicle high-voltage battery charging.

Conditions for Clearing the DTC

DTC P1EF3-P1EF5 are type A DTCs.

Circuit/System Verification

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that no hybrid electronics coolant system DTC is set.
If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
2. Verify that the hybrid/EV electronics cooling system is functioning properly, refer to [Hybrid/EV Electronics Cooling Diagnostic](#) .
If the hybrid/EV electronics cooling system is not functioning properly, repair the fault.
3. Disable the high voltage at the T18 battery charger. Refer to [High Voltage Disabling](#) . Replace the T18 battery charger.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

Preliminary Procedures

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the left front wheelhouse rear liner. Refer to [Front Wheelhouse Rear Liner Replacement](#) .
3. Disengage the cable end from the charge port door actuator.
4. Using needle nose pliers, pinch the back of the retainer tabs to disengage the charge port door actuator harness retainer from the edge of the fender.
5. Disconnect the electrical connector for the charge port door ajar indicator switch assembly.
6. Remove the charge port door. Refer to [Charge Port Door Replacement](#) .
7. Remove the charge port housing bezel. Refer to [Charge Port Housing Bezel Replacement](#) .

Charge Port Housing Assembly

Caution: Refer to [Exterior Trim Emblem Removal Caution](#) in the Preface section.

Procedure

1. From inside the wing, release the lower tab to the charge port housing assembly.
2. Push outwards on the assembly housing.
3. Using a plastic trim-type stick, at the arrows, gently pry outwards while pulling outwards on the rear edge of the housing.
4. Rotate the rear edge of the housing forwards, pull the housing and seal from the front wing centre reinforcement bracket.
5. Remove the charge port housing assembly along with the electrical harness for the charge port door ajar indicator switch assembly and charge port door actuator cable assembly.
6. Transfer the charge port door ajar indicator switch assembly. Refer to [Charge Port Door Ajar Indicator Switch Replacement](#) .
7. Transfer the charge port door actuator cable. Refer to [Charge Port Door Actuator Cable Replacement](#) .

Tip

Upon the final assembly of the charge port housing into the front wing centre reinforcement bracket, ensure to re-seat the charge port housing seal around the entire circumference of the charge port receptacle. Use a blunt tool such as a rounded plastic trim tool to push the seal into position around the charge port receptacle.

8. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .

Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

Preliminary Procedures

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
3. Disconnect the electrical connectors.
4. Disconnect the coolant hoses from the charger assembly. Refer to [Generator Control Module Coolant Radiator Hose Replacement](#) and [Drive Motor Generator Control Module Cooling Outlet Hose Replacement](#) .

1	<p>Drive Motor Battery Charger Fastener (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 22 N·m (16 lb ft)</p>
2	<p>Drive Motor Battery Charger Assembly</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Fill the drive motor battery charger cooling system. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling . 2. Enable the high-voltage system. Refer to High-Voltage Enabling . 3. Program the drive motor battery charger. Refer to Battery Charger Programming and Set-up .

Drive Motor Battery Charger Receptacle Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none">1. Disable the high-voltage system. Refer to High Voltage Disabling .2. Remove the charge port housing. Refer to Charge Port Housing Replacement .	

1	<p>Drive Motor Battery Charger Receptacle Fastener (Qty: 4)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 12 N·m (106 lb in)</p>
2	<p>Drive Motor Battery Charger Receptacle Fastener</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connector.2. Enable the high-voltage system. Refer to High-Voltage Enabling .

Plug-In Charging System Description and Operation

Plug-In Charging System components

The Chevrolet Volt high-voltage battery charging system consists of four main components: The drive motor battery charger cable, the vehicle charge port (including receptacle), the battery charger and the hybrid/EV battery pack. A variety of mechanical, visual and audio indicators/devices are used to communicate/interface with the customer or other user of the charging equipment.

Drive Motor Battery Charger Equipment

The drive motor battery charger cable provided with the vehicle features a standard household electrical plug on one end and a plug designed to interface with the vehicle charge port receptacle on the other end. The drive motor battery charger cable features a charge current interrupt device with AC power, fault and missing earth indicators and it is stored beneath the vehicle's load floor. An optional 230/240 V charge station is also available to some customers who want to reduce the amount of time needed to recharge the high-voltage battery. The 230/240 V charge station is hard-wired to a 230/240 V power supply and mounted to the wall in the customer's garage. The 230/240 V charge station features the same plug on the vehicle end as the drive motor battery charger cable.

The Drive Motor Battery Charger Cable Indicators and the Vehicle Indicators

The drive motor battery charger cable has three indicators on it. The AC present indicator becomes permanently green when AC voltage is present at the wall plug. The Fault Indicator becomes permanently red for a current trip or failed self check. The Missing Earth Indicator becomes permanent red when no earth is detected at the wall outlet.

The battery charger is supervised and controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 is the primary controller, and all diagnostic trouble codes will set in that module even though some of the diagnostics are actually run within the battery charger. Charging events can be delayed at customer request to take advantage of lower rates during non-peak hours. The status of charging events, including delays, is communicated to the user through visual indications (instrument panel mounted charge status indicator) and audio tones (charge status enunciator). The vehicle charge status indicator, located at the top middle of the instrument panel, will be permanently green when the vehicle is charging under automatic control. It will have a fast flash green if the charging is delayed and will begin later. It will have a slow flash green when charging is complete. A permanent yellow indicator means the vehicle is not able to accept a charge. If there is no indicator, the drive motor battery charger cable is not working properly or not connected.

Vehicle Receptacle

The vehicle receptacle is located behind the charging port door on the driver's side front wing. The receptacle is accessed by pressing a switch located on the inside of the driver's door.

Battery Charger

The hybrid/EV battery charger is a serviceable assembly containing several micro-processors, two separate high-voltage chargers and a single low-voltage charger. It is mounted behind the passenger side headlamp assembly, is programmable and communicates via serial data. Engine coolant is used to ensure that the charger does not exceed its maximum designed operating temperature. The low-voltage charger is used to ensure that the 12 V battery does not become depleted during a charge event, while one of the high-voltage chargers is used with a 120 V charge source and both are used with a 240 V charge source.

DTC B1000

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B1000 00: Electronic Control Unit

DTC B1000 08: Electronic Control Unit Performance - Signal Invalid

DTC B1000 0F: Electronic Control Unit Signal Erratic

DTC B1000 12: Electronic Control Unit Low Input

DTC B1000 2B: Electronic Control Unit Missing Reference

DTC B1000 34: Electronic Control Unit RAM Malfunction

DTC B1000 35: Electronic Control Unit ROM Malfunction

DTC B1000 36: Electronic Control Unit EEPROM Performance/Malfunction

DTC B1000 37: Electronic Control Unit Software Malfunction

DTC B1000 38: Electronic Control Unit Supervision Software Malfunction

DTC B1000 39: Electronic Control Unit Internal Malfunction

DTC B1000 43: Electronic Control Unit EEPROM Incorrect Programming

DTC B1000 46: Electronic Control Unit Configuration Not Programmed

DTC B1000 4A: Electronic Control Unit Programming Checksum Error

DTC B1000 56: Electronic Control Unit Too Many Transitions

DTC B1000 73: Electronic Control Unit Parity Error

DTC B1000 F0: Electronic Control Unit

DTC B1000 F1: Electronic Control Unit

DTC B1000 F2: Electronic Control Unit

DTC B1000 F3: Electronic Control Unit

Circuit/System Description

The internal fault detection is handled inside the control module. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The module has detected an internal malfunction.

Action Taken When the DTC Sets

The module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the module.
- If this DTC is retrieved as both a current and history DTC, replace the module that set the DTC.

Circuit/System Verification

If this DTC is retrieved as a current DTC, replace the module that set the DTC.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for module replacement, setup, and programming

DTC B1001

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B1001 00: Option Configuration

DTC B1001 33: Option Configuration Special Memory Malfunction

DTC B1001 45: Option Configuration Variant Not Programmed

DTC B1001 4B: Option Configuration Calibration Not Learned

[Circuit/System Description](#)

Some control modules must be configured with serial numbers, vehicle options, or other information. If a control module was not properly configured after installation that module may set DTC B1001. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

[Conditions for Running the DTC](#)

Battery voltage is between 9-16 V and data link communications operate normally.

[Conditions for Setting the DTC](#)

The control module is not configured properly.

[Conditions for Clearing the DTC](#)

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

[DTC Descriptor](#)

DTC B1016 XX: Vehicle Identification Number Information Not Programmed

[Circuit/System Description](#)

The control module performs a self test and vehicle identification number (VIN) verification. This DTC indicates that a VIN is not programmed or that the control module has an internal fault. The internal fault detection is handled inside the control module, no external circuits are involved.

[Conditions for Running the DTC](#)

The only requirements are voltage and ground.

[Conditions for Setting the DTC](#)

The control module has detected that the VIN is not programmed.

[Conditions for Clearing the DTC](#)

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

[Circuit/System Verification](#)

Verify DTC B1016 is not set.

If the DTC is set, program the control module. If the DTC resets, replace the control module.

[Circuit/System Description](#)

The internal fault detection is handled inside the control module. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

[Conditions for Running the DTC](#)

- The control module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.
- The keyless entry control module will set this DTC with symptom byte 39 when the keyless entry control module antenna is activated.

[Conditions for Setting the DTC](#)

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

The control module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the control module.
- Do not replace a control module based only on DTC B101D being set in history with the exception of the following control modules:
 - K36 Inflatable Restraint Sensing and Diagnostic Module (SDM)
 - K85 Passenger Presence Detection Module
- If DTC B101D is set as current, replace the appropriate control module.

Circuit/System Verification

Verify that DTC B101D is not set.

If the DTC is set with symptom byte 43, program the control module that set the DTC. If the DTC resets, replace the control module that set the DTC.

If the DTC is set with other symptom bytes, replace the control module that set the DTC.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC Descriptors

DTC C078A 39: Tire Pressure Indicator Module Internal Malfunction

Circuit/System Description

The internal fault detection is handled inside the tyre pressure indicator module. No external circuit diagnosis is involved.

Conditions for Running the DTC

The control module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

The control module refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.

- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the control module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.
- If this DTC is retrieved as both a current and history DTC, replace the tire pressure indicator module.

Circuit/System Verification

Verify that DTC C078A is not set.

If the DTC is set, replace the K65 tire pressure indicator module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for control module replacement, setup, and programming

DTC P0601-P0604, P0606, or P062F

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0601 00: Control Module Read Only Memory Performance

DTC P0602 00: Control Module Not Programmed

DTC P0603 00: Control Module Long Term Memory Reset

DTC P0604 00: Control Module Random Access Memory Performance

DTC P0606 00: Control Module Processor Performance

DTC P062F 00: Control Module Long Term Memory Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the control module. This diagnostic also addresses if the control module is not programmed. The control module monitors its ability to read and write to the memory. It also monitors a timing function. No external circuits are involved.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 7 V.

Conditions for Setting the DTC

The control module detects an internal malfunction or incomplete programming.

Action Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, P0606, and P062F are Type A DTCs.
- The high-voltage contactor relays may open.

Conditions for Clearing the DTC

DTCs P0601, P0602, P0603, P0604, P0606, and P062F are Type A DTCs.

Diagnostic Aids

- The DTC P0606 may set in Hybrid Powertrain Control Module 2 due to other faults. Do not replace the Hybrid Powertrain Control Module 2 until other DTCs are diagnosed first.
- The DTC P0606 can falsely set in Hybrid Powertrain Control Module 2 when the 12 V battery has been disconnected. In this case, just disconnect and reconnect the 12 V battery again. If this DTC becomes history, use scan tool to clear this DTC. No further action is required.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

Note: The DTC P0606 can falsely set in Hybrid Powertrain Control Module 2 when disconnecting the 12 V battery. See Diagnostic Aids section for more information.

1. Verify that DTC P0606 is not set.
If the DTC P0606 is set with other DTCs set, diagnose all other DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
If the DTC P0606 is set without other DTCs set, replace the control module that set the DTC.
2. Verify that DTC P0602 is not set.
If the DTC P0602 is set, program the control module that set the DTC. If the DTC P0602 resets, replace the control module that set the DTC.
3. Verify that DTC P0601, P0603, P0604, or P062F is not set.
If any of the DTCs are set, replace the control module that set the DTC.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

DTC P06E4

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P06E4 00: Control Module Wake-Up Circuit Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wake Up Serial Data 2	P06E4, U0100-U02FF*	U0100-U02FF	U0100-U02FF	--
* Vehicle will not start.				

[Circuit/System Description](#)

The accessory wake-up serial data 2 circuit is energised by the hybrid powertrain control module 2 to immediately activate other control modules connected to this circuit when the body control module (BCM) signals the powertrain control module 2 that serial data is required.

Depending on the option content, control modules that may receive the wake-up signal are as follows:

- 14 V Power Module
- Battery Charger
- Battery Energy Control Module (BECM)
- Electronic Brake Control Module (EBCM)
- A/C Compressor
- Transmission Control Module (TCM)
- Engine Control Module (ECM)

- Power Inverter Module

Conditions for Running the DTC

- The system voltage is between 9–16 V.
- The vehicle power mode master requires serial data communication to occur.
- The hybrid powertrain control module 2 attempts to wake up the control modules connected to its control module output wake-up circuit.

Conditions for Setting the DTC

The hybrid powertrain control module 2 detects a fault in the control module output wake-up circuit.

Action Taken When the DTC Sets

- The DTC P06E4 is a type A DTC.
- The control modules is never signaled; therefore the specific subsystems will not function.
- The vehicle will not start while the circuit is shorted to ground.
- The MIL will illuminate, along with several DIC messages.

Conditions for Clearing the DTC

- The DTC P06E4 is a type A DTC.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

Short-circuit to earth will also set multiple no communication codes for high-speed GMLAN control modules.

Circuit/System Testing

Note: Use the schematic to identify the following:

- The control modules that share the K114B hybrid powertrain control module 2 terminal 69 X2 accessory wake-up serial data 2 circuit
- The control module B+, ignition, earth, accessory wake-up serial data 2 circuit terminals

1. Vehicle OFF, disconnect the X2 harness connectors at the K114B hybrid powertrain control module 2.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω , but less than infinite resistance, between the accessory wake-up serial data 2 circuit terminal 69 X2 and earth.
If less than the specified range, refer to Testing the Accessory Wake Up Serial Data 2 Circuits for a Short-Circuit to Earth.
If infinite resistance, test the accessory wake-up serial data 2 circuit for an open-circuit/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the K114B hybrid powertrain control module 2.
4. Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the K114B hybrid powertrain control module 2.
5. If the circuits test normal, replace the K114B hybrid powertrain control module 2.

Testing the Accessory Wake-Up Serial Data 2 Circuits for a Short-Circuit to Earth

1. Vehicle OFF, disconnect the X2 harness connector at the A4 hybrid/EV battery pack.

2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 100 Ω between the K114B hybrid powertrain control module 2 accessory wake-up serial data 2 circuit terminal 69 X2 and earth.
If greater than the specified range, replace the A4 hybrid/EV battery pack.
3. Vehicle OFF, disconnect the harness connector at an easily accessible control module that shares the K114B hybrid powertrain control module 2 terminal 69 X2 accessory wake-up serial data 2 circuit.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 100 Ω between the K114B hybrid powertrain control module 2 accessory wake-up serial data 2 circuit terminal 69 X2 and earth.
If greater than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until all control modules on the K114B hybrid powertrain control module 2 accessory wake-up serial data 2 circuit terminal 69 X2 have been disconnected.
6. Repair the short-circuit to earth on the accessory wake-up serial data 2 circuit.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup.

DTC P0A1F, P1A05 or P1A06

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0A1F 00: Battery Energy Control Module Internal Performance

DTC P1A05 00: Battery Energy Control Module Random Access Memory (RAM)

DTC P1A06 00: Battery Energy Control Module Read Only Memory (ROM)

Circuit/System Description

The battery energy control module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code (DTC) information.

This diagnostic applies to internal microprocessor integrity conditions within the battery energy control module. This fault is internal to the battery energy control module and no external circuits are involved.

Conditions for Running the DTC

- The battery energy control module is awake and communicating.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The battery energy control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P0A1F, P1A05 and P1A06 are type A DTCs.
- Vehicle goes to reduced battery power mode. After vehicle is turned off, vehicle will not return to propulsion active mode.

Conditions for Clearing the DTC

DTCs P0A1F, P1A05 and P1A06 are type A DTCs.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

Verify that DTC P0A1F, P1A05 or P1A06 is not set.

If any of the DTCs are set, replace the A4 hybrid/EV battery pack.

Repair Instructions

DTC P16B7

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P16B7 00: Electric A/C Compressor Control Module Wake-Up Circuit Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wake Up Serial Data 2	P16B7, U016B*	U016B*	U016B*	-

* Other DTCs may set with this fault

[Circuit/System Description](#)

The accessory wake-up serial data 2 circuit is energised by the hybrid powertrain control module 2 to immediately activate the A/C compressor connected to this circuit when the body control module (BCM) signals the hybrid powertrain control module 2 that serial data is required.

[Conditions for Running the DTC](#)

- The system voltage is greater than 10.25 V.
- The A/C compressor is awake.
- Vehicle ON.
- The A/C compressor receives a serial data message from hybrid powertrain control module 2 and "Propulsion System Active" is TRUE for 500 ms continuously.

[Conditions for Setting the DTC](#)

The A/C compressor detects a fault in the wake-up circuit.

[Action Taken When the DTC Sets](#)

DTC P16B7 is a type B DTC.

[Conditions for Clearing the DTC](#)

DTC P16B7 is a type B DTC.

[Diagnostic Aids](#)

Short-circuit to earth may set multiple no communication codes for high-speed GMLAN control modules.

Circuit/System Verification

Verify that DTC P06E4 is not set.

If the DTC is set, refer to [DTC P06E4](#) .

Circuit/System Testing

Note: Use the schematic to identify the control modules B+, ignition, earth, communication enable and serial data circuit terminals.

1. Vehicle OFF, disconnect the X1 harness connector at the G1 A/C compressor.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the wake-up circuit terminal 2 X1 and earth.
If the test lamp does not illuminate, test the circuit for a short-circuit to earth or open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
3. Vehicle OFF, verify that a test lamp does not illuminate between the wake-up circuit terminal 2 X1 and earth.
If the test lamp illuminates, test the circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. If all circuits test normal, replace the G1 A/C compressor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P16B8-P16BA

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P16B8 00: Electric A/C Compressor Control Module Random Access Memory Performance

DTC P16B9 00: Electric A/C Compressor Control Module Read Only Memory Performance

DTC P16BA 00: Electric A/C Compressor Control Module Long-Term Memory Performance

[Circuit/System Description](#)

The A/C compressor will diagnose its own systems and determine when a fault condition is present. This diagnostic applies to internal microprocessor integrity conditions within the A/C compressor. This fault is internal to the A/C compressor and no external circuits are involved.

[Conditions for Running the DTC](#)

- System voltage is greater than 10.25 V.
- The control module is awake and communicating.

[Conditions for Setting the DTC](#)

The control module has detected an internal malfunction.

[Action Taken When the DTC Sets](#)

DTCs P16B8, P16B9 and P16BA are type A DTCs.

Conditions for Clearing the DTC

- DTCs P16B8, P16B9 and P16BA are type A DTCs.
- After the vehicle has been OFF for a sufficient amount of time to allow the control modules to enter a sleep mode, the control modules will re-enable the output on the following ignition cycle and the DTC will become history.

Circuit/System Verification

Verify that DTC P16B8, P16B9 or P16BA is not set.

If any of the DTCs are set, replace the G1 A/C compressor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

DTC P16C1-P16C5

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P16C1 00: Battery Charger Control Module Read Only Memory Performance

DTC P16C2 00: Battery Charger Control Module Random Access Memory Performance

DTC P16C3 00: Battery Charger Control Module Long-Term Memory Performance

DTC P16C4 00: Battery Charger Control Module Serial Peripheral Interface (SPI) Bus 1

DTC P16C5 00: Battery Charger Control Module Serial Peripheral Interface (SPI) Bus 2

Circuit/System Description

The battery charger will diagnose its own systems and determine when a fault condition is present. This diagnostic applies to internal microprocessor integrity conditions within the battery charger. This fault is internal to the battery charger and no external circuits are involved.

Conditions for Running the DTC

- The control module is awake and communicating.
- The vehicle is in charge mode.
- Charge mode is not in heat-only mode.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

DTCs P16C1, P16C2, P16C3, P16C4, and P16C5 are type A DTCs.

Conditions for Clearing the DTC

DTCs P16C1, P16C2, P16C3, P16C4, and P16C5 are type A DTCs.

Diagnostic Aids

- The DTC may be stored as a history DTC without affecting the operation of the control module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

Verify that DTC P16C1, P16C2, P16C3, P16C4, or P16C5 is not set.

If any of the DTCs are set, replace the T18 battery charger.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

DTC P16C6

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P16C6 00: Battery Charger Control Module Wake-Up Circuit Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wake Up Serial Data 2	P16C6, U0100-U02FF	U0100-U02FF	U0100-U02FF	--
* Other DTCs may set with this fault				

[Circuit/System Description](#)

The accessory wake-up serial data 2 circuit is energised by the hybrid powertrain control module 2 to immediately activate the battery charger connected to this circuit when the body control module (BCM) signals the hybrid powertrain control module 2 that serial data is required. The battery charger monitors the accessory wake-up serial data 2 circuit along with the propulsion system active status serial data message. The propulsion system active status message should not be active when the accessory wake-up serial data 2 circuit is not high. This DTC is set when the accessory wake-up serial data 2 circuit is not high when the propulsion system active signal status is active.

[Conditions for Running the DTC](#)

DTC U2609 is not set.

[Conditions for Setting the DTC](#)

The battery charger detects a fault in the wake-up circuit.

Action Taken When the DTC Sets

- DTC P16C6 is a type A DTC.
- The control module is never signalled; therefore the specific subsystems will not function.

Conditions for Clearing the DTC

DTC P16C6 is a type A DTC.

Diagnostic Aids

Short-circuit to earth may set multiple no communication codes for high-speed GMLAN control modules.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1E8E 00: Hybrid/EV Battery Interface Control Module 1 Performance

DTC P1E8F 00: Hybrid/EV Battery Interface Control Module 1 Random Access Memory Performance

DTC P1E90 00: Hybrid/EV Battery Interface Control Module 1 Read Only Memory Performance

DTC P1E91 00: Hybrid/EV Battery Interface Control Module 1 Long-Term Memory Performance

Circuit/System Description

The hybrid battery interface control module 1 will diagnose its own systems and determine when a fault condition is present. This diagnostic applies to internal microprocessor integrity conditions within the hybrid battery interface control module 1. This fault is internal to the hybrid battery interface control module 1 and no external circuits are involved.

Conditions for Running the DTC

- The control module is awake.
- The system voltage is at least 9 V.
- DTC U2603 is not set.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

DTCs P1E8E, P1E8F, P1E90 and P1E91 are type A DTCs.

Conditions for Clearing the DTC

DTCs P1E8E, P1E8F, P1E90, and P1E91 are type A DTCs.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

Verify that DTC P1E8E, P1E8F, P1E90 or P1E91 is not set.

If any of the DTCs are set, replace the A4 hybrid/EV battery pack.

DTC Descriptor

DTC P1EB1 00: Hybrid/EV Battery Interface Control Module Software Incompatible

Circuit/System Description

This is the software incompatibility issue between the hybrid battery interface control modules and the battery energy control module. No external circuits are involved.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.
- DTC U2401, U2603, U2604, U2605 or U2606 is not set.

Conditions for Setting the DTC

- Any one of the hybrid battery interface control module software revision does not match.
- Battery energy control module software and hybrid battery interface control module software are incompatible.

Action Taken When the DTC Sets

- Slave data that is incompatible with the battery energy control module software is set to Invalid, 0 V and -40°C (-40°F).
- DTC P1EB1 is a type A DTC.

Conditions for Clearing the DTC

DTC P1EB1 is a type A DTC.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

If the DTC P1EB1 is set, program the K16 battery energy control module. This DTC should not reset.

If the DTC resets without other DTCs set, replace the A4 hybrid/EV battery pack.

If the DTC resets along with any of the DTCs P1EB2, P1EB3, P1EB4, or P1EB5 set, refer to [DTC P1EB2-P1EB5](#).

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Drive Motor Battery Replacement and Shipping Preparation](#)

DTC Descriptors

DTC P1EB2 00: Hybrid/EV Battery Interface Control Module 1 Not Programmed

DTC P1EB3 00: Hybrid/EV Battery Interface Control Module 2 Not Programmed

DTC P1EB4 00: Hybrid/EV Battery Interface Control Module 3 Not Programmed

DTC P1EB5 00: Hybrid/EV Battery Interface Control Module 4 Not Programmed

Circuit/System Description

When the battery energy control module is flash programmed, the hybrid battery interface module operating software and calibrations are provided to the battery energy control module. The hybrid battery interface module software and calibrations are then loaded to each of the hybrid battery interface modules from the battery energy control module. This operation is automatic and requires no operator action. At this point, if any of the hybrid battery interface control modules are not programmed correctly, the appropriate DTC is set.

This fault is internal to the hybrid battery interface control modules and no external circuits are involved.

Conditions for Running the DTC

- The battery energy control module is awake and communicating.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The hybrid battery interface control module is not programmed correctly.

Action Taken When the DTC Sets

- The slave data that is incompatible with the battery energy control module software is set to Invalid, 0 V, and -40°C (-40°F).
- DTCs P1EB2, P1EB3, P1EB4, and P1EB5 are type A DTCs.

Conditions for Clearing the DTC

- The hybrid battery interface control module is programmed correctly.
- DTCs P1EB2, P1EB3, P1EB4, and P1EB5 are type A DTCs.

Circuit/System Verification

If any of the DTCs P1EB2, P1EB3, P1EB4, and P1EB5 are set, program the K16 battery energy control module. The DTC should not reset.

If any of the DTCs reset, replace the A4 hybrid/EV battery pack.

[DTC Descriptor](#)

DTC P1EB9 00: High-Voltage Energy Communication Bus Enable Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High-Voltage Energy Management Communication Enable	P1EB9, U0100-U02FF*	U0100-U02FF	U0100-U02FF	--

* Vehicle will not start.

[Circuit/System Description](#)

The hybrid powertrain control module 2 activates the high-voltage energy management communication enable circuit when the vehicle is on. This circuit wakes-up the control modules for high-voltage energy bus communication.

[Conditions for Running the DTC](#)

- The system voltage is between 9–16 V.
- The vehicle power mode master requires serial data communication to occur.

[Conditions for Setting the DTC](#)

The hybrid powertrain control module 2 detects a fault in the high- voltage energy management communication enable circuit.

Action Taken When the DTC Sets

- DTC P1EB9 is a type A DTC.
- The control modules is never signalled, therefore the specific subsystems will not function.

Conditions for Clearing the DTC

DTC P1EB9 is a type A DTC.

Diagnostic Aids

Short-circuit to earth will also set multiple no communication codes for control modules on high-voltage energy serial data bus.

Circuit/System Testing

Note: Use the schematic to identify the following:

- The control modules that share the K114B hybrid powertrain control module 2 terminal 48 X2 high-voltage energy management communication enable circuit
- The control module B+, ignition and high-voltage energy management communication enable circuit terminals

1. Vehicle OFF, disconnect the X2 harness connector at the K114B hybrid powertrain control module 2.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω , but less than infinite resistance, between the high-voltage energy management communication enable circuit terminal 48 X2 and earth.
If less than the specified range, refer to Testing the High-Voltage Energy Management Communication Enable Circuits for a Short-Circuit to Earth.
If infinite resistance, test the high-voltage energy management communication enable circuit for an open-circuit/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the K114B hybrid powertrain control module 2.
4. Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the K114B hybrid powertrain control module 2.
5. If the circuits test normal, replace the K114B hybrid powertrain control module 2.

Testing the High-Voltage Energy Management Communication Enable Circuits for a Short-Circuit to Earth

1. Vehicle OFF, disconnect the X1 harness connector at the A4 hybrid/EV battery pack.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 100 Ω between the K114B hybrid powertrain control module 2 high-voltage energy management communication enable circuit terminal 48 X2 and earth.
If greater than the specified range, replace the A4 hybrid/EV battery pack.
3. Vehicle OFF, disconnect the X1 harness connector at the T18 battery charger.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 100 Ω between the K114B hybrid powertrain control module 2 high-voltage energy management communication enable circuit terminal 48 X2 and earth.
If greater than the specified range, replace the T18 battery charger.
5. Repair the short-circuit to earth on the high-voltage energy management communication enable circuit.

DTC P1EC1 or P1EC2

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1EC1 00: Battery Energy Control Module High-Voltage Energy Communication Bus Enable Circuit Low Voltage

DTC P1EC2 00: Battery Energy Control Module High-Voltage Energy Communication Bus Enable Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High-Voltage Energy Management Communication Enable	P1EC1	P1EC1	P1EC2	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 activates the high-voltage energy management communication enable circuit when the vehicle is on. The high-voltage energy management communication enable circuit wakes up the battery energy control module for serial data communication.

The battery energy control module compares the high-voltage energy management communication enable hardwire signal with a hybrid powertrain control module 2 serial data message indicating that the high-voltage energy management communication enable signal is active. If the high-voltage energy management communication enable hardwire signal is low when the serial data message indicates it should be high, then DTC P1EC1 is set.

[Conditions for Running the DTC](#)

- The control module is awake and communicating.
- The system voltage is at least 9 V.

- DTCs U2602, U180B, P1A0C, or P1A07 are not set.

[Conditions for Setting the DTC](#)

P1EC1

The ignition voltage on the high-voltage energy management communication enable circuit is less than 5 V.

[Action Taken When the DTC Sets](#)

DTCs P1EC1 and P1EC2 are type A DTCs.

[Conditions for Clearing the DTC](#)

P1EC1

The ignition voltage on the high-voltage energy management communication enable circuit is at least 5 V for 10 seconds.

DTCs P1EC1 and P1EC2 are type A DTCs.

[Diagnostic Aids](#)

Short-circuit to earth will also set multiple no communication codes for control modules on high-voltage energy serial data bus.

Circuit/System Verification

Verify that DTC P1EB9 or U185B is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

Circuit/System Testing

Note: Use the schematic to identify the high-voltage energy management communication enable circuit terminal of the control module.

1. Vehicle OFF, disconnect the X1 harness connector at the A4 hybrid battery pack.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the high -oltage energy management communication enable circuit terminal 5 X1 and earth.
If the test lamp does not illuminate, test the circuit for a short-circuit to earth or open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
3. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Verify that a test lamp does not illuminate between the high- voltage energy management communication enable circuit terminal 5 X1 and earth.
If the test lamp illuminates, test the circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
4. If all circuits test normal, replace the A4 hybrid/EV battery pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1EF8 00: Battery Charger Control Module High-Voltage Energy Communication Bus Enable Circuit Low Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High-Voltage Energy Management Communication Enable	P1EF8	P1EF8	--	--

[Circuit/System Description](#)

The battery charger compares the high-voltage energy management communication enable hardwire signal with a hybrid powertrain control module 2 serial data message indicating that the high-voltage energy management communication enable signal is active. If the high-voltage energy management communication enable hardwire signal is low when the serial data message indicates it should be high, then DTC P1EF8 is set.

[Conditions for Running the DTC](#)

The control module is awake and communicating.

[Conditions for Setting the DTC](#)

A short-circuit to earth or an open-circuit may exist on the high- voltage energy communication enable circuit.

[Action Taken When the DTC Sets](#)

DTC P1EF8 is a type A DTCs.

[Conditions for Clearing the DTC](#)

DTC P1EF8 is a type A DTCs.

[Diagnostic Aids](#)

Short-circuit to earth will also set multiple no communication codes for control modules on high-voltage energy serial data bus.

DTC P1F06-P1F09

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1F06 00: Hybrid/EV Battery Interface Control Module 1 Processor Performance

DTC P1F07 00: Hybrid/EV Battery Interface Control Module 2 Processor Performance

DTC P1F08 00: Hybrid/EV Battery Interface Control Module 3 Processor Performance

DTC P1F09 00: Hybrid/EV Battery Interface Control Module 4 Processor Performance

Circuit/System Description

The battery energy control module compares an expected value with a value reported from a hybrid battery interface control module. If the value does not match for a particular battery interface control module, then a DTC is set for the corresponding hybrid battery interface control module. This fault is internal to the battery energy control module and the hybrid battery interface control modules and no external circuits are involved.

Conditions for Running the DTC

The control modules are awake.

Conditions for Setting the DTC

A mismatch between an expected value in the control module and a value received from the external module.

Action Taken When the DTC Sets

DTCs P1F06, P1F07, P1F08, and P1F09 are type A DTCs.

Conditions for Clearing the DTC

- DTCs P1F06, P1F07, P1F08, and P1F09 are type A DTCs.
- Vehicle goes to low-battery power mode.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

Verify that DTC P1F06, P1F07, P1F08, or P1F09 is not set.

If any of the DTCs are set, replace the A4 hybrid/EV battery pack.

[DTC Descriptor](#)

DTC P262B 00: Control Module Power Off Timer Performance

[Circuit/System Description](#)

This diagnostic applies to internal microprocessor integrity conditions within the control module. No external circuits are involved.

[Conditions for Running the DTC](#)

- Vehicle ON.
- The hybrid powertrain control module 2 has been awake for at least 1 minute.
- DTC P0601, P0602, P0603, P0604, P0606, or P062F is not set.

[Conditions for Setting the DTC](#)

The control module detects an internal malfunction.

[Action Taken When the DTC Sets](#)

DTC P262B is a Type B DTC.

[Conditions for Clearing the DTC](#)

DTC P262B is a Type B DTC.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the control module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the control module.

Circuit/System Verification

Verify that DTC P262B is not set.

If the DTC is set, replace the control module that set the DTC.

DTC U0001

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC U0001 00: High Speed CAN Communication Bus

[Circuit Description](#)

Modules connected to the GMLAN serial data circuits monitor for serial data communications on the GMLAN network during normal vehicle operation. Operating information and commands are exchanged among the modules. Each module on GMLAN network maintains a transmit error counter (TEC) and a receive error counter (REC). The counter values increase with detected errors and will decrease with error-free messages. If the TEC value exceeds 255 the controller removes itself from the network and a DTC U0001 will be set.

[Conditions for Running the DTC](#)

- Voltage supplied to the module is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.

[Conditions for Setting the DTC](#)

A certain number of no valid transmitted messages on the GMLAN serial data circuits are detected by the module.

[Action Taken When the DTC Sets](#)

- The module suspends all message transmission.
- The module uses default values for all parameters received on the GMLAN serial data circuits.

- The module inhibits the setting of all other GMLAN communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Diagnostic Aids

- This DTC cannot be retrieved with a current status. Diagnosis of current DTC is accomplished via the symptom, Scan Tool Does Not Communicate with GMLAN Device. Refer to [Scan Tool Does Not Communicate with High Speed GMLAN Device](#) .
- An intermittent condition is likely to be caused by a short on the GMLAN serial data circuits. Use the Scan Tool Does Not Communicate with GMLAN Device procedure in order to isolate an intermittent condition. Refer to [Scan Tool Does Not Communicate with High Speed GMLAN Device](#) .

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC U0002: High Speed CAN Bus

Circuit/System Description

Control modules connected to the high speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. The supervision time-out period is 250 ms. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

- Voltage supplied to the control modules is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.
- The DTC U0001 does not have a current status.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module uses a default value for the missing parameter.

[Conditions for Clearing the DTC](#)

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

[Circuit/System Verification](#)

With a scan tool, attempt to communicate with all control modules.

[Circuit/System Testing](#)

1. With a scan tool, verify DTC U0100-U02FF or DTC U2105-U2199 is not set as current.
If DTC is set, refer to [DTC U0100-U02FF](#) or [DTC U2105-U2199](#) .

2. Vehicle OFF, disconnect the applicable control module harness connector.
3. Vehicle OFF, test for less than 10 Ω between the applicable control module earth circuit terminal and earth.
If greater than the specified range, test the ground circuit for an open/high resistance.
4. Vehicle in Service Mode, verify that a test lamp illuminates between the following circuits of the applicable control module and earth:
 - The battery positive voltage input circuits
 - The battery positive voltage output circuits
 - The ignition voltage input circuits
 - The ignition voltage output circuits
 - The switched battery positive voltage supply circuitsIf the test lamp does not illuminate, test the circuit for an open/high resistance. If the circuit fuse is open, test the circuit for a short to ground. If the circuit tests normal, replace the applicable control module.
5. Vehicle OFF, test for less than 5 Ω between the non-communicating control module GMLAN serial data circuits and the control module reporting DTC U0002.
If greater than the specified range, test the circuit for an open/high resistance.
6. If all circuits test normal, replace the applicable control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC U0020 00: Low Speed CAN Communication Bus Performance

Circuit/System Description

Control modules connected to the GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have programmed information about what messages are needed to be exchanged on the serial data circuits. The messages are also supervised and some periodic messages are used by the receiver module as an availability indication of the transmitter module.

DTC U0020 will set when fewer control modules are detected on the bus before the control modules can learn the other control modules IDs. If the communication bus is opened, or if the control modules power supply is lost when the vehicle is in the OFF power mode, and then placed in the ON power mode, U0020 will set in specific control modules.

Conditions for Running the DTCs

- Voltage at the control modules is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.
- The DTC U2100 does not have a current status.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTCs Sets

The control module uses a default value for the missing parameter.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

Diagnosis of this DTC is accomplished via the symptom or an additional DTC. Refer to [Symptoms - Data Communications](#) and [DTC U0100-U02FF](#) .

DTC U0073 or U2100

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC U0073 00: Control Module Communication Bus Off

DTC U0073 71: ECU HS Bus Off

DTC U0073 72: ECU LS Bus Off

DTC U2100 00: Controller Area Network (CAN) Bus Communication

DTC U2100 47: Controller Area Network (CAN) Bus Communication

Circuit/System Description

The serial data circuits are serial data buses are used to communicate information between the control modules. The serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTCs

- Supply voltage at the control modules is in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 seconds.

Action Taken When the DTCs Sets

- The control module suspends all message transmission.
- The control module uses default values for all parameters received on the serial data circuits.
- In the TCM, DTC U0073 will cause the transmission to go into default gears.
- In the ECM and TCM, DTC U0073 will cause the malfunction indicator lamp (MIL) to illuminate.
- The control module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- The ECM/TCM modules turn OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Refer to [Data Link References](#) to determine which serial data system is used for a specific control module.
2. This DTC cannot be retrieved with a current status. Diagnosis is accomplished using the symptom. Refer to [Symptoms - Data Communications](#) .

DTC U0074

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC U0074 00: Control Module Powertrain Expansion Communication Bus Off

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Powertrain High-Speed GMLAN Serial Data (+)	U0074	U0074, U0100-U02FF*	U0074	-
Powertrain High-Speed GMLAN Serial Data (-)	U0074	U0074, U0100-U02FF*	U0074	-
Earth (auxiliary data connector terminal 5)	-	U0074	--	--

* An open-circuit in only one powertrain high-speed GMLAN serial data circuit may allow degraded communication between the control modules.

[Circuit/System Description](#)

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 Ω resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another control module. The resistors are used as the load for the powertrain high-speed GMLAN bus during normal vehicle operation. The powertrain high-speed GMLAN is a differential bus. The powertrain high-speed GMLAN serial data bus (+) and powertrain high-speed GMLAN serial data bus (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds 1 V to the powertrain high-speed GMLAN serial data bus (+) circuit and subtracts 1 V from the powertrain high-speed GMLAN serial data bus (-) circuit. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note that a loss of serial data DTC does not represent a failure of the module that set it.

The powertrain high-speed GMLAN serial data circuits connect directly to the auxiliary data connector. The scan tool does not communicate with powertrain high-speed GMLAN bus.

Conditions for Running the DTC

- Supply voltage to the control modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communication on the powertrain high-speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The module suspends all message transmission.
- The MIL and battery indicators will illuminate, along with several DIC messages.
- DTC U0074 is a type A DTC.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.
- DTC U0074 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- The engine will not start when there is a total malfunction of the powertrain high-speed GMLAN serial data bus.

- Use [Data Link References](#) to determine which control modules connect to the powertrain high-speed GMLAN serial data bus.

[Circuit/System Testing](#)

Note: Some control modules with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the control module for each of the following tests.

Each control module may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- Powertrain high-speed GMLAN serial data circuit terminating resistors
- Control module locations on the powertrain high-speed GMLAN serial data circuits

- Each control module's powertrain high-speed GMLAN serial data circuit terminals

1. Disconnect the scan tool from the X84 data link connector (DLC). The following tests will be done at the X84B auxiliary data connector.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, test for less than 4.5 V between the serial data circuits listed below and earth:
 - Terminal 12
 - Terminal 13If greater than the specified range, test the serial data circuit for a short to voltage. Refer to Testing the Serial Data Circuits for a Short to Voltage.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω between the serial data circuits listed below and ground:
 - Terminal 12
 - Terminal 13If not the specified value, test the serial data circuit for a short to ground. Refer to Testing the Serial Data Circuits for a Short to Ground.
5. Test for 50-70 Ω between the serial data circuits terminal 3 and terminal 11.
If less than 35 Ω , test for a short between the serial data circuits. Refer to Testing the Serial Data Circuits for a Short between the Circuits.
If 35-50 Ω there may be a third terminating resistor between the serial data circuits. This can happen if the incorrect control module is installed. Some control modules are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness.
If greater than 70 Ω but less than infinite, test the serial data circuit for an open/high resistance. Refer to Testing the Serial Data Circuits for an Open/High Resistance.
If infinite, test the serial data circuits between the X84B auxiliary data connector and the first connection to the serial data circuit for an open-circuit/high resistance.
6. If the serial data circuits test normal, refer to Testing the Control Module Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the powertrain high-speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle in Service Mode, test for greater than 4.5 V between each serial data circuit at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was disconnected.
3. Vehicle OFF, disconnect the harness connectors with the powertrain high-speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to voltage.
4. Vehicle in Service Mode, test for greater than 4.5 V between the serial data circuits at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to voltage on the serial data circuit between 2 control modules or splice packs, if equipped

- A short to voltage on the serial data circuit between a control module and a terminating resistor

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, disconnect the harness connectors with the powertrain high-speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .

If all serial data circuits are greater than the specified range, replace the control module that was disconnected.

3. Disconnect the harness connectors with the powertrain high- speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to earth.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .

If greater than the specified range for all serial data circuits, replace the control module that was just disconnected.

5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to ground on the serial data circuit between 2 control modules or splice packs, if equipped
 - A short to ground on the serial data circuit between a control module and a terminating resistor
 - A short-circuit to earth on the serial data circuit between the X84B auxiliary data connector and the first control module or splice pack, if equipped

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, disconnect the harness connectors with the powertrain high-speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .

If each pair of serial data circuits is greater than the specified range, replace the control module that was disconnected.

3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the powertrain high- speed GMLAN serial data circuits at another control module, in the direction of the circuits shorted together.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .

If each pair of serial data circuits is greater than the specified range, replace the control module that was just disconnected.

6. Repeat step 3 until one of the following conditions are isolated:
 - Serial data circuits shorted together between 2 control modules
 - Serial data circuits shorted together between a control module and a terminating resistor
 - A shorted terminating resistor

- Serial data circuits shorted together between the X84B auxiliary data connector and the first control module or splice pack, if equipped

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, disconnect the harness connectors with the powertrain high-speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω .

If each pair of serial data circuits is less than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the powertrain high-speed GMLAN serial data circuits at another control module, in the direction of the open circuit.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits is greater than 130 Ω .

If each pair of serial data circuits is less than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
 - An open/high resistance on the serial data circuit between 2 control modules
 - An open/high resistance on the serial data circuit between a control module and a terminating resistor
 - An open/high resistance terminating resistor

Testing the Control Module Circuits

1. Vehicle OFF, disconnect the harness connectors at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between each earth circuit terminal and earth, and at the control module connector that was just disconnected.

If greater than the specified range, test the earth circuit and earth connection for an open-circuit/high resistance.
3. Vehicle OFF, verify that a test lamp does not illuminate between each ignition circuit terminal and earth.

If the test lamp does illuminate, test the ignition circuit for a short to voltage. If the circuits test normal, replace the appropriate control module.
4. Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.

If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the appropriate control module.
5. Vehicle OFF, connect the harness connectors at the control module that was disconnected.
6. Repeat step 1 at another control module that is not communicating until one of the following conditions are isolated:
 - An open-circuit/high resistance on the earth circuit or earth connection
 - A short-circuit to voltage, a short-circuit to earth or an open-circuit/high resistance on the ignition circuit

DTC Descriptor

DTC U0077 00: Control Module Chassis Expansion Communication Bus Off

Circuit/System Description

The GMLAN high speed chassis expansion bus functions the same as the GMLAN high speed bus, and the two buses operate in parallel. The expansion chassis bus was added to reduce message congestion on the primary high speed bus. Since the GMLAN high speed chassis bus and primary GMLAN high speed bus operate in the same manner, the diagnostics for each are the same.

The chassis high-speed GMLAN serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTC

- Supply voltage to the control modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communications on the chassis high-speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The module suspends all message transmission.

- The control module uses default values for all parameters received on the serial data circuits.
- The control module inhibits the setting of all other communication DTCs.
- DTC U0077 is a type A DTC.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.
- DTC U0077 is a type A DTC.

Circuit/System Verification

Diagnosis is accomplished using the symptom. Refer to [Scan Tool Does Not Communicate with Chassis High Speed GMLAN Device](#) .

DTC U007A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

[DTC Descriptor](#)

DTC U007A 00: Control Module High Voltage Energy Management Communication Bus Off

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High-Voltage Energy Management High Speed GMLAN Serial Data (+)	U007A*	U007A*	U007A*	-
High-Voltage Energy Management High Speed GMLAN Serial Data (-)	U007A*	U007A*	U007A*	-
Earth (auxiliary data connector terminal 5)	-	U007A*	--	--

* Other DTCs may be set with this fault.

[Circuit/System Description](#)

Control modules connected to the high-voltage energy management high speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules when the vehicle is on. The high-voltage energy management high speed GMLAN serial data bus uses a terminating resistor that is in parallel with the high-voltage energy management high speed GMLAN (+) and (-) circuits.

The high-voltage energy management high speed GMLAN serial data circuits connect directly to the auxiliary data connector. The scan tool does not communicate with high-voltage energy management high speed GMLAN bus.

[Conditions for Running the DTC](#)

- Supply voltage to the control modules are in the normal operating range.

- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communication on the high-voltage energy management high-speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The module suspends all message transmission.
- The control module uses default values for all parameters received on the serial data circuits.
- The control module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- The engine may not start when there is a total malfunction of the high-voltage energy management high-speed GMLAN serial data bus.
- Use [Data Link References](#) to determine which control modules connect to the high-voltage energy management high-speed GMLAN serial data bus.

[Circuit/System Testing](#)

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High-Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high-voltage.
- Identify how to test for the presence of high-voltage.

- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1,000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Note: Some control modules with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the control module for each of the following tests.

Each control module may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- High-voltage energy management high-speed GMLAN serial data circuit terminating resistors
- Control module locations on the high-voltage energy management high-speed GMLAN serial data circuits
- Each control module's high-voltage energy management high-speed GMLAN serial data circuit terminals

1. Perform the High-Voltage Disabling procedure before proceeding with this diagnostic. Refer to [High Voltage Disabling](#) .
2. Reconnect the 12 V battery after performing the high-voltage disabling procedure.
3. Disconnect the scan tool from the X84 data link connector (DLC). The following tests will be done at the X84B auxiliary data connector.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
5. Vehicle in Service Mode, test for less than 4.5 V between the serial data circuits listed below and earth:
 - Terminal 3
 - Terminal 11
 - If greater than the specified range, test the serial data circuit for a short to voltage. Refer to Testing the Serial Data Circuits for a Short to Voltage.
6. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω between the serial data circuits listed below and ground:
 - Terminal 3
 - Terminal 11
 - If not the specified value, test the serial data circuit for a short to ground. Refer to Testing the Serial Data Circuits for a Short to Ground.
7. Test for 50-70 Ω between the serial data circuits terminal 3 and terminal 11.
 - If less than 35 Ω , test for a short between the serial data circuits. Refer to Testing the Serial Data Circuits for a Short between the Circuits.
 - If 35-50 Ω there may be a third terminating resistor between the serial data circuits. This can happen if the incorrect control module is installed. Some control modules

are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness.

If greater than 70 Ω but less than infinite, test the serial data circuit for an open/high resistance. Refer to Testing the Serial Data Circuits for an Open/High Resistance.

If infinite, test the serial data circuits between the X84B auxiliary data connector and the first connection to the serial data circuit for an open-circuit/high resistance.

8. If the serial data circuits test normal, refer to Testing the Control Module Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the high- voltage energy management high-speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle in Service Mode, test for greater than 4.5 V between each serial data circuit at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was disconnected.
3. Vehicle OFF, disconnect the harness connectors with the high- voltage energy management high-speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to voltage.
4. Vehicle in Service Mode, test for greater than 4.5 V between the serial data circuits at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to voltage on the serial data circuit between 2 control modules or splice packs, if equipped
 - A short to voltage on the serial data circuit between a control module and a terminating resistor

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, disconnect the harness connectors with the high- voltage energy management high-speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .
If all serial data circuits are greater than the specified range, replace the control module that was disconnected.
3. Disconnect the harness connectors with the high-voltage energy management high-speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to earth.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .
If greater than the specified range for all serial data circuits, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to ground on the serial data circuit between 2 control modules or splice packs, if equipped
 - A short to ground on the serial data circuit between a control module and a terminating resistor

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, disconnect the harness connectors with the high-voltage energy management high-speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .

If each pair of serial data circuits is greater than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high-voltage energy management high-speed GMLAN serial data circuits at another control module, in the direction of the circuits shorted together.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .

If each pair of serial data circuits is greater than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
 - Serial data circuits shorted together between 2 control modules
 - Serial data circuits shorted together between a control module and a terminating resistor
 - A shorted terminating resistor

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, disconnect the harness connectors with the high-voltage energy management high-speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω .

If each pair of serial data circuits is less than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high-voltage energy management high-speed GMLAN serial data circuits at another control module, in the direction of the open circuit.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits is greater than 130 Ω .

If each pair of serial data circuits is less than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
 - An open/high resistance on the serial data circuit between 2 control modules
 - An open/high resistance on the serial data circuit between a control module and a terminating resistor

- An open/high resistance terminating resistor

Testing the Control Module Circuits

1. Vehicle OFF, disconnect the harness connectors at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between each earth circuit terminal and earth, and at the control module connector that was just disconnected.
If greater than the specified range, test the earth circuit and earth connection for an open-circuit/high resistance.
3. Vehicle OFF, verify that a test lamp does not illuminate between each ignition circuit terminal and earth.
If the test lamp does illuminate, test the ignition circuit for a short to voltage. If the circuits test normal, replace the appropriate control module.
4. Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the appropriate control module.
5. Vehicle OFF, connect the harness connectors at the control module that was disconnected.
6. Repeat step 1 at another control module that is not communicating until one of the following conditions are isolated:
 - An open-circuit/high resistance on the earth circuit or earth connection
 - A short-circuit to voltage, a short-circuit to earth or an open-circuit/high resistance on the ignition circuit

DTC Descriptor

DTC U0078 00: Control Module Low Speed Communication Bus Off

Circuit/System Description

The low speed GMLAN serial data bus is used to communicate information between the control modules. The serial data is transmitted over a single wire to the appropriate control modules. The low speed GMLAN serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTC

- Supply voltage to the control modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 seconds.

Action Taken When the DTC Sets

- The control module suspends all message transmission.
- The control module uses default values for all parameters received on the serial data circuits.
- The control module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

Diagnosis is accomplished using the symptom. Refer to [Scan Tool Does Not Communicate with Low Speed GMLAN Device](#) .

DTC U0100-U02FF

[Diagnostic Instructions](#)

[Circuit/System Description](#)

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC) on the driver's side, the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). The auxiliary data connector on the passenger side is used for expansion buses. When the vehicle is on, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non-communicating control module. The DTC is unique to the control module which is not communicating and one or more control modules may set the same exact code. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

[Conditions for Running the DTC](#)

The system voltage is between 9–16 V.

[Conditions for Setting the DTC](#)

A supervised periodic message that includes the transmitter module availability has not been received.

[Action Taken When the DTC Sets](#)

- Specific subsystems will not function.
- DTC U0100 in the TCM will cause the transmission to go into default gears.
- Both DTC U0100 in the TCM and DTC U0101 in the ECM will cause the malfunction indicator lamp (MIL) to illuminate.

[Conditions for Clearing the DTC](#)

- The ECM/TCM module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC clears when the malfunction is no longer present.

- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- Some control modules may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the control module.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the control module that set the communication DTC, the control module that the communication DTC was set against and any in-line harness connectors between the two control modules. Do not replace a control module based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition..
- This diagnostic can be used for any control module that is not communicating, regardless of the type of serial data circuit it is connected to, providing the vehicle is equipped with the control module.

Special Tools

EL-48900 HEV Safety Kit

Circuit/System Verification

1. Determine the control module that is not communicating. Refer to [Control Module U Code List](#) .
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
3. Engine running for 10 seconds.
4. Vehicle in Service Mode, verify that DTC U0100-U02FF is not set with symptom byte 00.
If the DTC U0100-U02FF is set with symptom byte 00, refer to Circuit/System Testing.
5. Verify that DTC U0100-U02FF is not set with symptom byte 71 or 72.
If the DTC U0100-U02FF is set with symptom byte 71 or 72 along with other DTCs set, diagnose all other DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
If the DTC U0100-U02FF is set with symptom byte 71 or 72 and without other DTCs set, reprogram the control module. If the DTC resets, replace the control module.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High-Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high-voltage.
- Identify how to test for the presence of high-voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1,000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Note: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- Control module locations on each GMLAN serial data busses
- The control module's B+, ignition, earth, accessory wake-up serial data, accessory wake-up serial data 2, serial data communication enable and serial data circuit terminals

1. Using the High-Voltage Module Chart below, verify that the non-communicating control module is not a high-voltage module. If the control module is a high-voltage module, perform the High-Voltage Disabling procedure before proceeding with this diagnostic. Refer to [High Voltage Disabling](#).
2. If high-voltage disabling is required, reconnect the 12 V battery after performing the high-voltage disabling procedure.
3. Vehicle OFF, disconnect the harness connector at the control module that is not communicating.
4. Test for less than 10 Ω between each ground circuit terminal and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
 - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the control module.
6. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
 - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the control module.

Note: Only the high-speed GMLAN modules have a serial data communication enable circuit OR an accessory wake-up serial data circuit OR an accessory wake-up serial data 2 circuit. Either the K9 BCM or the K114B hybrid powertrain control module 2 is the output for these circuits. Refer to the control module schematics to identify which control modules have these circuits and which control module is the output for these circuits.

7. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the serial data communication enable circuit terminal OR the accessory wake-up serial data circuit terminal coming from the K9 BCM and earth.
 - If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 BCM, for an open-circuit/high resistance or short-circuit to earth. If the

circuits test normal, replace the K9 BCM.

8. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal coming from K114B hybrid powertrain control module 2 and earth.

If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.

Note: Only the high-voltage energy management high-speed GMLAN modules have a high-voltage energy management communication enable circuit and the K114B hybrid power train control module 2 is the output for this circuit. Refer to the control module schematics to identify which control modules have this circuit.

9. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the high-voltage energy management communication enable circuit terminal coming from K114B hybrid powertrain control module 2 and earth.

If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.

10. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 metres away from vehicle. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between each serial data circuit terminal and the appropriate data link connector (DLC) terminal listed below:

- X84 DLC low-speed GMLAN serial data circuit terminal 1
- X84 DLC high-speed GMLAN serial data circuit terminal 6 or 14
- X84 DLC mid-speed GMLAN serial data circuit terminal 3 or 11
- X84 DLC chassis high-speed GMLAN serial data circuit terminal 12 or 13
- X84B auxiliary data connector powertrain high-speed GMLAN serial data circuit terminal 12 or 13
- X84B auxiliary data connector high-voltage energy high-speed GMLAN serial data circuit terminal 3 or 11

If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the non communicating control module and the control module setting the DTC or a serial data splice pack.

11. If all circuits test normal, replace the control module that is not communicating.

High-Voltage Module Chart

Module	Voltage System	Data Link Type

DTC U0301 00: Software Incompatibility with Engine Control Module

DTC U0302 00: Software Incompatibility with Transmission Control Module

DTC U0315 00: Software Incompatibility with Electronic Brake Control Module

[Circuit/System Description](#)

Some control modules must be configured with specific software, serial numbers, vehicle options, or other information. If a control module was not properly configured after installation that module may set the appropriate U Code. No external circuit diagnosis is involved.

[Conditions for Running the DTC](#)

Battery voltage is between 9-16 V and data link communications operate normally.

[Conditions for Setting the DTC](#)

The control module is not configured properly.

[Conditions for Clearing the DTC](#)

- A current DTC clears when the malfunction is no longer present.

- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

[DTC Descriptor](#)

Refer to [Control Module U Code List](#) .

[Circuit/System Description](#)

The serial data is transmitted over a Local Interconnect Network (LIN) single wire network circuit bus between a master control module and other control modules within a particular subsystem. If serial data communication is lost between any of the control modules on the LIN bus network, a no communication code against the non-communicating control module will be set. A master control module is the one that reports the non communication code. Note: a loss of serial data communications DTC does not represent a failure of the master control module that set it.

[Diagnostic Aids](#)

- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication will be available between the master control module and the scan tool if there is a loss of communications with any of the other control modules on the LIN bus network.
- An open in the LIN bus serial data circuit between the splice pack and a control module will only affect that specific control module. This type of failure will set a loss of communication DTC for each control module affected and the other control modules will still communicate.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the control module that set the communication DTC, the control module that the communication DTC was set against and any in-line harness connectors between the two control modules. Do not replace a control module based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition.

Circuit/System Testing

Note:

- Use the schematic to identify the following:
 - LIN devices the vehicle is equipped with
 - The LIN device's B+, ignition, earth and serial data circuit terminals
- Use the Control Module U Code list to determine which LIN device is not communicating with the master control module. Refer to [Control Module U Code List](#).
- A loss of serial data communications DTC does not represent a failure of the master control module that set it.

1. Vehicle OFF, disconnect the harness connector at a LIN device that is not communicating.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the LIN device for a short to ground. If the circuits test normal, replace the LIN device.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the LIN device for a short to ground. If the circuits test normal, replace the LIN device.

5. Vehicle in Service Mode, test for 2-12 V between the LIN serial data circuit and earth.
If greater than the specified range, test the LIN serial data circuit for a short to voltage. If the circuit tests normal, replace the master control module.
If less than the specified range, test the LIN serial data circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the master control module.
6. If all circuits test normal, replace the LIN device.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

DTC U1793 will set when no communication is established between the 14 V power module and the hybrid powertrain control module 1 on the powertrain high-speed GMLAN

serial data bus.

Conditions for Running the DTC

- The system voltage is between 9–16 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.

- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

Circuit/System Verification

1. Verify that DTC U0293 is not set.
If the DTC is set, refer to [DTC U0100-U02FE](#) .
2. Verify that DTC U0074, P06E4, U1814, U2099, B1428, B1370, B1380, B1440, B1441, B1325, or P0562 is not set.
If any of these DTCs is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control module location on the powertrain high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the T6 power inverter module.
2. Test for less than 5 Ω between the T6 power inverter module case and earth.
If greater than the specified value, test the earth strap for an open-circuit/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the X2 harness connector at the K1 14V power module.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each powertrain high-speed GMLAN serial data circuit between the T6 power inverter module and the K1 14V power module.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the T6 power inverter module and the K1 14V power module.
8. If all circuits test normal, replace the T6 power inverter module.

DTC Descriptor

DTC U1795 00: 14V Power Module Powertrain Expansion Communication Bus Off

Circuit/System Description

The powertrain high-speed GMLAN serial data circuits are serial data buses used to communicate information between the control modules. The powertrain high-speed GMLAN serial data circuits also connect directly to the auxiliary data connector on passenger side. If this serial data system is inoperative, some control modules will still communicate with the scan tool due to other serial data systems but not with each other.

Conditions for Running the DTC

- Supply voltage to the control modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communication on the powertrain high-speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The control module suspends all message transmission.
- The MIL and battery indicators will illuminate, along with several DIC messages.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

Verify that U0074 is not set.

If the DTC is set, refer to [DTC U0074](#) .

DTC U179A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

Ground	--	U179A	--	--
1. Scan Tool Does Not Communicate With Low-Speed GMLAN Device				
2. Scan Tool Does Not Communicate With High-Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is on, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non communicating control module. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

DTC U179A is a type A DTC.

Conditions for Clearing the DTC

DTC U179A is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.

- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The hybrid powertrain control module 2 locations on each GMLAN serial data busses
- The hybrid powertrain control module 2 B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 BCM, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the harness connectors at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each serial data circuit between the K114B hybrid powertrain control module 2 and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the control module setting the DTC.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Ground	--	U1803	--	--
1. Scan Tool Does Not Communicate With Low-Speed GMLAN Device				
2. Scan Tool Does Not Communicate With High-Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non communicating control module. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary

conditions and should never be interpreted as an intermittent fault, causing you to replace a part.

- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Verification](#)

Verify that DTC U0073, U0074, U0078, U007A, U1814, U2099, B1428, B1370, B1380, B1440, B1441, B1325 or P0562 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

Circuit/System Testing

Note: Use the schematic to identify the following:

- The hybrid powertrain control module 2 locations on each GMLAN serial data busses
- The hybrid powertrain control module 2 B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open/high resistance or short to ground.
If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the harness connectors at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each serial data circuit between the K114B hybrid powertrain control module 2 and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the control module setting the DTC.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

[DTC Descriptor](#)

DTC U1806 00: Battery Energy Control Module High Voltage Energy Management Communication Bus Off

[Circuit/System Description](#)

The high-voltage energy management high-speed GMLAN serial data circuits are serial data buses used to communicate information between the hybrid powertrain control module 2, the battery energy control module and the battery charger. If this serial data system is inoperative the control modules will not communicate with each other on this bus, but they still communicate with the scan tool through the high-speed GMLAN bus.

The scan tool does not communicate with control modules through the high-voltage energy management high-speed GMLAN bus. The high-voltage energy high-speed GMLAN serial data circuits connect directly to the auxiliary data connector and do not connect with the scan tool.

[Conditions for Running the DTC](#)

- Vehicle ON.
- The system voltage is at least 9 V.

[Conditions for Setting the DTC](#)

The control module setting the DTC has attempted to establish communications on the serial data circuits for more than 1.4 seconds without success.

[Action Taken When the DTC Sets](#)

The DTC U1806 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1806 is a type B DTC.

Circuit/System Verification

Verify that U007A is not set.

If the DTC is set, refer to [DTC U007A](#) .

DTC U1807

DTC Descriptor

DTC U180D 00: Electronic Brake Control Module Chassis Expansion Communication Bus Off

Circuit/System Description

The chassis high-speed GMLAN serial data circuits are serial data buses used to communicate information between the control modules. The chassis high-speed GMLAN serial data circuits also connect directly to the data link connector (DLC) for programming purposes. If this serial data system is inoperative, the control modules will still communicate with the scan tool due to other serial data systems but not with each other.

Conditions for Running the DTC

- Supply voltage to the control modules are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The control module setting the DTC has attempted to establish communication on the high-speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The control module suspends all message transmission.
- The control module uses default values for all parameters received on the serial data circuits.
- The control module inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

Verify that U0077 is not set.

If the DTC is set, refer to [DTC U0077](#) .

DTC U1814

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC U1814 00: Accessory Wake-up Serial Data Circuit

DTC U1814 01: Accessory Wake-up Serial Data Circuit Short-Circuit to Battery

DTC U1814 02: Accessory Wake-up Serial Data Circuit Short-Circuit to Earth

DTC U1814 04: Accessory Wake-up Serial Data Circuit Open

DTC U1814 5A: Accessory Wake-up Serial Data Circuit Not Plausible

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wakeup Serial Data	U1814	U0100-U02FF	--	--

[Circuit/System Description](#)

The body control module (BCM) activates the accessory wake-up serial data circuit when the vehicle is on. The accessory wake-up serial data circuit wakes up the hybrid powertrain control module 2 for serial data bus communication.

[Conditions for Running the DTC](#)

- The system voltage is between 9-16 volts.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the accessory wakeup serial data circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The control modules use a default value for the missing parameters until the next ignition cycle.
- The control module(s) is never signalled, therefore the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- Short to ground will also set multiple history no communication codes for GMLAN high speed modules.

[Circuit/System Testing](#)

Note: Use the schematic to determine which control modules are on the BCM accessory wake-up serial data circuit 22, X4.

1. Vehicle OFF, disconnect the harness connector at the most easily accessible control module on the K9 BCM accessory wake-up serial data circuit.
2. Vehicle in Service Mode, retest for current DTCs. DTC U1814 should remain current.
If the DTC becomes history, replace the control module that was just disconnected.
3. With the prior control modules disconnected, repeat steps 1 and 2 for each control module on the circuit except the K9 BCM.
4. Vehicle OFF, disconnect the X4 harness connector at the K9 BCM.
5. Test for infinite resistance between the accessory wake-up serial data circuit terminal 22 X4 and earth.
If less than infinite resistance, repair the accessory wake-up serial data circuit for a short-circuit to earth.
6. If all circuits tests normal, replace the K9 BCM.

Ground	--	U1817*	--	--

* Other DTCs may set with this fault.

[Circuit/System Description](#)

Control modules connected to the powertrain high-speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

The motor control modules and the hybrid powertrain control module 1 are all internal to the power inverter module. All circuits to the hybrid powertrain control module 1 are

also internal to the power inverter module and replaced as a single component.

Communication diagnostics for the serial data, including control module power and earth, as well as the wake-up circuits for motor control modules and the hybrid powertrain control module 1, are all diagnosed from external sources only to the power inverter module connector because any circuit fault condition within the power inverter module will cause a complete replacement.

Conditions for Running the DTC

- The system voltage is more than 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

DTC U1817 is a type A DTC.

Conditions for Clearing the DTC

DTC U1817 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.

- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

1. Verify that DTC U0293 is not set.
If the DTC is set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0074, P06E4, B1428, B1370, B1380, B1440, B1441, B1325, or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

3. Verify that DTCs U1818, U1821 and U182D are not set.
If all the DTCs are set, refer to [DTC U0074](#).

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control module location on the powertrain high-speed GMLAN serial data circuits
- Control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals.

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the T6 power inverter module.
2. Test for less than 5 Ω between the T6 power inverter module case and earth.
If greater than the specified range, test the earth strap for an open-circuit/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each powertrain high-speed GMLAN serial data circuit between the T6 power inverter module and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the T6 power inverter module and the control module setting the DTC.
8. If all circuits test normal, replace the T6 power inverter module.

[Circuit/System Verification](#)

1. Verify that DTC U0100 is not set.
If the DTC is set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0074, P06E4, B1428, B1370, B1380, B1440, B1441, B1325, or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
3. Verify that DTCs U1817, U1821 and U182D are not set.
If all the DTCs are set, refer to [DTC U0074](#) .

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module location on the powertrain high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect harness connector at the K20 engine control module (ECM).
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K20 ECM for a short-circuit to earth. If the circuits test normal, replace the K20 ECM.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K20 ECM for a short-circuit to earth. If the circuits test normal, replace the K20 ECM.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each powertrain high-speed GMLAN serial data circuit between the K20 ECM and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K20 ECM and the control module setting the DTC.
8. If the circuits test normal, replace the K20 ECM.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1821	U1821	--	--
Ignition	U1821	U1821	--	--
Accessory Wake Up Serial Data 2	P06E4*	U1821	--	--
Powertrain High-Speed GMLAN Serial Data (+)	U0074*	U1821*	U0074*	-
Powertrain High-Speed GMLAN Serial Data (-)	U0074*	U1821*	U0074*	--
Ground	--	U1821	--	--

* Other DTCs may set with this fault.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

[Conditions for Running the DTC](#)

- The system voltage is between 9–16 V.
- The vehicle power mode master requires serial data communication to occur from this specific module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

Note: Use the schematic to identify the following:

- The control module location on the powertrain high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the low-voltage harness connector at the K1 14 V power module.
2. Test for less than 5 Ω between the K1 14 V power module case and earth.
If greater than the specified range, test the earth strap for an open-circuit/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K1 14 V power module for a short-circuit to earth. If the circuits test normal, replace the K1 14V power module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K1 14 V power module for a short-circuit to earth. If the circuits test normal, replace the K1 14V power module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each powertrain high-speed GMLAN serial data circuit between the K1 14 V power module and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K1 14V power module and the control module setting the DTC.
8. If all circuits test normal, replace the K1 14 V power module.

Ground	--	U182D	--	--

* Other DTCs may set with this fault.

[Circuit/System Description](#)

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When hybrid powertrain control module 2 stops communicating on the serial data circuit, for example if the hybrid powertrain control module 2 loses power or earth, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the hybrid powertrain control module 2. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is at least 11 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received for 10 seconds.

Action Taken When the DTC Sets

The DTC U182D is a type B DTC.

Conditions for Clearing the DTC

The DTC U182D is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. 1. Verify that DTC U0121 or U0129 is not set.
If any of the DTCs are set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0077, P06E4, U1814, U2099, B1428, B1370, B1380, B1440, B1441, B1325, or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- Control module location on the chassis high-speed GMLAN serial data circuits
- Control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module (EBCM).

2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K17 EBCM for a short-circuit to earth. If the circuits test normal, replace the K17 EBCM.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K17 EBCM for a short-circuit to earth. If the circuits test normal, replace the K17 EBCM.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each chassis high-speed GMLAN serial data circuit between the K17 EBCM and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K17 EBCM and the control module setting the DTC.
8. If all circuits test normal, replace the K17 EBCM.

Chassis High Speed GMLAN Serial Data (-)	U007A*	U007A, U1838*	U007A*	--
Ground	--	U1838	--	--

* Other DTCs may be set with this fault.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

The system voltage is more than 10 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1838 is a type A DTC.

Conditions for Clearing the DTC

The DTC U1838 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

Note: Use the schematic to identify the following:

- The control module locations on the all GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2, high-voltage energy management communication enable and serial data circuit terminals

1. Vehicle OFF, disconnect the low-voltage harness connector at the T18 battery charger.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T18 battery charger for a short-circuit to earth. If the circuits test normal, replace the T18 battery charger.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T18 battery charger for a short-circuit to earth. If the circuits test normal, replace the T18 battery charger.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the high-voltage energy management communication enable circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
7. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
8. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-voltage energy serial data circuit between the T18 battery charger and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the T18 battery charger and the control module setting the DTC.
9. If all circuits test normal, replace the T18 battery charger.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

The communication for auxiliary transmission fluid pump control module and all drive motor control modules is handled through the hybrid powertrain control module 1. The auxiliary transmission fluid pump control module and the hybrid powertrain control module 1 are all internal to the power inverter module. All circuits to the auxiliary transmission fluid pump control module and hybrid powertrain control module 1 are also internal to the power inverter module. Communication diagnostics for the serial data, including control module power and earth as well as the wake-up circuits for all drive motor control modules and the hybrid powertrain control module 1 are all diagnosed from external sources only to the power inverter module connector.

Conditions for Running the DTC

- The system voltage is at least 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1839 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1839 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.

- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

Note: Use the schematic to identify the following:

- Control module locations on the high-speed GMLAN and powertrain high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect harness connector at the K20 engine control module (ECM).
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified value, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K20 ECM for a short-circuit to earth. If the circuits test normal, replace the K20 ECM.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K20 ECM for a short-circuit to earth. If the circuits test normal, replace the K20 ECM.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the X1 harness connector at the T6 power inverter module.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each serial data circuit between the K20 ECM and the T6 power inverter module.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K20 ECM and the T6 power inverter module.
8. If all circuits test normal, replace the K20 ECM.

[Circuit/System Description](#)

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When hybrid powertrain control module 2 stops communicating on the serial data circuit, for example if the hybrid powertrain control module 2 loses power or earth, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the hybrid powertrain control module 2. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

The auxiliary transmission fluid pump control module is controlled by drive motor 3 control module. The communication for auxiliary transmission fluid pump control module and all drive motor control modules is handled through the hybrid powertrain control module 1. The auxiliary transmission fluid pump control module and the hybrid powertrain control module 1 are all internal to the power inverter module. All circuits to the auxiliary transmission fluid pump control module and hybrid powertrain control module 1 are also internal to the power inverter module. Communication diagnostics for the serial data, including control module power and earth as well as the wake-up circuits, for auxiliary transmission fluid pump control module and the hybrid powertrain control module 1 are all diagnosed from external sources only to the power inverter module connector.

Conditions for Running the DTC

The system voltage is at least 10 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U183C is a type B DTC.

Conditions for Clearing the DTC

The DTC U183C is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.

- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the control module.

Note: Use the schematic to identify the following:

- The control module location on the powertrain high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open-circuit/high resistance or a short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the X1 harness connector at the T6 power inverter module.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each powertrain high-speed GMLAN serial data circuit between the K114B hybrid powertrain control module 2 and the T6 power inverter module.
If greater than the specified range, test the serial data circuit for an open/high-resistance between the K114B hybrid powertrain control module 2 and the T6 power inverter module.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

[DTC Descriptor](#)

DTC U183E 00: Lost Communication with OnStar Module on Low Speed Communication Bus

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U183E	U183E	--	--
Ignition	U183E	U183E	--	--
Serial Data Communication Enable	U1814, U2099	U183E	--	--
Low Speed GMLAN Serial Data	U0078, 1	U0078, U183E	U0078, 1	--
Ground	--	U183E	--	--
1. Scan Tool Does Not Communicate With Low-Speed GMLAN Device				

[Circuit/System Description](#)

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non communicating control module. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module location on low-speed GMLAN serial data circuits
- The control module B+, ignition, earth, serial data communication enable and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K73 telematics communication interface control module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K73 telematics communication interface control module for a short-circuit to earth. If the circuits test normal, replace the K73 telematics communication interface control module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K73 telematics communication interface control module for a short-circuit to earth. If the circuits test normal, replace the K73 telematics communication interface control module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the serial data communication enable circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open/high resistance or short to ground.
If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in the low-speed GMLAN serial data circuit between the K73 telematics communication interface control module and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K73 telematics communication interface control module and the control module setting the DTC.
8. If all circuits test normal, replace the K73 telematics communication interface control module.

DTC Descriptors

DTC U1845 00: Drive Motor Control Module 1 Lost Communication with Hybrid Powertrain Control Module

DTC U1846 00: Drive Motor Control Module 2 Lost Communication with Hybrid Powertrain Control Module

Circuit/System Description

The motor control modules and the hybrid powertrain control module 1 are all internal to the power inverter module. The motor control modules communicate only with the hybrid powertrain control module 1 with the hybrid powertrain control module 1 sending out diagnostic trouble code information to other control modules regarding the motor control modules. All circuits to the hybrid powertrain control module 1 and motor control modules are also internal to the power inverter module and replaced as a single component.

Communication diagnostics for the serial data, including control module power and earth, as well as the wake-up circuits for motor control modules and the hybrid powertrain control module 1, are all diagnosed from external sources only to the power inverter module connector because any circuit fault condition within the power inverter module will cause a complete replacement.

Conditions for Running the DTC

- The system voltage is more than 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.
- If DTC U1845 or U1846 is only set current in the hybrid powertrain control module 1, the power inverter module must be replaced due to all circuits between the hybrid powertrain control module 1 and motor control modules being internal to the power inverter module.

1. Scan Tool Does Not Communicate With High-Speed GMLAN Device.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

- The system voltage is at least 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1849 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1849 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of- communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

* Scan Tool Does Not Communicate With Low-Speed GMLAN Device

Circuit/System Description

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that state of health message, detect its absence; those control modules in turn set a DTC associated with the loss of state of health of the non communicating control module. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) Data Link References to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Description](#)

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non communicating control module. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

1. Verify that DTC U0164 is not set.
If the DTC is set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0073, U0078, B1428, B1370, B1380, B1440, B1441, B1325 or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module location on low-speed GMLAN serial data circuits
- The control module B+, ignition, earth and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K33 HVAC control module for a short-circuit to earth. If the circuits test normal, replace the K33 HVAC control module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K33 HVAC control module for a short-circuit to earth. If the circuits test normal, replace the K33 HVAC control module.
5. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
6. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in the low-speed GMLAN serial data circuit between the K33 HVAC control module and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K33 HVAC control module and the control module setting the DTC.
7. If all circuits test normal, replace the K33 HVAC control module.

* Scan Tool Does Not Communicate With Low-Speed GMLAN Device

[Circuit/System Description](#)

The serial data circuit is the means by which the control modules in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each control module for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each control module communicating on the serial data circuit sends a state of health (SOH) message to ensure that the control module is operating properly. When a control module stops communicating on the serial data circuit, for example if the control module loses power or ground, the SOH message it normally sends on the serial data circuit disappears. Other control modules on the serial data circuit, which expect to receive that SOH message, detect its absence; those control modules in turn set a DTC associated with the loss of SOH of the non communicating control module. A loss of serial data communications DTC does not represent a failure of the control modules that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. 1. Scan Tool Does Not Communicate With High-Speed GMLAN Device.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

- The system voltage is at least 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1850 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1850 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of- communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.

- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Verification](#)

1. Verify that DTC U0293 is not set.
If the DTC is set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0077, P06E4, B1428, B1370, B1380, B1440, B1441, B1325, or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- Control module location on the high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the T6 power inverter module.
2. Test for less than 5 Ω between the T6 power inverter module case and earth.
If greater than the specified range, test the earth strap for an open-circuit/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the harness connector at the K17 electronic brake control module.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each chassis high-speed GMLAN serial data circuit between the T6 power inverter module and the K17 electronic brake control module.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the T6 power inverter module and the K17 electronic brake control module.
8. If all circuits test normal, replace the T6 power inverter module.

* Multiple DTCs may be set and multiple symptoms including a no- start condition may occur.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

The system voltage is more than 10 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received for more than 500 ms.

Action Taken When the DTC Sets

DTC U185A is a type A DTC.

Conditions for Clearing the DTC

DTC U185A is a type A DTC.

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module locations on high-voltage energy management high-speed GMLAN serial data circuits
- The control module B+, ignition, high-voltage fault signal, earth, accessory wake-up serial data 2, high-voltage energy management communication enable and serial data circuit terminals

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the A4 hybrid battery pack.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. Vehicle in Service Mode, test for 4.8-5.2 V between the high-voltage fault signal circuit terminal 6 X2 and earth.
If less than the specified range, test the high-voltage fault signal circuit for a short-circuit to earth or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
If greater than the specified range, test the high-voltage fault signal circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
6. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
7. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the high-voltage energy management communication enable circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
8. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
9. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-voltage energy high-speed GMLAN serial data circuit between the A4 hybrid battery pack and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the A4 hybrid battery pack and the control module setting the DTC.
10. If all circuits test normal, replace the A4 hybrid/EV battery pack.

* Other DTCs may set with this fault.

Circuit/System Description

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

This diagnostic is used to check the loss of communication with the hybrid powertrain control module 2 on high-voltage energy high-speed GMLAN bus. The battery energy

control module supervises a periodic serial data message to check the communication status of the hybrid powertrain control module 2. If this message is not received within 1 second, this DTC is set.

Conditions for Running the DTC

- The control module is awake and communicating.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received within 1 second.

Action Taken When the DTC Sets

- No Cell Balancing function. However, cell balancing switch diagnostics still run.
- DTC U185B is a type B DTC.

Conditions for Clearing the DTC

DTC U185B is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.

- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the control module.

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module locations on high-voltage energy management high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open-circuit/high resistance or a short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the X1 harness connector at the A4 hybrid battery pack.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-voltage energy serial data circuit between the K114B hybrid powertrain control module 2 and the A4 hybrid battery pack.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the A4 hybrid battery pack.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.
9. If the DTC resets, replace the A4 hybrid/EV battery pack.

Circuit/System Verification

Verify that DTC U007A, U1814, U2099, B1428, B1370, B1380, B1440, B1441, B1325 or P0562 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to diagnose those DTCs prior to this diagnostic.

Circuit/System Testing

Note: Use the schematic to identify the following:

- The control module locations on the all GMLAN serial data circuits.
- The control module B+, ignition, earth, accessory wake up serial data and serial data circuit terminals.

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.

3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open-circuit/high resistance or a short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the X1 harness connector at the T18 battery charger.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-voltage energy high-speed GMLAN serial data circuit between the K114B hybrid powertrain control module 2 and the T18 battery charger.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the T18 battery charger.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Circuit/System Description

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

The system voltage is greater than 10.25 V.

Conditions for Setting the DTC

The A/C compressor control module is not able to receive the serial data message from the hybrid powertrain control module 2 for 3 seconds.

Action Taken When the DTC Sets

The DTC U1860 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1860 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

Circuit/System Verification

Verify that DTC U0073, U1814, B1428, B1370, B1380, B1440, B1441, B1325 or P0562 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to diagnose those DTCs prior to this diagnostic.

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control module location on the high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.

3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open-circuit/high resistance or a short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the X1 harness connector at the G1 A/C compressor.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-speed GMLAN serial data circuit between the K114B hybrid powertrain control module 2 and the G1 A/C compressor.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the G1 A/C compressor.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

[DTC Descriptor](#)

DTC U1861 00: Battery Charger Control Module Lost Communication with Engine Control Module

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1861*	U1861	--	--
Ignition	U1861*	U1861*	--	--
Accessory Wake Up Serial Data 2	P06E4*	U1861*	--	--
High Speed GMLAN Serial Data (+)	U0073*	U0073, U1861*	U0073*	--
High Speed GMLAN Serial Data (-)	U0073*	U0073, U1861*	U0073*	--
Ground	--	U1861*	--	--

* Other modules/DTCs may set with this fault and multiple symptoms including a no-start condition may occur.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

[Conditions for Running the DTC](#)

- The system voltage is between 9–16 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1861 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1861 is a type B DTC.

The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

- The system voltage is greater than 9.5 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1876 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1876 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Verification](#)

1. Verify that DTC U0100 is not set.
If the DTC is set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0073, U0074, P06E4, U1814, B1428, B1370, B1380, B1440, B1441, B1325, or P0562 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- Control module locations on the high-speed GMLAN and powertrain high-speed GMLAN serial data circuits

- The control modules B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module (ECM).
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K20 ECM for a short-circuit to earth. If the circuits test normal, replace the K20 ECM.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K20 ECM for a short-circuit to earth. If the circuits test normal, replace the K20 ECM.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the X1 harness connector at the T6 power inverter module.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-speed GMLAN and powertrain high-speed GMLAN serial data circuit between the K20 ECM and the T6 power inverter module.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K20 ECM and the T6 power inverter module.
8. If all circuits test normal, replace the K20 ECM.

* Other modules/DTCs may set with this fault and multiple symptoms including a no-start condition may occur.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

- The system voltage is greater than 9.5 V.
- The vehicle power mode master requires serial data communication to occur from this specific control module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The DTC U1879 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1879 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

This diagnostic is used to check the loss of communication with hybrid powertrain control module 1 on high-speed GMLAN bus. The battery energy control module supervises

a periodic serial data message to check the communication status of the hybrid powertrain control module 1. If this message is not received within 3 seconds, then this DTC is set.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.
- The DTC U180B is not set.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received within 3 seconds.

Action Taken When the DTC Sets

The DTC U1885 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1885 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. [Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- Control module location on the high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the T6 power inverter module.
2. Test for less than 5 Ω between the T6 power inverter module case and earth.
If greater than the specified range, test the earth strap for an open-circuit/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the X2 harness connector at the A4 hybrid battery pack.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-speed GMLAN serial data circuit between the T6 power inverter module and the A4 hybrid battery pack.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the T6 power inverter module and the A4 hybrid battery pack.
8. If all circuits test normal, replace the T6 power inverter module.
9. If the DTC resets, replace the A4 hybrid/EV battery pack.

DTC Descriptor

DTC U18B9: Primary High Speed CAN Bus Subnet Configuration List

DTC U18BF: Secondary High Speed CAN Bus Subnet Configuration List

Circuit/System Description

Control modules on the high-speed GMLAN serial data bus and the chassis high-speed GMLAN serial data bus must be programmed with software that specifically identifies the correct type and quantity of control modules on the bus based on RPO configuration. If a control module was not properly configured after installation, the appropriate U Code may be set for that control module. No external circuit diagnosis is involved.

Conditions for Running the DTC

- Voltage supplied to the control module is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.

Conditions for Setting the DTC

- The control module is not configured properly.
- Control unit recognises a programming error.
- CAN-Bus configuration is invalid

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC U2099

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC U2099 00: High Speed Communication Enable Circuit

DTC U2099 01: High Speed Communication Enable Circuit Short to Battery

DTC U2099 02: High Speed Communication Enable Circuit Short to Ground

DTC U2099 04: High Speed Communication Enable Circuit Open

DTC U2099 5A: High Speed Communication Enable Circuit Not Plausible

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Serial Data Communication Enable	U2099, U0100-U02FF ¹	U0100-U02FF	U0100-U02FF ²	-

¹ Vehicle will not start.

² History only. If cleared the DTC will return after several ignition cycles.

[Circuit/System Description](#)

The body control module (BCM) activates the serial data communication enable circuit, when the vehicle is ON. The serial data communication enable circuit wakes up the control modules for serial data bus communication.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The BCM senses a short to ground on the serial data communication enable circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The control modules use a default value for the missing parameters until the next ignition cycle.
- The control module(s) is never signalled, therefore the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- Short to ground will also set multiple history no communication codes for GMLAN high speed modules.

[Circuit/System Testing](#)

Note: Use the schematic to determine which control modules are on the BCM serial data communications enable circuit 23, X4.

1. Vehicle OFF, disconnect the harness connector at the most easily accessible control module on the K9 BCM serial data communication enable circuit.
2. Vehicle in Service Mode, retest for current DTCs. DTC U2099 should remain current.
If the DTC becomes history, replace the control module that was just disconnected.
3. With the prior control modules disconnected, repeat steps 1 and 2 for each control module on the circuit except the K9 BCM.
4. Vehicle OFF, disconnect the X4 harness connector at the K9 BCM.
5. Test for infinite resistance between the serial data communication enable circuit terminal 23 X4 and ground.
If less than infinite resistance, repair the serial data communication enable circuit for a short-circuit to earth.
6. If all circuits tests normal, replace the K9 BCM.

DTC U2103

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC U2103 00: Fewer Controllers On Than Programmed

[Circuit Description](#)

Control modules connected to the GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have programmed information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are also supervised and some periodic messages are used by the receiver module as an availability indication of the transmitter module.

DTC U2103 will set when fewer modules are detected on the bus before the control modules can learn the other control module IDs. If the communication bus is opened, or if the control module power supply is lost when the vehicle is in the OFF power mode, and then placed in the ON power mode, U2103 will set in specific control modules.

[Conditions for Running the DTCs](#)

- Voltage supplied to the control modules is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.
- The DTC U2100 does not have a current status.

[Conditions for Setting the DTC](#)

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module uses a default value for the missing parameter.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Diagnostic Aids

- Diagnosis of this DTC is accomplished via the symptom or an additional DTC. Refer to [Symptoms - Data Communications](#) or [DTC U0100-U02FF](#) .
- An intermittent condition is likely to be caused by a short on the GMLAN serial data circuits. Use the [DTC U0100-U02FF](#) procedure in order to isolate an intermittent condition.

DTC U2105-U2199

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using the diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

3. Scan tool does not communicate with chassis high speed GMLAN device

Circuit/System Description

Control modules connected to the high and low speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Conditions for Running the DTC

- The system voltage is between 9–16 V.
- The vehicle power mode requires serial data communication to occur.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module uses a default value for the missing parameters.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be

temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.

- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- Some control modules may not have internal protection for specific voltage outputs and may open a battery positive voltage or ignition voltage source fuse. If a voltage input fuse is open and no short is found in that circuit, ensure that no control module output voltage circuit is shorted to ground before replacing the control module.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the control module that set the communication DTC, the control module that the communication DTC was set against and any in-line harness connectors between the two control modules. Do not replace a control module based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition..
- This diagnostic can be used for any control module that should communicate with high or low speed GMLAN serial data providing the vehicle is equipped with the option that uses that control module.

[Circuit/System Verification](#)

1. Determine the control module that is not communicating. Refer to [Control Module U Code List](#) .
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800,

C0899, C12E1, P0560, or P0562 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

Circuit/System Testing

Note: Terminal and connector identifiers will be different depending on the individual control module being tested. Use Schematic Reference and Connector End View Reference to determine the control module's connector and B+, ignition, earth, accessory wake-up serial data, accessory wake-up serial data 2, serial data communication enable and serial data circuit terminals.

1. Vehicle OFF, disconnect the harness connector at the control module that is not communicating.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the appropriate control module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the control module for a short to ground. If the circuits test normal, replace the appropriate control module.

Note: Only the high-speed GMLAN modules have a serial data communication enable circuit OR an accessory wake-up serial data circuit OR an accessory wake-up serial data 2 circuit. Either the K9 body control module or the K114B hybrid power train control module 2 is the output for these circuits. Refer to the control module schematics to identify which control modules have these circuits and which control module is the output for these circuits. If the control module that is not communicating does not have any of these circuits, proceed to the next step.

5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the serial data communication enable circuit terminal OR the accessory wake-up serial data circuit terminal coming from the K9 body control module and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K9 body control module.
6. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal coming from K114B hybrid powertrain control module 2 and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
7. Vehicle OFF, disconnect the harness connector at the control module setting the DTC.
8. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 metres away from vehicle. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each GMLAN serial data circuit between the non-communicating control module and the control module setting the DTC.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the non communicating control module and the control module setting the DTC.
9. If all circuits test normal, replace the control module that is not communicating.

[DTC Descriptor](#)

DTC U2401 00: Battery Energy Control Module Dedicated Bus 1 Off

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
BECM Dedicated Serial Data (+)	U2401	U2401, U2603-U2606	U2401	-
BECM Dedicated Serial Data (-)	U2401	U2401, U2603-U2606	U2401	--

[Circuit/System Description](#)

The battery energy control module (BECM) dedicated bus is a communication bus used to communicate between the BECM and the hybrid battery interface control modules inside the hybrid battery pack assembly. The BECM dedicated bus does not communicate with the scan tool.

This diagnostic is used to check the internal BECM dedicated bus off. If the transmit error counter of a bus is greater than 255 (carry condition in case of an 8-bit transmit error counter) then the supervisor requests the physical layer to set the bus into the "Bus Off" state. At this time, the battery energy control module increases its fail count. When this fail count is over X Cal Value (7) during Y Cal Value (10 samples), this fail code will happen.

[Conditions for Running the DTC](#)

- Vehicle ON.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The control module setting the DTC has received too many transmit errors on the BECM dedicated serial data circuits.

Action Taken When the DTC Sets

- DTC U2401 is a type A DTC.
- The battery energy control module sends all hybrid battery interface control module data to Invalid, 0 V, and -40°C (-40°F) on high-voltage energy high-speed GMLAN bus.

Conditions for Clearing the DTC

- DTC U2401 is a type A DTC.
- No bus-off status.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- The engine will not start when there is a total malfunction of the BECM dedicated bus.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) with the scan tool.

* Scan Tool Does Not Communicate With High-Speed GMLAN Device

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

This diagnostic is used to check the loss of communication with the hybrid powertrain control module 2 on high-speed GMLAN bus. The battery energy control module

supervises a periodic serial data message to check the communication status of the hybrid powertrain control module 2. If this message is not received within 400 ms, the battery energy control module increases its fail count. When this fail count is over X Cal Value (7) during Y Cal Value (10 samples), the diagnostic status of this code is set to Failed and transmitted over high-voltage energy high-speed GMLAN bus to the hybrid powertrain control module 2.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.
- The DTC U180B is not set.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received within 400 ms.

Action Taken When the DTC Sets

The DTC U2602 is a type B DTC.

Conditions for Clearing the DTC

The DTC U2602 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the

control module using multiple GMLAN busses.

- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

Verify that DTC U0073, U1814, B1428, B1370, B1380, B1440, B1441, B1325 or P0562 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to diagnose those DTCs prior to this diagnostic.

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module locations on the high-speed GMLAN and high-voltage energy GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open-circuit/high resistance or a short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the X1 and X2 harness connectors at the A4 hybrid battery pack.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-speed GMLAN serial data circuit between the K114B hybrid powertrain control module 2 and the A4 hybrid battery pack.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the A4 hybrid battery pack.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.
9. If the DTC resets, replace the A4 hybrid/EV battery pack.

DTC Descriptor

DTC U2605 00: Battery Energy Control Module Lost Communication with Hybrid/EV Battery Interface Control Module 3

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	U2605	U2605	--	--
High-Voltage Fault Signal	U2605	U2605	--	--
BEEM Dedicated Serial Data (+)	U2401	U2401, U2605	U2401	-
BEEM Dedicated Serial Data (-)	U2401	U2401, U2605	U2401	-
Low Reference	-	U2605	--	--

Circuit/System Description

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

Scan tool does not communicate the hybrid battery interface control module 3 on battery energy control module dedicated bus.

Conditions for Running the DTC

- The control module is awake and communicating.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

There is no temperature report message from hybrid battery interface control module 3 to battery energy control module within 4 seconds.

Action Taken When the DTC Sets

- Cell voltage or cell temperature corresponding to hybrid battery interface control module 3 will be reported by the battery energy control module to the hybrid powertrain control module 2 as 0 V or -40°C (-40°F).
- The DTC U2605 is a type A DTC.

Conditions for Clearing the DTC

The DTC U2605 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.

[Circuit/System Verification](#)

1. Verify that DTC U0293 is not set.
If the DTC is set, refer to [DTC U0100-U02FF](#) .
2. Verify that DTC U0073, P06E4, U1814, U2611, B1428, B1370, B1380, B1440, or B1441 is not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- Control module location on the high-speed GMLAN serial data circuits
- The control module B+, ignition, earth, accessory wake-up serial data 2 and serial data circuit terminals

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the T6 power inverter module.

2. Test for less than 5 Ω between the T6 power inverter module case and earth.
If greater than the specified value, test the earth strap for an open-circuit/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the T6 power inverter module for a short-circuit to earth. If the circuits test normal, replace the T6 power inverter module.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake-up serial data 2 circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K114B hybrid powertrain control module 2, for an open-circuit/high resistance or short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
6. Vehicle OFF, disconnect the X1 harness connectors at the G1 A/C compressor.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each high-speed GMLAN serial data circuit between the T6 power inverter module and the G1 A/C compressor.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the T6 power inverter module and the G1 A/C compressor.
8. If all circuits test normal, replace the T6 power inverter module.

DTC U2611

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC U2611 00: Auxiliary Transmission Fluid Pump Control Module Lost Communication with Hybrid Powertrain Control Module

Circuit/System Description

The Auxiliary Transmission Fluid Pump Control Module and the Hybrid Powertrain Control Module 1 are all internal to the Power Inverter Module. The Auxiliary Transmission Fluid Pump Control Module communicates only with the Hybrid Powertrain Control Module 1 with the Hybrid Powertrain Control Module 1 sending out diagnostic trouble code information to other control modules regarding the Auxiliary Transmission Fluid Pump Control Module. All circuits to the Hybrid Powertrain Control Module 1 and Auxiliary Transmission Fluid Pump Control Module are also internal to the Power Inverter Module and replaced as a single component.

Communication diagnostics for the serial data, including control module power and earth as well as the wake-up circuits for Auxiliary Transmission Fluid Pump Control Module and the Hybrid Powertrain Control Module 1 are all diagnosed from external sources only to the Power Inverter Module connector because any circuit fault condition within the Power Inverter Module will cause a complete replacement.

Conditions for Running the DTC

- The system voltage is more than 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific module.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter module availability has not been received.

Action Taken When the DTC Sets

The control module is never signalled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to earth, ensure none of the control circuits are shorted to earth before replacing the non communicating control module.
- If DTC U2611 is only set current in the hybrid powertrain control module 1, the power inverter module must be replaced due to all circuits between the hybrid powertrain control module 1 and auxiliary transmission fluid pump control module being internal to the power inverter module.

Ground	--	U2612	--	--
1. Scan Tool Does Not Communicate With High-Speed GMLAN Device				
* Other DTCs may set with this fault				

[Circuit/System Description](#)

Control modules connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the control modules. The control modules have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for

each virtual network. The messages are supervised and also, some periodic messages are used by the receiver module as an availability indication of the transmitter module. Each message contains the identification number of the transmitter module.

[Conditions for Running the DTC](#)

The system voltage is between 9–16 V.

[Conditions for Setting the DTC](#)

A supervised periodic message that includes the transmitter module availability has not been received.

[Action Taken When the DTC Sets](#)

The DTC U2612 is a type B DTC.

[Conditions for Clearing the DTC](#)

The DTC U2612 is a type B DTC.

[Diagnostic Aids](#)

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more control modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
- If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A control module may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between control modules can be temporary with no apparent symptom or complaint; this does not mean the control module is faulty. Do not replace a control module based only on a history U-code.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- Use [Data Link References](#) to determine what GMLAN serial data communications the non communicating control module uses.
- The control module may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not

shorted to ground, ensure none of the control circuits are shorted to ground before replacing the control module.

[Circuit/System Verification](#)

Verify that DTC U0073, U007A, U1814, B1428, B1370, B1380, B1440, B1441, B1325 or P0562 is not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) to diagnose those DTCs prior to this diagnostic.

[Circuit/System Testing](#)

Note: Use the schematic to identify the following:

- The control module locations on the high-speed GMLAN and high- voltage energy management GMLAN serial data circuits

- The control module B+, ignition, earth, accessory wake-up serial data and serial data circuit terminals

1. Vehicle OFF, disconnect the harness connector at the K114B hybrid powertrain control module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each B+ circuit terminal and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
4. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit fuse is open, test the control circuits of the K114B hybrid powertrain control module 2 for a short-circuit to earth. If the circuits test normal, replace the K114B hybrid powertrain control module 2.
5. If equipped, vehicle in Service Mode, verify that a test lamp illuminates between the accessory wake up serial data circuit terminal and earth.
If the test lamp does not illuminate, test the entire circuit, including the B+ circuit to the K9 body control module (BCM), for an open-circuit/high resistance or a short-circuit to earth. If the circuits test normal, replace the K9 BCM.
6. Vehicle OFF, disconnect the X1 harness connectors at the T18 battery charger.
7. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω in each serial data circuit between the K114B hybrid powertrain control module 2 and the T18 battery charger.
If greater than the specified range, test the serial data circuit for an open-circuit/high resistance between the K114B hybrid powertrain control module 2 and the T18 battery charger.
8. If all circuits test normal, replace the K114B hybrid powertrain control module 2.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [GMLAN Wiring Repairs](#)
- [Control Module References](#) for control module replacement, programming and setup

Symptoms - Data Communications

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Data Link Communications Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Scan Tool Does Not Power Up](#)
- [Scan Tool Does Not Communicate with High Speed GMLAN Device](#)
- [Scan Tool Does Not Communicate with Low Speed GMLAN Device](#)
- [Scan Tool Does Not Communicate with Chassis High Speed GMLAN Device](#)

Scan Tool Does Not Power Up

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
DLC B+	1	1	--	--
DLC Ground	--	1	--	--
1. Scan Tool Does Not Power Up				

[Circuit/System Description](#)

The data link connector (DLC) is a standardised 16 cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool B+ voltage at terminal 16
- Scan tool ground at terminal 4
- Common ground at terminal 5

[Diagnostic Aids](#)

- The scan tool will power up with the vehicle OFF. Some control modules however, will not communicate unless the vehicle is ON and the power mode master module sends the appropriate power mode message.
- If the B+ circuit, ground circuits, and connections of the DLC are functioning properly, the malfunction must be due to the scan tool.

[Control Module References](#) for scan tool information.

Circuit/System Testing

1. Vehicle OFF, test for less than 2.0 Ω between the earth circuits terminal 4 of the DLC and earth, and terminal 5 of the DLC and earth.
If greater than the specified range, test the ground circuit for an open/high resistance.
2. Vehicle in Service Mode, verify a test lamp illuminates between the B+ circuit terminal 16 at the DLC and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. If all circuits test normal, refer to the scan tool user guide.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Scan Tool Does Not Communicate with Chassis High Speed GMLAN Device

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Chassis High Speed GMLAN Serial Data (+)	1	U0100-U02FF*	1	--
Chassis High Speed GMLAN Serial Data (-)	1	U0100-U02FF*	1	--
Ground (DLC, terminal 5)	--	1	--	--

* No communications with one or more chassis high speed GMLAN modules. An open in only one chassis high speed GMLAN serial data circuit may allow degraded communication between the modules. An open between the data link connector (DLC) and the first splice will only effect the communication with the scan tool. The vehicle modules will still communicate.

1. No communication with any chassis high speed GMLAN module

Circuit/System Description

The GMLAN high speed chassis expansion bus functions the same as the GMLAN high speed bus, and the two buses operate in parallel. The expansion chassis bus was added to reduce message congestion on the primary high speed bus. Since the GMLAN high speed chassis bus and primary GMLAN high speed bus operate in the same manner, the diagnostics for each are the same.

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 ohm resistors. The terminating resistor can be a separate resistor in a connector assembly or internal to a control module. The resistors are used as the load for the chassis high speed GMLAN bus during normal vehicle operation. The chassis high-speed GMLAN is a differential bus. The chassis high-speed GMLAN serial data bus (+) and chassis high-speed GMLAN serial data bus (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds one volt to the chassis high-speed GMLAN serial data bus (+) circuit and subtracts one volt from the chassis high-speed GMLAN serial data bus (-) circuit. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note that a loss of serial data DTC does not represent a failure of the control module that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more modules was interrupted during diagnosis
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U code. The U code identifies which control module needs to be diagnosed for a communication issue.
- Communication may be available between the control module and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the control module using multiple GMLAN busses.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC).
- The engine may not start when there is a total malfunction of the chassis high speed GMLAN serial data bus.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Testing](#)

Note: Each control module may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- Chassis high speed GMLAN serial data circuit terminating resistors
- Control module locations on the chassis high speed GMLAN serial data circuits
- Each control module chassis high speed GMLAN serial data circuit terminals

1. Attempt to communicate with all control modules on the chassis high-speed GMLAN serial data circuit. Refer to [Data Link References](#) . Communications should not be available with two or more control modules on the chassis high speed GMLAN serial data circuit.

If only one control module is not communicating, diagnose that control module only. Refer to [DTC U0100-U02FF](#) .

2. Disconnect the scan tool from the X84 data link connector (DLC). The following tests will be done at the DLC connector.

3. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

4. Vehicle in Service Mode, test for less than 4.5 V between the serial data circuits listed below and earth:

- Terminal 12
- Terminal 13

If greater than the specified range, test the serial data circuit for a short to voltage. Refer to Testing the Serial Data Circuits for a Short to Voltage.

5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω between the serial data circuits listed below and ground:

- Terminal 12
- Terminal 13

If less than the specified range, test the serial data circuit for a short to ground. Refer to Testing the Serial Data Circuits for a Short to ground.

6. Test for 50-70 Ω between the serial data circuits terminal 12 and terminal 13.

If less than 35 Ω , test for a short between the serial data circuits. Refer to Testing the Serial Data Circuits for a Short between the Circuits.

If 35-50 Ω there may be a third terminating resistor between the serial data circuits. This can happen if the incorrect control module is installed. Some control modules are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness.

If greater than 70 Ω but less than infinite, test the serial data circuit for an open/high resistance. Refer to Testing the Serial Data Circuits for an Open/High Resistance.

If infinite, test the serial data circuits between the DLC and the first connection to the serial data circuit for an open/high resistance.

7. If the serial data circuits test normal, refer to Testing the Control Module Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the chassis high-speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle in Service Mode, test for greater than 4.5 V between each serial data circuit at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was disconnected.
3. Vehicle OFF, disconnect the harness connectors with the chassis high-speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to voltage.
4. Vehicle in Service Mode, test for greater than 4.5 V between the serial data circuits at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to voltage on the serial data circuit between 2 control modules or splice packs, if equipped
 - A short to voltage on the serial data circuit between a control module and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, disconnect the harness connectors with the chassis high-speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .
If all serial data circuits are greater than the specified range, replace the control module that was disconnected.
3. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to ground.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .
If greater than the specified range for all serial data circuits, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to ground on the serial data circuit between 2 control modules or splice packs, if equipped
 - A short to ground on the serial data circuit between a control module and a terminating resistor.

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, disconnect the harness connectors with the chassis high-speed GMLAN serial data circuits at an easily accessible control module that is not communicating.

2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .
If each pair of serial data circuits is greater than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another control module, in the direction of the circuits shorted together.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .
If each pair of serial data circuits is greater than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
 - Serial data circuits shorted together between 2 control modules or splice packs, if equipped
 - Serial data circuits shorted together between a control module and a terminating resistor
 - A shorted terminating resistor

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, disconnect the harness connectors with the chassis high-speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω .
If each pair of serial data circuits is less than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another control module, in the direction of the open circuit.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω .
If each pair of serial data circuits is less than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
 - An open/high resistance on the serial data circuit between 2 control modules or splice packs, if equipped
 - An open/high resistance on the serial data circuit between a control module and a terminating resistor
 - An open/high resistance terminating resistor

Testing the Control Module Circuits

1. Vehicle OFF, disconnect the harness connectors at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to

power down. Test for less than 10 Ω between each earth circuit terminal and earth, and at the control module connector that was just disconnected.

If greater than the specified range, test the earth circuit and earth connection for an open-circuit/high resistance.

3. Vehicle OFF, verify that a test lamp does not illuminate between each ignition circuit terminal and earth.

If the test lamp does illuminate, test the ignition circuit for a short to voltage. If the circuits test normal, replace the appropriate control module.

4. Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.

If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the appropriate control module.

5. Vehicle OFF, connect the harness connectors at the control module that was disconnected.

6. Repeat step 1 at another control module that is not communicating until one of the following conditions are isolated:

- An open-circuit/high resistance on the earth circuit or earth connection
- A short-circuit to voltage, a short-circuit to earth or an open-circuit/high resistance on the ignition circuit

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data (+)	1	U0100-U02FF*	1	--
High Speed GMLAN Serial Data (-)	1	U0100-U02FF*	1	--
Ground (DLC, terminal 5)	--	1	--	--

* No communications with one or more high speed GMLAN modules. An open in only one high-speed GMLAN serial data circuit may allow degraded communication between the control modules. An open between the data link connector (DLC) and the first splice will only effect the communication with the scan tool. The vehicle modules will still communicate.

1. No communication with any high speed GMLAN module

[Circuit/System Description](#)

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 ohms resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another control module. The resistors are used as the load for the high-speed GMLAN bus during normal vehicle operation. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data bus (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds one volt to the high speed GMLAN serial data bus (+) circuit and subtracts one volt from the high speed GMLAN serial data bus (-) circuit. If serial data is lost, control modules will set a no communication code against the non-communicating control module. Note that a loss of serial data DTC does not represent a failure of the control module that set it.

[Diagnostic Aids](#)

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or

have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

- A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more modules was interrupted during diagnosis.
 - A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U code. The U code identifies which control module needs to be diagnosed for a communication issue.
 - Communication may be available between the body control module (BCM) and the scan tool with the high speed GMLAN serial data system inoperative. This condition is due to the BCM using both the high and low speed GMLAN systems.
 - An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
 - The engine will not start when there is a total malfunction of the high speed GMLAN serial data bus.
 - Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed GMLAN communications with the scan tool.
 - These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:
 - Vehicle will not crank
 - Vehicle cranks but will not start
 - Vehicle stability enhancement system warning lights and messages
 - PRNDL gear indicator position errors

Circuit/System Verification

Note: Each control module may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- High speed GMLAN serial data circuit terminating resistors
- Control module locations on the high speed GMLAN serial data circuits
- Each control module's B+, ignition, earth and high-speed GMLAN serial data circuit terminals

1. Attempt to communicate with all control modules on the high speed GMLAN serial data circuit Refer to [Data Link References](#) . Communications should not be available with two or more control modules on the high speed GMLAN serial data circuit.

If only one control module is not communicating, diagnose that control module only. Refer to [DTC U0100-U02FF](#) .

2. Disconnect the scan tool from the X84 data link connector (DLC). The following tests will be done at the DLC connector.

3. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

4. Vehicle in Service Mode, test for less than 4.5 V between the serial data circuits listed below and earth:

- Terminal 6
- Terminal 14

If greater than the specified range, test the serial data circuit for a short to voltage. Refer to Testing the Serial Data Circuits for a Short to Voltage.

5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω between the serial data circuits listed below and ground:

- Terminal 6
- Terminal 14

If less than the specified range, test the serial data circuit for a short to ground. Refer to Testing the Serial Data Circuits for a Short to ground.

6. Test for 50-70 Ω between the serial data circuits terminal 6 and terminal 14.

If less than 35 Ω , test for a short between the serial data circuits. Refer to Testing the Serial Data Circuits for a Short between the Circuits.

If 35-50 Ω there may be a third terminating resistor between the serial data circuits. This can happen if the incorrect control module is installed. Some control modules are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness.

If greater than 70 Ω but less than infinite, test the serial data circuit for an open/high resistance. Refer to Testing the Serial Data Circuits for an Open/High Resistance.

If infinite, test the serial data circuits between the DLC and the first connection to the serial data circuit for an open/high resistance.

7. If the serial data circuits test normal, refer to Testing the Control Module Circuits.

Circuit/System Testing

Note: Some control modules with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the control module for each of the following tests.

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the high- speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle in Service Mode, test for greater than 4.5 V between each serial data circuit at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was disconnected.
3. Vehicle OFF, disconnect the harness connectors with the high- speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to voltage.
4. Vehicle in Service Mode, test for greater than 4.5 V between the serial data circuits at the control module connector that was just disconnected and earth. Verify that one or more serial data circuits are greater than 4.5 V.
If all serial data circuits are less than the specified range, replace the control module that was just disconnected.
5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to voltage on the serial data circuit between 2 control modules or splice packs, if equipped.
 - A short to voltage on the serial data circuit between a control module and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, disconnect the harness connectors with the high- speed GMLAN serial data circuits at an easily accessible control module.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between each serial data circuit at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .
If all serial data circuits are greater than the specified range, replace the control module that was disconnected.
3. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuit shorted to ground.
4. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 1k Ω between the serial data circuits at the control module connector that was just disconnected and ground. Verify that one or more serial data circuits are less than 1k Ω .
If greater than the specified range for all serial data circuits, replace the control module that was just disconnected.

5. Repeat step 3 until one of the follow conditions are isolated:
 - A short to ground on the serial data circuit between 2 control modules or splice packs, if equipped.
 - A short to ground on the serial data circuit between a control module and a terminating resistor.
 - A short to ground on the serial data circuit between the DLC and the first control module or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, disconnect the harness connectors with the high- speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .

If each pair of serial data circuits is greater than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the circuits shorted together.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 110 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are less than 110 Ω .

If each pair of serial data circuits is greater than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:
 - Serial data circuits shorted together between 2 control modules or splice packs, if equipped.
 - Serial data circuits shorted together between a control module and a terminating resistor.
 - Serial data circuits shorted together between the DLC and the first control module or splice pack.
 - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, disconnect the harness connectors with the high- speed GMLAN serial data circuits at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω .

If each pair of serial data circuits is less than the specified range, replace the control module that was disconnected.
3. Connect the harness connectors at the control module that was disconnected.
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another control module, in the direction of the open circuit.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 130 Ω between each pair of serial data circuits at the control module connector that was just disconnected. Verify that one pair of serial data circuits are greater than 130 Ω .

If each pair of serial data circuits is less than the specified range, replace the control module that was just disconnected.
6. Repeat step 3 until one of the following conditions are isolated:

- An open/high resistance on the serial data circuit between 2 control modules or splice packs, if equipped.
- An open/high resistance on the serial data circuit between a control module and a terminating resistor.
- An open/high resistance terminating resistor.

Testing the Control Module Circuits

1. Vehicle OFF, disconnect the harness connectors at an easily accessible control module that is not communicating.
2. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between each earth circuit terminal and earth, and at the control module connector that was just disconnected.
If greater than the specified range, test the earth circuit and earth connection for an open-circuit/high resistance.
3. Vehicle OFF, verify that a test lamp does not illuminate between each ignition circuit terminal and earth.
If the test lamp does illuminate, test the ignition circuit for a short to voltage. If the circuits test normal, replace the appropriate control module.
4. Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuits test normal, replace the appropriate control module.
5. Vehicle OFF, connect the harness connectors at the control module that was just disconnected.
6. Repeat step 1 at another control module that is not communicating until one of the following conditions are isolated:
 - An open-circuit/high resistance on the earth circuit or earth connection
 - A short-circuit to voltage, a short-circuit to earth or an open-circuit/high resistance on the ignition circuit

Scan Tool Does Not Communicate with Low Speed GMLAN Device

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Speed GMLAN Serial Data	1	U0100-U02FF*	1	--
Ground (DLC, terminal 5)	--	1*	--	--

* An open between the data link connector serial data circuit terminal 1 or ground circuit terminal 5 and the BCM circuit will only effect the communication with the scan tool.

1. No communication on any low speed GMLAN module

Circuit/System Description

The serial data is transmitted over a single wire to the appropriate control modules. The transmission speed for GMLAN low-speed is up to 83.33 Kb/s. Under normal vehicle operating conditions, the speed of the bus is 33.33 Kb/s. The control modules toggle the serial data circuit between 0-5 V during normal communications. To wake the control modules connected to the GMLAN low speed serial data circuit, a voltage wake up pulse of 10 V is sent out. If serial data is lost, control modules will set a no communication code against the non-communicating control module. A loss of serial data communications DTC does not represent a failure of the module that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of- communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
 - A control module on the data communication circuit was disconnected while the communication circuit is awake.
 - Power to one or more modules was interrupted during diagnosis

- A low battery condition was present, so some control modules stop communicating when battery voltage drops below a certain threshold.
 - Battery power was restored to the vehicle and control modules on the communication circuit did not all re-initialise at the same time.
 - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a control module reporting a U-code. The U-code identifies which control module needs to be diagnosed for a communication issue.
 - Communication may be available between the body control module (BCM) and the scan tool with the low speed GMLAN serial data system inoperative. This condition is due to the BCM using both the high and low speed GMLAN systems.
 - An open in the low speed GMLAN serial data circuit between the splice pack and a module will only affect that specific module. This type of failure will set a loss of communication DTC for each module effected, and the other modules will still communicate.
 - An open-circuit in the data link connector (DLC) ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
 - The engine may not start when there is a total malfunction of the low speed GMLAN serial data circuit.
 - Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed LAN communications with the scan tool. These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:
 - Vehicle will not crank
 - Vehicle cranks but will not start
 - Vehicle stability enhancement system warning lights and messages
 - PRNDL gear indicator position errors

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- Control module and splice pack locations on the low speed GMLAN serial data circuit
- The low speed GMLAN serial data circuit terminals for each control module, component, or splice pack

1. Attempt to communicate with all control modules on the low speed GMLAN serial data circuit. Refer to [Data Link References](#) . Communications should not be available with two or more control modules on the low speed GMLAN serial data circuit.
 - If only one control module is not communicating, diagnose that control module only. Refer to [DTC U0100-U02FE](#) .
 - If one or more control modules are communicating but not all, refer to Testing the Serial Data Circuit for an Open/High Resistance.
2. Vehicle OFF, disconnect the scan tool from the X84 data link connector (DLC). The following tests will be done at the DLC connector.
3. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
4. Vehicle in Service Mode, test for less than 4.5 V between the serial data circuit terminal 1 and earth.
 - If greater than the specified range, test the serial data circuit for a short to voltage. Refer to Testing the Serial Data Circuit for a Short to Voltage.
5. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω between the serial data circuit terminal 1 and earth.
 - If less than the specified range, test the serial data circuit for a short to ground. Refer to Testing the Serial Data Circuits for a Short to ground.
6. Disconnect the harness connector at the first splice pack closest in the circuit to the DLC.
7. Test for less than 2 Ω between the DLC serial data circuit terminal 1 and the splice pack connector serial data input terminal.
 - If greater than the specified range, test the serial data circuit for an open/high resistance. If the circuit tests normal, replace the splice pack.

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the appropriate harness connectors at the following components:
 - All low speed serial data splice packs
 - Any control module or component that may be between the splice packs
2. Vehicle in Service Mode, test for less than 4.5 V between the DLC serial data circuit terminal 1 and earth.
 - If greater than the specified range, repair the short to voltage.
3. Test for less than 4.5 V between each serial data circuit at each component connector and ground.
 - If greater than the specified range, perform the appropriate test listed below:
 - Serial data circuits with one control module, test the serial data circuit for a short to voltage. If the circuit tests normal, replace the control module.
 - Serial data circuits with 2 or more control modules, test each section of the serial data circuit for a short to voltage. If the circuits test normal, replace the control

- module that causes the short to voltage when connected.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, disconnect the appropriate harness connectors at the following components:
 - All low speed serial data splice packs
 - Any control module or component that may be between the splice packs
2. Test for infinite resistance between the DLC serial data circuit terminal 1 and ground.
If not the specified value, repair the short to ground.
3. Vehicle OFF, and all vehicle systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω between each serial data circuit at the splice pack and earth.
If less than the specified range, perform the appropriate test listed below:
 - Serial data circuits with one control module, test the serial data circuit for a short to ground. If the circuit tests normal, replace the control module.
 - Serial data circuits with 2 or more control modules, test each section of the serial data circuit for a short to ground. If the circuits test normal, replace the control module that causes the short to ground when connected.

Testing the Serial Data Circuit for an Open/High Resistance

1. If equipped with a second splice pack, Vehicle in Service Mode, verify the scan tool communicates with one or more control modules connected to the second splice pack.
If all control modules on the second splice pack do not communicate, test the serial data circuit between the first and second splice packs for an open/high resistance. If the circuit tests normal, test the second splice pack for an open/high resistance. If the splice pack tests normal, replace any control module or component that may be between those two splice packs.
2. If equipped with a third splice pack, Vehicle in Service Mode, verify the scan tool communicates with one or more control modules connected to the third splice pack.
If all control modules on the third splice pack do not communicate, test the serial data circuit between the second and third splice packs for an open/high resistance. If the circuit tests normal, test the third splice pack for an open/high resistance. If the splice pack tests normal, replace any control module or component that may be between the those two splice packs.
3. Vehicle OFF, disconnect the splice pack containing the serial data circuits to the control modules that are not communicating.
4. Install a 3 A fused jumper wire between the splice pack connector serial data input terminal and a low speed GMLAN serial data circuit that is not communicating.
5. Vehicle in Service Mode, verify that the scan tool communicates with the control modules connected to the low-speed GMLAN serial data circuit.
If any control module does not communicate, test each section of the serial data circuit for an open/high resistance. If the circuits test normal, replace the control module that does not communicate when connected.

Data Link References

This table identifies which serial data link that a particular module uses for in-vehicle data transmission. Some modules may use more than one data link to communicate. Some modules may have multiple communication circuits passing through them without actively communicating on that data link. This table is used to assist in correcting a communication malfunction. For the description and operation of these serial data communication circuits refer to [Data Link Communications Description and Operation](#).

Body Control System Description and Operation

The body control system consists of the body control module (BCM), communications, and various input and outputs. Some inputs, outputs and messages require other modules to interact with the BCM. The BCM also has discrete input and output terminals to control the vehicle's body functions. The BCM is wired to the high speed GMLAN serial data bus, low speed GMLAN serial data bus and Multiple LIN buses and acts as a gateway between them.

[Power Mode Master](#)

This vehicle body control module (BCM) functions as the power mode master (PMM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determining the power mode that will be sent over the serial data circuits to the other modules that need this information; the PMM will activate relays and other direct outputs of the PMM as needed. Refer to [Power Mode Description and Operation](#) for a complete description of power mode functions.

[Gateway](#)

The body control module (BCM) in this vehicle functions as a gateway or translator. The purpose of the gateway is to translate serial data messages between the GMLAN high speed bus and the GMLAN low speed bus for communication between the various modules. The gateway will interact with each network according to that network's transmission protocol.

All communication between the BCM and a scan tool is on the high speed GMLAN serial data circuits. A lost communication DTC typically is set in modules other than the module with a communication failure.

[Body Control](#)

The various body control module (BCM) input and output circuits are illustrated in the corresponding functional areas on the BCM electrical schematics. Refer to the [Body Control System Schematics](#) for more detailed information.

Data Link Communications Description and Operation

Note: This is an overview of different serial data buses used by GM control modules to communicate with each others. Use schematics to find out which serial data buses are configured for a specific vehicle.

[Circuit Description](#)

There are many components in a vehicle that rely on information from other sources, transmit information to other sources, or both. Serial data communication networks provide a reliable, cost effective, way for various components of the vehicle to "talk" to one another and share information.

GM uses a number of different communication buses to insure the timely and efficient exchange of information between control modules. When compared to each other, some of these buses are different in nature as far as speed, signal characteristics, and behaviour. An example of this is the High Speed GMLAN and Low Speed GMLAN buses.

On the other hand, when other buses are compared to each other they have similar characteristics and simply operate in parallel. In this case they are used to group together components which have high interaction. Examples are the High Speed GMLAN, Powertrain Expansion, and Chassis Expansion buses. This allows them to communicate with each other on a bus with reduced message congestion insuring faster and the more timely exchange of information than if all vehicle control modules were on a single bus.

The majority of information that exists within a given network generally stays local; however some information will have to be shared on other networks. Control modules designated as Gateway's perform the function of transferring information between the various buses. A Gateway module is connected to at least 2 buses and will interact with each network according to its message strategy and transmission models.

GMLAN provides the capability for a receiving control module to monitor message transmissions from other control modules in order to determine if messages of interest are not being received. The primary purpose is to allow reasonable default values to be substituted for the information no longer being received. Additionally, a control module may set a Diagnostic Trouble Code to indicate that the control module it is expecting information from is no longer communicating.

[High Speed GMLAN Circuit Description](#)

A High Speed GMLAN Bus is used where data needs to be exchanged at a high enough rate to minimise the delay between the occurrence of a change in sensor value and the reception of this information by a control device using the information to adjust vehicle system performance.

The High Speed GMLAN serial data network consists of two twisted wires. One signal circuit is identified as GMLAN-High and the other signal circuit is identified as GMLAN-Low. At each end of the data bus there is a 120 Ω termination resistor between the GMLAN-High and GMLAN-Low circuits.

Data symbols (1s and 0s) are transmitted sequentially at a rate of 500 Kbit/s. The data to be transmitted over the bus is represented by the voltage difference between the

GMLAN-High signal voltage and the GMLAN-Low signal voltage.

When the two wire bus is at rest the GMLAN-High and GMLAN-Low signal circuits are not being driven and this represents a logic "1". In this state both signal circuits are at the same voltage of 2.5 V. The differential voltage is approximately 0 V.

When a logic "0" is to be transmitted, the GMLAN-High signal circuit is driven higher to about 3.5 V and the GMLAN-Low circuit is driven lower to about 1.5 V. The differential voltage becomes approximately 2.0 (+/- 0.5) V.

Chassis High Speed GMLAN Circuit Description

The GMLAN Chassis Expansion Bus is basically a copy of the High Speed GMLAN Bus except that its use is reserved for chassis components. This implementation splits message congestion between two parallel buses helping to insure timely message transmission and reception. Sometimes communication is required between the Chassis Expansion Bus and the primary High Speed GMLAN Bus. This is accomplished by using the Electronic Brake Control Module (EBCM) as the Gateway module. Since the High Speed GMLAN Chassis Expansion Bus and primary High Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

Powertrain High-Speed GMLAN Circuit Description

The GMLAN Powertrain Expansion Bus is basically a copy of the High-Speed GMLAN Bus except that its use is reserved for Hybrid powertrain components or Diesel powertrain components in some cases. The bus is optional based upon feature content. Sometimes communication is required between the Powertrain Expansion Bus and the primary High-Speed GMLAN Bus. This is accomplished by using the Engine Control Module (ECM) as the Gateway module. Since the High-Speed GMLAN Powertrain Expansion Bus and the primary High-Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

All diagnostic information is available only through the primary high-speed GMLAN bus. However, Service Programming for the high-speed GMLAN powertrain expansion bus is performed only through the auxiliary data connector.

High-Voltage Energy Management High-Speed GMLAN Circuit Description

The GMLAN High-Voltage Energy Management Bus is basically a copy of the High-Speed GMLAN Bus except that its use is reserved for Hybrid charging components of an electric vehicle. Sometimes communication is required between the Low-Speed GMLAN Bus and the High-Voltage Energy Management Bus. This is accomplished by using the Hybrid Powertrain Control Module 2 as the Gateway module. Since the High-Speed GMLAN High-Voltage Energy Management Bus and primary High-Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

All diagnostic information is available only through the primary high-speed GMLAN bus.

CAN Graphical Interface (CGI) Circuit Description

This bus is used by the Entertainment sub-system to transfer high-rate display graphics between the Radio and the Info Display Module and/or Radio/HVAC Control. The electrical characteristics of the CAN Graphical Interface (CGI) Bus are very similar to the High Speed GMLAN Bus. The message strategy and construction of messages are different however. Sometimes communication is required between the CAN Graphical Interface Bus and the Low Speed GMLAN Bus. This is accomplished by using the Radio SilverBox as the Gateway module. Since the CAN Graphical Interface Bus and primary High Speed GMLAN Bus have similar electrical characteristics, the diagnostics for each are similar.

In the case where the Info Display Module and Radio/HVAC Control are separate control modules the Info Display Module is responsible for passing information between the Radio and the Radio/HVAC Control. The Radio interfaces only with the Info Display Module and the Info Display Module then communicates with the Radio/HVAC Control through a Local Interconnect Network (LIN) interface.

A bus wake up signal will be generated by the Radio or by the Info Display Module when the system functionality is required. The communication function of the CAN Graphical Interface shall be enabled or disabled based on the voltage level of the Centre Stack Wake. The network will stay awake as long as the circuit voltage is driven low, to less than 1.5 V. Communications are disabled with a high circuit voltage around 5.0 V.

The Radio can execute a warm reset of the Info Display Module if the Info Display Module fails to respond to the Radio's request. The Centre Stack Reset is a low-asserted pull down output (less than 1.5 V) from the Radio to the Info Display Module and has the same electrical characteristics as those for the Centre Stack Wake signal defined above.

Mid Speed GMLAN Circuit Description

The Mid Speed GMLAN Bus is very similar to the High Speed GMLAN Bus except that it uses a slower transmission rate of 125 Kbit/s. This bus is intended for use where the system response time demands that a large amount of data be transmitted in a relatively short amount of time, such as updating a graphics display. As such it has usually been used for infotainment applications. Sometimes communication is required between the Low Speed GMLAN Bus and the Mid Speed GMLAN Bus. This is accomplished by using the Radio (Silverbox) as the Gateway module. Since the Mid Speed GMLAN Bus and primary High Speed GMLAN Bus operate in a similar manner, the diagnostics for each are similar.

Low Speed GMLAN Circuit Description

Low Speed GMLAN Bus is used in applications where a high data rate is not required which allows for the use of less complex components. It is typically used for operator controlled functions where the response time requirements are slower than those required for dynamic vehicle control.

The Low Speed GMLAN Serial Data Network consists of a single wire, ground referenced bus with high side voltage drive. During on road vehicle operation data symbols (1s and 0s) are transmitted sequentially at the normal rate of 33.3 Kbit/s. For component programming only, a special high speed data mode of 83.3 Kbit/s may be used.

Unlike the high speed dual wire networks, the single wire low speed network does not use terminating resistors at either end of the network.

The data symbols to be transmitted over the bus are represented by different voltage signals on the bus. When the Low Speed GMLAN Bus is at rest and is not being driven, there is a low signal voltage of approximately 0.2 V. This represents a logic "1". When a logic "0" is to be transmitted, the signal voltage is driven higher to around 4.0 V or higher.

Local Interconnect Network (LIN) Circuit Description

The Local Interconnect Network (LIN) Bus consists of a single wire with a transmission rate of 10.417 Kbit/s. This bus is used to exchange information between a master control module and other smart devices which provide supporting functionality. This type of configuration does not require the capacity or speed of either a High Speed GMLAN Bus or Low Speed GMLAN Bus and is thus relatively simpler.

The data symbols (1s and 0s) to be transmitted are represented by different voltage levels on the communication bus. When the LIN Bus is at rest and is not being driven, the

signal is in a high voltage state of approximately V_{batt} . This represents a logic "1". When a logic "0" is to be transmitted, the signal voltage is driven low to about ground (0.0 V).

Communication Enable Circuit Description

Control modules on GMLAN high speed type networks, excluding the Mid Speed GMLAN Bus and CAN Graphical Interface Bus, enable or disable communication based on the voltage level of this circuit. When the circuit voltage is high (around 12 V), communications are enabled. When the circuit is low, communications are disabled.

The CAN Graphical Interface Bus is similar but uses different voltage levels. See description above for the CAN Graphical Interface Bus.

Data Link Connector (DLC)

The data link connector (DLC) is a standardised 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Pin 1 Low speed GMLAN communications terminal
- Pin 2 Class 2 communications terminal
- Pin 3 Mid speed GMLAN serial bus (+) terminal
- Pin 4 Scan tool power ground terminal
- Pin 5 Common signal ground terminal
- Pin 6 High speed GMLAN serial data bus (+) terminal
- Pin 7 Keyword communications terminal
- Pin 11 Mid speed GMLAN serial bus (-) terminal
- Pin 12 Chassis high-speed GMLAN serial bus (+) terminal
- Pin 13 Chassis high-speed GMLAN serial bus (-) terminal
- Pin 14 High speed GMLAN serial data bus (-) terminal
- Pin 16 Scan tool power, battery positive voltage terminal

Auxiliary Data Connector

The auxiliary data connector is a standardised 16-cavity connector. This connector shall be available on all vehicles that require service programming for controllers on the Powertrain Expansion Bus for Hybrid applications only. Diagnostics shall be available via the data link connector (DLC), and not provided via the auxiliary data connector. The pinouts for this auxiliary data connector are as follows:

- Pin 3 High-voltage energy management high-speed GMLAN serial bus (+) terminal
- Pin 4 Scan tool power ground terminal
- Pin 5 Common signal ground terminal
- Pin 8 Ground terminal for auxiliary data connector identification
- Pin 11 High-voltage energy management high-speed GMLAN serial bus (-) terminal

- Pin 12 Powertrain high-speed GMLAN serial bus (+) terminal
- Pin 13 Powertrain high-speed GMLAN serial bus (-) terminal
- Pin 16 Scan tool power, battery positive voltage terminal

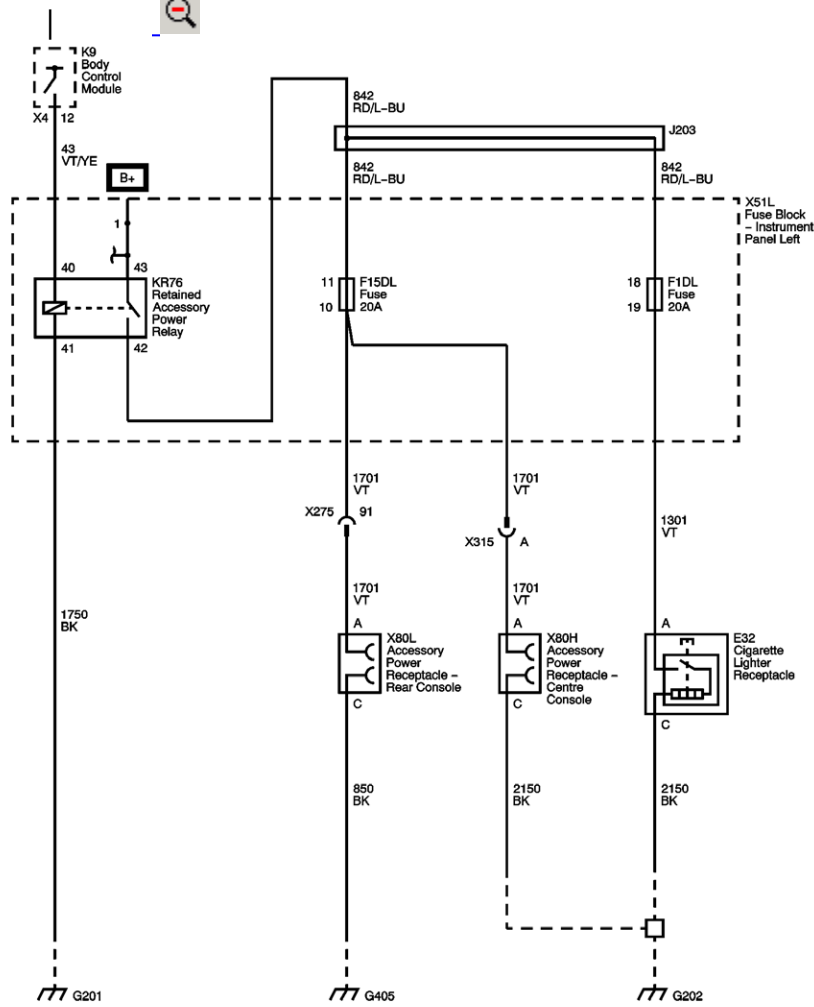

Serial Data Reference

The scan tool communicates over the various buses on the vehicle. When a scan tool is installed on a vehicle, the scan tool will try to communicate with every control module that could be optioned into the vehicle. If an option is not installed on the vehicle, the scan tool will display No Comm for that optional control module. In order to avert misdiagnoses of No Communication with a specific control module, refer to [Data Link References](#) for a list of control modules, the buses they communicate with, and the RPO codes for a specific control module.

Cigar Lighter/Power Outlet Schematics

Cigarette Lighter/Power Outlets

[Master Electrical Component List](#)

[F1DL, F2DL, F3DL, F4DL, F5DL, F6DL, F7DL, F10DL, F11DL and F15DL Fuses](#)

[G201, G203, G205, G304, G401 and G404](#)

[G405](#)

[G201, G203, G205, G304, G401 and G404](#)

Symptoms - Power Outlets

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Power Outlet Receptacle Malfunction - DTC B1445](#) in order to diagnose the system.

Power Outlet Receptacle Malfunction - DTC B1445

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B1445 02: Control Module Voltage Output Circuit Short to Ground

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Switch B+	1	1	--	--
Relay Coil Ignition	B1445 02	1	2	--
Relay Switch Control	1	1	2	--
Relay Coil Ground	--	1	--	--
Ground	--	1	--	--
1. Accessory Power Receptacle or Cigarette Lighter Malfunction				
2. Accessory Power Receptacle or Cigarette Lighter Always ON				

[Circuit/System Description](#)

The body control module (BCM) controls the wired power components by applying voltage to the ignition voltage circuit at harness connector X4 terminal 12. Voltage is applied when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

[Conditions for Running the DTC](#)

- The system voltage is between 9–16 V.
- The DTC can only set when the output is actively being requested by the module.

Conditions for Setting the DTC

The DTC will set only when the module requests the output and there is a short to ground in the ignition voltage circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present.
- A history DTC clears when the module power mode cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

Install a 12 V DC accessory into a appropriate X80 Accessory Power Receptacle or activate the E32 Cigarette Lighter Receptacle. Vehicle in Service Mode, command the Auxiliary Power Relay Command ON and OFF with a scan tool. The KR76 Retained Accessory Power Relay should click and the 12 V DC accessory or the E32 Cigarette Lighter Receptacle should have power.

Circuit/System Testing

DTC B1445 02 and Accessory Power Receptacle or Cigarette Lighter Malfunction

1. Vehicle OFF, disconnect the KR76 Retained Accessory Power Relay.
2. Test for less than 5 Ω between the ground circuit terminal 41 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Verify that a test lamp does not illuminate between the control circuit terminal 40 and earth.
If the test lamp illuminates, test the control circuit for a short to voltage.
4. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 40 and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. Verify that a test lamp illuminates between the B+ circuit terminal 43 and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the control circuit terminal 42 for a short to earth.
6. Disconnect the harness connector at the inoperative X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.
7. Test for less than 5 Ω between the ground circuit terminal C and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
8. Connect the harness connector at the appropriate X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.
9. Connect a 20 A fused jumper wire between the KR76 Retained Accessory Power Relay B+ circuit terminal 43 and the control circuit terminal 42. Verify that the accessory has power.
If the accessory does not have power, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the appropriate X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.
10. If all circuits test normal, test or replace the KR76 Retained Accessory Power Relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR76 Retained Accessory Power Relay.
2. Test for 60-180 Ω between terminals 40 and 41.
If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
 - 43 and 40
 - 43 and 42
 - 43 and 41

-
- 41 and 42

If not the specified value, replace the KR76 Retained Accessory Power Relay.

4. Install a 20 A fused jumper wire between relay terminal 40 and 12 V. Install a jumper wire between relay terminal 41 and earth. Test for less than 2 Ω between terminals 42 and 43.

If greater than specified range, replace the KR76 Retained Accessory Power Relay.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Accessory Power Receptacle Replacement](#)
- [Relay Replacement](#) : [Within an Electrical Center](#) → [Attached to Wire Harness](#)

Accessory Power Receptacle Replacement

Special Tools

EL-42059 Cigar Lighter Socket Remover

For equivalent regional tools, refer to [Special Tools](#).

[Removal Procedure](#)

1. Remove the auxiliary power outlet fuse from the fuse block.
2. Remove the receptacle:

- 2.1. Look into the receptacle. There are two 3 mm (0.11 in) tab windows 12 mm (0.47 in) from the front of the receptacle. The *EL-42059* remover pushes the plastic latches from these tab windows and the receptacle can be pulled straight out.
- 2.2. Place one side of the "T" portion of the *EL-42059* remover into the tab window. The *EL-42059* remover will not fit straight into the receptacle. Angle the slightly for insertion into the receptacle.
- 2.3. Insert the other side of the "T" into the opposite tab window.

You must move the *EL-42059* remover handle horizontally to engage the other tab window.

- 2.4. Use the *EL-42059* remover to pull the receptacle straight out.

3. If *EL-42059* remover tool fails to release the lighter socket from the retainer, perform the following alternate method:
 - 3.1. Insert a small grinding tool with a cutoff wheel into the socket.
 - 3.2. Remove the plastic latches in the 3 mm (0.11 in) square windows.
 - 3.3. Use the *EL-42059* remover as directed above to remove the socket.

[Installation Procedure](#)

1. Route the connector through the retainer. Align the accessory power receptacle retainer to the slot in the opening.
2. Install the retainer by pressing into place fully seated.
3. Connect the electrical connector to the receptacle.
4. Align the tabs on the receptacle to the slots in the retainer. Install the accessory power receptacle by pressing into place until fully seated.
5. Install the accessory power receptacle fuse.

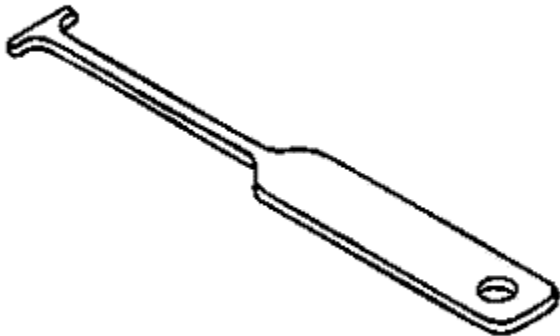

Power Outlets Description and Operation

[12 Volt Power Outlet Receptacle Description and Operation](#)

The accessory power receptacles and cigarette lighter receptacle are supplied with 12 V when the vehicle is in Service Mode or in Vehicle ON Mode.

Vehicle Zoning Strategy - Passenger Car

All grounds, in-line connectors, pass-through grommets, and splices have identifying numbers that correspond to where they are located in the vehicle. The following table explains the numbering system.

Callout Numbers	Zone Description
100-199	Engine compartment- All forward of the dash panel Note: 001-099 are additional for the engine compartment - ONLY to be used if all 100-199 items are used

200-299	Within the instrument panel area
300-399	Passenger compartment - From the instrument panel to the rear wheelhouse
400-499	Luggage compartment - From the rear wheelhouse to the rear of the vehicle
500-599	Within the left front door
600-699	Within the right front door
700-799	Within the left rear door
800-899	Within the right rear door
900-999	Within the luggage compartment lid or hatch

A23RR	Door Latch Assembly - Right Rear	--	In the passenger compartment, in the rear middle of the right rear door	Right Rear Door Components	A23RR Door Catch Assembly - Right Rear
B1	A/C Refrigerant Pressure Sensor	--	In the engine compartment, at the upper right side of the A/C condenser, in the high-pressure line	Engine Compartment Components - Front	B1 A/C Refrigerant Pressure Sensor
B1C	A/C Low Side Pressure Sensor	-	In the engine compartment, at the front of the engine, attached to the A/C line	Right Front of Engine Components	B1C A/C Low-Side Pressure Sensor
B5LF	Wheel Speed Sensor - Left Front	--	Under the vehicle, mounted to the left front steering knuckle	Underbody - Wheel Components	B5LF Wheel Speed Sensor - Left Front
B5LR	Wheel Speed Sensor - Left Rear	--	Under the vehicle, mounted to the left rear suspension	Underbody - Wheel Components	B5LR Wheel Speed Sensor - Left Rear
B5RF	Wheel Speed Sensor - Right Front	--	Under the vehicle, mounted to the right front steering knuckle	Underbody - Wheel Components	B5RF Wheel Speed Sensor - Right Front
B5RR	Wheel Speed Sensor - Right Rear	--	Under the vehicle, mounted to the right rear suspension	Underbody - Wheel Components	B5RR Wheel Speed Sensor - Right Rear
B7B	Air Temperature Sensor - Duct Lower	-	In the passenger compartment, behind the instrument panel, attached to the left lower HVAC duct	Instrument Panel - HVAC Components	B7B Air Temperature Sensor - Duct Lower
B7F	Air Temperature Sensor - Duct Upper	-	In the passenger compartment, behind the instrument panel, attached to the left upper HVAC duct	Instrument Panel - HVAC Components	B7F Air Temperature Sensor - Duct Upper
B9	Ambient Air Temperature Sensor	-	At the right front corner of the vehicle, behind the right side of the front fascia	Engine Compartment Components - Front	B9 Ambient Air Temperature Sensor
B10B	Ambient Light/Sunload Sensor	-	In the passenger compartment, at the top centre of the instrument panel	Instrument Panel Components (1 of 2)	B10B Ambient Light/Sunload Sensor
B14A	Transmission Output Shaft Speed Sensor	-	In the engine compartment, internal to the transmission	-	B14A Transmission Output Shaft Speed Sensor
B15	Transmission Internal Mode Switch	-	In the engine compartment, internal to the transmission	-	<ul style="list-style-type: none"> B15 Transmission Internal Mode Switch X1 B15 Transmission Internal Mode Switch X2
B18	Battery Current Sensor	--	In the luggage compartment, under the storage compartment floor, on the negative battery cable	Luggage Compartment Components	B18 Battery Current Sensor
B20	Brake Fluid Level Switch	--	In the left rear of the engine compartment, at the bottom of the brake fluid reservoir	Engine Compartment Components - Left	B20 Brake Fluid Level Switch
B22	Brake Pedal Position Sensor	--	in the passenger compartment, under the driver side of the instrument panel, connected to the brake pedal	Instrument Panel Components (2 of 2)	B22 Brake Pedal Position Sensor

B23E	Camshaft Position Sensor - Exhaust	-	In the right front of the engine compartment, on the right front of the cylinder head	Right Front of Engine Components	B23E Camshaft Position Sensor - Exhaust
B23F	Camshaft Position Sensor – Inlet	-	In the right front of the engine compartment, on the right rear of the cylinder head	Right Front of Engine Components	B23F Camshaft Position Sensor - Intake
B24	Mobile Phone Microphone	-	In the passenger compartment, at the front centre of the headliner, in the overhead console	Headliner Components	B24 Cellular Phone Microphone
B26	Crankshaft Position Sensor	-	In the left rear of the engine compartment, in the left rear of the engine block, above the oil pan	Left Rear of Engine Components	B26 Crankshaft Position Sensor
B30	Hybrid/EV Battery Pack Current Sensor	-	Under the vehicle, in the Hybrid/EV battery pack, between section 1 and 2	-	B30 Hybrid Battery Pack Current Sensor
B32A	Hybrid/EV Battery Pack Temperature Sensor 1	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 1	Underbody - Hybrid/EV Battery Pack Section 3	-
B32B	Hybrid/EV Battery Pack Temperature Sensor 2	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 1	Underbody - Hybrid/EV Battery Pack Section 3	-
B32C	Hybrid/EV Battery Pack Temperature Sensor 3	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 2	Underbody - Hybrid/EV Battery Pack Section 3	-
B32D	Hybrid/EV Battery Pack Temperature Sensor 4	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 3	Underbody - Hybrid/EV Battery Pack Section 3	-
B32E	Hybrid/EV Battery Pack Temperature Sensor 5	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 3	Underbody - Hybrid/EV Battery Pack Section 3	-
B32F	Hybrid/EV Battery Pack Temperature Sensor 6	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 4	Underbody - Hybrid/EV Battery Pack Section 3	-
B32G	Hybrid/EV Battery Pack Temperature Sensor 7	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 4	Underbody - Hybrid/EV Battery Pack Section 3	-
B32H	Hybrid/EV Battery Pack Temperature Sensor 8	-	Under the vehicle, in the Hybrid/EV battery section 2, part of Hybrid/EV battery module 5	Underbody - Hybrid/EV Battery Pack Section 2	-
B32J	Hybrid/EV Battery Pack Temperature Sensor 9	-	Under the vehicle, in the Hybrid/EV battery section 2, part of Hybrid/EV battery module 5	Underbody - Hybrid/EV Battery Pack Section 2	-
B32K	Hybrid/EV Battery Pack Temperature Bank 10	-	Under the vehicle, in the Hybrid/EV battery section 2, part of Hybrid/EV battery module 6	Underbody - Hybrid/EV Battery Pack Section 2	-
B32L	Hybrid/EV Battery Pack Temperature Bank 11	-	Under the vehicle, in the Hybrid/EV battery section 2, part of Hybrid/EV battery module 6	Underbody - Hybrid/EV Battery Pack Section 2	-
B32M	Hybrid/EV Battery Pack Temperature Bank 12	-	Under the vehicle, in the Hybrid/EV battery section 1, part of Hybrid/EV battery module 7	Underbody - Hybrid/EV Battery Pack Section 1	-
B32N	Hybrid/EV Battery Pack Temperature Bank 13	-	Under the vehicle, in the Hybrid/EV battery section 1, part of Hybrid/EV battery module 7	Underbody - Hybrid/EV Battery Pack Section 1	-
B32P	Hybrid/EV Battery Pack	-	Under the vehicle, in the Hybrid/EV battery section 1, part of	Underbody - Hybrid/EV	-

	Temperature Bank 14		Hybrid/EV battery module 8	Battery Pack Section 1	
B32Q	Hybrid/EV Battery Pack Temperature Bank 15	-	Under the vehicle, in the Hybrid/EV battery section 1, part of Hybrid/EV battery module 8	Underbody - Hybrid/EV Battery Pack Section 1	-
B32R	Hybrid/EV Battery Pack Temperature Bank 16	-	Under the vehicle, in the Hybrid/EV battery section 1, part of Hybrid/EV battery module 9	Underbody - Hybrid/EV Battery Pack Section 1	-
B34	Engine Coolant Temperature Sensor	-	In the engine compartment, at the left end of the cylinder head, mounted in the coolant tube	Left Rear of Engine Components	B34 Engine Coolant Temperature Sensor
B37	Engine Oil Pressure Switch	-	In the right front of the engine compartment, at the right front of the cylinder head, next to the thermostat housing	Right Front of Engine Components	B37 Engine Oil Pressure Switch
B39	A/C Evaporator Temperature Sensor	-	In the passenger compartment, behind the instrument panel, in the right side of the HVAC module assembly	Instrument Panel - HVAC Components	B39 A/C Evaporator Temperature Sensor
B46	Fuel Level Sensor	-	Under the vehicle, in the fuel tank, part of the fuel pump and level sensor assembly	Underbody - Fuel System Components	-
B47	Fuel Pressure Sensor	-	Under the vehicle, at the right of the fuel tank, in the fuel feed line	Underbody - Fuel System Components	B47 Fuel Pressure Sensor
B52A	Heated Oxygen Sensor 1	-	In the front of the engine compartment, at the top of the catalytic converter	Right Front of Engine Components	B52A Heated Oxygen Sensor 1
B52B	Heated Oxygen Sensor 2	-	In the front of the engine compartment, in the exhaust pipe, downstream of the catalytic converter	Right Front of Engine Components	B52B Heated Oxygen Sensor 2
B55	Bonnet Ajar Switch	-	At the front centre of the vehicle, part of the hood latch	Engine Compartment Components - Front	B55 Bonnet Ajar Switch
B59L	Front Impact Sensor - Left	-	At the front of the vehicle, mounted to the top left of the radiator core support	Engine Compartment Components - Front	B59L Front Impact Sensor - Left
B59R	Front Impact Sensor - Right	-	At the front of the vehicle, mounted to the top right of the radiator core support	Engine Compartment Components - Front	B59R Front Impact Sensor - Right
B60	Passenger Presence Detection Sensor	-	In the passenger compartment, mounted to the bottom of the passenger seat cushion	Passenger Seat Components	-
B63LF	Side Impact Sensor - Left Front	-	In the passenger compartment, in the centre of the left front door	Driver Door Components	B63LF Side Impact Sensor - Left Front
B63LR	Side Impact Sensor - Left Rear	-	In the passenger compartment, in the centre of the left rear door	Left Rear Door Components	B63LR Side Impact Sensor - Left Rear
B63RF	Side Impact Sensor - Right Front	-	In the passenger compartment, in the centre of the right front door	Passenger Door Components	B63RF Side Impact Sensor - Right Front
B63RR	Side Impact Sensor - Right Rear	-	In the passenger compartment, in the centre of the right rear door	Right Rear Door Components	B63RR Side Impact Sensor - Right Rear
B68	Knock Sensor	-	In the engine compartment, at the top rear of the engine block	Left Rear of Engine Components	B68 Knock Sensor

B74	Manifold Absolute Pressure Sensor	-	In the engine compartment, at the top centre of the intake manifold	Left Rear of Engine Components	B74 Manifold Absolute Pressure Sensor
B75B	Mass Air Flow/Intake Air Temperature Sensor	-	In the right of the engine compartment, mounted in the air filter housing outlet tube	Engine Compartment Components - Right	B75B Mass Airflow/Intake Air Temperature Sensor
B78A	Front Object Sensor - Left Outer	UD5	At the front of the vehicle, mounted in the front fascia	Front of Vehicle Components	B78A Front Object Sensor - Left Outer
B78B	Front Object Sensor - Right Outer	UD5	At the front of the vehicle, mounted in the front fascia	Front of Vehicle Components	B78B Front Object Sensor - Right Outer
B78C	Front Object Sensor - Left Middle	UD5	At the front of the vehicle, mounted in the front fascia	Front of Vehicle Components	B78C Front Object Sensor - Left Middle
B78D	Front Object Sensor - Right Middle	UD5	At the front of the vehicle, mounted in the front fascia	Front of Vehicle Components	B78D Front Object Sensor - Right Middle
B78E	Rear Object Sensor - Left Middle	UD5	At the rear of the vehicle, mounted in the rear fascia	Rear of Vehicle Components	B78E Rear Object Sensor - Left Middle
B78F	Rear Object Sensor - Right Middle	UD5	At the rear of the vehicle, mounted in the rear fascia	Rear of Vehicle Components	B78F Rear Object Sensor - Right Middle
B78G	Rear Object Sensor - Left Outer	UD5	At the rear of the vehicle, mounted in the rear fascia	Rear of Vehicle Components	B78G Rear Object Sensor - Left Outer
B78H	Rear Object Sensor - Right Outer	UD5	At the rear of the vehicle, mounted in the rear fascia	Rear of Vehicle Components	B78H Rear Object Sensor - Right Outer
B87	Rearview Camera	UD5	At the rear of the vehicle, between the license plate lamps, in the centre of the fascia	Rear of Vehicle Components	B87 Rear-view Camera
B88D	Seat Belt Switch - Driver	--	In the passenger compartment, part of the driver seat belt buckle	Driver's Seat Components	B88D Seat Belt Switch - Driver
B88LR	Seat Belt Switch - Left Rear	-	In the passenger compartment, part of the left rear seat belt buckle	Rear Seat Components	B88LR Seat Belt Switch - Left Rear
B88P	Seat Belt Switch - Passenger	-	In the passenger compartment, part of the passenger seat belt buckle	Passenger Seat Components	B88P Seat Belt Switch - Passenger
B88RR	Seat Belt Switch - Right Rear	-	In the passenger compartment, part of the right rear seat belt buckle	Rear Seat Components	B88RR Seat Belt Switch - Right Rear
B99	Steering Wheel Angle Sensor	-	In the passenger compartment, at the top of the steering column, behind the steering wheel	Steering Column Components	B99 Steering Wheel Angle Sensor
B107	Accelerator Pedal Position Sensor	--	In the passenger compartment, under the driver side of the instrument panel, part of the accelerator pedal	Instrument Panel Components (2 of 2)	B107 Accelerator Pedal Position Sensor
B118	Windshield Washer Fluid Level Sensor	-	At the left front of the vehicle, behind the left side of the fascia, in the washer solvent bottle	Engine Compartment Components - Front	B118 Windscreen Washer Fluid Level Sensor
			In the passenger compartment, between the front seats,	Passenger Compartment	B119 Multi-Axis Acceleration

B119	Multi-axis Acceleration Sensor	-	under the carpet, to the rear of the inflatable restraint sensing and diagnostic module	Components	Sensor
B135	Coolant Heater Temperature Sensor	-	At the right rear of the engine compartment, mounted to the bulkhead, next to the coolant heater control module	Engine Compartment Components - Right	B135 Coolant Heater Temperature Sensor
B150	Fuel Tank Pressure Sensor	-	Under the vehicle, rear of the fuel tank, mounted on the evaporative emission canister	Underbody - Fuel System Components	B150 Fuel Tank Pressure Sensor
B160	Windscreen Temperature and Inside Moisture Sensor	-	In the passenger compartment, at the top centre of the windscreen	Headliner Components	B160 Windscreen Temperature and Inside Moisture Sensor
B197	Charge Port Door Position Switch	-	At the left front of the vehicle, behind the rear of the left front wing	Left Front of Vehicle Components	B197 Charge Port Door Ajar Switch
B201	Brake Control Brake Pedal Position Sensor	-	In the passenger compartment, under the driver side of the instrument panel, mounted to the brake pedal	Instrument Panel Components (2 of 2)	B201 Brake Control Brake Pedal Position Sensor
B202	Hybrid/EV Electronics Coolant Temperature Sensor	-	At the right front of the engine compartment, mounted in the Hybrid/EV electronics radiator	Engine Compartment Components - Front	B202 Hybrid Electronics Coolant Temperature Sensor
B203	Engine Coolant Radiator Temperature Sensor	-	At the right front of the engine compartment, mounted in the engine radiator	Engine Compartment Components - Front	B203 Engine Coolant Radiator Temperature Sensor
B204A	Hybrid/EV Battery Pack Coolant Temperature Sensor 1	-	Under the vehicle, inside the hybrid/EV battery pack, in the coolant inlet tube	Underbody - Hybrid/EV Battery Pack Assembly Components	B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1
B204B	Hybrid/EV Battery Pack Coolant Temperature Sensor 2	-	Under the vehicle, inside the hybrid/EV battery pack, in the coolant outlet tube	Underbody - Hybrid/EV Battery Pack Assembly Components	B204B Hybrid/EV Battery Pack Coolant Temperature Sensor 2
B207A	Drive Motor 1 Temperature Sensor	-	In the engine compartment, internal to the transmission assembly	-	B207A Drive Motor 1 Temperature Sensor
B207B	Drive Motor 2 Temperature Sensor	-	In the engine compartment, internal to the transmission assembly	-	B207B Drive Motor 2 Temperature Sensor
B208	Fuel Door Status Switch Assembly	-	At the right rear of the vehicle, behind the right rear quarter panel	--	--
B222	A/C Refrigerant Low-Side Temperature Sensor	-	In the front of the engine compartment, in the refrigerant line near the compressor inlet	Right Front of Engine Components	B222 A/C Refrigerant Low-Side Temperature Sensor
C1	Battery	--	In the luggage compartment, under the storage compartment floor	Luggage Compartment Components	-
C4A	Hybrid/EV Battery Section 1	-	Under the vehicle, in the Hybrid/EV battery pack, forward section	Underbody - Hybrid/EV Battery Pack Internals	<ul style="list-style-type: none"> C4A Hybrid/EV Battery Pack Cell Section 1 X1 C4A Hybrid/EV Battery Pack Cell Section 1 X2 C4A Hybrid/EV Battery Pack Cell Section 1 X3

C4B	Hybrid/EV Battery Section 2	-	Under the vehicle, in the Hybrid/EV battery pack, middle section	Underbody - Hybrid/EV Battery Pack Internals	<ul style="list-style-type: none"> • C4B Hybrid/EV Battery Pack Cell Section 2 X1 • C4B Hybrid/EV Battery Pack Cell Section 2 X2
C4C	Hybrid/EV Battery Section 3	-	Under the vehicle, in the Hybrid/EV battery pack, rear section	Underbody - Hybrid/EV Battery Pack Internals	<ul style="list-style-type: none"> • C4C Hybrid/EV Battery Pack Cell Section 3 X1 • C4C Hybrid/EV Battery Pack Cell Section 3 X2 • C4C Hybrid/EV Battery Pack Cell Section 3 X3 • C4C Hybrid/EV Battery Pack Cell Section 3 X4
C5A	Hybrid/EV Battery Module 1	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 3	Underbody - Hybrid/EV Battery Pack Section 3	-
C5B	Hybrid/EV Battery Module 2	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 3	Underbody - Hybrid/EV Battery Pack Section 3	-
C5C	Hybrid/EV Battery Module 3	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 3	Underbody - Hybrid/EV Battery Pack Section 3	-
C5D	Hybrid/EV Battery Module 4	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 3	Underbody - Hybrid/EV Battery Pack Section 3	-
C5E	Hybrid/EV Battery Module 5	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 2	Underbody - Hybrid/EV Battery Pack Section 2	-
C5F	Hybrid/EV Battery Module 6	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 2	Underbody - Hybrid/EV Battery Pack Section 2	-
C5G	Hybrid/EV Battery Module 7	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 1	Underbody - Hybrid/EV Battery Pack Section 1	-
C5H	Hybrid/EV Battery Module 8	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 1	Underbody - Hybrid/EV Battery Pack Section 1	-
C5J	Hybrid/EV Battery Module 9	-	Under the vehicle, in the Hybrid/EV battery pack, part of Hybrid/EV battery section 1	Underbody - Hybrid/EV Battery Pack Section 1	-
E4C	Daytime Running Lamp - Left	-	At the left front of the vehicle, part of the headlamp assembly	Front of Vehicle Components	-
E4D	Daytime Running Lamp - Right	-	At the right front of the vehicle, part of the headlamp assembly	Front of Vehicle Components	--
E4G	Headlamp - Left Dipped beam	-	At the left front of the vehicle, part of the headlamp assembly	--	--
E4H	Headlamp - Right Dipped beam	-	At the right front of the vehicle, part of the headlamp assembly	--	--

E4N	Park/Indicator Lamp - Left	-	At the left front of the vehicle, in the front fascia, below the headlamp assembly	Front of Vehicle Components	E4N Park/Indicator Lamp - Left
E4P	Park/Indicator Lamp - Right	-	At the right front of the vehicle, in the front fascia, below the headlamp assembly	Front of Vehicle Components	E4P Park/Indicator Lamp - Right
E4Y	Indicator Repeater Lamp - Left	-	Outside the vehicle, part of the outside rear-view mirror assembly	<ul style="list-style-type: none"> • Front of Vehicle Components • Driver Door Components 	E4Y Indicator Repeater Lamp - Left
E4Z	Indicator Repeater Lamp - Right	-	Outside the vehicle, part of the outside rear-view mirror assembly	<ul style="list-style-type: none"> • Front of Vehicle Components • Passenger Door Components 	E4Z Indicator Repeater Lamp - Right
E5	Reversing Light	-	At the rear of the vehicle, in the bottom centre of the rear fascia	Rear of Vehicle Components	E5 Reversing Light
E5E	Tail Lamp - Left	-	At the left rear corner of the vehicle, part of the tail lamp assembly	Rear of Vehicle Components	-
E5F	Tail Lamp - Right	-	At the right rear corner of the vehicle, part of the tail lamp assembly	Rear of Vehicle Components	-
E5L	Brake lamp - Left	-	At the left rear corner of the vehicle, part of the tail lamp assembly	--	--
E5R	Brake lamp - Right	-	At the right rear corner of the vehicle, part of the tail lamp assembly	--	--
E6	Centre High Mounted Brake Lamp	-	At the rear of the vehicle, in the centre of the liftgate assembly, above the lower glass	Rear of Vehicle Components	E6 Centre High Mounted Brake Lamp
E7L	Number Plate Lamp - Left	-	At the rear of the vehicle, above the license plate pocket, in the rear fascia	Rear of Vehicle Components	E7L Number Plate Lamp - Left
E7R	Number Plate Lamp - Right	-	At the rear of the vehicle, above the license plate pocket, in the rear fascia	Rear of Vehicle Components	E7R Number Plate Lamp - Right
E13L	Headlamp - Left	--	At the left front corner of the vehicle	Front of Vehicle Components	-
E13R	Headlamp - Right	--	At the right front corner of the vehicle	Front of Vehicle Components	-
E14A	Seat Heating Element - Driver Back	KA1	In the passenger compartment, part of the driver seat back	Driver's Seat Components	E14A Seat Heating Element - Driver Back
E14B	Seat Heating Element - Driver Cushion	KA1	In the passenger compartment, part of the driver seat cushion	Driver's Seat Components	E14B Seat Heating Element - Driver Cushion
E14C	Seat Heating Element - Passenger	KA1	In the passenger compartment, part of the passenger seat	Passenger Seat	E14C Seat Heating Element -

	Back		back	Components	Passenger Back
E14D	Seat Heating Element - Passenger Cushion	KA1	In the passenger compartment, part of the passenger seat cushion	Passenger Seat Components	E14D Seat Heating Element - Passenger Cushion
E18A	Rear Demisting Grid - Upper	-	At the rear of the vehicle, in the liftgate, part of the upper glass	Liftgate Components	<ul style="list-style-type: none"> • E18A Rear Demister Grid - Upper X1 • E18A Rear Demisting Grid - Upper X2
E18B	Rear Demister Grid - Lower	-	At the rear of the vehicle, in the liftgate, part of the lower glass	Liftgate Components	E18B Rear Demisting Grid - Lower X2
E31L	Sunshade Mirror Lamp - Left	-	In the passenger compartment, at the front left of the headliner, part of the sunshade assembly	Headliner Components	E31L Sunshade Mirror Lamp - Left
E31R	Sunshade Mirror Lamp - Right	-	In the passenger compartment, at the right front of the headliner, part of the sunshade assembly	Headliner Components	E31R Sunshade Mirror Lamp - Right
E32	Cigarette Lighter Receptacle	-	In the passenger compartment, at the top centre of the instrument panel, in the storage compartment	Instrument Panel Components (2 of 2)	E32 Cigarette Lighter Receptacle
E33	Cargo Lamp	-	In the luggage compartment, at the left	Luggage Compartment Components	E33 Cargo Lamp
E36AH	Dome Lamp	-	In the passenger compartment, at the rear centre of the headliner	Headliner Components	E36AH Interior light
E37F	Dome/Reading Lamps - Front	-	In the passenger compartment, at the front centre of the headliner	Headliner Components	E37F Dome/Reading Lamps - Front
E41	Engine Coolant Thermostat Heater	-	In the engine compartment, at the right front of the cylinder head, part of the thermostat housing	Right Front of Engine Components	E41 Engine Coolant Thermostat Heater
E42L	Tail Lamp Assembly - Left	-	At the left rear corner of the vehicle	Rear of Vehicle Components	E42L Tail Lamp Assembly - Left
E42R	Tail Lamp Assembly - Right	-	At the right rear corner of the vehicle	Rear of Vehicle Components	E42R Tail Lamp Assembly - Right
F101	Passenger Instrument Panel Air Bag	-	In the passenger compartment, mounted in the passenger side of the instrument panel	--	--
F103	Power Inverter Module Assembly Cable Cover	-	In the left side of the engine compartment, covering the power inverter module	Engine Compartment Components - Left	F103 Power Inverter Module Assembly Cable Cover
F105L	Roof Rail Air Bag - Left	-	In the passenger compartment, along the left roof rail	Passenger Compartment Components	F105L Roof Rail Air Bag - Left
F105R	Roof Rail Air Bag - Right	-	In the passenger compartment, along the right roof rail	Passenger Compartment Components	F105R Roof Rail Air Bag - Right
F106LF	Side Air Bag - Left Front	-	In the passenger compartment, mounted in the outboard side of the left front seat back	Driver's Seat Components	F106LF Side Air Bag - Left Front

F106RF	Side Air Bag - Right Front	-	In the passenger compartment, mounted in the outboard side of the right front seat back	Passenger Seat Components	F106RF Side Air Bag - Right Front
F107	Steering Wheel Air Bag	-	In the passenger compartment, mounted in the centre of the steering wheel	Steering Column Components	-
F112D	Seat Belt Retractor Pretensioner - Driver	-	In the passenger compartment, at the base of the driver B-pillar	Passenger Compartment Components	F112D Seat Belt Retractor Pretensioner - Driver
F112P	Seat Belt Retractor Pretensioner - Passenger	-	In the passenger compartment, at the base of the passenger B-pillar	Passenger Compartment Components	F112P Seat Belt Retractor Pretensioner - Passenger
F113D	Seat Belt Anchor Pretensioner - Driver	-	In the passenger compartment, under the outboard side of the driver seat cushion	Driver's Seat Components	-
F113P	Seat Belt Anchor Pretensioner - Passenger	-	In the passenger compartment, under the outboard side of the passenger seat cushion	Passenger Seat Components	-
F114D	Knee Air Bag - Driver's	-	In the passenger compartment, at the bottom of the driver side of the instrument panel	Instrument Panel Components (2 of 2)	F114D Knee Air Bag - Driver's
F114P	Knee Air Bag - Passenger	-	In the passenger compartment, at the bottom of the passenger side of the instrument panel	Instrument Panel Components (2 of 2)	F114P Knee Air Bag - Passenger
F115	Hybrid/EV Battery Pack Fuse Cover	-	Under the vehicle, at the front of the Hybrid/EV battery pack	Underbody - Hybrid/EV Battery Pack Assembly Components	-
F116	A/C Compressor Jumper Connector	-	In the engine compartment, part of A/C compressor connector X2	-	F116 A/C Compressor Jumper Connector
F117	14V Power Module Jumper Connector	-	Under the vehicle, rear of the fuel tank, part of 14 V power module X1	-	F117 14V Power Module Jumper Connector
F118	Hybrid/EV Battery Pack Connector Jumper Connector	-	At the rear centre of the engine compartment, part of Hybrid/EV battery pack X3	-	F118 Hybrid/EV Battery Pack Connector Jumper Connector
F119	Cabin Heater Control Module Jumper Connector	-	At the rear centre of the engine compartment, part of cabin heater control module X2	-	F119 Coolant Heater Control Module Jumper Connector
F120	Battery Charger Jumper Connector	-	At the right front of the vehicle, behind the right side of the front fascia, part of battery charger X4	-	F120 Battery Charger Jumper Connector
G1	A/C Compressor	-	In the engine compartment, mounted to the right front of the engine	Right Front of Engine Components	<ul style="list-style-type: none"> • G1 A/C Compressor X1 • G1 A/C Compressor X2
G10L	Cooling Fan Motor - Left	-	At the front of the engine compartment, rear of the left side of the radiator	Engine Compartment Components - Front	G10L Cooling Fan Motor - Left
G10R	Cooling Fan Motor - Right	-	At the front of the engine compartment, rear of the right side of the radiator	Engine Compartment Components - Front	G10R Cooling Fan Motor - Right
G12	Fuel Pump	-	Under the rear of the vehicle, in the fuel tank, part of the fuel pump and level sensor assembly	Underbody - Fuel System Components	-

G24	Windscreen Washer Pump	--	At the left front of the vehicle, behind the left side of the fascia, in the washer solvent bottle	Engine Compartment Components - Front	G24 Windscreen Washer Pump
G35	Hybrid/EV Electronics Coolant Pump	-	At the left front of the engine compartment, mounted to the left side of the lower radiator support	Engine Compartment Components - Front	G35 Hybrid Electronics Coolant Pump
G36	Auxiliary Heater Coolant Pump	-	At the right of the engine compartment, mounted to the suspension cradle	Engine Compartment Components - Right	G36 Auxiliary Heater Coolant Pump
G37	Hybrid/EV Battery Pack Coolant Pump	-	At the front of the engine compartment, mounted to the centre of the lower radiator support	Engine Compartment Components - Front	G37 Hybrid Battery Pack Coolant Pump
G38	14 V Power Module Cooling Fan	-	In the luggage compartment, under the storage compartment floor, on the 14 V power module	Luggage Compartment Components	G38 14V Power Module Cooling Fan
K1	14 V Power Module	-	In the luggage compartment, under the storage compartment floor	Luggage Compartment Components	<ul style="list-style-type: none"> • K1 14 V Power Module X1 • K1 14 V Power Module X2 • K1 14 V Power Module X3 • K1 14 V Power Module X4
K8	Blower Motor Control Module	-	In the passenger compartment, under the passenger side of the instrument panel, mounted to the HVAC module assembly	Instrument Panel - HVAC Components	K8 Blower Motor Control Module X1
K9	Body Control Module	-	In the passenger compartment, behind the passenger side of the instrument panel, next to the glove box	Instrument Panel Components (2 of 2)	<ul style="list-style-type: none"> • K9 Body Control Module X1 • K9 Body Control Module X2 • K9 Body Control Module X3 • K9 Body Control Module X4 • K9 Body Control Module X5 • K9 Body Control Module X6 • K9 Body Control Module X7

G103	Forward Lamp Harness	--	In the engine compartment, on the front of the left frame rail, rear of G101	G101, G103, G109, and G117	-
G104	Forward Lamp Harness	--	In the engine compartment, on the front of the right frame rail, rear of G102	G102, G104, and G105	-
G105	Cooling Fan Jumper Harness	-	In the engine compartment, on the front of the right frame rail, below the right front headlamp assembly	G102, G104, and G105	-
G106	Engine Harness	--	In the engine compartment, at the left rear of the cylinder head	G106 and G113	-
G109	Engine Harness	--	In the engine compartment, at the side of the left strut tower	G101, G103, G109, and G117	-
G113	Engine Harness	--	In the engine compartment, on the rear of the transmission assembly	G106 and G113	-
G117	Body Harness	-	In the engine compartment, at the front of the left strut tower	G101, G103, G109, and G117	-
G201	Instrument Panel Harness	-	In the passenger compartment, behind the instrument panel, above the brake pedal, on the instrument panel support	G201, G202, G203, and G204	-
G202	Instrument Panel Harness	--	In the passenger compartment, behind the right side of the instrument panel, above the glove box, on the instrument panel support	G201, G202, G203, and G204	-
G203	Instrument Panel Harness	--	In the passenger compartment, behind the left side of the instrument panel, earth strap from body to instrument panel support	G201, G202, G203, and G204	--
G204	Instrument Panel Harness	--	In the passenger compartment, behind the centre of the instrument panel, on the instrument panel support	G201, G202, G203, and G204	-
G205	Instrument Panel Harness	-	In the passenger compartment, behind the left side of the instrument panel, earth strap from body to instrument panel support	G205 and G304	--
G301	Body Harness	-	In the passenger compartment, under the left front door sill trim	G301	--
G302	Body Harness	-	In the passenger compartment, under the right front door sill trim	G302	-
G304	Instrument Panel Harness	-	In the passenger compartment, under the center console, to the rear of the shifter	G205 and G304	-

G402	Body Harness	--	In the luggage compartment, below the storage compartment floor, attached to the negative battery post	G402 and G403	-
G403	Body Harness	-	In the luggage compartment, behind the left trim panel below the fuse block - rear	G402 and G403	-
G405	Body Harness	-	In the luggage compartment, behind the right trim panel	G405 and G406	-
G406	Body Harness	-	In the luggage compartment, behind the right trim panel	G405 and G406	-
J100	Front Fascia Harness	-	In the front fascia harness approximately 13.6 cm (5.35 in) from the X100 and X101 breakout	--	--
J101	Front Fascia Harness	-	In the front fascia harness approximately 21 cm (8.26 in) from the X100 and X101 breakout	--	--
J102	Front Fascia Harness	-	In the front fascia harness approximately 11 cm (4.33 in) from the front object sensor - left middle connector breakout	--	--
J105	Forward Lamp Harness	--	In the forward lamp harness approximately 32 cm (12.59 in) from the windscreen wiper motor breakout	--	--
J106	Forward Lamp Harness	--	In the forward lamp harness approximately 5 cm (1.96 in) in to the horn - right breakout	--	--
J107	Forward Lamp Harness	--	In the forward lamp harness approximately 14 cm (5.51 in) from the X105 and X107 breakout	--	--
J108	Forward Lamp Harness	--	In the forward lamp harness approximately 18.5 cm (7.28 in) from the X105 and X107 breakout	--	--
J110	Cooling Fan Jumper Harness	-	In the cooling fan jumper harness approximately 4.5 cm (1.77 in) from the X103 breakout	--	-
J125	Engine Harness	--	In the engine harness approximately 5 cm (1.96 in) from the engine coolant temperature sensor breakout	--	--
J126	Engine Harness	--	In the engine harness approximately 5 cm (1.96 in) from the power steering control module breakout	--	--
J128	Engine Harness	--	In the engine harness approximately 5 cm (1.96 in) from the power inverter module assembly cover connector breakout	--	--
J129	Engine Harness	--	In the engine harness approximately 5 cm (1.96 in) in to the power inverter module assembly connector breakout	--	--
J130	Engine Harness	--	In the engine harness on the power inverter module breakout approximately 28.5 cm (11.22 in) from power inverter module assembly X3	--	—
J201	Instrument Panel Harness	--	In the instrument panel harness approximately 8.4 cm (3.30 in) from fuse block - instrument panel left	Instrument Panel Harness Routing	—
J202	Instrument Panel Harness	--	In the instrument panel harness approximately 2.5 cm (0.98 in) from fuse block - instrument panel left	Instrument Panel Harness Routing	--

J203	Instrument Panel Harness	--	In the instrument panel harness approximately 5.2 cm (2.04 in) from the brake control brake pedal position sensor connector breakout	Instrument Panel Harness Routing	--
J204	Instrument Panel Harness	--	In the instrument panel harness approximately 5 cm (1.96 in) from the park brake control switch connector breakout	Instrument Panel Harness Routing	-
J205	Instrument Panel Harness	--	In the instrument panel harness in the info display module breakout approximately 7.4 cm (2.91 in) from info display module X1	Instrument Panel Harness Routing	—
J206	Instrument Panel Harness	--	In the instrument panel harness, in the radio connector breakout, approximately 10 cm (3.93 in) from radio X4	Instrument Panel Harness Routing	—
J207	Instrument Panel Harness	--	In the instrument panel harness, in the radio connector breakout, approximately 7.5 cm (2.95 in) from radio X4	Instrument Panel Harness Routing	-
J208	Instrument Panel Harness	-	In the instrument panel harness, in the transmission shift lever connector breakout, approximately 4.5 cm (1.77 in) from X315	Instrument Panel Harness Routing	—
J209	Instrument Panel Harness	--	In the instrument panel harness approximately 2.5 cm (0.98 in) from radio X1	Instrument Panel Harness Routing	--
J210	Instrument Panel Harness	--	In the instrument panel harness approximately 6 cm (2.36 in) from radio X1	Instrument Panel Harness Routing	-
J220	Instrument Panel Harness	--	In the instrument panel harness approximately 10 cm (3.93 in) from the X260 connector breakout	Instrument Panel Harness Routing	-
J221	Instrument Panel Harness	-	In the instrument panel harness approximately 5 cm (1.96 in) from the X260 connector breakout	Instrument Panel Harness Routing	-
J222	Instrument Panel Harness	-	In the instrument panel harness approximately 2.5 cm (0.98 in) from the X250 connector breakout	Instrument Panel Harness Routing	-
J223	Instrument Panel Harness	-	In the instrument panel harness approximately 5 cm (1.96 in) from the X250 connector breakout	Instrument Panel Harness Routing	-
J224	Instrument Panel Harness	-	In the instrument panel harness, in the X275 connector breakout, approximately 7.5 cm (2.95 in) from X275	Instrument Panel Harness Routing	-
J225	Instrument Panel Harness	-	In the instrument panel harness, in the X275 connector breakout, approximately 15.8 cm (6.22 in) from X275	Instrument Panel Harness Routing	-
J226	Instrument Panel Harness	-	In the instrument panel harness, in the X275 connector breakout, approximately 18.3 cm (7.20 in) from X275	Instrument Panel Harness Routing	-
J227	Instrument Panel Harness	-	In the instrument panel harness approximately 4.6 cm (1.81 in) in to the telematics communication interface control module connector breakout	Instrument Panel Harness Routing	-
J228	Instrument Panel Harness	-	In the instrument panel harness approximately 4.6 cm (3.77 in) in to the telematics communication interface control	Instrument Panel	—

			module connector breakout	Harness Routing	
J301	Body Harness	-	In the body harness approximately 23 cm (9.05 in) from the X500 breakout	--	--
J302	Body Harness	-	In the body harness approximately 20.7 cm (8.14 in) from the X600 breakout	--	—
J303	Body Harness	-	In the body harness approximately 15.7 cm (6.18 in) from the X600 breakout	--	—
J304	Body Harness	--	In the body harness approximately 10 cm (3.93 in) from X320	—	—
J305	Body Harness	-	In the body harness approximately 10 cm (3.93 in) from the G302 breakout	--	—
J306	Body Harness	-	In the body harness approximately 25 cm (9.84 in) from the G302 breakout	--	—
J307	Body Harness	-	In the body harness approximately 30 cm (11.81 in) from the G302 breakout	--	—
J308	Body Harness	-	In the body harness approximately 28 cm (11.02 in) from the X700 breakout	--	--
J309	Body Harness	-	In the body harness approximately 18 cm (7.08 in) from the X700 breakout	--	--
J310	Body Harness	-	In the body harness approximately 8.5 cm (3.34 in) from the X700 breakout	--	--
J317	Console Harness	-	In the floor console harness approximately 5 cm (1.96 in) from X315	Center Console Harness Routing	-
J320	Body Harness	-	In the body harness approximately 5.3 cm (2.08 in) from the seat belt switch - right rear connector breakout	--	--
J350	Headliner Harness	-	In the headliner harness approximately 5 cm (1.96 in) from the breakout for overhead console connectors	--	--
J351	Headliner Harness	-	In the headliner harness approximately 6.3 cm (2.48 in) in to the breakout for the overhead console connectors	Headliner Harness Routing	-
J352	Headliner Harness	-	In the headliner harness approximately 16.2 cm (6.37 in) from the sunshade mirror lamp - right breakout	--	--
J353	Headliner Harness	-	In the headliner harness approximately 35.4 cm (13.93 in) from the sunshade mirror lamp - right breakout	--	--
J354	Headliner Harness	-	In the headliner harness approximately 45.4 cm (17.87 in) from the sunshade mirror lamp - Right breakout	--	--
J375	EVAP Harness	-	In the evaporative emissions harness approximately 10 cm (3.93 in) from X350	Underbody Harness Routing	-
			In the evaporative emissions harness approximately 18.5 cm	Underbody Harness	

J376	EVAP Harness	-	(7.28 in) from the X355 connector breakout	Routing	-
J377	EVAP Harness	-	In the evaporative emissions harness approximately 13.5 cm (5.31 in) from the X355 connector breakout	Underbody Harness Routing	—
J401	Body Harness	-	In the body harness approximately 18.4 cm (7.34 in) from the X350 breakout	Right Side of Luggage Compartment Harness Routing	--
J402	Body Harness	-	In the body harness approximately 32 cm (12.59 in) from the seat belt switch - left rear	Right Side of Luggage Compartment Harness Routing	-
J403	Body Harness	-	In the body harness approximately 6.7 cm (2.63 in) in to the fuel pump control module breakout	Right Side of Luggage Compartment Harness Routing	-
J450	Body Harness	-	In the body harness approximately 8 cm (3.14 in) from X450	Left Rear of Vehicle Harness Routing	-
J451	Rear Fascia Harness	-	In the rear fascia harness approximately 22.8 cm (8.97 in) in to the backup lamp connector breakout	Rear of Vehicle Harness Routing	-
J452	Rear Fascia Harness	-	In the rear fascia harness in the X450 and X451 breakout approximately 5 cm (1.96 in) from X451	Rear of Vehicle Harness Routing	-
J453	Rear Fascia Harness	-	In the rear fascia harness approximately 9 cm (3.54 in) from rear object sensor - left middle connector breakout	Rear of Vehicle Harness Routing	-
J454	Rear Fascia Harness	-	In the rear fascia harness approximately 10 cm (3.93 in) from the license plate lamp - left connector breakout	Rear of Vehicle Harness Routing	-
J455	Rear Fascia Harness	-	In the rear fascia harness approximately 5 cm (1.96 in) from the license plate lamp - left connector breakout	Rear of Vehicle Harness Routing	-
J456	Rear Fascia Harness	-	In the rear fascia harness approximately 7.5 cm (2.95 in) from the rear-view camera connector breakout	Rear of Vehicle Harness Routing	-
J457	Rear Fascia Harness	-	In the rear fascia harness, in the rear-view camera connector breakout, approximately 6.9 cm (2.71 in) from the rear-view camera connector	Rear of Vehicle Harness Routing	-
J515	Driver Door Harness	-	In the left front door harness approximately 8.3 cm (3.26 in) from the X510 connector breakout	Driver Door Harness Routing	-
J516	Driver Door Harness	-	In the left front door harness approximately 3 cm (1.18 in) from the X510 connector breakout	Driver Door Harness Routing	-
J517	Driver's Door Trim Harness	-	In the left door trim harness approximately 12.3 cm (4.84 in) from X505 connector breakout	Driver Door Harness Routing	-
J518	Driver's Door Trim Harness	-	In the left door trim harness approximately 16.3 cm (6.41 in) from X505 connector breakout	Driver Door Harness Routing	-

J519	Driver's Door Trim Harness	-	In the left door trim harness approximately 6.5 cm (2.55 in) from the outside rear-view mirror switch connector breakout	Driver Door Harness Routing	-
J615	Passenger Door Harness	-	In the right front door harness approximately 12.2 cm (4.80 in) from the X610 connector breakout	--	--
J715	Left Rear Door Harness	--	In the left rear door harness approximately 21.5 cm (8.46 in) from the window motor - left rear connector breakout	--	--
J815	Right Rear Door Harness	--	In the right rear door harness approximately 11.5 cm (4.52 in) from the window motor - right rear connector breakout	Right Rear Door Harness Routing	--
J901	Tailgate Harness	-	In the liftgate harness approximately 33.8 cm (13.30 in) from the rear demisting grid connector breakout	Liftgate Harness Routing	-
J902	Tailgate Harness	-	In the liftgate harness approximately 11.4 cm (4.48 in) from the rear demisting grid connector breakout	Liftgate Harness Routing	-
JX300	Body Harness	-	In the luggage compartment, behind the left trim panel	Left Side of Luggage Compartment Harness Routing	JX300

DTC B144B

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B144B 01 : Run/Crank Power Relay Circuit Short to Battery

DTC B144B 02 : Run/Crank Power Relay Circuit Short-Circuit to Earth

DTC B144B 04 : Run/Crank Power Relay Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B144B 02*	B144B 04*	B144B 01*	-
Control	B144B 02**	1	2	--

1. No Start

2. Engine will continue to run after the ignition is turned OFF

* DTC set in keyless entry control module

** DTC Set in BCM

[Circuit/System Description](#)

The body control module (BCM) controls the ignition run relay through the control circuit by applying voltage to the ignition run relay coil control circuit. The ignition run relay is

energised when the vehicle is in Service Mode, the vehicle is ON or when a remote start is requested. This is part of the BCM's primary function in controlling the vehicle power mode.

The keyless entry control module controls the back-up power for the ignition run relay through the control circuit by applying voltage to the ignition circuit. This circuit is a pass-thru in the BCM and will energise the ignition circuit when the vehicle is in Service Mode, the vehicle is ON or when a remote start is requested.

Conditions for Running the DTC

System voltage is greater than 9 V

Conditions for Setting the DTC

B144B 01

The ignition output is not active and a short-circuit to battery is detected 3 consecutive times on the ignition voltage circuit

B144B 02 - BCM

A short-circuit to earth is detected on the ignition run relay coil control circuit

B144B 02 - Keyless Entry Control Module

The ignition output is active and a short-circuit to earth is detected 3 consecutive times on the ignition voltage circuit

B144B 04

The ignition output is not active and an open-circuit is detected 20 consecutive times on the ignition voltage circuit

Action Taken When the DTC Sets

B144B 01, B144B 04

No action is taken

B144B 02

The ignition relay is deactivated when the fault is set. After 100 ms, the ignition run relay will be activated. If the fault is still set, the relay will be deactivated. The ignition run relay will again be activated after 100 ms. If this also results in a fault, the ignition run relay will be deactivated until a new ignition request is received.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present and an ignition request is received.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Diagnostic Aids

A short-circuit to voltage on the ignition run relay coil control will cause the engine to remain running after the vehicle mode is changed to OFF.

Circuit/System Verification

Vehicle in Service Mode, verify DTC B1330 is not set.

If the DTC is set, refer to [DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0562, P0563, P1A0C, P1A0D, or P1EFC](#) .

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K84 keyless entry control module.
2. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
If the test lamp does not illuminate, test the B+ circuit for an open-circuit/high resistance. If the B+ circuit fuse is open, test the B+ circuit for a short-circuit to earth.
3. Connect the X2 harness connector at the K84 keyless entry control module. Disconnect the X3 harness connector at the K9 body control module.
4. Vehicle OFF, test for less than 1 V between the ignition circuit terminal 6 and earth.
If greater than the specified range, test the ignition circuit for a short-circuit to voltage. If the circuit tests normal, replace the K84 keyless entry control module.
5. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 6 and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K84 keyless entry control module.
6. Vehicle OFF, connect the X3 harness connector at the K9 body control module. Disconnect the KR74 ignition run relay.
7. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
8. Connect a test lamp between the control circuit terminal 86 and earth.
9. Cycle between Service Mode and vehicle OFF. The test lamp should turn ON and OFF when changing Service Modes and vehicle OFF.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 body control module.
If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the K9 body control module.
10. If all circuits test normal, test or replace the KR74 ignition run relay.

Component Testing

1. Vehicle OFF, disconnect the KR74 ignition run relay.
2. Test for 70-150 Ω between terminals 85 and 86.
If the resistance is not within the specified range, replace the KR74 ignition run relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87
If less than specified, replace the KR74 ignition run relay.
4. Install a 3 A fused jumper wire between relay terminal 86 and 12 V. Install a jumper wire between relay terminal 85 and earth. Measure for less than 5 Ω between terminals 87 and 30.
If greater than specified, replace the KR74 ignition run relay.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Relay Replacement](#) : [Within an Electrical Center](#) → [Attached to Wire Harness](#)
- [Control Module References](#) for BCM or keyless entry control module replacement, programming and set-up

DTC B1451

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B1451 01: Accessory Power Circuit Short-Circuit to Battery

DTC B1451 02: Accessory Power Circuit Short-Circuit to Earth

DTC B1451 04: Accessory Power Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B1451 02	B1451 04	B1451 01	--

[Circuit/System Description](#)

The keyless entry control module provides back-up controls for the ignition power circuit, through the control circuit, by applying voltage to the circuit. The ignition power circuit is energised when the vehicle power mode is in Vehicle ON or Vehicle in Service Mode.

[Conditions for Running the DTC](#)

B1451 01, B1451 04

- Vehicle power mode is Vehicle OFF
- Module is awake

- DTC B1451 not already set
- System voltage between 6 and 16 V

B1451 02

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode
- Module is awake
- The DTC is only run when the output is active
- DTC B1451 is not already set
- System voltage between 6 and 16 V

Conditions for Setting the DTC

B1451 01

Ignition output is not active and a short-circuit to battery is detected 3 consecutive times.

B1451 02

Ignition output is active and a short-circuit to earth is detected 3 consecutive times.

B1451 04

Ignition output is not active and an open-circuit is detected 20 consecutive times.

Action Taken When the DTC Sets

B1451 02

The ignition output is deactivated when a short-circuit to earth is detected. After 100 ms the output is activated again. This happens 3 times and then the output is deactivated until a new Vehicle ON or Vehicle in Service Mode request is received.

B1451 01, B1451 04

No action is taken.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present during a DTC check.

- A history DTC clears when the module power mode cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

- A short-circuit to voltage in the ignition control circuit will keep the vehicle modules awake, which can drain the vehicle's battery.
- A short-circuit to earth in the extension of this circuit through the body control module can back feed to the keyless entry control module. Check for a short-circuit to earth on the ignition circuit on the other side of the ignition pass thru, in the body control module, before replacing the body control module.

Circuit/System Verification

Verify DTC B1330 is not set.

If the DTC is set, refer to [DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0562, P0563, P1A0C, P1A0D, or P1EFC](#) .

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K84 keyless entry control module.
2. Verify that a test lamp illuminates between B+ circuit terminal 5 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
3. Vehicle OFF, reconnect the X2 harness connector at the K84 keyless entry control module and disconnect the X3 harness connector at the K9 body control module.
4. Vehicle OFF, test for less than 1 V between the ignition circuit terminal 5 and earth.
If greater than the specified range, test the ignition circuit for a short-circuit to voltage. If the circuit tests normal, replace the K84 keyless entry control module.
5. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 5 and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K84 keyless entry control module.
6. If all circuits test normal, replace the K9 body control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for the appropriate control module replacement, programming and set-up

DTC C0847, C0848, C1240 or C1241

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC C0847 00: Device Ignition 1 Circuit Low

DTC C0848 00: Device Ignition 1 Circuit High

DTC C1240 00: Electronic Brake Control Module Ignition On/Start Switch Circuit Low Voltage

DTC C1241 00: Electronic Brake Control Module Ignition On/Start Switch Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	C0847 00, C1240 00	C0847 00, C1240 00	C0848 00, C1241 00	--

[Circuit/System Description](#)

The body control module (BCM) controls the ignition relay through the control circuit by applying voltage to the circuit. The ignition circuit is energised when the vehicle power mode is Vehicle ON or Vehicle in Service Mode. The hybrid powertrain control module 2 sends the Vehicle ON or Vehicle in Service Mode power mode status in a serial data message to the electronic brake control module.

[Conditions for Running the DTC](#)

C0847 00, C1240 00

- Hybrid powertrain control module 2 is awake.
- System voltage between 9 and 16 V.
- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- The DTC can only run when the output is activated.

C0848 00, C1241 00

- Hybrid powertrain control module 2 is awake.
- System voltage between 9 and 16 V.
- Vehicle power mode is Vehicle OFF.

Conditions for Setting the DTC

C0847 00, C1240 00

- Hybrid powertrain control module 2 is awake.
- Ignition output is active and a short-circuit to earth or open-circuit is detected for greater than 5 seconds.

C0848 00, C1241 00

- Hybrid powertrain control module 2 is awake.
- Ignition output is not active and a short-circuit to battery is detected for greater than 5 seconds.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present during a DTC check.
- A history DTC clears when the module power mode cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

A short-circuit to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

Fuel Pump Control Module Ignition - Terminal 21	P2534	P2534	P2535	-
TCM Ignition - Terminal 13	P2534	P2534	P2535	--

Circuit/System Description

The body control module (BCM) controls the ignition run relay through the control circuit by applying voltage to the circuit. The ignition circuit is energised when the vehicle power mode is Vehicle ON or Vehicle in Service Mode. The hybrid powertrain control module 2 sends the vehicle power mode status in a serial data message to the battery charger control module, A/C compressor, battery energy control module, fuel pump control module and the transmission control module (TCM).

Conditions for Running the DTC

P15B9

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- System voltage greater than 10.25 V.

P15BA

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle OFF.
- System voltage greater than 10.25 V.

P1A5E

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Battery energy control module is awake.
- System voltage greater than 9 V.

P1A5F

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle OFF.
- Battery energy control module is awake.
- System voltage greater than 9 V.

P1EF6

- Hybrid powertrain control module 2 is awake.
- System voltage between 9-16 V.
- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- This DTC can only run when the output is activated.

P1EF7

- Hybrid powertrain control module 2 is awake.
- System voltage between 9-16 V.
- Vehicle power mode is Vehicle OFF.

P2534, P2535

- The hybrid powertrain control module 2 is awake.
- The engine is running.
- The TCM is communicating on the serial data circuits.

Conditions for Setting the DTC

P15B9

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Hybrid powertrain control module 2 ignition input is active.
- A/C compressor ignition input is not active and not greater than 5 V.

P15BA

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle OFF.
- Hybrid powertrain control module 2 ignition input is not active.
- A/C compressor ignition input is active and not below 5 V.

P1A5E

- Hybrid powertrain control module 2 is awake.
- Ignition input is active and not above 5 V.

P1A5F

- Hybrid powertrain control module 2 is awake.
- Ignition input is not active and not below 5 V.

P1EF6

- Hybrid powertrain control module 2 is awake.
- Ignition output is active and a short-circuit to earth is detected 3 consecutive times.
- Ignition output is not active and an open-circuit is detected 20 consecutive times.

P1EF7

- Hybrid powertrain control module 2 is awake.
- Ignition output is not active and a short-circuit to battery is detected 3 consecutive times.

P2534, P2535

- The hybrid powertrain control module 2 is awake.
- The fuel pump control module detects that the ignition voltage is less than 6 V.
- The TCM detects less than 2 V on the ignition voltage circuit at the TCM for greater than 10 seconds.

Action Taken When the DTC Sets

P15B9, P15BA

DTCs P15B9 and P15BA are type A DTCs.

P1A5E, P1A5F

DTCs P1A5E and P1A5F are type B DTCs.

P1EF6

- The ignition output is deactivated when a short-circuit to earth is detected. After 100 ms the output is activated again. This happens 3 times and then the output is deactivated until a new Vehicle ON or Vehicle in Service Mode request is received.
- Open: No action is taken.

P1EF7

No action is taken

P2534, P2535

- DTCs P2534 and P2535 are type A DTCs.
- The TCM turns off all solenoids.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.

Conditions for Clearing the DTC

P15B9, P15BA, P2534 and P2535

DTCs P15B9, P15BA, P2534 and P2535 are type A DTCs.

P1A5E, P1A5F

DTCs P1A5E and P1A5F are type B DTCs.

P1EF6, P1EF7

- The current DTC will clear when the malfunction is no longer present during a DTC check.
- A history DTC clears when the module power mode cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

A short-circuit to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

Circuit/System Verification

1. Verify DTC B144B is not set.
If the DTC is set, refer to [DTC B144B](#) .
2. Vehicle in Service Mode, verify that DTC P15B9, P15BA P1A5E, P1A5F, P1EF6, P1EF7, P2534, or P2535 is not set.
If two or more DTCs are set, refer to Hybrid Powertrain Control Module 2 Circuit Malfunction.
If only one DTC is set, refer to Non-Hybrid Powertrain Control Module 2 Control Module Circuit Malfunction.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High-Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high-voltage.
- Identify how to test for the presence of high-voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1,000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

Hybrid Powertrain Control Module 2 Circuit Malfunction

1. Disconnect the X2 harness connector at the K114B Hybrid Powertrain Control Module 2.
2. Vehicle OFF, verify that a test lamp does not illuminate between the ignition circuit terminal 27 and earth.
If the test lamp illuminates appears, test the ignition circuit for a short to voltage. If the circuit tests normal, refer to [Power Mode Mismatch](#) .
3. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 27 and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal, refer to [Power Mode Mismatch](#) .
4. If all circuits test normal, replace the K114B Hybrid Powertrain Control Module 2.

Non-Hybrid Powertrain Control Module 2 Control Module Circuit Malfunction

1. Perform the High-Voltage Disabling procedure before proceeding with this diagnostic. Refer to [High Voltage Disabling](#) .
2. Reconnect the 12 V battery.
3. Disconnect the harness connector at the appropriate control module.
4. Vehicle OFF, verify that a test lamp does not illuminate between the ignition circuit at the module and earth.
If the test lamp illuminates appears, test the ignition circuit for a short to voltage. If the circuit tests normal, refer to [Power Mode Mismatch](#) .
5. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit at the module and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal, refer to [Power Mode Mismatch](#) .
6. If all circuits test normal, replace the control module.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for the appropriate control module replacement, programming and set-up

DTC P1A60

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1A60: Battery Energy Control Module Ignition Accessory Switch Circuit Low Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Serial Data Wake-Up	P1A60	P1A60	--	--

[Circuit/System Description](#)

The hybrid powertrain control module 2 sends the serial data wake-up power mode status in a serial data message to the battery energy control module. The hybrid powertrain control module 2 also powers up the serial data wake-up circuit to the battery energy control module when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

[Conditions for Running the DTC](#)

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode
- Battery energy control module is awake
- System voltage greater than 9 V

[Conditions for Setting the DTC](#)

Ignition input is active, and 500 ms after the ignition input transitions high, a voltage below 5 V is detected 3 consecutive times

Action Taken When the DTC Sets

DTC P1A60 is a type B DTC.

Conditions for Clearing the DTC

DTC P1A60 is a type B DTC.

Diagnostic Aids

A short-circuit to voltage in the serial data wake-up circuit will keep the vehicle bus awake, which can drain the vehicle's battery.

1. Perform the High-Voltage Disabling procedure before proceeding with this diagnostic. Refer to [High Voltage Disabling](#) .
2. Reconnect the 12 V battery.
3. Disconnect the X2 harness connector at the A4 hybrid battery pack.
4. Vehicle OFF, verify that a test lamp does not illuminate between the serial data wake-up circuit terminal 3 and earth.
If the test lamp illuminates, test the serial data wake-up circuit for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
5. Vehicle in Service Mode, verify that a test lamp illuminates between the serial data wake-up circuit terminal 3 and earth.
If the test lamp does not illuminate, test the serial data wake-up circuit for a short-circuit to earth or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid powertrain control module 2.
6. If all circuits test normal, replace the K16 battery energy control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic repair.

[Control Module References](#) for the appropriate control module replacement, programming and set-up

Symptoms - Wiring Systems

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to:
 - [Power Mode Description and Operation](#)
 - [Retained Accessory Power Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Power Mode Mismatch](#)
- [Retained Accessory Power Malfunction](#)

Power Mode Mismatch

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The body control module (BCM) controls the ignition run relay through the control circuit by applying voltage to the ignition run relay coil control circuit. The ignition run relay is energised when the vehicle is in Service Mode, the vehicle is ON or when a remote start is requested. This is part of the BCM's primary function in controlling the vehicle power mode.

The keyless entry control module controls the back-up power for the ignition run relay through the control circuit by applying voltage to the ignition voltage circuit. This circuit is a pass-thru in the BCM and will energise the ignition circuit when the vehicle is in Service Mode, the vehicle is ON or when a remote start is requested.

Circuit/System Verification

Verify DTC B144B is not set.

If the DTC is set, refer to [DTC B144B](#) .

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High-Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high-voltage.
- Identify how to test for the presence of high-voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1,000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: The Volt Battery Pack will utilise an exchange program. Please consult the most recent revision of bulletin/PI #PIP4841, available in Service Information (SI), for a list of approved Volt Battery Pack service procedures. Components that may be removed and serviced without exchanging the complete battery pack are identified in the bulletin/PI. Please contact the GM Technical Assistance Centre (1-877-446-8227) if you have any questions.

1. Vehicle OFF, disconnect the KR74 ignition run relay.
2. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal

85 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Vehicle in Service Mode, verify that a test lamp illuminates between the relay B+ circuit terminal 30 and earth.

If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.

4. Connect a test lamp between the control circuit terminal 86 and earth.

5. Cycle the power mode between Vehicle in Service Mode and Vehicle OFF. The test lamp should turn ON and OFF when changing S83 vehicle ON/OFF switch positions.

If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K9 body control module.

If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the K9 body control module.

Note: If you are working on a module that requires high-voltage disabling, perform steps 6 and 7.

6. Perform the High-Voltage Disabling procedure before proceeding with this diagnostic. Refer to [High Voltage Disabling](#).

7. Reconnect the 12 V battery.

8. Disconnect the harness connector at the appropriate control module.

9. Vehicle OFF, verify that a test lamp does not illuminate between the ignition circuit at the module and earth.

If the test lamp does illuminate, test the ignition circuit for a short to voltage. If the circuit tests normal, test or replace the KR74 ignition run relay.

10. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit at the module and earth.

If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the KR74 ignition run relay.

11. If all circuits test normal, replace the control module.

Component Testing

1. Vehicle OFF, disconnect the KR74 ignition run relay.

2. Test for 70-150 Ω between terminals 85 and 86.

If the resistance is not within the specified range, replace the KR74 ignition run relay.

3. Test for infinite resistance between the following terminals:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87

If less than specified, replace the KR74 ignition run relay.

4. Install a 3 A fused jumper wire between relay terminal 86 and 12 V. Install a jumper wire between relay terminal 85 and earth. Measure for less than 5 Ω between terminals 87 and 30.

If greater than specified, replace the KR74 ignition run relay.

Repair Instructions

Retained Accessory Power Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Switch B+	1	1	--	--
Relay Coil Ignition	B1445 02	1	2	--
Relay Switch Control	1	1	2	--
Relay Coil Ground	--	1	--	--
Ground	--	1	--	--
1. Accessory Power Receptacle or Cigarette Lighter Malfunction				
2. Accessory Power Receptacle or Cigarette Lighter Always ON				

[Circuit/System Description](#)

The retained accessory power (RAP) system allows specific vehicle functions to operate after the vehicle enters the Vehicle Off power mode for a predetermined time. Relay retained accessory power is controlled by the body control module (BCM) using inputs from the door ajar switches to determine control of the relay when the vehicle enters the Vehicle Off power mode. Radio retained accessory power is controlled by a serial data message from the BCM using inputs from the driver door open switch. Refer to [Retained Accessory Power Description and Operation](#) for more detail on subsystems using retained accessory power.

[Diagnostic Aids](#)

The radio retained accessory power mode is a separate function and will still operate properly. The radio retained accessory power function is controlled by serial data and the specific module. These functions are not affected by the BCM retained accessory power relay circuits.

[Circuit/System Verification](#)

Note: Battery voltage must remain above 9.6 V for retained accessory power to operate properly.

Radio Retained Accessory Power

1. Vehicle in Service Mode, observe the Driver's Door Ajar Switch scan tool parameter while opening and closing each vehicle door. The reading should change between Inactive/Active.
If any parameter does not change as specified, refer to [Door Ajar Indicator Malfunction](#) .
2. If the door ajar operation is correct, and the radio is the only retained accessory power concern, replace the radio.

Relay Retained Accessory Power

1. Vehicle in Service Mode, observe the Driver's Door Ajar Switch scan tool parameter while opening and closing each vehicle door. The reading should change between Inactive/Active.
If any parameter does not change as specified, refer to [Door Ajar Indicator Malfunction](#) .
2. Command the scan tool Accessory/Retained Accessory Power Relay Command OFF. Attempt to operate any retained accessory power relay controlled component within 5 seconds. The component should not operate.
3. Command the scan tool Accessory/Retained Accessory Power Relay Command ON. Attempt to operate any retained accessory power relay controlled component within 5 seconds. The component should operate.
4. Vehicle in Service Mode, all doors closed. Observe the scan tool parameter Accessory/Retained Accessory Power Relay Command. Vehicle Off, transmitter out of range, the reading should be Active for approximately 10 minutes then change to Inactive.
If the parameter does not respond as specified, replace the K9 body control module.

Circuit/System Testing

Accessory Power Receptacle or Cigarette Lighter Malfunction

1. Vehicle OFF, disconnect the KR76 retained accessory power relay.
2. Test for less than 10 Ω between the ground circuit terminal 1 and earth.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Verify that a test lamp does not illuminate between the control circuit terminal 2 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage.
4. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 2 and earth.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test the control circuit terminal 3 for a short to ground.
6. Disconnect the harness connector at the inoperative X80 accessory power receptacle or E32 cigarette lighter.
7. Test for less than 10 Ω between the ground circuit terminal C and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
8. Connect the harness connector at the X80 accessory power receptacle or E32 cigarette lighter.
9. Connect a 20 A fused jumper wire between the KR76 Retained Accessory Power relay B+ circuit terminal 5 and the control circuit terminal 3. Verify that the accessory has power.
If the accessory does not have power, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the appropriate X80 accessory power receptacle or E32 cigarette lighter.
10. If all circuits test normal, test or replace the KR76 retained accessory power relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR76 retained accessory power relay.
2. Test for 60-180 Ω between terminals 85 and 86.
If not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87If not the specified value, replace the relay.
4. Install a 20 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
If greater than specified range, replace the relay.

DTC B097C 02: Power Mode Run/Crank Indicator Circuit Short-Circuit to Earth

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B097C 02	2	1	--
Ground	-	2	--	--

1. Vehicle ON/OFF switch indicator always on

2. Vehicle ON/OFF switch indicator inoperative

[Circuit/System Description](#)

The vehicle ON/OFF switch has a single LED that indicates the vehicle power mode. When the vehicle is in the OFF mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch for five seconds, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch.

[Conditions for Running the DTC](#)

Control module voltage is 9-16 V

[Conditions for Setting the DTC](#)

- The BCM detects a short-circuit to earth in the control circuit.
- The above condition exists for more than 1 minute.

[Action Taken When the DTC Sets](#)

The BCM disables the control output.

[Conditions for Clearing the DTC](#)

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module power mode cycle counter reaches 40, without a repeat of the malfunction.

** DTC set in keyless entry control module

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicate the vehicle power mode. When the vehicle is in the off mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch for five seconds, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch.

Conditions for Running the DTC

Control module voltage is 9-16 V.

Conditions for Setting the DTC

B097B 00

- The voltage seen at the BCM monitored switch does not match the voltage seen at the keyless entry control module monitored switch.
- The above condition exists for more than 1 second

B097B 02

- The control module detects a short to earth in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 second

B097B 04

- The control module detects a open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 second

B097B 05

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 second

B097B 08

- The control module detects a change in the ignition mode without observing a switch press
- The above condition occurs 4 consecutive times

B097B 61

- The control module detects a continuously closed vehicle ON/OFF switch
- The above condition exists for more than 1 minute

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears after 40 consecutive module ignition cycles without a repeat of the malfunction.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify DTC B097B 08 or B097B 61 is not set.
If either DTC is set, test or replace the S83 vehicle ON/OFF switch.
2. With the brake pedal released, press and hold the S83 vehicle ON/OFF switch for 5 seconds. The blue LED should illuminate and the vehicle should be in Service Mode.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S83 vehicle ON/OFF switch.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle OFF, test for less than 10 Ω between the low reference circuit terminal 7 and earth.
If greater than specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K84 keyless entry control module.
4. Verify the scan tool BCM Push Button Ignition Switch Voltage parameter is greater than 11 V.
If less than the specified range, test the signal circuit terminal 6 for a short to earth. If the circuit tests normal, replace the K9 body control module.
5. Install a 3 A fused jumper wire between the signal circuit terminal 6 and earth. Verify the scan tool BCM Push Button Ignition Switch Voltage parameter is less than 1 V.
If greater than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 body control module.
6. Connect the harness connector at the S83 vehicle ON/OFF switch.
7. With the S83 vehicle ON/OFF switch released, verify the scan tool BCM Push Button Ignition Switch Voltage parameter is 8-10 V.
If not within the specified range, test or replace the S83 vehicle ON/OFF switch.
8. With the S83 vehicle ON/OFF switch pressed, verify the scan tool BCM Push Button Ignition Switch Voltage parameter is 4-7 V.
If not within the specified range, test or replace the S83 vehicle ON/OFF switch.
9. Disconnect the X1 harness connector at the K84 keyless entry control module.
10. Vehicle OFF, test for infinite resistance between the signal circuit terminal 11 and earth.
If not the specified value, test the signal circuit for a short to earth.
11. Vehicle in Service Mode, test for less than 1 V between the signal circuit terminal 11 and earth.
If greater than the specified range, test the signal circuit for a short to voltage.
12. With the S83 vehicle ON/OFF switch pressed, test for 4.5-5.5k Ω between the signal terminal 11 and the low reference terminal 12.
If not within the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, test or replace the S83 vehicle ON/OFF switch.
13. With the S83 vehicle ON/OFF switch released, test for 1-1.5k Ω between the signal terminal 11 and the low reference terminal 12.

If not within the specified range, test or replace the S83 vehicle ON/OFF switch.

14. If all circuits test normal, test or replace the K84 keyless entry control module.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the S83 vehicle ON/OFF switch.
2. With the S83 vehicle ON/OFF switch released, test for 4.5-5.5k Ω between the terminal listed below:

- Signal terminal 4 and low reference terminal 6
- Signal terminal 3 and low reference terminal 7

If not within the specified range, replace the S83 vehicle ON/OFF switch.

3. With the S83 vehicle ON/OFF switch pressed, test for 1-1.5k Ω between the terminal listed below:

- Signal terminal 4 and low reference terminal 6
- Signal terminal 3 and low reference terminal 7

If not within the specified range, replace the S83 vehicle ON/OFF switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Ignition and Start Switch Replacement](#)
- [Control Module References](#) for BCM or keyless entry control module replacement, programming, and setup

General Electrical Diagnosis

[Basic Knowledge Required](#)

Without a basic knowledge of electricity, it will be difficult to use the diagnostic procedures contained in the service manual. You should understand the basic theory of electricity, and know the meaning of voltage (V), current (A), and resistance (Ω). You should also be able to read and understand a wiring diagram, as well as understand what happens in a circuit with an open or a shorted wire.

Checking Aftermarket Accessories

Warning: Refer to [SIR Warning](#) in the Preface section.

Caution: The OBD II symbol is used on the circuit diagrams in order to alert the technician that the circuit is essential for proper OBD II emission control circuit operation. Any circuit which fails and causes the malfunction indicator lamp (MIL) to turn ON, or causes emissions-related component damage, is identified as an OBD II circuit.

Do not connect aftermarket accessories into the following circuits:

- SIR circuits, all such circuits are indicated on circuit diagrams with the SIR symbol.
- OBD II circuits, all such circuits are indicated on circuit diagrams with the OBD II symbol.

Always check for aftermarket accessories (non-OEM) as the first step in diagnosing electrical problems. If the vehicle is so equipped, disconnect the system to verify that these add-on accessories are not the cause of the problems.

Possible causes of vehicle problems related to aftermarket accessories include:

- Power feeds connected to points other than the battery
- Antenna location
- Transceiver wiring located too close to vehicle electronic modules or wiring
- Poor shielding or poor connectors on aerial feed line
- Check for recent service bulletins detailing installation guidelines for aftermarket accessories.

Circuit Testing

The Circuit Testing section contains the following diagnostic testing information. Using this information along with the diagnostic procedures will identify the cause of the electrical malfunction.

Using Connector Test Adapters

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Caution: Do not insert test equipment probes (DMM etc.) into any connector or fuse block terminal. The diameter of the test probes will deform most terminals. A deformed terminal will cause a poor connection, which will result in a system failure. Always use the EL-38125-580 GM Approved Terminal Release Tool Kit in order to front probe terminals. Do not use paper clips or other substitutes to probe terminals.

When using the EL-38125-580 GM Approved Terminal Release Tool Kit , ensure the terminal test adapter choice is the correct size for the connector terminal. Do not visually choose the terminal test adapter because some connector terminal cavities may appear larger than the actual terminal in the cavity. Using a larger terminal test adapter will damage the terminal. Refer to the EL-38125-580 GM Approved Terminal Release Tool Kit label on the inside of the EL-38125-580 GM Approved Terminal Release Tool Kit for the correct adapter along with the connector end view for terminal size.

Probing Electrical Connectors

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Note: Always be sure to reinstall the connector position assurance (CPA) and terminal position assurance (TPA) when reconnecting connectors or replacing terminals.

[Front probe](#)

Disconnect the connector and probe the terminals from the mating side (front) of the connector.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

Note: When probing female 0.64 terminals, it is important to use the correct adapter. There have been some revisions to the test adapter for 0.64 terminals. The proper adapter for 0.64 terminals is the J-35616-64B which has a gold terminal and a black wire between the base and tip. Failure to use the proper test adapter may result in damage to the terminal being tested and improper diagnosis.

Note: The proper adapter for probing the terminals for fuses, relays, or diodes in an electrical centre is J-35616-35. Using any other tool or adapter may damage the terminal being tested.

Refer to the following table as a guide in selecting the correct test adapter for front probing connectors:

Test Adapter	Description
J-35616-2A	150 Male Probe Adapter (grey)
J-35616-3	150 Female Probe Adapter (grey)
J-35616-4A	280 Male Probe Adapter (purple)
J-35616-5	280 Female Probe Adapter (purple)
J-35616-6	100W Male (round) Probe Adapter (brown)
J-35616-7	100W Female (round) Probe Adapter (brown)

J-35616-8	Weather Pack Male Probe Adapter (orange)
J-35616-9	Weather Pack Female Probe Adapter (orange)
J-35616-10	100W Male (round) Probe Adapter (green)
J-35616-11	100W Female (round) Probe Adapter (green)
J-35616-12	130 Male Probe Adapter (blue)
J-35616-13	130 Female Probe Adapter (blue)
J-35616-14	150 Male Probe Adapter (green)
J-35616-16	100 Male Probe Adapter (lt green)
J-35616-17	100 Female Probe Adapter (lt green)
J-35616-18	220 Male Probe Adapter (black)
J-35616-19	220 Female Probe Adapter (black)
J-35616-21	950 Female Probe Adapter (red)
J-35616-22	950 Male Probe Adapter (red)
J-35616-31	500 Male Probe Adapter (orange)
J-35616-32	500 Female Probe Adapter (orange)
J-35616-33	160/180 Male Probe Adapter (yellow)
J-35616-34	160/180 Female Probe Adapter (yellow)
J-35616-35	280 Male Probe Adapter (violet)
J-35616-40	480 Male Probe Adapter (dk blue)
J-35616-41	480 Female Probe Adapter (dk blue)
J-35616-42	630 Male Probe Adapter (red)
J-35616-43	630 Female Probe Adapter (red)
J-35616-44	800 Male Probe Adapter (yellow)
J-35616-45	800 Female Probe Adapter (yellow)
J-35616-54	280 Male (round) Probe Adapter (tan)
J-35616-55	280 Female (round) Probe Adapter (tan)
J-35616-64B	0.64 Male Probe Adapter (lt blue)
J-35616-65B	0.64 Female Probe Adapter (lt blue)
J-35616-66	150 Male (round) Probe Adapter (yellow)
J-35616-67	150 Female (round) Probe Adapter (yellow)

[Back probe](#)

Note:

Back probe connector terminals only when specifically required in diagnostic procedures.

-
- Do not back probe a sealed (Weather Pack®) connector, less than a 280 series Metri-Pack connector, a Micro-Pack connector, or a flat wire connector.
- Back probing can be a source of damage to connector terminals. Use care in order to avoid deforming the terminal, either by forcing the test probe too far into the cavity or by using too large of a test probe.
- After back probing any connector, inspect for terminal damage. If terminal damage is suspected, test for proper terminal contact.

Do not disconnect the connector and probe the terminals from the harness side (back) of the connector.

Fault-finding with a Digital Multimeter

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#).

Danger: High-voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures exactly as written may result in serious injury or death.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

[Digital Multimeter \(DMM\) Basic Requirements](#)

Service information is validated using digital multimeters that meet or exceed the following requirements. Using a multimeter that does not meet these basic requirements may give inaccurate readings which could lead to an incorrect diagnosis.

Display and Settings

1. Four digits displayed
2. Voltage, current, resistance, frequency, diode test settings, and min-max function
3. Display positive and negative values

Voltage

1. Have at least 10 M Ω input impedance
2. Test a DC voltage range of 0.1-1000 V.
3. Test an AC voltage range of 0.1-1000 V.

Current

1. Test a DC current range of 0.1[micro]A-10 A.
2. Test an AC current range of 0.1[micro]A-10 A.

Resistance

Test a resistance range of 0.1 Ω -40 M Ω and displays infinite for a value greater than 40 M Ω (O.L. (Over-load))

Frequency

Test for a frequency range of 0.5 HZ-199 K HZ

Diode Test

1. Apply at least 2 mA when performing the diode bias test
2. Display the break over voltage drop (0-3 V) of a forward biased diode
3. Display infinite (O.L. (Over-load)) when a diode is reverse biased

Min-Max Readings

1. Can update at a 25 ms sample rate
2. Saves and displays minimum and maximum values

Note: Circuits which include any solid state control modules, such as the engine control module (ECM), should only be tested with a 10 megohm or higher impedance digital multimeter such as the EL-39200.

The DMM instruction manual is a good source of information and should be read thoroughly upon receipt of the DMM as well as kept at hand for future reference.

A DMM should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The multimeter function on a DMM shows how much resistance exists between 2 points along a circuit. Low resistance in a circuit means good continuity.

Note: Disconnect the power feed from the suspect circuit when measuring resistance with a DMM. This prevents incorrect readings. DMMs apply such a small voltage to measure resistance that the presence of voltages can upset a resistance reading.

Diodes and solid state components in a circuit can cause a DMM to display a false reading. To find out if a component is affecting a measurement take a reading once, then reverse the leads and take a second reading. If the readings differ the solid state component is affecting the measurement.

Following are examples of the various methods of connecting the DMM to the circuit to be tested:

- Probe both ends of the connector and either hold the leads in place while manipulating the connector or tape the leads to the harness for continuous monitoring while you perform other operations or test driving. Refer to [Probing Electrical Connectors](#) .
- Disconnect the harness at both ends of the suspected circuit where it connects either to a component or to other harnesses.
- If the system that is being diagnosed has a specified pinout or breakout box, it may be used in order to simplify connecting the DMM to the circuit or for testing multiple

circuits quickly.

Fault-finding with a Test Lamp

Special Tools

EL-35616-200 Test Lamp – Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

A test lamp can simply and quickly test a low impedance circuit for voltage. A digital multimeter (DMM) should be used instead of a test lamp in order to test for voltage in high-impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The *EL-35616-200* kit is Micro-Pack compatible and comprised of a 12 V light bulb with an attached pair of leads.

To properly operate this tool use the following procedures.

When testing for voltage:

1. Attach one lead to ground.
2. Touch the other lead to various points along the circuit where voltage should be present.
3. When the bulb illuminates, there is voltage at the point being tested.

When testing for ground:

1. Attach one lead to battery positive voltage.
2. Touch the other lead to various points along the circuit where ground should be present.
3. When the bulb illuminates, there is ground at the point being tested.

Using Fused Jumper Wires

Special Tools

EL 35616-20F Fused Jumper Wire

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

Note: A fused jumper may not protect solid state components from being damaged.

The *EL 35616-20F* Fused Jumper Wire includes banana jack connectors that provide adaptation to most connectors without damage. This fused jumper wire is supplied with a 20 A fuse which may not be suitable for some circuits. Do not use a fuse with a higher rating than the fuse that protects the circuit being tested.

Measuring Voltage

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Danger: Before working on any high- voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1,000 V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high- voltage battery assembly, whether the system is energised or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

The following procedure measures the voltage at a selected point in a circuit.

1. Disconnect the electrical harness connector for the circuit being tested, if necessary.
2. Enable the circuit and/or system being tested. Use the following methods:
 - Vehicle power mode to Vehicle in Service Mode or Vehicle On.
 - Turn ON the circuit and/or system with a scan tool in Output Controls.
 - Turn ON the switch for the circuit and/or system being tested.
3. Select the V (AC) or V (DC) position on the digital multimeter (DMM).
4. Connect the positive lead of the DMM to the point of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. The DMM displays the voltage measured at that point.

Measuring Voltage Drop

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#).

Caution: Refer to [Test Probe Caution](#) in the Preface section.

The following procedure determines the difference in voltage potential between 2 points.

1. Set the Digital Multimeter (DMM) to the V (DC) position.

2. Connect the positive lead of the DMM to one point of the circuit to be tested.
3. Connect the negative lead of the DMM to the other point of the circuit.
4. Operate the circuit.
5. The DMM displays the difference in voltage between the 2 points.

Measuring Frequency

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Caution: Refer to [Test Probe Caution](#) in the Preface section.

The following procedure determines the frequency of a signal.

Note: Connecting the Digital Multimeter (DMM) to the circuit before pressing the Hz button will allow the DMM to autorange to an appropriate range.

1. Apply power to the circuit.
2. Set the DMM to the V (AC) position.
3. Connect the positive lead of the DMM to the circuit to be tested.
4. Connect the negative lead of the DMM to a good ground.
5. Set to Hz on the DMM.
6. The DMM will display the frequency measured.

Testing Ground and Low Reference Circuits

Because a test lamp can light with up to 200 Ω in a ground or low reference circuit they are not recommended to be used for this type of test. A low impedance test lamp can light and indicate the circuit is good when there is as much as 20-30 Ω present, while a high impedance test lamp can light with up to 200 Ω present in the circuit. This is why the Digital Multi-Meter (DMM) is used when validating a ground or low reference circuit continuity.

When using the DMM there are many vehicle conditions that can affect the ground and low reference continuity testing. If these conditions are not met, a ground or low reference circuit test can fail on a good circuit. This may cause longer diagnosis time and incorrect component replacement.

Any current flow through a ground or low reference circuit, while being tested, will skew the DMM continuity reading, or display a reading higher than when there is no current flowing. Performing a ground or low reference circuit continuity test, in reference to the vehicles battery negative terminal, will have the highest risk of failing a good ground or low reference circuit test than any other ground reference point. The best ground test points would be a control module housing (if the control modules housing is metal and grounded), door jamb striker (if attached to metal), under dash metal frame work, engine block, or body ground studs (other than where the negative battery cable is attached).

A typical DMM earth or low-reference circuit continuity reading can be as high as 100 Ω with the vehicle power mode in Vehicle ON or Vehicle in Service Mode, and drop to 15-25 Ω after switching to Vehicle OFF. The reading will drop below 10 Ω after 30-40 seconds, then below 5 Ω after 60 seconds. Once the vehicle completely goes to sleep (generally 3-10 minutes) the reading will drop below 0.3 Ω .

The following list of conditions may need to be met to ensure a valid continuity reading on a ground or low reference circuit:

- Vehicle OFF
- Transmitter out of range of the vehicle
- Retained Accessory Power (RAP) OFF (open and close the driver door after Vehicle OFF)
- Battery charger set at a 2 A or less charge rate
- Scan tool not communicating with any vehicle control module (in some cases it may need to be disconnected from the DLC)
- All entry doors closed
- Headlamps OFF (auto headlamps disabled)
- Any delay lighting OFF
- HVAC after blow OFF
- Any accessory that can work when the vehicle power mode is Vehicle OFF
- Wait up to 60 seconds (after all other listed conditions are met)

Activating the DOOR LOCK function with a remote transmitter can greatly reduce the time to achieve a valid earth or low reference continuity test result.

Testing for Continuity

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

The following procedures verify good continuity in a circuit.

[With a Digital Multimeter \(DMM\)](#)

1. Set the DMM to the Ω position.
2. Disconnect the power feed (i.e. fuse, control module) from the suspect circuit.
3. Disconnect the load.
4. Select the MIN MAX function on the DMM.
5. Connect one lead of the DMM to one end of the circuit to be tested.
6. Connect the other lead of the DMM to the other end of the circuit.
7. If the DMM displays low or no resistance, the circuit has good continuity.

[With a Test Lamp](#)

Note: Only use the test lamp procedure on low impedance power and ground circuits.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to one end of the circuit to be tested.
4. Connect the other lead of the test lamp to battery positive voltage.
5. Connect the other end of the circuit to ground.
6. If the test lamp illuminates (full intensity), then the circuit has good continuity.

Testing for Short to Ground

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

The following procedures test for a short to ground in a circuit.

With a Digital Multimeter (DMM)

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the rotary dial of the DMM to the Ω position.
4. Connect one lead of the DMM to one end of the circuit to be tested.
5. Connect the other lead of the DMM to a good ground.
6. If the DMM does NOT display infinite resistance (OL), there is a short to ground in the circuit.

With a Test Lamp

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to battery positive voltage.
4. Connect the other lead of the test lamp to one end of the circuit to be tested.
5. If the test lamp illuminates, there is a short to ground in the circuit.

Fuse Powering Several Loads

1. Review the system schematic and locate the fuse that is open.
2. Open the first connector or switch leading from the fuse to each load.
3. Connect a DMM across the fuse terminals (be sure that the fuse is powered).
 - When the DMM displays voltage the short is in the wiring leading to the first connector or switch.
 - If the DMM does not display voltage refer to the next step.
4. Close each connector or switch until the DMM displays voltage in order to find which circuit is shorted.

Testing for a Short to Voltage

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Caution: Refer to [Test Probe Caution](#) in the Preface section.

The following procedure tests for a short to voltage in a circuit.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the digital multimeter (DMM) to the V (DC) position.
4. Connect the positive lead of the DMM to one end of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. Switch the vehicle power mode to Vehicle in Service Mode and operate all accessories.
7. If the voltage measured is greater than 1 V, there is a short to voltage in the circuit.

Testing for Intermittent Conditions and Poor Connections

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- Poor terminal to wire connection--Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

[Testing for Terminal Fretting](#)

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidised wear debris that can form when there is a small motion between electrical contacts. The oxidised wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can

experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add Nyogel lubricant 760G (dielectric grease) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the *EL-35616* kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tab, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centres (BEC)

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical centre (BEC). Use *EL-35616* kit to test for proper terminal contact. Failure to use *EL-35616* kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underbonnet or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.

3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter from the on the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underbonnet/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures--In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference (EMI) or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high-voltage/high-current devices such as secondary ignition components, motors, generator, etc.--These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, mobile phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

[Incorrect Control Module](#)

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

Note: DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogramme the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

Inducing Intermittent Fault Conditions

Special Tools

EL-25070 Heat Gun

For equivalent regional tools, refer to [Special Tools](#) .

Danger: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, engine torque, bumps/rough pavement, etc. In order to duplicate the customer's concern, it may be necessary to manipulate the wiring harness if the malfunction appears to be vibration related. Manipulation of a circuit can consist of a wide variety of actions, including:

- Wiggling the harness
- Disconnecting a connector and reconnecting
- Stressing the mechanical connection of a connector
- Pulling on the harness or wire in order to identify a separation/break inside the insulation
- Relocating a harness or wires

All these actions should be performed with some goal in mind. For instance, with a scan tool connected, wiggling the wires may uncover a faulty input to the control module. The snapshot option would be appropriate here. Refer to [Scan Tool Snapshot Procedure](#) . Another option is, with the component commanded ON and OFF by the scan tool, to move related connectors and wiring and observe the component operation. With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/system operation, or engine operation, inspect and repair the harness/connections as necessary.

You may need to load the vehicle in order to duplicate the concern. This may require the use of weights, floor jacks, axle stands, frame machines, etc. In these cases you are attempting to duplicate the concern by manipulating the suspension or frame. This method is useful in finding harnesses that are too short and their connectors pull apart enough to cause a poor connection. A DMM set to the Min/Max mode and connected to the suspect circuit while testing can yield desirable results. Refer to [Testing for Electrical Intermittents](#) .

Certainly, using the senses of sight, smell, and hearing while manipulating the circuit can provide good results as well.

There may be instances where circuit manipulation alone will not meet the required criteria for the fault condition to appear. In such cases it may be necessary to expose the suspect circuit to other conditions while manipulating the harness. Such conditions would include high moisture conditions, along with exceptionally high or low temperatures. The following discusses how to expose the circuit to these kinds of conditions.

High Temperature Conditions

If the complaint tends to be heat-related, you can simulate the condition using the *EL-25070* heat gun .

Using the heat gun, you can heat up the suspected area or component. Manipulate the harnesses under high temperature conditions while monitoring the scan tool or DMM to locate the fault condition.

The high temperature condition may be achieved simply by test driving the vehicle at normal operating temperature. If a heat gun is unavailable, consider this option to enhance your diagnosis. This option does not allow for the same control, however.

Low Temperature Conditions

Depending on the nature of the fault condition, placing a fan in front of the vehicle while the vehicle is in the shade can have the desired effect.

If this is unsuccessful, use local cooling treatments such as ice or a venturi type nozzle (one that provides hot or cold air). This type of tool is capable of producing air stream temperatures down to -18°C (0°F) from one end and $+71^{\circ}\text{C}$ (160°F) from the other. This is ideally suited for localized cooling needs. In addition, circuit cooling spray can be used to cool down a component or circuit.

Once the vehicle, component, or harness has been sufficiently cooled, manipulate the harness or components in an effort to duplicate the concern.

Duplicating Failure Conditions

- If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions.
- Freeze Frame/Failure Records data, where applicable, contains the conditions that were present when the DTC set.
 1. Review and record Freeze Frame/Failure Records data.
 2. Clear the DTCs using the scan tool.
 3. Switch the vehicle power mode to Vehicle Off and wait 15 seconds.
 4. Operate the vehicle under the same conditions that were noted in Freeze Frame/Failure Records data, as closely as possible. The vehicle must also be operating within the Conditions for Running the DTC. Refer to Conditions for Running the DTC in the supporting text if a DTC is being diagnosed.
 5. Monitor DTC Status for the DTC being tested. The scan tool will indicate Ran, when the enabling conditions have been satisfied long enough for the DTC to run. The scan tool will also indicate whether the DTC passed or failed.
- An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the concern occurs, may help you locate the concern.

Testing for Electrical Intermittents

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This procedure should not be performed on high-voltage circuits. Performing this procedure on high-voltage circuits may result in serious injury or death.

Perform the following procedures while wiggling the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the test equipment.

- [Testing for Short to Ground](#)
- [Testing for Continuity](#)
- [Testing for a Short to Voltage](#)

If the fault is not identified, perform the procedure below using the MIN MAX feature on the *EL-39200* DMM . This feature allows you to manipulate the circuit without having to watch the DMM. The DMM will generate an audible tone when a change is detected.

Note: The DMM must be used to perform the following procedure since the DMM can monitor current, resistance or voltage while recording the minimum (MIN), and maximum (MAX) values measured.

1. Connect the DMM to both sides of a suspected connector (still connected), or from one end of a suspected circuit to the other. Refer to [Fault-finding with a Digital Multimeter](#) for information on connecting the DMM to the circuit.
2. Set the rotary dial of the DMM to the V (AC) or V (DC) position.
3. Press the range button of the DMM in order to select the desired voltage range.

Note: The 100 ms RECORD mode is the length of time an input must stay at a new value in order to record the full change.

4. Select the MIN MAX function of the DMM. The DMM displays the 100 ms RECORD and emits an audible tone (beep).
5. Simulate the condition that is potentially causing the intermittent connection, either by wiggling the connections or the wiring, test driving, or performing other operations. Refer to [Inducing Intermittent Fault Conditions](#) .
6. Listen for the audible Min Max Alert which indicates that a new minimum or maximum value has been recorded.
7. Press the MIN MAX button until the MAX value is displayed and note the value.
8. Press the MIN MAX button until the MIN value is displayed and note the value.
9. Determine the difference between the MIN and MAX values.

- If the variation between the recorded MIN and MAX voltage values is 1 V or greater an intermittent open or high resistance condition exists. Repair the condition as necessary.
- If the variation between the recorded MIN and MAX voltage values is less than 1 V an intermittent open or high resistance condition does not exist.

Scan Tool Snapshot Procedure

[Using Snapshots in Global Diagnostic System \(GDS\)](#)

Overview

A snapshot is a recording of what a control module on the vehicle was receiving for information while the snapshot is being made. A snapshot may be used to analyse the data during the time a vehicle condition is current. This allows you to concentrate on making the condition occur, rather than trying to view all the data in anticipation of the fault. To record a snapshot in GDS, select, Record Snapshot, from the options at the top right portion of any of the various pages that allow snapshots to be taken (e.g. Data Display, Control Functions, etc.). When you are finished recording, select, Stop Snapshot recording. The snapshot will now be available for replay.

Snapshot Replay

The Snapshot Replay function allows reviews of previously recorded vehicle snapshot data. This information can be used in analysis of vehicle problems and detection of trigger error conditions. The graph function can be used to compare parameters to see if a component is functioning properly. Recorded snapshots can be selected for viewing by the following three methods:

- Selecting a snapshot file from the Vehicle Home Page and clicking on the Review selection.
- Double clicking on the selected snapshot from the Vehicle Home Page.
- Entering the Tools selection from the Menu selection and selecting Snapshot replay. Next, open the Snapshot Manager. Double click on the snapshot file you wish to view or click on the Load Snapshot selection and select a snapshot file.

Regardless of selection method, a File Loaded pop-up window will be displayed from the Snapshot Replay screen. Select OK from the pop-up window.

Snapshot Play Functions

There are several snapshot play functions that are used to replay recorded snapshots

- The Play function is used to play the snapshot forward by clicking on this selection. A marker will move across the screen when this selection is used. All selections in this area turn grey when they are active.
- The Pause function is used to pause play of the snapshot. When this selection is clicked a second time the snapshot will start playing where it left off.
- The Stop function is used to stop playing the snapshot. The snapshot will start from the beginning, if Play is selected after using the Stop function.

Time Control

Time control is used to control the snapshot replay. This function allows selection of a specific time frame, display of different views, and control of display speed. The following functions can be selected directly under Time Control.

- The Bookmark selection allows you to add a specific comment in the current display and return to this point in the future. When this option is selected, a pop-up window is displayed. Enter a bookmark name and select OK.
- The Note Pad can be selected to add comments to the snapshot replay file at the current point of time. When this option is selected, a pop-up window is displayed. Enter a comment for the snapshot file and select OK.
- The Load Snapshot (blue folder) opens a snapshot file and makes it ready for further analysis. This function is also available by clicking on an available snapshot file from the Snapshot Manager.
- The Down Arrow displays all Time Control options when selected. Individual options can also be selected by clicking on the item you want.
- The Snapshot Display Speed can be controlled by selecting this option. Slow speeds of 1/8X, 1/4X, and 1/2X can be selected. The real time speed can also be selected at 1. Faster speeds of 2X, 4X, and 8X can also be obtained by using this selection.

View Selections

Each View Selection provides a different way of displaying vehicle data for analysis. The following functions can be selected under Available Views:

Note: The parameter name will be shown in the original language used for capture if no translation is available for the name.

- Parameter List View -- Displays incoming information from the snapshot file. The current value of the parameters is displayed on the screen.
- Log View -- Contains all the information from the snapshot file. All parameter values are listed in the order they were recorded. Specific parameters can be added or removed from a watchlist by clicking on the appropriate item.
- State View -- Shows the values of all parameters in a specific time frame. These values can be used for comparison with the trigger view.
- Trigger View -- Displays all system and user defined triggers. This function can be used when there is a combination of factors involved in a diagnostic problem. When a Trigger condition is met a caution triangle will be displayed on the screen.

Triggers:

- Load Triggers -- Allows you to load a file containing trigger definitions.
- Save Triggers -- Allows you to save the trigger to your computer's hard drive.
- Remove Trigger -- Allows you to remove the current trigger. It will no longer be present.
- Edit Trigger -- Displays a pop-up window where you can modify the limits and parameters contained within a trigger.
- Adds Trigger -- Displays a pop-up window to configure a trigger.
- DTC View -- After the Play function is selected and this option is selected this function opens the list of recorded DTCs.
- Line Graph View -- Displays data that can be visualised against the time-axis. From this view, specific parameters can be selected for graphing by checking the box under Selected. At the bottom of the graph there are four functions Zoom In (increase size), Zoom Out (decrease size), Bookmarks, and Pause Scrolling. Each of these functions can be accessed by clicking on them.

Circuit Protection - Fuses

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#).

The fuse is the most common method of an automotive wiring circuit protection. Whenever there is an excessive amount of current flowing through a circuit the fusible element will melt and create an open or incomplete circuit. Fuses are a one time protection device and must be replaced each time the circuit is overloaded. To determine if a fuse is open, remove the suspected fuse and examine if the element in the fuse is broken (2). If not broken (1), also check for continuity using a Digital Multimeter (DMM) or a continuity tester. If the element is broken or continuity is suspect, replace the fuse with one of equal current rating.

Fuse Types

Current Rating Amperes	Colour
Auto Fuses, Mini Fuses	

2	Grey
3	Violet
5	Tan
7.5	Brown
10	Red
15	Blue
20	Yellow
25	White or Natural
30	Green
Maxi Fuses	
20	Yellow
30	Lamp Green
40	Orange or Amber
60	Blue
50	Red
J-Case Fuses	
20	Blue
30	Pink
40	Green
50	Red
60	Yellow
Midi Fuses	
80	Black
Mega Fuses	
100	Black
150	Black
200	Black

Circuit Protection - Circuit Breakers

A circuit breaker is a protective device that is designed to open the circuit when a current load is in excess of the rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. Two types of circuit breakers are used.

Circuit Breaker: This type opens when excessive current passes through it for a period of time. It closes again after a few seconds, and if the cause of the high current is still present, it will open again. The circuit breaker will continue to cycle open and closed until the condition causing the high current is removed.

Positive Temperature Coefficient (PTC) Circuit Breaker: This type greatly increases its resistance when excessive current passes through it. The excessive current heats the PTC device, as the device heats its resistance increases. Eventually the resistance gets so high that the circuit is effectively open. Unlike the ordinary circuit breaker the PTC unit will not reset until the circuit is opened, by removing the voltage from its terminals. Once the voltage is removed the circuit breaker will re-close within a second or 2.

Circuit Protection - Fusible Links

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Note: When repairing a fusible link, fusible links cut longer than 225 mm (approximately 9 in) will not provide sufficient overload protection.

Fusible link is wire designed to melt and break continuity when excessive current is applied. It is often located between or near the battery and starter or electrical centre. Use a continuity tester or a Digital Multimeter (DMM) at each end of the wire containing the fusible link in order to determine if it is broken. If broken, it must be replaced with fusible link of the same gauge size.

Wiring Harness Repair Astra-J, Insignia, Meriva-B and Movano-B

Please use the current wiring harness repair strategy for the Astra-J, Meriva-B and Insignia until the new global wiring harness repair strategy has been introduced. Use the same procedure as for the other Opel/Vauxhall carlines. This procedure is described in the general information for these carlines and in the paper manual "Wiring Harness Repair" (KTA-1950/2). In case of a warranty issue, the labour time can be found in the respective part of the table of content of the Astra-J, Meriva-B and Insignia Information in Tis2Web. The first list below shows the connectors that are used in the Astra-J of which repair is supported, together with the supplier part numbers, the concerned pigtail kit and the release tools that should be used for the concerned connector. The second list shows the connectors that are used in the Meriva-B of which repair is supported with the same information. The third list shows the connectors that are used in the Insignia of which repair is supported with the same information. For Movano-B the harness repair information is not yet available.

Repairing Damaged Wire Insulation

Table 1: [Wire Size Conversion](#)

Danger: In order to reduce the risk of personal injury, loss of high-voltage isolation to earth and higher system impedance, do not attempt to repair any HV wiring, connector or terminal that is damaged. High-voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high-voltage wiring, cables or terminals. Performing this procedure on high-voltage circuits may result in serious injury or death.

If the wire insulation has been chafed, or broken, enough to show the conductive portion of the wire, and the wire is not damaged, determine the length of insulation that needs to be repaired. If the repair is less than 280 mm (11 in), cut the wire within the damaged area. Then slide the appropriate heat shrink tubing (listed below) over the wire, and repair the wire by splicing the wires together. Refer to [Splicing Copper Wire Using Splice Sleeves](#) . Once the wire is spliced together slide heat shrink tubing over the damaged area and apply heat to seal the repaired wire.

If the wire is damaged, or the damaged area is larger than 280 mm (11 in), then replace the damaged wire by splicing in a new section of wire. Refer to [Splicing Copper Wire Using Splice Sleeves](#) .

GM Part Number	Diameter		Description	Colour	Length	
	Metric	English			Metric	English
12355003	9.5 mm	0.375 in	Tubing, Shrink 3/8	Black	305 mm	12 in
12355005	12.7 mm	0.5 in	Tubing, Shrink 1/2	Black	305 mm	12 in

Flat Wire Repairs

The flat wire within the flex wiring harness is not serviceable. If an open or short exists within the flex wiring harness the complete harness must be replaced.

Folded-Over Wire Repair

Special Tools

EL-38125-10 Splice Sleeve Crimping Tool

For equivalent regional tools, refer to [Special Tools](#) .

Danger: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

The GM global wire repair strategy uses connector assemblies (pigtails) and terminated leads to repair wiring harnesses.

To reduce and manage GM Service Parts proliferation, the service pigtails and terminated leads are designed with the largest wire gauge size that can be held by either the terminal or the connector housing.

The folded over wire repair technique, in which the copper wire strands are folded over before being installed into a splice sleeve, allows the service part to be used when repairing a smaller gauge size wire in a vehicle. This technique has passed all GM testing standards.

The larger harness size wires (1) will be placed in one side of the splice sleeve and match the splice sleeve closely in size. The wires are moved into the splice sleeve until they hit the stop (4) in the splice sleeve. The smaller harness size wires (2) will be placed in the other side of the splice sleeve. The smaller harness size wires will be folded over (3) to match up with the splice sleeve size.

Use the folded over wire repair for:

Note: Increasing the amount of copper strands in the smaller gauge size will allow for a better crimp

- Splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes)

Note: Vehicle side needs to be of same or less gauge size (not greater than the service part's gauge size)

- Splicing wires of different gauges

Use the Service Information (SI) connector end-views to determine:

- Gauge size of wiring harness

- Recommended Repair: Terminated Lead or Pigtail

The following table lists the acceptable variance within the gauge size

Folded-Over Wire Selection Table

Harness Wire Gauge		Connector Assembly (Pigtail) or Terminated Lead Wire Gauge Size			
-		Salmon Colour		Blue Colour	Yellow Colour
		Splice Sleeve		Splice Sleeve	Splice Sleeve
Metric	-	0.35 mm	0.5-0.8 mm	1.0-2.0 mm	3.0-5.0 mm
-	Wire Gauge (AWG)	22	20-18	16-14	12-10
0.13 mm	26	Fold Over Wire	Fold Over Wire	Fold Over Wire	Not Acceptable
0.22 mm	24	Fold Over Wire	Fold Over Wire	Fold Over Wire	Not Acceptable
0.35 mm	22	Fold Over Wire	Fold Over Wire	Fold Over Wire	Not Acceptable
0.5 mm	20	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
0.75 mm	-	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
0.8 mm	18	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
1.0 mm	16	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
1.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.0 mm	14	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
3.0-5.0 mm	12-10	Not Acceptable	Not Acceptable	Not Acceptable	Wire to Wire

Example

For an IP Harness of 0.22 mm (24 gauge on left side of table) wire size, the SI connector end-view recommends a pigtail with leads of 0.8 mm (18 gauge on the top of the table) with a salmon coloured DuraSeal splice sleeve of 0.5-1.0 mm (20-16 gauge).

Follow these steps to use the folded over wire (1) technique on an IP Harness.

Strip twice the amount of insulation on the smaller (1) wire (IP Harness is the lower wire) than normally required. Normally, the terminated leads have 5 mm of insulation stripped off the wire.

Note: Use *EL-38125-10* splice sleeve crimping tool .

1. For wiring repair, refer to [Splicing Copper Wire Using Splice Sleeves](#) .

2. Twist the wires before you fold them over to prevent the wire strands from opening up. Fold over the copper wire strands of the smaller (1) gauge wire so that it is the same length as the non-folded wire.

3. Insert the folded over wire (1) into the splice sleeve.

4. Use the proper crimp tool to crimp the splice sleeve to the smaller wire (harness side of repair). Complete the crimp as usual (using the heat tool to shrink the tube).

Wiring Harness Repair

Please use the existing Opel/Vauxhall wiring harness repair strategy as described in the paper manual:

"Wiring Harness Repair" (KTA-1950/2).

High Temperature Wiring Repairs

Danger: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

Note: All wiring repairs need to be 200 mm from the heat zone. Areas for consideration would be any area located near the exhaust manifolds, catalytic converter, exhaust pipes, and turbocharged engines.

Items Required

- DuraSeal splice sleeves to crimp and seal connections
- High temperature SCT1 shrink tubing to protect the splice sleeves
- Terminated leads or pigtails
- The correct tools to remove the terminals from the connectors

Use high temperature bulk wire rated at 150°C (302°F) continuous temperature of the same or larger gauge size as the original wire when repair damage wire. Also replace any reflective tape that you remove during the repair.

High Temperature Wiring

Wiring that is exposed to high temperatures, 135°C (275°F) or higher, for prolonged periods of time may use materials i.e. wires, connectors, and shielding that has a higher heat rating than typical wiring. When making a repair in a high temperature area observe the following:

- Use high temperature bulk wire rated at 150°C (302°F) continuous temperature to replace any damaged wire.
- Replace any heat shielding that is removed.
- Cover any DuraSeal splice sleeves with SCT1 shrink tubing.
- After making a wiring repair, ensure that the location of the wiring is not moved closer to the heat source.

Identifying High Temperature Wiring

Note: High temperature areas would be areas located near exhaust manifolds, catalytic converters, exhaust pipes, and turbocharged engines.

Wiring that is exposed to high temperature, 135°C (275°F) or higher, for prolonged periods of time need special considerations when making wiring repairs. Areas that may be exposed to higher temperatures can be identified by heat resistant materials that are being used in those areas. These materials may include heat reflective tape, moon tape, and high temperature shrink tubing. Also conduit and other protective coverings may be used. Because conduit or similar coverings are used throughout the vehicle

regardless of the temperature, it may be necessary for the technician to determine if an area is exposed to excessive heat before making a wiring repair.

Heated Oxygen Sensor Wiring Repairs

Caution: Do not solder repairs under any circumstances as this could result in the air reference being obstructed.

If the heated oxygen sensor pigtail wiring, connector, or terminal is damaged the entire oxygen sensor assembly must be replaced. Do not attempt to repair the wiring, connector, or terminals. In order for the sensor to function properly it must have a clean air reference. This clean air reference is obtained by way of the oxygen sensor signal and heater wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference and degrade oxygen sensor performance.

The following guidelines should be used when servicing the heated oxygen sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor, causing poor performance. Also, the sensor pigtail and harness wires must not be damaged in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.
- Neither the sensor nor vehicle lead wires should be bent sharply or kinked. Sharp bends, kinks, etc., could block the reference air path through the lead wire.
- Do not remove or defeat the oxygen sensor ground wire (where applicable). Vehicles that utilize the ground wire sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will also cause poor engine performance.
- To prevent damage due to water intrusion, be sure that the peripheral seal remains intact on the vehicle harness connector.

Splicing Copper Wire Using Splice Sleeves

Special Tools

- *EL-38125-10* Splice Sleeve Crimping Tool
- *EL-38125-5* Ultra Torch Special Tool
- *J-38125-8* Splice Sleeve Crimping Tool
- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring

For equivalent regional tools, refer to [Special Tools](#) .

Danger: In order to reduce the risk of personal injury, loss of high-voltage isolation to earth and higher system impedance, do not attempt to repair any HV wiring, connector or terminal that is damaged. High-voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high-voltage wiring, cables or terminals. Performing this procedure on high-voltage circuits may result in serious injury or death.

Note: Use only DuraSeal splice sleeves. Other splice sleeves may not protect the splice from moisture or provide a good electrical connection.

Use DuraSeal splice sleeves to form a one-to-one splice on all types of insulation, except Tefzel and coaxial. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Colour	Crimp Tool Nest Colour		Wire gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19168446	Red (1) or Red/Green (1)	Red (2)	0.5-0.8/(18-20)
Blue 19168447	Blue (2)	Blue (3)	1.0-2.0/(14-16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0-5.0/(10-12)

Note: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:
 - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
 - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
 - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:
 - When adding a length of wire to the existing harness, use the same size wire as the original wire.
 - Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
 - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
 - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
 - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing over the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the colour coding of the DuraSeal splice sleeves and the crimp tool nests.

6. The *EL-38125-10* splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

7. The *J-38125-8* splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimping tool in order to position the DuraSeal splice sleeve in the correct colour nest of the splice sleeve crimping tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram call-out numbers match the numbers in the table (under crimp tool nest colour).

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

12. Using the EL-38125-5 ultra torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Centre the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the EL-38125-5 ultra torch, apply heat to the high- temperature heat shrink tubing.
3. Gradually move the heat from the centre to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

Splicing Twisted or Shielded Cable

Danger: In order to reduce the risk of personal injury, loss of high-voltage isolation to earth and higher system impedance, do not attempt to repair any HV wiring, connector or terminal that is damaged. High-voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high-voltage wiring, cables or terminals. Performing this procedure on high-voltage circuits may result in serious injury or death.

Twisted/shielded cable is used in order to protect wiring from electrical noise. Two-conductor cable of this construction is used between the radio and the Delco-Bose® speaker/amplifier units and other applications where low level, sensitive signals must be carried. Follow the instructions below in order to repair the twisted/shielded cable.

1. Remove the outer jacket (1). Use care not to cut into the drain wire of the mylar tape.
2. Unwrap the tape. Do not remove the tape. Use the tape in order to rewrap the twisted conductors after the splice is made.

3. Prepare the splice. Untwist the conductors and follow the instructions for [Splicing Copper Wire Using Splice Sleeves](#) . Staggering the splices by 65 mm (2.5 in) is recommended.

Note: Apply the mylar tape with the aluminium side inward. This ensures good electrical contact with the drain wire.

4. Re-assemble the cable.
- Rewrap the conductors with the mylar tape. If the mylar tape is damaged, use 3M product AL-36FR to replace the damaged mylar tape.
 - Use caution not to wrap the drain wire in the tape (1).

- Follow the splicing instructions for copper wire and splice the drain wire.
- Wrap the drain wire around the conductors and tape with electrical tape to replace the outer insulation.

5. Tape over the entire cable. Use a winding motion when you apply the tape.

Splicing Inline Harness Diodes

Many vehicle electrical systems use a diode to isolate circuits and protect the components from voltage spikes. When installing a new diode use the following procedure.

1. Open the harness.
 - If the harness is taped, remove the tape.
 - To avoid wiring insulation damage, use a sewing seam ripper (available from sewing supply stores) in order to cut open the harness.
 - If the harness has a black plastic conduit, pull out the diode.
2. If the diode is taped to the harness, remove all of the tape.
3. Check and record the current flow direction and orientation of diode.
4. Remove the inoperative diode from the harness with a suitable soldering tool.

Note: If the diode is located next to a connector terminal remove the terminal(s) from the connector to prevent damage from the soldering tool.

5. Carefully strip away a section of insulation next to the old soldered portion of the wire(s). Do not remove any more than is needed to attach the new diode.
6. Check current flow direction of the new diode, being sure to install the diode with correct bias. Reference the appropriate service manual wiring schematic to obtain the correct diode installation position.
7. Attach the new diode to the wire(s) using 60/40 rosin core solder. Before soldering attach some heat sinks (aluminium alligator clips) across the diode wire ends to protect the diode from excessive heat. Follow the manufacturer's instruction for the soldering equipment.
8. Reinstall terminal(s) into the connector body if previously removed.

Note: To prevent shorts to ground and water intrusion, completely cover all exposed wire and diode attachment points with tape.

9. Tape the diode to the harness or connector using electrical tape.

Wiring Harness Repair

Please use the existing Opel/Vauxhall wiring harness repair strategy as described in the paper manual:

"Wiring Harness Repair" (KTA-1950/2).

Connector Repairs

Connector Repairs contains a list of all connector repairs. The connector repairs are listed by the connector manufacturer and then by connector type. If the technician cannot identify the manufacturer of the connector, refer to Identifying Connectors below. Knowing the connector manufacturer will assist in finding the correct connector repair from the following list:

- [Connector Position Assurance Locks](#)
- [Terminal Position Assurance Locks](#)
- [AFL/EPC Connectors](#)
- [Bosch Connectors](#) : [ECM](#) → [2.8 JPT](#) → [0.64](#) → [BSK](#)
- [Delphi Connectors](#) : [Steering Gear](#) → [12-Way](#) → [Micro .64](#) → [Micro-Pack 100W](#) → [Pull To Seat](#) → [Push To Seat](#) → [Weather Pack](#)
- [FCI Connectors](#) : [SIR](#) → [Lever Lock](#)
- [FEP Connectors](#) : [Steering Gear](#)
- [JST Connectors](#)
- [Kostal Connectors](#) : [Transmission](#) → [Glow Plug Control Module](#)
- [Molex Connectors](#)
- [Sumitomo Connectors](#)
- [Tyco/AMP Connectors](#) : [SIR](#) → [102-Way Inline](#) → [Seat](#) → [Door Module](#) → [43-Way](#) → [0.25 Cap](#) → [Sensor](#) → [CM 42-Way](#)
- [Yazaki Connectors](#) : [16-Way](#) → [2-Way](#)
- [Repairing Connector Terminals](#) : [Terminated Lead Repair](#)

[Connector Anatomy](#)

- (1) Connector Positive Assurance (CPA)
- (2) Assist Lever
- (3) Wiredress Cover
- (4) Seal Strain/Relief
- (5) Slide Left Hand
- (6) Slide Right Hand
- (7) Terminal Positive Assurance (TPA)
- (8) Terminal Positive Assurance (TPA)
- (9) Connector Seal
- (10) Connector Housing
- (11) Inner Connector

Identifying Connectors

Knowing the connector manufacturer is helpful when trying to locating the correct connector repair procedure. There are many different connector designs used on GM vehicles and it is sometimes difficult to identify the connector manufacturer. The information in this document should help with the identification of connector manufactures.

The following connector manufacturers make most of the connectors found in GM vehicles:

- AFL/EPC (Alcoa Fujikura Ltd./Engineered Plastics Components)
- Bosch

- Delphi
- FCI (Framatome Connectors International)
- JAE (Japan Aviation Electronics)
- JST (Japan Solderless Terminals)
- Kostel
- Molex
- Sumitomo
- Tyco/AMP
- Yazaki

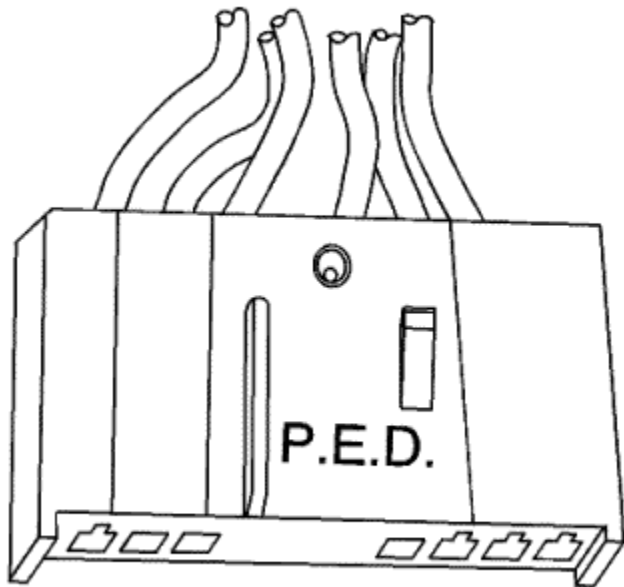

Identifying the manufacturer of a connector is often difficult. When trying to determine the manufacturer of a connector, look for specific identifying marks that are unique to that connector supplier. Most of these identify marks are hard to find or see. Check the connector carefully and refer to the information below for pictures and descriptions of connector identification markings.

- Most of AFLs connectors have EPC on their connector body. Some of the smaller connectors will not have any markings on them.

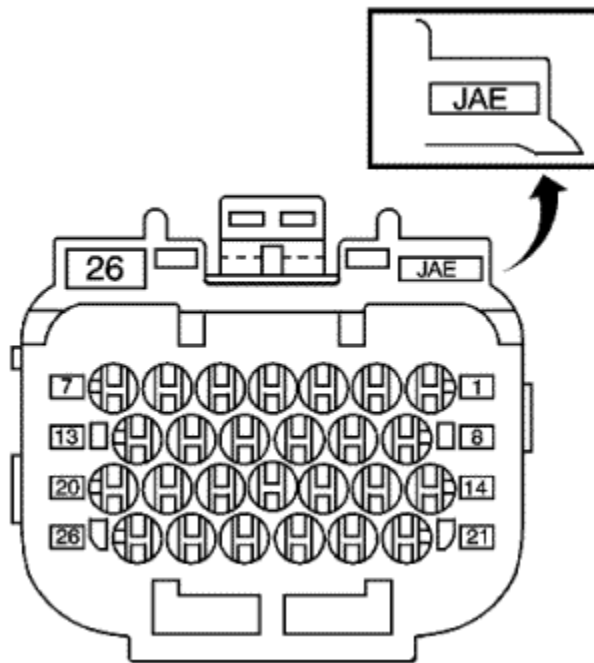

- In some cases Bosch will actually be printed on the connector. If Bosch does not appear on the connector, look for the Bosch logo. The Bosch logo is a circle with a blunted arrow inside. This logo can appear anywhere on the connector and is often very small.

- In some cases Delphi will actually be printed on the connector. If Delphi is not printed on the connector, look for PED. In both cases there is no specific orientation for Delphi or PED and they can appear anywhere on the connector.

- FCI connectors may have the FCI logo on their connectors. The logo is the letters FCI with an "A" above it.

- JAE connectors have JAE in small letters on their connectors.

- JST connectors have JST in small letters on their connectors, similar to that above. The location of the logo will vary with the connector size and style.

- Kostel has an "LK" with a circle around it. These connector are usually used as a transmissions connection.

- Most Molex connectors will have the Molex logo on the dresscover of the connector. In some cases the connectors may have MX followed by another letter. The third letter indicates where the connector was made. A connector with MXD is a Molex connector made in Detroit.

- Sumitomo has a unique symbol on their connector and possibly a part number. The symbol is similar to that of a diamond lying on its side, similar to that shown. The logo could appear anywhere but the most common place is at the wire side of the housing.
- Tyco/AMP has many different and unique connector designs. Some may or may not have identifiable marks on them.

- Yazaki has a wedge or arrow shape, similar to that shown.

Connector Position Assurance Locks

The connector position assurance (CPA) is a small plastic insert that fits through the locking tabs of the connector. CPAs are used in various connectors throughout the vehicle. CPAs are also used in all SIR system electrical connectors. The CPA ensures that the connector halves cannot vibrate apart. You must have the CPA in place in order to ensure good contact between the mating terminals of the connector.

Terminal Position Assurance Locks

The terminal position assurance (TPA) insert resembles the plastic combs used in the control module connectors. The TPA keeps the terminal securely seated in the connector body. Do not remove the TPA from the connector body unless you remove a terminal for replacement. If the TPA is removed, be sure to reinstall it before reconnecting the connector.

AFL/EPC Connectors

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-12A* Terminal Release Tool
- *J-38125-216* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

Follow the steps below in order to remove terminals from the connector.

1. For connectors with a bolt in the dress cover, turn the bolt anti-clockwise to remove the connector from the component.

2. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

3. Slide the lever lock forward while pressing down on the lever lock release tab.

4. View showing depressing of the lever lock release tab.

5. View of connector in released position.
6. Disconnect the connector from the component.
7. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

8. Release the rear lower half of the wire antenna cover.

9. Release the tabs that are holding the wiredress cover to the connector body.
10. Remove the nose piece by inserting a small flat-blade tool into the slots on both ends of the connector body. Gently prise the nose piece out of the connector. J-38125-216 can also be used to remove the nose piece.

11. Use the J-38125-12A tool to release the terminals by lifting the terminal retaining tabs on the inside of the connector.

12. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a

connector.

13. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Bosch Connectors - BSK

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-561* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Disconnect the connector from the component.
2. Remove the wire dress cover, if necessary.
3. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

4. Insert the J-38125-561 tool into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
5. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Bosch Connectors - 0.64

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-560* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Locate the lever lock on the wire dress cover. While pressing the lock, pull the lever over and past the lock until the lever is at the end of its travel.
2. Disconnect the connector from the component.
3. Pull the rubber boot that covers the wires back to expose the end of the connector dress cover.
4. Place the connector locking lever in the centre of the connector.

5. Locate the 2 dress cover locking tabs that are on the wire end of the connector. Insert a small flat-bladed tool between the cover and connector body and prise up.

6. Locate the 2 dress cover locking tabs located on the opposite side of the connector. Insert a small flat-bladed tool between the cover at the connector end and prise up.

7. Remove the dress cover.
8. Cut the tie wrap on the wire bundle.

9. Remove the terminal position assurance (TPA) by inserting a small flat-bladed tool into the small slot in the end of the slider and pushing on the TPA until it comes out of the connector. When the TPA exits the opposite side of the connector, grasp the TPA and pull it completely out of the connector.
10. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

11. Insert the J-38125-560 into the 2 triangular cavities on each side of the terminal at the front of the connector.
12. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
13. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

[Terminal Insertion Procedure](#)

1. Prior to installation the terminal must be aligned so the (1) coding lugs align with the (2) coding grooves on the connector.
2. Once the terminal is aligned, slide the terminal into the cavity until the retainer has engaged in the cavity of the connector.
3. Slide the TPA in the connector body and seat it using a small flat bladed tool. The TPA is seated when it is flush with the contact housing.
4. Secure the wires to the connector body using a tie wrap and replace the dress cover and grommet.

Bosch Connectors - 2.8 JPT

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-557* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Pull out the slider on the connector position assurance (CPA) until it is at the end of its travel.
2. Disconnect the connector from the component.
3. Remove the wire dress cover, if necessary.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

5. Insert the J-38125-557 into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
6. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

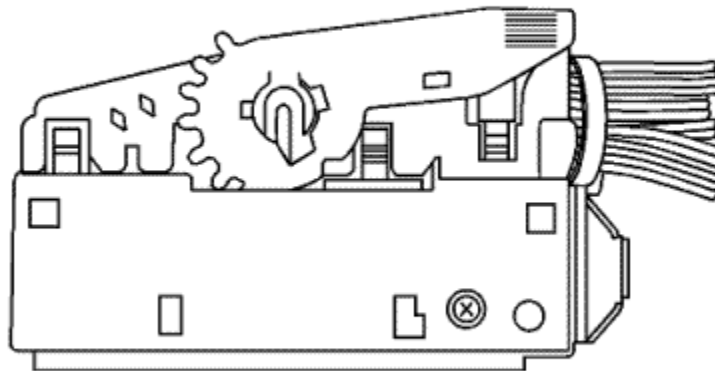

Bosch Connectors - ECM

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-213* Terminal Release Tool
- *J-38125-556* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Locate the assist lever on the top of the connector. Move the assist lever to the forward position.

2. Disconnect the connector from the component.

3. Locate the dress cover locking tabs at the corners of the connector. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

4. The terminal positive assurance (TPA) is located in the front of the connector.

5. Use a small flat-blade tool to remove TPA from the connector.

6. Use the J-38125-213 or the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity.

7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Note: Ensure that the dress cover and connector body are both in the released position before reassembling. Failure to do so may cause damage to the connector and component.

10. Reconnect the connector bodies.

Delphi Connectors - Weather Pack

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-10A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

The following is the proper procedure for the repair of Weather Pack® Connectors.

1. Separate the connector halves (1).
2. Open the secondary lock. A secondary lock aids in terminal retention and is usually moulded to the connector (1).
3. Grasp the wire and push the terminal to the forward most position. Hold the wire in this position.

4. Insert the Weather Pack® terminal removal tool J-38125-10A into the front (mating end) of the connector cavity until it rests on the cavity shoulder (1).
5. Gently pull on the wire to remove the terminal through the back of the connector (2).

Note: Never use force to remove a terminal from a connector.

6. Inspect the terminal and connector for damage. Repair as necessary. Refer to Repairing Connector Terminals : [Terminated Lead Repair](#) .
7. Reform the lock tab (2) and reset terminal in connector body.
8. Close secondary locks and join connector halves.
9. Verify that circuit is complete and working satisfactorily.
10. Perform system check.
11. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Delphi Connectors - Push To Seat

Special Tools

EL-38125-580 Terminal Release Tool Kit

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

Follow the steps below in order to repair push to seat connectors.

1. Remove the terminal position assurance (TPA) device, the connector position assurance (CPA) device, and/or the secondary lock.

2. Separate the connector halves (1).

3. Use the proper pick or removal tool (1) in order to release the terminal.
4. Gently pull the cable and the terminal (2) out of the back of the connector.

5. Re-form the locking device if you are going to reuse the terminal (1).
6. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

[Terminal Insertion Procedure](#)

1. In order to reuse a terminal or lead assembly, refer to [Wiring Repairs](#) .
2. Ensure that the cable seal is kept on the terminal side of the splice.

3. Insert the lead from the back until it catches.
4. Install the TPA, CPA, and/or the secondary locks.

Delphi Connectors - Pull To Seat

Special Tools

EL-38125-580 Terminal Release Tool Kit

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

If the terminal is visibly damaged or is suspected of having a faulty connection, the terminal should be replaced.

Follow the steps below in order to repair pull-to-seat connectors:

1. Remove the connector position assurance (CPA) device and/or the secondary lock.
2. Disconnect the connector from the component or separate the connectors for in-line connectors.
3. Remove the terminal position assurance (TPA) device.
4. Review the connector end view to determine the correct test probe and release tool.
5. Insert the release tool into the front of the connector body.
6. Grasp the wire at the back of the connector body and gently push the terminal out the front of the connector body.
7. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. Align the terminal and pull the wire from the back of the connector in order to seat the terminal.
2. If the connector is outside of the passenger compartment, apply dielectric grease to the connector.
3. Install the TPA, CPA, and/or the secondary locks.

Delphi Connectors - Micro-Pack 100W

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-12A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

There are 2 styles of Micro-Pack 100W connectors. These connectors are very similar but use different terminals and have some minor physical differences also.

The first connector design of the Micro-Pack 100W (1) has a white connector interface that holds the terminals. The second design of the Micro-Pack 100W (2) has a grey

interface to hold the terminals. Also, the first design has terminal cavities that are further apart (3 mm centreline) and offset from the other row of terminal cavities in the connector. The second design has terminal cavities that are closer together (2.54 mm centreline) and aligned vertically. One other way to identify the second design is the thin strip of material that runs along the outside of the cavities.

Note: There are 2 styles of Micro-Pack 100W terminals which are very similar. Ensure that you have the correct terminal before crimping the new terminal to the wire. The first design connector uses the longer terminal (1) that has a raised area in front of the recess in the terminal. The second design connector uses the shorter terminal without the raised area.

Follow the steps below in order to remove terminals from Micro-Pack 100W connectors. Some Micro-Pack 100W connector disassembly procedures will vary. Use this procedure as a guide.

1. Disconnect the connector from the component.

2. Locate the nose piece locking tabs that are positioned on the side of the connector nose piece. The connector nose piece acts as a terminal positive assurance (TPA) and may be referred to as such.

3. Use a small flat-blade tool to push in one of the locking tabs while gently pulling on the same side of the nose piece.
4. Repeat the procedure for the other locking tab and remove the nose piece.
5. Remove the wire dress cover. The following is a general procedure for wire dress cover removal. Use this procedure as a guide, some dress cover removal procedures may vary.

6. Use fingers to squeeze the 2 locking legs of the cover.

7. Apply pressure and gently rock the cover until one locking leg is unseated.

8. Continue to apply pressure and rock the cover until the second locking leg is unseated. Repeat procedure for the other side of the dress cover and remove the cover.

9. Use J-38125-12A to gently lift the terminal retaining tab while gently pulling the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. If the terminal is severely bent or damaged, it may be possible on some connectors to push the wire out of the front of the connector instead of pulling it through. This will prevent damage to the internal seals of the connector. Once the terminal is pushed out of the connector, cut the wire as close to the terminal as possible and pull the wire through the connector.
11. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

[Terminal Insertion Procedure](#)

After the terminal is crimped to the wire perform the following procedure in order to replace Micro-Pack 100 terminals.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the Terminal Removal Procedure.

Delphi Connectors - Micro .64

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-21* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

Follow the steps below in order to remove terminals from Micro .64 connectors.

1. Locate the lever lock on the wire dress cover. While depressing the lock, pull the lever over and past the lock. The lever lock may be located on the top or sides of the

wire dress cover.

2. View of a typical Micro 64 connector.

3. Depress the lock and pull the lever over and past the lock.

4. View of the connector when released from the component.

5. View of another type of Micro 64 connector.

6. Depress the locks that are located on both sides of the wire dress cover and pull the lever over and past the locks.

7. View of the connector when released from the component.

8. Disconnect the connector from the component.

9. Locate the dress cover locking tabs at the front of the connector. Using a small flat-blade tool push down on one of the locking tabs and pull the cover up until the dress cover releases. Repeat this procedure for the other locking tab.
10. Once the front 2 locks are unlocked, lift the front of the dress cover and pull it forward.

Note: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

11. Remove the TPA by inserting a small flat-blade tool into the small slot on the TPA and pushing down until the TPA releases. Gently prise the TPA out of the connector.

Note: Be careful not to angle or rock the J-38125-21 tool when inserting it into the connector, as the tool may break.

12. Insert the J-38125-21 tool into the round canal between the terminals cavities at the front of the connector.

13. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
14. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
15. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Delphi Connectors - 12-Way

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-12A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

Follow the steps below in order to remove terminals from the connector.

1. Locate the lever lock on the wire dress cover. Remove the connector position assurance (CPA) and slide the lever lock away from the connector body.

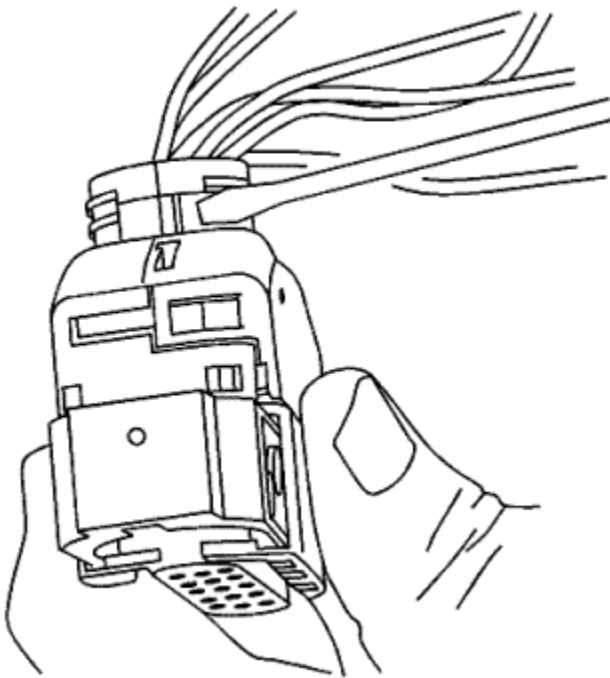

2. Disconnect the connector from the component.

3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-blade tool release all of the locking tabs.

4. Release the lower wire dress cover locking tab.

5. Release the upper wire dress cover locking tab.

6. Once the locks are unlocked, lift the dress cover off.

Note: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

7. Remove the TPA by inserting a small flat-blade tool into the locking tabs on both sides of the TPA. Gently prise the TPA out of the connector.

8. Remove the nose piece by inserting a small flat-blade tool into the locking tabs on both sides of the nose piece. Gently prise the nose piece out of the connector.

9. Insert the J-38125-12A tool to release the terminals by inserting the tool into the terminal release cavity.

10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
11. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Delphi Connectors - Steering Gear

[Removal Procedure](#)

1. Use a small flat-bladed tool to release the locking tab on the connector.

2. Push down the locking tab to release the connector. The small flat-bladed tool may need to be pushed down and angled back slightly to depress the locking tab. Pull on the connector body while releasing the locking tab to disconnect the connector.

FCI Connectors - Lever Lock

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-556* Terminal Release Tool
- *J-38125-560* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

Follow the steps below in order to remove terminals from the connector.

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. The release tab is located on the top of the wireless cover.

3. View of connector in released position.
4. Disconnect the connector from the component.
5. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

6. Use a small flat-blade tool to slide the terminal position assurance (TPA) up one notch on both ends of the connector. The TPA is located underneath the wire dress cover.

7. For the larger terminals insert the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.

8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

FCI Connectors - SIR

[Removal Procedure](#)

Note: The orange connector position assurance (CPA) must be released first to disconnect or to connect the connector.

1. Lift the orange CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the orange CPA. The orange CPA can also be released manually without any tools.

2. Grab the connector on both sides and lift the connector vertically to disconnect the connector.

Installation Procedure

1. Lift the orange CPA vertically approximately 4 mm before installing the connector. Use a small flat-bladed tool to help release the orange CPA. The orange CPA can also be released manually without any tools.

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push the connector down into the initiator connector sub assembly until fully seated.

3. After the connector is fully seated, push down the orange CPA with your thumb. Push down until the orange CPA is touching the yellow cover on the connector.

FEP Connectors - Steering Gear

[Removal Procedure](#)

1. Use a small flat-bladed tool to release the locking tab on the connector.

2. Push down the locking tab to release the connector. The small flat-bladed tool may need to be pushed down and angled back slightly to depress the locking tab. Pull on the connector body while releasing the locking tab to disconnect the connector.

JST Connectors

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *EL-38125-553* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

The JST connector family consists of seven unique connector housings differentiated by colour and keying. This connector family is designed to use both 0.64 and 2.8 sized terminals.

[JST BCM Connector](#)

GM Service Part #	Colour
88988806	Grey
88988837	Brown
88988838	Lt Green
88988839	Natural
88988840	Lt Blue
88988841	Black
88988842	Pink

1. While depressing the lock, remove the connector from the component.

2. Unlock the terminal position assurance (TPA):
 - Position connector as shown (above) and locate TPA staging cavities.

- Using connector terminal release tool J-38125-553 (1) lift the TPA into the staged position. Perform this step on both sides of the TPA.

- You will feel the TPA click into place when fully extended into the staged position. The figure above shows the TPA (1) in the staged position.

3. Release the terminal from the connector:

- Position the connector as shown (above) and locate the terminal release entry canal (1) of the suspect terminal.
- Insert the connector terminal release tool J-38125-553 into the entry canal with the angled side of the tool facing the connector wall containing cavity 4 (2).

- The cavity on the left (1) is a 2.8 mm cavity and the cavity on the right (2) is a 0.64 mm cavity.
 - Place the tip of the connector terminal release tool onto the connector lance (3) and deflect the lance to the right (5) to release the lock. Hold this released position.
 - Holding the lance in the released position, slightly pull on the suspect terminal to remove it from the connector housing. The side TPA (4) is a secondary lock.
4. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
 5. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Kostal Connectors - Glow Plug Control Module

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-24* Terminal Release Tool
- *J-38125-560* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

View of typical connector.

View of connector in released position.

1. Locate the assist lever at the back of the connector. Move the assist lever to the rear position.
2. Disconnect the connector from the component.

3. Use a small flat-blade tool to remove the dress cover.

4. Slide the dress cover forward and off of the connector.

5. The terminal positive assurance (TPA) is located in the front and rear of the connector.

Note: The front TPA cannot be removed from the connector. Only move it to the preset position.

6. Use a small flat-blade tool to move the front TPA to the preset position, outboard approximately 0.125 in. (3 mm).

7. Use a small flat-blade tool to completely remove the rear TPA from the connector.

8. Use the J-38125-24 or the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.

9. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.

Kostal Connectors - Transmission

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-28* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. While depressing the lock, twist and remove the connector from the component.

2. Locate the terminal position assurance (TPA).

Note: The TPA cannot be removed from the connector while there are terminals present in the connector body.

3. Use a small flat-blade tool to push the TPA until it bottoms out.

4. Use the J-38125-28 tool to release the terminals by inserting the tool into the terminal cavity as shown in the illustration.
5. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.

3. Locate the TPA.

4. Use a small flat-blade tool to push the TPA until it bottoms out.

5. Ensure the TPA is fully seated. The TPA should be centred and flush with the connector body when viewed.

Molex Connectors

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-213* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

2. Slide the lever lock forward while pressing down on the lever lock release tab.

3. The lever should be in the full forward position.

4. Disconnect the connector from the component.

5. Remove the dress cover by using a flat bladed tool to release the dress cover locking tabs and lift up on the dress cover.

6. Cut the tie wrap that holds the wires to the connector body.

7. Use a small flat-blade tool to prise one side of the nose piece up to the pre-stage position. When the nose piece is in the pre-staged position, the nose piece will be raised above the connector body the length of the step in the nose piece.

8. Use a small flat-blade tool to prise the other side of the piece to the pre-stage position. If the nose piece is higher than the first step in the nose piece, gently push down on the nose piece until it meets with resistance from the connector body, you should feel the nose piece click into position.

9. Insert the J-38125-213 into the small terminal release hole on the nose piece and gently pull on the back of the wire.
10. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

[Terminated Lead Repair](#)

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gauge size.
4. Refer to [Splicing Copper Wire Using Splice Sleeves](#) .

[Terminal Insertion Procedure](#)

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Insure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

Sumitomo Connectors

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-12A* Terminal Release Tool
- *J-38125-552* Terminal Release Tool
- *J-38125-553* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Slide the lever lock forward while pressing down on the lever lock release tab.

2. Disconnect the connector from the component.

3. Remove the dress cover by using a flat-blade tool to release the connector locking tabs and pulling off the dress cover.

4. Relieve the tension on the nose piece retainers by inserting J-38125-12A into the single retainer slot on the end of the nose piece and gently prising out the locking tab. Repeat the process for both of the nose piece locking tabs on the opposite side of the nose piece.

5. Once the nose piece retainers are released, use the J-38125-552 to pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should raise slightly.

6. On the opposite side of the nose piece, use the J-38125-552 to pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should release completely. If the nose piece does not come off, repeat the procedure on the opposite side.

7. The illustration above identifies the entry canal where the terminal release tool will be inserted, and the terminal cavity.
- Terminal (1)
 - Entry Canal (2)

8. Insert the J-38125-553 tool into the entry canal and prise up on the terminal retainer. The terminal retainer is a small plastic piece on the top of the terminal. The terminal retainer must be held up while the terminal is pulled out of the connector.

9. The illustration shows a cutaway view of the connector to aid the technician in releasing the terminal retainer.
10. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

Tyco/AMP Connectors - CM 42-Way

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-12A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Locate the connector position assurance (CPA) on the connector body and pull the CPA out. The CPA is on the wire harness side of connector.
2. Disconnect the connector from the component.

3. Use a small flat-bladed tool to gently prise off the dress cover by inserting the tool under the cover opposite the harness side and levering up.

4. Remove the cover.

5. Using a small flat-bladed tool, push on the side of the nose piece retainer while pushing the nose piece forward with your thumb. This will release the terminal position assurance (TPA).

6. Insert the *J-38125-12A* tool into the corresponding terminal release cavity. The release cavities are the 2 centre rows of cavities on one half of the connector.

7. Pressing the *J-38125-12A* tool into the release cavity of the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use

force when pulling a terminal out of a connector.

8. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Tyco/AMP Connectors - Sensor

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-11A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Disconnect the connector from the component.

2. Insert the J-38125-11A tool into the cavity on the lower right-hand face of the connector until the terminal release tab access panel slides over.

3. Ensure that the terminal release tab access panel is in the correct location to access the terminals.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

5. Insert the J-38125-11A into the terminal release tab access slot located behind the access panel of the connector and press down on the terminal while carefully pulling the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.

7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Tyco/AMP Connectors - 0.25 Cap

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-24* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Disconnect the connector from the component by pressing down on the connector position assurance (CPA).

2. Use a small flat-bladed tool to release the terminal position assurance (TPA) by inserting the tool in the small recess on the side of the connector and pushing up until the TPA releases from the connector body. The TPA should raise just slightly. Do not try to remove the TPA.

Note: The TPA on this connector cannot be removed unless the terminals are removed first. The TPA will come out of the connector body, but only slightly. When the TPA is slightly raised the terminals can be removed. Using excessive force to remove the TPA with the terminals still in the connector will damage the connector.

3. Repeat the process for the other side of the connector.

4. Ensure that the TPA is in the proper position to remove the terminals.

5. While pushing the terminal forward, insert the J-38125-24 into the release cavity above the terminal you are removing, and gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the [Repairing Connector Terminals : Terminated Lead Repair](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Tyco/AMP Connectors - 43-Way

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-12A* Terminal Release Tool
- *J-38125-13A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

Follow the steps below in order to remove terminals from the connector.

1. Locate the lever lock on the wire dress cover. Slide the lever lock away from the connector body.
2. Disconnect the connector from the component.
3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-bladed tool release all of the locking tabs.
4. Once the locks are unlocked, lift the dress cover off.

Note: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

5. Release the TPA by inserting a small flat-bladed tool into the blue locking tabs on both ends of the connector. Gently slide the TPA up to the released position on both ends.

6. For the larger terminals insert the *J-38125-13A* tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the *J-38125-12A* tool to release the terminals by inserting the tool into the terminal release cavity.

7. View of the release tool being used for the larger terminals.

8. View of the release tool being used for the larger terminals.

9. View of the release tool being used for the smaller terminals.
10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
11. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Tyco/AMP Connectors - Door Module

Special Tools

Side view of connector.

View of top of connector.

1. Locate the assist lever and lock on the top of the connector.

2. While depressing the lock, pull the lever over and past the lock.

3. Disconnect the connector from the component.

4. Locate the dress cover locking tabs at the rear of the connector. Use a small flat-blade tool to release the locking tabs. Repeat this procedure for the other locking tab.

5. Once the locking tabs are unlocked, slide the inner connector out of the rear of the connector housing.

6. Use the J-38125-12A tool to release the terminals by pressing on the tab.
7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

[Terminal Removal Procedure](#)

View of a typical connector in the assembled position.

1. Pull the locking lever to the 90 degree position from the connector body.

2. With the locking lever in the 90 degree position and the male connector body separated, it can be slid outward for removal.

3. Slide the male connector body out away from the guide plates.

Note: During assembly the terminal position assurance (TPA) will not fully seat if any terminal is not fully seated.

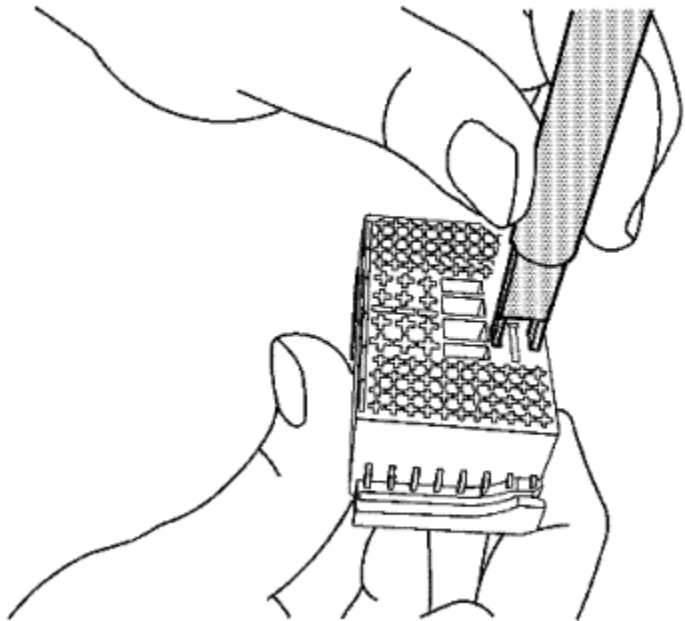

4. Using terminal release tool J-38125-11A or equivalent, remove the TPA from the connector body.

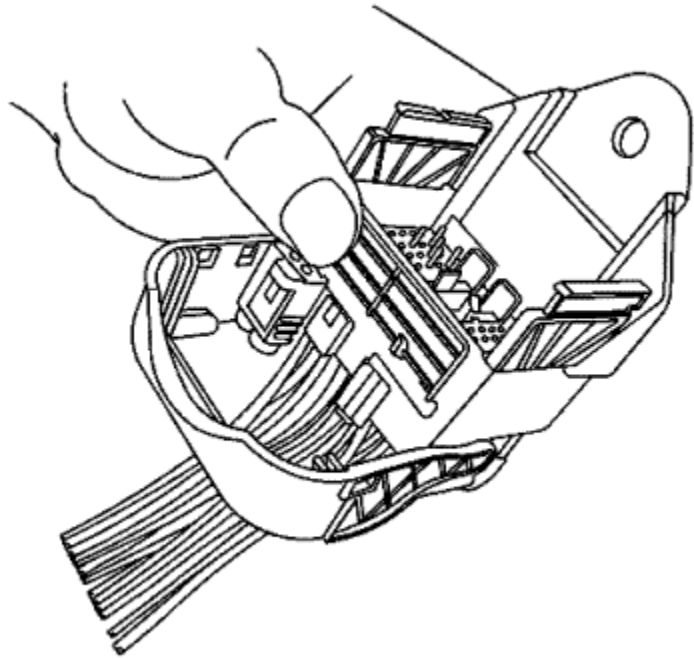

5. Using terminal release tool J-38125-566, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

6. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

7. Using terminal release tool J-38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

8. The female connector body may have an additional connector hooked to the edge of the body. Use terminal release tool J-38125-11A or equivalent to release the locking tab and slide the connector off the female body.

9. Move the locking lever 180 degrees from the connected position.

10. With the locking lever in the 180 degree position the guide plates can be removed from the connector body.

Note: During assembly the TPA will not fully seat if any terminal is not fully seated.

11. Using terminal release tool J-38125-11A or equivalent, remove the TPA from the connector body.

12. Using terminal release tool J-38125-216, lift the terminal plate past the terminals and out of the connector body cavity.

13. Terminal plate will bind slightly on each corner.

14. Using terminal release tool J-38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

15. Using terminal release tool J-38125-212, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

16. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

17. Press the terminal plate back into the female connector to the preset position. The plate will bind slightly on each corner.

18. With the locking lever in the 180 degree position, align the guide plates to mesh with the gears on the locking lever.

19. Slide the male connector body back inward toward the guide plates.

20. With the locking lever in the 90 degree position and the male connector body connected, it can be slid inward for assembly.

21. Move the lever into the locked position or in the assembled position. This will pull the male connector down into the female connector.
22. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
23. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Tyco/AMP Connectors - Seat

Special Tools

- *EL-38125-580* Terminal Release Tool Kit

[Terminal Removal Procedure](#)

1. Grasp the locking slide lever and pull outward from the end of the connector.

2. As the slide lever is pulled out the mating connector is lifted from the seated position.

Note: Terminal position assurance (TPA) is keyed and can only be inserted in one direction.

3. Using terminal release tool J-38125-11A or equivalent, push the TPA tabs into the connector body.

4. Pull the TPA from the connector body.

5. Using terminal release tool J-38125-11A or equivalent, release the connector wire dress cover locking tab.

6. With the lock tab released, lift the connector wire dress cover from the connector body.

7. Using terminal release tool J-38125-212, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

8. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

9. Using terminal release tool J-38125-556, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.
10. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Tyco/AMP Connectors - SIR

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-11A* Terminal Release Tool
- *J-38125-215A* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Removal Procedure](#)

1. Using your thumbs press down and slide the red CPA away from the connector lever.

2. Using your thumb press down on the locking tab and move the lever to the released position.

3. Using terminal tool J-38125-11A or equivalent, release the wire dress cover locking tabs.

4. Pivot connector wire dress cover while removing from the connector body.

5. Using terminal tool J-38125-11A or equivalent, remove the TPA by lifting straight off the connector body.

6. Using terminal release tool J-38125-215A, place the tip of the tool on the outside edge next to the terminal and depress the lock tab and remove the rear of the connector body.

[Terminal Repair Procedure](#)

Use the appropriate terminal and crimper in order to replace the terminal.

Yazaki Connectors - 2-Way

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-553* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. Disconnect the connector from the component.

2. Insert a small flat-blade tool in the slot below the front loaded terminal position assurance (TPA) and prise up.
3. Remove the TPA by pulling it out of the connector.

4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

5. Insert the J-38125-553 at a slight upward angle into the cavity below the terminal to be removed. Ensure that the pointed on the end of the tool is facing the bottom of the terminal and it stays in contact with the terminal until it stops on the plastic terminal retainer.

6. Gently prise the plastic terminal retainer down and carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Yazaki Connectors - 16-Way

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *J-38125-215* Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

[Terminal Removal Procedure](#)

1. While depressing the lock, pull the two connector halves apart.

Note: The terminal position assurance (TPA) is fragile and may break if not done carefully.

2. Use a small flat-blade tool to very carefully push the TPA toward the face of the connector on both sides of the connector.

3. View of the male half of the connector with female terminals.

4. View of the female half of the connector with male terminals.
5. Use the J-38125-215 tool to release the terminals by inserting the tool into the terminal release cavity.

6. View of the female half of the connector with male terminals.

7. View of the male half of the connector with female terminals.

8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.

9. Repair the terminal by following the Repairing Connector Terminals : [Terminated Lead Repair](#) procedure.

10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Repairing Connector Terminals - Terminated Lead Repair

Note: All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repairs procedures.

For high temperature wiring repairs, refer to [High Temperature Wiring Repairs](#) .

Terminated leads are terminals that are crimped onto wires. The terminated lead can be used throughout the vehicle since it is designed for temperatures up to 150°C. The length of the wire is 450 mm.

1. Use the connector end view to identify the correct terminated lead.
2. The terminated lead package should include a DuraSeal splice sleeve. If not, use the chart to in Splicing Copper Wire Using Splice Sleeves to identify the correct DuraSeal splice sleeve, refer to [Splicing Copper Wire Using Splice Sleeves](#) .

Terminal Removal

Special Tools

- *EL-38125-580* Terminal Release Tool Kit
- *EL-35616* Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

Note: All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repair procedures.

1. Find the appropriate connector end view within the connector end view section. The connector end view has the following information:
 - Diagnostic probe tool
 - Terminal release tool
 - Terminal/terminated lead part numbers

Note: Not using the proper test kit probe may cause damage to the terminal(s) that are probed.

2. Determine if a terminal is damaged.
 - Locate the diagnostic probe tool from the connector end view. The connector end view describes the colour and part number to help the technician find and use the correct tool.
 - Connect the probe tool to the Digital Multimeter.
 - Insert the probe tool into the cavity and follow the procedures from the [Fault-finding with a Digital Multimeter](#) .
3. Disconnect the connector body to perform the repair.
4. Use the following procedure to remove the terminal from the connector body.

Note: Several procedures for specific connector bodies are called out in the Wiring Repairs section.

- The terminal position assurance (TPA) and connector position assurance (CPA) should be removed before releasing the terminal for the connector body.
- Look at the connector end view to locate the cavity of the damaged terminal and find the proper terminal release tool from the terminal release tool kit.

Note: Using the incorrect terminal release tool can damage the connector body.

Note: Some terminals have a lever that must be disengaged before the terminal can be released.

- Insert the terminal release tool into the cavity.

5. Gently pull the wire out of the back of the connector.
6. Repair the terminal by following the [Repairing Connector Terminals](#) : [Terminated Lead Repair](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Relay Replacement - Attached to Wire Harness

[Removal Procedure](#)

1. Locate the relay. Refer to the [Master Electrical Component List](#) to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

Note: Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.

4. Separate the relay (1) from the wire harness connector (2).

[Installation Procedure](#)

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

Relay Replacement - Within an Electrical Center

Special Tools

J 43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.
2. Locate the relay. Refer to [Electrical Centre Identification Views](#) to locate the electrical centre where the relay exists.

Note:

- Always note the orientation of the relay.
- If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in the same location.
- Ensure that the electrical centre is secure, as not to put added stress on the wires or terminals.

3. Using the J 43244 (1) position the tool on opposing corners of the relay (2).

Caution: Use J43244 to pull the relay straight out from the electrical centre terminals. The use of pliers or a flat bladed tool could damage the electrical centre.

4. Remove the relay (2) from the electrical centre.

Installation Procedure

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

Fuse Block Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the fuse block cover.2. Remove the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .3. Remove the battery positive cable from the fuse block only. Refer to Battery Positive Cable Replacement .	

4. Remove the positive and negative cable (B+ APM module to battery fuse block) from the fuse block only. Refer to [Battery Positive and Negative Cable Replacement](#) .

1	<p>Body Harness Terminal Nut (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 17 N·m (13 lb ft)</p>
2	<p>Fuse Block</p> <p>Procedure</p> <p>Loosen the battery positive post clamp nut and remove the fuse block.</p>

Accessory Wiring Junction Block Replacement

Callout	Component Name
Preliminary Procedure	
Disconnect the battery. Refer to Battery Negative Cable Disconnection and Connection .	
Battery Cable Nut	

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

- 1 Disconnect the battery positive cable from the junction block by removing the nut.

Note: Remove the junction strut tower cover to access the battery positive nut.

Tighten

7 N·m (62 lb in)

Accessory Wiring Junction Block Cover

- 2 **Procedure**

Remove the accessory wiring junction block cover by pushing in on the 3 retainer tabs located on the ends of the cover and lift. To reinstall, fit together the retainer tabs located on the ends of the cover and push down on the cover until the tabs on the ends of the cover lock into place.

Accessory Wiring Junction Block Harness Connector Bolt (Qty: 3)

- 3 **Procedure**

Remove the accessory wiring harness from the accessory wiring junction block retainer.

Tighten

10 N·m (89 lb in)

Accessory Wiring Junction Block Retainer

- 4 **Procedure**

Remove the accessory wiring junction block retainer by pushing in on the 4 retainer tabs located on the sides of the retainer and lift. To reinstall, fit together the retainer tabs located on the sides of the retainer and push down on the retainer until the tabs on the sides of the cover lock into place.

Accessory Wiring Junction Block Retainer Base Nut

- 5 **Tighten**

20 N·m (15 lb ft)

Accessory Wiring Junction Block Retainer Base

- 6 **Procedure**

Position the junction block retainer base alignment tab to the bracket first, then install the nut.

Ignition and Start Switch Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the radio control assembly. Refer to Radio Control Assembly Replacement .</p>	
	<p>Ignition and Start Switch</p>

1

Procedure

1. Disconnect electrical connection.
2. Depress tabs on switch and remove from the panel.

Power Mode Description and Operation

[Serial Data Power Mode Master](#)

Power to many of this vehicles circuits is controlled by the module that is designated the power mode master. This vehicles power mode master is the body control module (BCM). The power button switch is a low-current push button switch with discrete power button switch signals to the power mode master for determination of the power mode that will be sent over the serial data circuits to the other modules that need this information. The power mode master will also activate relays and other direct outputs of the power mode master as needed. The power mode master determines which power mode (Vehicle Off, Vehicle On, Vehicle in Service Mode) is required and reports this information to other modules via serial data. Modules which have switched voltage inputs may operate in a default mode if the power mode serial data message does not match what the individual module can see from its own connections.

The power mode master receives power button switch signals and transmitter in range signals to identify the operators desired power mode. The Power Mode Parameters table below illustrates the correct state of these input parameters (circuits) in correspondence to the power button switch position and the transmitter to vehicle range:

[Power Mode Parameters](#)

Power Mode	Power Mode Transmitted	Push Button Ignition Switch (Power Button Switch Circuit Input to the BCM)	Push Button Ignition Switch Voltage Push Button Ignition Switch Voltage Input to the BCM	Key in Cylinder Switch/Key Fob in Vehicle (Transmitter in Range to the BCM Signal)
Transmitter in Range	Vehicle Off	Inactive	9 V	Yes
Transmitter out of Range	Vehicle Off	Inactive	9 V	No
Vehicle On Power Mode, then Press the Power Button Switch (Foot on or off the Brake Pedal); Transmitter in Vehicle	Vehicle Off	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes
Vehicle Off Power Mode, then Press the Power Button Switch with foot on the Brake Pedal; Transmitter in Vehicle	Vehicle On	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes
Vehicle Off Power Mode, then Press and Hold the Power Button Switch for over 5 seconds with foot off the Brake Pedal; Transmitter in Vehicle	Vehicle in Service Mode	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes

[Relay Controlled Power Mode](#)

The BCM uses the discrete power button switch inputs, transmitter in range status, current power mode state and the brake pedal position state to distinguish the correct power mode (Vehicle Off, Vehicle On and Vehicle in Service Mode). The BCM, after determining the desired power mode, will activate the appropriate relays for that power mode and send the power mode message out to other modules in a serial data message.

The retained accessory power relay remains on for a timed period after the power mode transitions to Vehicle Off. Refer to [Retained Accessory Power Description and Operation](#) for more information on the retained accessory power function.

[Push Button Start](#)

The vehicle has an electronic push button start switch. The power button switch is equipped with two blue LED's, one for backlighting and one for Vehicle On indication or Vehicle In Service Mode indication. The power button switch light flashes when the driver door is open and the vehicle is not on. The flashing light will eventually time out. The power button switch light is on steady when in Vehicle On or Vehicle In Service Mode. When the vehicle is turned off, the power button switch light will turn off.

[Vehicle On](#)

This position is for driving and starting. The Vehicle On mode will be used for service (including maintenance and lubrication) and diagnostics on the electronic propulsion system or the gas engine. With the vehicle off, and the brake pedal applied, pressing the power button switch once will place the vehicle in Vehicle On mode. The instrument cluster displays an active fuel or battery gauge, along with an audio start-up cue, when the vehicle is ready to be driven. This could take up to 15 seconds at extremely cold temperatures. The gas engine will only start if needed. If the vehicle did not start, the instrument cluster will display a screen with inactive fuel and battery gauges. The electric propulsion system is active in this power mode. The gas engine will start if the bonnet is opened while in this power mode. The vehicle can be charged while in this power mode.

[Vehicle In Service Mode](#)

Note: The vehicle will not charge if the charging cable is attached to the vehicle after being placed into the Vehicle In Service Mode. Attach the charging cable to the vehicle before entering the Vehicle In Service Mode to charge the vehicle.

This power mode is available for service and diagnostics, and to verify the proper operation of the MIL as may be required for emission inspection purposes. The Vehicle In Service Mode will be used for service and diagnostics for items not requiring the electronic propulsion to be active or the operation of the gas engine. With the vehicle off, and the brake pedal not applied, pressing and holding the power button switch for more than 5 seconds will place the vehicle in Vehicle In Service Mode. The instruments and audio systems will operate as they do in Vehicle On mode, but the vehicle will not be able to be driven. The electric propulsion system is inactive in this power mode. The gas engine will not start if the bonnet is opened while in this power mode. The vehicle can only be charged in this power mode if the charging cable is attached before this power mode is enabled.

[Vehicle Off](#)

To turn the vehicle off, push the power button switch with the vehicle in P (Park). Retained Accessory Power (RAP) will remain active until the driver door is opened. Refer to [Retained Accessory Power Description and Operation](#) for more information on the retained accessory power function. When turning off the vehicle, if the vehicle is not in P (Park), the SHIFT TO PARK message is displayed in the Driver Information Centre (DIC). The electric propulsion system is inactive in this power mode. The gas engine will not start if the bonnet is opened in this power mode. The vehicle can be charged while in this power mode.

Battery Saver Mode

The battery saver mode reduces the parasitic load of some modules during overseas shipment or during vehicle storage conditions. This improves the drain time on the battery (up to 70 days without the battery going dead). When the vehicle is in transport/storage, some features may have reduced functionality while in the battery saver mode, such as disabling the Remote Function Actuator or content theft features.

The battery saver mode incorporates a latching relay that when enabled disconnects some modules from their ignition power or memory power sources. Battery saver mode is initiated by turning on the hazard flashers, placing the vehicle in Vehicle On mode, and then pushing the power button switch for greater than 15 seconds. The mode is disengaged by repeating the previous process causing the relay to latch in the other direction. Once the vehicle is in Vehicle On mode and the hazard flashers are on, pushing the power button switch for more than 15 seconds will latch the relay in the other direction. This feature can be used as many times as necessary if the vehicle is to be stored for an extended period of time.

BCM Awake/Sleep States

The BCM is able to control or perform all of the BCM functions in the awake state. The BCM enters the sleep state when active control or normal monitoring of system functions has stopped and a time limit has passed. The BCM must detect certain wake-up inputs before entering the awake state. The BCM monitors for these inputs during the sleep state.

The BCM will enter the awake state if any of the following wake-up inputs are detected:

- Activity on the serial data line (including wake-up circuits)
- Detection of a battery reconnect
- Any door open signal
- Headlamps ON
- Vehicle On
- Vehicle In Service Mode
- Park lamps ON
- Keyless entry or remote start message

The BCM will enter a sleep state when all of the following conditions exist:

- Vehicle Off, transmitter is out of range
- No activity exists on the serial data line (including wake-up circuits)
- No outputs are commanded.
- No delay timers are actively counting.
- No wake-up inputs are present.

If all these conditions are met, the BCM will enter a low power or sleep condition.

Serial Data Wake-Up

Control modules on the serial data wake-up circuit enable or disable communication based on the voltage level of this circuit.

Retained Accessory Power Description and Operation

Retained Accessory Power

The body control module (BCM) monitors the vehicle power modes, battery condition, and each door ajar/open switch status to determine whether the retained accessory power should be initiated or terminated. Retained accessory power is controlled by two different methods; relay control and serial data. Some modules receive a retained accessory power message from the BCM over the serial data circuits. Serial data controlled retained accessory power is deactivated as required by their modules retained accessory power mode operation. Other subsystems are activated directly by the BCM through a relay. Components and systems that are active in retained accessory power are also activated anytime the vehicle power mode is any state other than Vehicle OFF regardless of the door switch signals.

Relay Controlled Retained Accessory Power

The BCM keeps the relay energised during all power modes, except Vehicle Off. The relay is also energised for approximately 10 minutes after moving to the Vehicle OFF state and moving the transmitter out of range, providing no door is opened.

Relay controlled retained accessory power will end when one of the following conditions is met:

- The BCM receives an input from any door ajar or open switch indicating the opening of any door after entering the Vehicle Off state and the transmitter is out of range..

Note: If the BCM is receiving any door ajar or open signal from those switches when the Vehicle Off state is entered and the transmitter is out of range, retained accessory power will not initiate.

- The BCM internal timer for the retained accessory power expires after approximately 10 minutes.
- The BCM detects a decrease in battery capacity below a prescribed limit.

Systems powered by the accessory relay during the retained accessory power mode are as follows:

- Accessory power outlet centre console compartment
- Cigar Lighter

Serial Data Controlled Retained Accessory Power

Retained accessory power systems controlled by serial data are as follows:

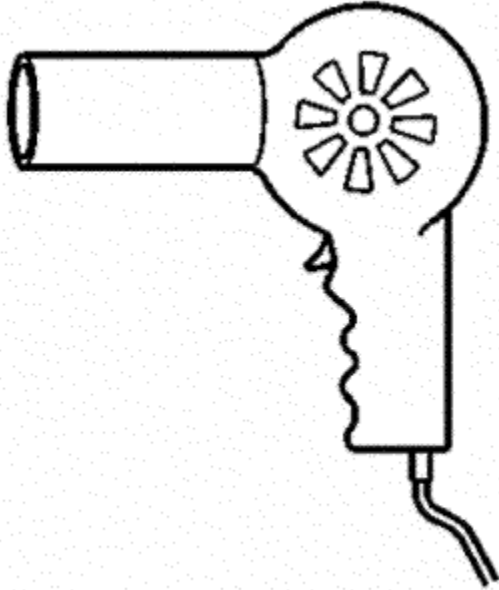

Radio

Radio retained accessory power activation / termination is the same as relay operation with one exception; the only door switch that will turn off the radio during retained accessory power is the driver door open switch.

DTC B2955

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B2955 00: Security Sensor Data Circuit Malfunction

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B2955 00	B2955 00	--	--
Serial Data	B2955 00	B2955 00	B2955 00	B2955 00
Low Reference	--	B2955 00	--	--

[Circuit/System Description](#)

When a keyless entry transmitter is inserted into the transmitter pocket/slot and the ignition mode switch is pressed, the transponder embedded in the transmitter is energised by the immobiliser aerial exciter coil. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

[Conditions for Running the DTC](#)

Vehicle is ON or in Service Mode.

[Conditions for Setting the DTC](#)

The BCM detects a circuit fault on the immobiliser aerial circuits.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information centre.

Conditions for Clearing the DTC

- A current DTC will be cleared when the condition for setting the DTC are no longer present.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

[Control Module References](#) for scan tool information

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K89 immobiliser control module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal 1 and ground.
If 30 Ω or greater
 - 2.1. Vehicle OFF, disconnect the harness connector at the K9 BCM.
 - 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K9 BCM.***If less than 30 Ω***
3. Connect a test lamp between the B+ circuit terminal 3 and ground.
4. Verify the test lamp illuminates or flashes for three seconds after ignition mode switch is pressed.
If the test lamp does not illuminate
 - 4.1. Vehicle OFF, disconnect the harness connector at the K9 BCM.
 - 4.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 4.3. Test for less than 2 Ω in the B+ circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K9 BCM.***If the test lamp illuminates***
5. Vehicle in Service Mode.
6. Test for 12-13 V between the serial data circuit terminal 2 and ground.
If less than 12 V
 - 6.1. Vehicle OFF, disconnect the harness connector at the K9 BCM.
 - 6.2. Test for infinite resistance between the serial data circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 6.3. Test for less than 2 Ω in the serial data circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K9 BCM.***If greater than 13 V***
 - 6.1. Vehicle OFF, disconnect the harness connector at the K9 BCM, vehicle ON.
 - 6.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K9 BCM.***If within 12-13 V***
7. Replace the K89 immobiliser control module.

8. Verify DTC B2955 is not set.

If DTC B2955 is set

Replace the K9 BCM.

If DTC B2955 is not set or is set as history

9. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC B3031

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B3031 00: Security Controller In Learn Mode Malfunction

Circuit/System Description

When learning a coded key, the body control module (BCM) is placed in learn mode. DTC B3031 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the coded key is learned, learn mode will be exited and the DTC cleared. If the BCM does not exit learn mode, B3031 will remain current and indicate a fault. The instrument cluster security indicator will illuminate and the driver information centre will display a message.

Conditions for Running the DTC

The immobilizer system is the learn coded keys state.

Conditions for Setting the DTC

The DTC will set any time the BCM enters the learn coded keys state.

Action Taken When the DTC Sets

The security indicator will illuminate. The driver information centre will display a message.

Conditions for Clearing the DTC

- A current DTC B3031 will be cleared upon the successful exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalogue.

If a key is not correct

Replace the key

If all keys are correct

2. Perform the Vehicle Key Relearn procedure. Refer to [Key with Integrated Transmitter Programming](#) .
3. Verify the BCM learns the vehicle key and exits the learn coded key state. The scan tool BCM Master Keys Learned parameter should increment to 1.

If the BCM does not exit the learn coded key state after the programming attempt

Replace the K9 body control module

If the BCM exits the learn coded key state after the programming attempt

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B3055 00: No Transponder Modulation or No Transponder

Circuit/System Description

When an ignition key is inserted into the transmitter slot and the ignition mode is changed, the transponder embedded in the head of the key is energised by the exciter coils. The energised transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

The BCM is unable to measure the ignition key transponder value.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. A service message will be displayed in the driver information centre.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC B3060

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B3060 00 : Unprogrammed Transponder Identification Code Received Malfunction

Circuit/System Description

When an ignition key is inserted into the transmitter slot and the power mode is changed, the transponder embedded in the head of the key is energised by the exciter coils. The energised transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

The transponder value measured by the BCM is incorrect or not learned to the vehicle.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. The driver information centre will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

If a Key Part Number is not read
Replace the appropriate key.
If a Key Part Number is read with each key
3. All OK.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Key with Integrated Transmitter Programming](#)

DTC B389A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B389A 00: Environment Identification

[Circuit/System Description](#)

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping of modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The instrument cluster, electronic brake control module (EBCM), HVAC control module, sensing and diagnostic module (SDM), engine control module (ECM), and steering column lock control module, if equipped, each learn the environment identifier during their configuration process. During vehicle operation, each of these modules compare their environment identifier to that of the BCM. If the identifiers match, vehicle starting is allowed. If an environment identifier does not match, vehicle starting is disabled.

[Conditions for Running the DTC](#)

Ignition is in the ACCESSORY or RUN position.

[Conditions for Setting the DTC](#)

An incorrect environment identifier is stored by the BCM.

[Action Taken When the DTC Sets](#)

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the BCM learns a correct environment identifier.

Diagnostic Aids

If BCM programming is not completed after BCM replacement, the environment identifier will not be learned. If DTC B389A sets immediately after the replacement and programming of a BCM, perform the programming procedure again.

Circuit/System Verification

1. Verify DTC B389A did not set immediately following the replacement and programming of a BCM.

If the DTC set immediately after the replacement and programming of a BCM

The immobiliser learn procedure was not properly completed. Perform the BCM immobiliser learn using the Body Control Module IMMO Function with Existing

Transponder or Remote Key in SPS. Refer to [Immobiliser System Component Programming](#) .

If the DTC did not set immediately after the replacement and programming of a BCM

2. Verify DTC B3902 is not set in the any of the control modules listed below:

- ECM
- SDM
- EBCM
- HVAC control module
- Instrument cluster
- Steering column lock control module, if equipped

If DTC B3902 is set in any of the modules

Refer to [DTC B3902](#) .

If DTC B3902 is not set in any of the modules

3. Perform the BCM immobiliser learn using Body Control Module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to [Immobiliser System Component Programming](#) .

4. Verify DTC B389A does not set after programming.

If the DTC sets after programming

Replace the K9 body control module.

If the DTC does not set after programming

5. All OK.

[Repair Instructions](#)

DTC B3902

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B3902 00: Incorrect Immobiliser Identifier Received

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping of modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The instrument cluster, electronic brake control module (EBCM), HVAC control module, sensing and diagnostic module (SDM), engine control module (ECM), and steering column lock control module, if equipped, each learn the environment identifier during their configuration process. During vehicle operation, each of these modules compare their environment identifier to that of the BCM. If the identifiers match, vehicle starting is allowed. If an environment identifier does not match, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The control module's environment identifier does not match the environment identifier stored by the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the module learns a correct environment identifier.

DTC B3935

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B3935 00: Transponder Authentication Error

Circuit/System Description

When an ignition key is inserted into the transmitter slot and the ignition mode is changed, the transponder embedded in the head of the key is energised by the exciter coils surrounding the ignition lock cylinder. The energised transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- A valid transponder value has been read.

Conditions for Setting the DTC

- The transponder value is valid and matches the value stored in the BCM memory.
- The transponder calculation of the challenge from the BCM does not match the BCM calculation.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. The driver information centre will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid transponder value has been read and authenticated.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC Descriptor

DTC B3976 00: Unconfigured Transponder

Circuit/System Description

When an ignition key is inserted into the transmitter slot and the ignition mode is changed, the transponder embedded in the head of the key is energised by the exciter coils surrounding the ignition lock cylinder. The energised transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- The BCM is in the learn coded key state.

Conditions for Setting the DTC

The BCM has determined the current key is not configured as a proper vehicle key.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information centre.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a properly configured vehicle key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B3984 00: Device 1 Environment Identifier Not Programmable

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping of modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The instrument cluster, electronic brake control module (EBCM), HVAC control module, sensing and diagnostic module (SDM), engine control module (ECM), and steering column lock control module, if equipped, each learn the environment identifier during their configuration process. During vehicle operation, each of these modules compare their environment identifier to that of the BCM. If the identifiers match, vehicle starting is allowed. If an environment identifier does not match, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

An incorrect environment identifier is programmed or no environment identifier is programmed.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the module learns a correct environment identifier.

DTC P0513

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0513: Immobiliser Key Incorrect

[Circuit/System Description](#)

The body control module (BCM) sends the pre-release information to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the BCM. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

[Conditions for Running the DTC](#)

Vehicle is ON or in Service Mode.

[Conditions for Setting the DTC](#)

The calculated response from the BCM does not equal the calculation performed by the ECM.

[Action Taken When the DTC Sets](#)

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

[Conditions for Clearing the DTC](#)

- A current DTC P0513 will be cleared when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The key referenced in the DTC descriptor does not refer to the vehicle key. In this case, key is referring to the challenge response.

Circuit/System Verification

Note: Because of normal system communications between the BCM and ECM, any immobiliser DTCs set in the BCM must be diagnosed prior to the diagnosis immobiliser DTCs set in the ECM.

1. Perform the BCM immobiliser learn using the Body Control Module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to [Immobiliser System Component Programming](#) .

2. Verify the BCM successfully completes the learn procedure and the engine starts.

If the BCM does not successfully learn or the engine does not start

Perform the ECM immobiliser learn using the Engine Control Module IMMO Learn in SPS. Refer to [Immobiliser System Component Programming](#) .

If the vehicle starts

3. All OK

DTC P0633

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0633: Immobiliser Key Not Programmed

[Circuit/System Description](#)

When learning the immobiliser data, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. DTC P0633 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the immobiliser data and challenge/response are learned, learn mode will be exited when the engine is successfully started. If the ECM does not exit learn mode, DTC P0633 will remain current and indicate a fault.

[Conditions for Running the DTC](#)

The ECM is in learn mode.

[Conditions for Setting the DTC](#)

DTC P0633 will set any time the ECM enters learn mode.

[Action Taken When the DTC Sets](#)

The security indicator in the instrument cluster will illuminate.

[Conditions for Clearing the DTC](#)

- A current DTC P0633 will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

DTC Descriptor

DTC P1631: Immobiliser Fuel Enable Signal Not Correct

Circuit/System Description

The body control module (BCM) sends the pre-release information to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the BCM. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting. The BCM follows this action by sending the remaining immobiliser data to the ECM. If the immobiliser data sent by the BCM matches that stored by the ECM, the ECM will allow the engine to remain running.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

The ECM receives incorrect immobiliser data from the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P1631 will be cleared when correct immobiliser data is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles or when a scan tool is used to clear DTCs.

Immobiliser System Component Programming

This procedure will learn the immobiliser function and require more than 15 minutes to complete. If the battery voltage is low, charge the battery before proceeding with the learn. If the body control module (BCM) or engine control module (ECM) have been replaced, they must be programmed before performing this learn procedure.

Depending on the immobiliser function being learned or the component replaced, different learn functions are required to be performed. These learn functions are as follows:

Function name on SPS tool:	Function description:	When the function should be used:	Notes:
Body Control Module IMMO Function with Existing Transponder or Remote Key	The BCM will relearn the immobiliser passwords and data while reusing the existing vehicle keys	The BCM has been replaced and the existing vehicle keys are being reused or a diagnostic has instructed to perform the learn	-
Body Control Module IMMO Function with New Transponder or Remote Key	The BCM will relearn the immobiliser passwords and data while using new vehicle keys	The BCM has been replaced and new vehicle keys are being reused	-
Engine Control Module IMMO Learn	The ECM will relearn the immobiliser passwords and data	The ECM has been replaced or a diagnostic has instructed to perform the learn	-
Engine Control Module and Body Control Module IMMO Learn	The ECM and BCM will learn new immobiliser passwords and data	Both the ECM and BCM have been replaced (this selection will REQUIRE new vehicle keys be used)	Because both the ECM and BCM have been replaced and are learning new immobiliser passwords and data, all vehicle keys must also be replaced
Program Transponder or Remote Key (Add)	A new vehicle key will learn the immobilizer passwords and data	A new vehicle key is being added (does not affect other vehicle keys)	This function may not be available in all sales regions
Program Transponder or Remote Key (Delete)	All existing vehicle keys will be invalidated and any desired keys are relearned	All vehicle keys are desired to be invalidated and certain keys relearned or a diagnostic has instructed to perform the learn	This procedure may be used if a customer has had their keys lost or stolen and wishes to invalidate the keys, making them unable to start the vehicle

1. Connect a scan tool to the vehicle and access SPS.
2. Vehicle in Service Mode, engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. Select SPS application and follow the onscreen instructions.
5. Select Reprogram ECU.
6. Select IMMO Immobilizer Learn - Setup.
7. Select the appropriate programming function based on the component that was replaced or is being programmed. Refer to the table at the top of this document for assistance in choosing the correct programming function.

Note:

- At multiple times during the learn procedure, SPS will instruct you to turn the vehicle to Service Mode. Make sure the vehicle is actually in the Service Mode before continuing on the SPS terminal. If the vehicle is not in the Service Mode, the learn procedure will fail.
 - The transmitter slot is located inside the upper instrument panel storage compartment. The rubber mat lining at the bottom of the compartment needs to be removed to access the slot.
8. Follow the on-screen instructions.
 9. After programming all keys "Programming Complete" is displayed.
 10. Press and hold the vehicle ON/OFF switch for 15 seconds.
 11. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow passive and active keyless entry functions to be established.
 12. With a scan tool, clear any DTCs.
 13. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Key with Integrated Transmitter Programming

Keys can be programmed in various ways using the procedures outlined below. Using the Replacing Keys procedure will first erase all the known keys from the vehicle. Any existing keys and any new keys will then be programmed. This procedure should be used any time a key is required to be unlearned or erased from a vehicle. If a new key is being learned to a vehicle to replace a damaged, inoperative, or stolen key, the Replacing Keys procedure must be used. This ensures that the old key cannot be used to access or start the vehicle after programming.

The Adding Keys procedure does not erase any keys prior to programming. The procedure will simply program the key into the next available slot. The Adding Keys procedure should only be used when adding an additional key to the vehicle. The Adding Keys procedure should never be used to program a key to a vehicle that is having a key replaced, regardless of the cause for the replacement.

[Replacing Keys \(With SPS\)](#)

Note:

- This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.
- This procedure may be used with or without existing learned keys being present.
- This procedure will take more than 15 minutes to complete.
- A total of 8 keys may be learned to a single vehicle.
- This procedure will only learn the vehicle key information. This procedure will not learn any immobiliser information between the body control module (BCM) and engine control module (ECM).
- If the battery voltage is low, charge the battery before continuing with the procedure.

1. Connect a scan tool to the vehicle and access SPS. Refer to [Service Programming System \(SPS\)](#) .
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the onscreen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.

Note:

- At multiple times during the learn procedure, SPS will instruct you to turn the vehicle to the Service Mode position. Make sure the vehicle is actually in the Service Mode before continuing on the SPS terminal. If the ignition is not in the run mode, the learn procedure will fail.
- The key slot is located inside the upper instrument panel storage compartment. The rubber mat lining at the bottom of the compartment needs to be removed to

access the slot.

7. Follow the on-screen instructions.
8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Adding Keys (With SPS)

Note:

- This procedure may be used with or without existing learned keys being present.
- This procedure will take more than 15 minutes to complete.
- A total of 8 keys maybe be learned to a single vehicle.
- This procedure will only learn the vehicle key information. This procedure will not learn any immobiliser information between the body control module (BCM) and engine control module (ECM).
- If the battery voltage is low, charge the battery before continuing with the procedure.

1. Connect a scan tool to the vehicle and access SPS. Refer to [Service Programming System \(SPS\)](#) .
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the onscreen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.

Note:

- At multiple times during the learn procedure, SPS will instruct you to turn the vehicle to the Service Mode. Make sure the vehicle is actually in the Service Mode before continuing on the SPS terminal. If the igniting is not in the run mode, the learn procedure will fail.
- The key slot is located inside the upper instrument panel storage compartment. The rubber mat lining at the bottom of the compartment needs to be removed to access the slot.

7. Follow the on-screen instructions.
8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Immobiliser Description and Operation

The immobiliser system functions are provided by the keyless entry control module, the remote control door lock receiver, the body control module (BCM) and the engine control module (ECM), as well as any modules which store and report the environment identifier. The keyless start system uses low frequency aerials in three different locations on the vehicle to determine the location of the transmitter. Multiple aerials are used to ensure complete coverage of the vehicle interior and rear compartment.

When the vehicle ON/OFF switch is pressed, the low frequency aerials emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits its response as an RF message. The transmitter transmits a signal that contains its unique value, which is received by the BCM through the remote control door lock receiver. The BCM then compares this value to a value stored in memory. The BCM also monitors various modules to determine if the stored environment identifiers match.

If both the environment identifier and the value received from the transponder match, the BCM will send the prerelease password via serial data to the ECM. If the encrypted code's unique value is incorrect or the environment identifier does not match, the BCM will send the fuel disable message to the ECM.

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via serial data. Both the ECM and BCM perform a calculation on this challenge. If the BCM calculated response to the challenge equals the calculation performed by the ECM, the ECM will allow vehicle starting.

If RF communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat. The immobiliser aerial coil is located directly beneath the transmitter slot. Placing the transmitter in the pocket will create a low powered coupling between the transmitter and immobiliser aerial, allowing communications to occur and enabling vehicle starting.

The components of the theft system are as follows:

- BCM
- ECM
- Immobiliser aerial
- Ignition key or keyless entry transmitter
- Security indicator
- Various modules which store and report the environment identifier

[Body Control Module \(BCM\)](#)

The immobiliser system is an integral part of the BCM and is controlled internally within the BCM. The BCM can learn up to 8 keys (transponder values).

The BCM uses the following inputs:

- Environment identifier exchange with various modules
- Encrypted code from the vehicle key, received by the immobiliser aerial

The BCM uses the following outputs:

- Prerelease password communication with ECM
- Challenge/response with ECM

When the vehicle ON/OFF switch is pressed, the low frequency aerials emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits its response as an RF message. The transmitter transmits a signal that contains its unique value, which is received by the BCM through the remote control door lock receiver. The BCM then compares this value to a value stored in memory. The BCM then performs one of the following functions:

- If the encrypted code value matches the values stored in the BCM memory, the BCM will send the prerelease password to the ECM via serial data.
- If the encrypted code unique value does not match the value stored in the BCM, the BCM will send the start disable message to the ECM via serial data.
- If the BCM is unable to measure the ignition key encrypted code value, the BCM will not send any messages to the ECM.

Engine Control Module (ECM)

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via the serial data circuit. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The ECM will disable vehicle starting if any of the following immobilisation conditions occur:

- The prerelease password is invalid.
- The start disable password is sent by the BCM.
- No passwords are received. There is no communication with the BCM.
- The BCM calculated response to the challenge does not equal the calculation performed by the ECM.

Immobiliser Aerial

The immobiliser aerial contains an immobiliser coil. The coil passively powers the transponder located in the ignition key when the key is in the transmitter slot. When powered, the key transmits its unique value to the immobiliser aerial, which is then relayed to the BCM via a LIN serial data circuit. The immobiliser aerial also receives B+ and ground from the BCM.

The immobiliser aerial is used to:

1. Learn keys
2. To start vehicle with or without RF interference

3. To start vehicle when key battery is dead

Keyless Entry Transmitter

Each keyless entry transmitter contains a transponder with a unique encrypted value. The transponder's encrypted value is fixed and unable to be changed. The immobiliser system uses the transponder value to determine if a valid transmitter is being used to start the vehicle.

Environment Identifier

Various modules throughout the vehicle learn a specific environment identifier during the module programming process. The environment identifier is learned by each individual module and matches the environment identifier stored in the BCM. Prior to starting after a battery disconnect, each of the modules which store an environment identifier will compare their identifier to that of the identifier stored in the BCM. If all the identifiers match, the engine starting process will continue. If the environment identifiers do not match, engine starting will be disabled.

Security Indicator

The BCM will command the instrument panel cluster to illuminate the security indicator when the vehicle is in Service Mode to indicate a fault has occurred within the immobiliser system and when the engine starting is disabled.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 8 V to the object sensors via the 8 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle in Service Mode or ON.
- The park assist is activated. The activation takes place through putting in the reverse gear or through operating the park assist switch.

Conditions for Setting the DTC

B0954 01, B0955 01, B0956 01, or B0957 01

The parking assist control module has detected the voltage at the sensor circuit is greater than 11.5 V or the object sensor is not grounded.

B0954 06, B0955 06, B0956 06, or B0957 06

The parking assist control module has detected the voltage at the sensor circuit is less than 0.5 V.

B0954 08, B0955 08, B0956 08, or B0957 08

The parking assist control module has received an invalid signal.

B0954 21, B0955 21, B0956 21, or B0957 21

The object sensor determines no change in the position of an object while the vehicle is in motion.

B0954 3A, B0955 3A, B0956 3A, or B0957 3A

The parking assist control module determines the wrong sensor type is installed.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information centre displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Verify that DTC B1405 is not present.
If DTC is present, refer to [DTC B1405](#) .
2. Verify that DTC B0954 01, B0955 01, B0956 01 or B0957 01 is not present.
If DTC is present, check the appropriate sensor for contamination with mud, ice or snow. If no contamination is diagnosed, refer to Circuit/System Testing.
3. Verify that DTC B0954 21, B0955 21, B0956 21 or B0957 21 is not present.
If DTC is present, check the respective sensor for contamination by mud, ice or snow. If no contamination is diagnosed, replace the sensor.
4. Verify that DTC B0954 3A, B0955 3A, B0956 3A or B0957 3A is not present.
If DTC is present, replace the respective sensor with a sensor of correct sensor type.
5. Vehicle in Service Mode, transmission in REVERSE, verify the scan tool Parking Assist System Status parameter displays Enabled.

Circuit/System Testing

1. Vehicle OFF for 30 s, disconnect the harness connector at the appropriate front object sensor.
2. Test for less than 30 Ω between the low reference circuit terminal 2 and ground.

If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.

3. Vehicle in Service Mode, activate the park assist, test for 7.5-9.0 V between the 8 V reference circuit terminal 1 and ground.
If less than the specified range, test the 8 V reference circuit for an open/high resistance. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.
4. Vehicle OFF, remove the malfunctioning object sensor and swap locations with another properly functioning front object sensor. Connect the harness connector at both sensors.
5. Vehicle in Service Mode, verify the DTC is set for the new location in which the malfunctioning sensor is installed.
If the DTC does not set for the new location, test the signal circuit terminal 3 for a short to voltage, short to ground, or an open/high resistance. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.
6. If the DTC sets for the new location in which the malfunctioning sensor is installed, replace the appropriate front object sensor.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 8 V to the object sensors via the 8 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle in Service Mode or ON.
- The parking assist is activated. The activation takes place through putting in the reverse gear or through operating the park assist switch.

Conditions for Setting the DTC

B0958 01, B0959 01, B0960 01, or B0961 01

The parking assist control module has detected the voltage at the sensor circuit is greater than 11.5 V or the object sensor is not grounded.

B0958 06, B0959 06, B0960 06, or B0961 06

The parking assist control module has detected the voltage at the sensor circuit less than 0.5 V.

B0958 08, B0959 08, B0960 08, or B0961 08

The parking assist control module has received an invalid signal.

B0958 21, B0959 21, B0960 21, or B0961 21

The object sensor determines no change in the position of an object while the vehicle is in motion.

B0958 3A, B0959 3A, B0960 3A, or B0961 3A

The parking assist control module determines the wrong sensor type is installed.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information centre displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Verify that DTC B1405 is not present.
If DTC is present, refer to [DTC B1405](#) .
2. Verify that DTC B0958 01, B0959 01, B0960 01 or B0961 01 is not present.
If DTC is present, check the appropriate sensor for contamination with mud, ice or snow. If no contamination is diagnosed, refer to Circuit/System Testing.
3. Verify that DTC B0958 21, B0959 21, B0960 21 or B0961 21 is not present.
If DTC is present, check the appropriate sensor for contamination with mud, ice or snow. If no contamination is diagnosed, replace the sensor.
4. Verify that DTC B0958 3A, B0959 3A, B0960 3A or B0961 3A is not present.
If DTC is present, replace the appropriate sensor with a sensor of correct sensor type.
5. Vehicle in Service Mode, transmission in REVERSE, verify the scan tool Parking Assist System Status parameter displays Enabled.

Circuit/System Testing

1. Vehicle OFF for 30 s, disconnect the harness connector at the appropriate rear object sensor.
2. Test for less than 30 Ω between the low reference circuit terminal 2 and ground.

If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.

3. Vehicle in Service Mode, transmission in REVERSE, test for 7.5-9.0 V between the 8 V reference circuit terminal 1 and ground.
If less than the specified range, test the 8 V reference circuit for an open/high resistance. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.
4. Vehicle OFF, remove the malfunctioning object sensor and swap locations with another properly functioning rear object sensor. Connect the harness connector at both sensors.
5. Vehicle in Service Mode, verify the DTC is set for the new location in which the malfunctioning sensor is installed.
If the DTC does not set for the new location, test the signal circuit terminal 3 for a short to voltage, short to ground, or an open/high resistance. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.
6. If the DTC sets for the new location in which the malfunctioning sensor is installed, replace the appropriate rear object sensor.

1. Parking Assist Switch Malfunction

[Circuit/System Description](#)

The parking assist can be activated/deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Conditions for Running the DTC

- Vehicle in Service Mode or ON.
- The parking assist is activated. The activation takes place by putting in the reverse gear or by pressing the parking assist switch.

Conditions for Setting the DTC

B0967 02

The parking assist control module has detected a short to ground.

B0968 01

The parking assist control module has detected a short to battery.

B0968 06

The parking assist control module has detected a short to ground or open.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information centre displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Verify that DTC B0967 02 is not present.
If DTC is present, refer to Parking Assist Switch Circuit Malfunction.
2. Verify that B0968 01 or B0968 06 is not present.
If DTC is present, refer to Parking Assist Switch Indicator Circuit Malfunction.
3. Activate and deactivate the parking assist switch and verify the scan tool Park Assist Switch parameter changes between Active and Inactive.

Circuit/System Testing

Parking Assist Switch Circuit Malfunction

1. Vehicle OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If greater than the specified value, test the ground circuit for an open/high resistance.
3. Connect the harness connector at the S48B Multifunction Switch - Overhead Console.
4. Disconnect the X1 harness connector at the K41 Front and Rear Parking Assist Control Module.
5. Vehicle in Service Mode, test for less than 0.3 V between the signal circuit terminal 8 X1 and ground.
If greater than the specified value, test the signal circuit for a short to voltage.
6. Vehicle in Service Mode, verify that a test lamp does not illuminate between the B+ circuit terminal 1 X1 and signal circuit terminal 8 X1.
If the test lamp illuminates, test signal circuit for a short to ground. If the circuit tests normal, replace the S48B Multifunction Switch - Overhead Console.
7. Verify that the test lamp illuminates between the B+ circuit terminal 1 X1 and signal circuit terminal 8 X1 while pressing the parking assist switch.
If the test lamp does not illuminate, test the signal circuit for an open/high resistance. If all circuits test normal, replace the S48B Multifunction Switch - Overhead Console.
8. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.

Parking Assist Switch Indicator Circuit Malfunction

1. Vehicle OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
2. Vehicle in Service Mode, test for B+ between the ignition circuit terminal 3 and ground.
If less than the specified value, test the ignition circuit for a short to ground or an open/high resistance.
3. Command the Park Assist Switch LED output control ON with the scan tool. Test for B+ between the ignition circuit terminal 3 and the signal circuit terminal 6.
If less than the specified value, test the signal circuit for an open/high resistance. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.
4. Command the Park Assist Switch LED output control OFF with the scan tool. Test for less than 0.3 V between the ignition circuit terminal 3 and the signal circuit terminal 6.
If greater than the specified value, test the signal circuit for a short to ground. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.
5. If all circuits test normal, replace the S48B Multifunction Switch - Overhead Console.

DTC B1015

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B1015 00: Vehicle Identification Number Information Malfunction

[Circuit/System Description](#)

When the vehicle is turned ON, the parking assist control module receives the vehicle identification number (VIN) from the body control module. The parking assist control module will compare the VIN received to the VIN stored in memory.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

The VIN stored in the parking assist control module does not match the received VIN.

[Action Taken When the DTC Sets](#)

- The parking assist is disabled.
- The driver information centre displays SERVICE PARK ASSIST.

[Conditions for Clearing the DTC](#)

The VIN stored in the parking assist control module matches the VIN stored in the body control module.

Circuit/System Description

The object sensors are 3 wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 8 V to the object sensors via the 8 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle in Service Mode or ON
- The parking assist is activated. The activation takes place through putting in the reverse gear or through operating the parking assist switch.

Conditions for Setting the DTC

B1405 02

The parking assist control module has detected the 8 V reference circuit is shorted to ground.

B1405 03

The parking assist control module has detected the 8 V reference circuit is less than 6.3 V.

B1405 07

The parking assist control module has detected the 8 V reference circuit is greater than 10.4 V.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information centre displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Vehicle in Service Mode, activate the parking assist, observe the scan tool Park Assist Sensor Reference Voltage parameter. The reading should be between 6.3-10.4 V.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at each of the object sensors.
2. Start at the B78G Rear Object Sensor - Left Outer, Vehicle in Service Mode, activate the park assist, test for 6.3-10.4 V between the 8 V reference circuit terminal 1 at the object sensor harness connector and ground.

If less than the specified range, test the 8 V reference circuit for a short to ground. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control

Module.

If greater than the specified range, test the 8 V reference circuit for a short to voltage. If the circuit tests normal, replace the K41 Front and Rear Parking Assist Control Module.

3. Install each object alarm sensor harness connector one at a time, checking DTCs after each sensor is connected. Verify DTC B1405 is not set as current. If the DTC is set, replace the object alarm sensor that was connected immediately before the DTC set.

Note: Make sure to check front object sensors.

4. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Front Parking Assist Alarm Sensor Replacement](#)
- [Rear Parking Assist Alarm Sensor Replacement](#)

Symptoms - Object Detection

Note: The following steps must be completed before using the symptom tables:

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Object Detection Description and Operation](#) : [UVC](#) → [UD5](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Make sure the parking assist sensors located on the rear bumper are clear. Remove any snow, mud or ice that is blocking the sensors.
- Make sure the rear vision camera is clear. Remove any snow, mud or ice that is blocking the rear vision camera.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

- [Parking Assist System Malfunction](#)
- [Rear Vision Camera System Malfunction](#)

Parking Assist System Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

Parking Assist Switch Indicator Control	B0968 06	B0968 06	B0968 01	-
Parking Assist Switch Ground	--	1	--	--
1. Parking Assist Switch Malfunction				

[Circuit/System Description](#)

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicle's path when moving forward or reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by eight object sensors: four located in the rear bumper and four located in the front bumper. The parking assist system will notify the driver using an audible signal through the radio.

[Diagnostic Aids](#)

When the "Park Assist Off", "Park Assist Blocked See Owners Manual", or "Park Assist Blocked See Owners Manual" message is displayed in the Driver Information Centre the disable reason is stored in the Park Assist Disable History.

The scan tool Park Assist Disable History parameters are a list of the seven previous reasons the parking assist system was disabled. These parameters may help in the diagnosis of an intermittent concern or a customer concern which is the result of normal system operation. The following is a brief description of potential causes which may aid in diagnosis:

- Manual Disable - The parking assist system has been disabled through the parking assist switch or audio system personalization menu.

- Hitch/Object Attached - The parking assist control module is detecting an object that is attached to the vehicle. Common items such as a hitch receiver, trailer, or a bicycle rack may cause this concern. Additionally, damage to the rear of the vehicle or a misaligned sensor may cause this concern. If the vehicle is damaged in a manner that causes the sensor to detect the bumper itself, the parking assist control module will interpret this as an attached object and disable the system. Carefully inspect the bumper, bumper mounting surface, and sensor retainers before continuing with normal diagnosis. After the detected cause has been addressed the vehicle must be driven at speed greater than 40 km/h (25 MPH).
- Reverse Overspeed - The vehicle is travelling too fast in reverse at speeds of greater than 8 km/h (5 MPH).
- Inhibit - The parking assist control module has lost or received invalid GMLAN signal(s).
- Sensor Disturbance - An outside interference is causing sensor movement. Such interference may be caused a heavy pounding, like that of a nearby jackhammer, or large changes in pressure, such as a large truck's air brakes.
- Sensor Ring Time - If the sensor fails its own diagnostic initialization the parking assist control module will set this error. After the detected cause has been addressed the vehicle must be driven at speed greater than 40 km/h (25 MPH). The following is a list of reasons this cause may have set:
 - One or more of the sensors may be blocked by snow, mud, ice, or other debris. This might happen after going through a car wash in cold weather.
 - Silicone insulator surrounding sensor maybe missing, cut, or twisted.
 - Improperly installed sensor, sensor maybe be crooked due to a tight wire harness.
 - One or more of the sensors may be scratched or the paint maybe chipped.
 - Excessive paint thickness on a sensor may cause an excessive sensor ring time. When replacing or refinishing a sensor, do not apply an excessive amount of paint or clear coat.

Circuit/System Verification

1. Vehicle in Service Mode, verify the park assist system is enabled through the parking assist switch or audio system personalisation menu.
If the park assist system is manually disabled, enable the system. Refer to the vehicle owners manual for instructions on enabling the system.
2. Observe the scan tool Park Assist Switch parameter while pressing and releasing the parking assist switch. The parameter should change between Active and Inactive.
If the parameter does not change between the specified values, refer to Parking Assist Switch Circuit Malfunction.
3. Command the Park Assist Switch LED ON and OFF with the scan tool. The parking assist switch indicator should turn ON and OFF when changing between the commanded states.
If the indicator does not turn ON and OFF, refer to Parking Assist Switch Indicator Circuit Malfunction.

Note: After completing the next step the vehicle might need to be driven in the forward direction at speed greater than 40 km/h (25 MPH).

4. Transmission in Reverse, verify that one audible beep sounds and the scan tool Park Assist System Status parameter is Enable.
If not the specified values, refer to Diagnostic Aids and the scan tool Park Assist Disable History parameters to determine the cause of the inhibit.

Circuit/System Testing

Parking Assist Switch Circuit Malfunction

1. Vehicle OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If greater than the specified value, test the ground circuit for an open/high resistance.
3. Connect the harness connector at the S48B Multifunction Switch - Overhead Console.
4. Disconnect the X1 harness connector at the K41 Front and Rear Parking Assist Control Module.
5. Vehicle in Service Mode, test for less than 0.3 V between the signal circuit terminal 8 X1 and ground.
If greater than the specified value, test the signal circuit for a short to voltage.
6. Vehicle in Service Mode, verify that a test lamp does not illuminate between the B+ circuit terminal 1 X1 and signal circuit terminal 8 X1.
If the test lamp illuminates, test signal circuit for a short to ground. If the circuit tests normal, replace the S48B Multifunction Switch - Overhead Console.
7. Verify that the test lamp illuminates between the B+ circuit terminal 1 X1 and signal circuit terminal 8 X1 while pressing the parking assist switch.
If the test lamp does not illuminate, test the signal circuit for an open/high resistance. If all circuits test normal, replace the S48B Multifunction Switch - Overhead Console.
8. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.

Parking Assist Switch Indicator Circuit Malfunction

1. Vehicle OFF, disconnect the harness connector at the S48B Multifunction Switch - Overhead Console.
2. Vehicle in Service Mode, test for B+ between the ignition circuit terminal 3 and ground.
If less than the specified value, test the ignition circuit for a short to ground or an open/high resistance.
3. Command the Park Assist Switch LED output control ON with the scan tool. Test for B+ between the ignition circuit terminal 3 and the signal circuit terminal 6.
If less than the specified value, test the signal circuit for an open/high resistance. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.
4. Command the Park Assist Switch LED output control OFF with the scan tool. Test for less than 0.3 V between the ignition circuit terminal 3 and the signal circuit terminal 6.
If greater than the specified value, test the signal circuit for a short to ground. If all circuits test normal, replace the K41 Front and Rear Parking Assist Control Module.
5. If all circuits test normal, replace the S48B Multifunction Switch - Overhead Console.

Repair Instructions

Rear Vision Camera System Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

When the transmission is placed into REVERSE, a 12 V signal is sent to the rearview camera indicating that camera operation is requested. Ignition voltage and ground are supplied to the rearview camera. The rearview camera sends video information to the radio through a video signal + and a video signal - circuit. A grounded shielding also wraps the video signal circuits to reduce electronic interference which may degrade the video signal and cause a distorted or otherwise degraded image.

[Diagnostic Aids](#)

A poor video image can be caused by ice, snow, and mud buildup on the lens of the rearview camera. Also, extreme lighting conditions can affect performance, such as operating in the dark or with bright sunlight shining on the camera. Extreme high or low temperatures can also affect the image quality. An open in the shield of the video signal circuit can also cause a distorted screen.

Circuit/System Verification

1. Verify that DTC B2545 is not present.
If DTC is present, refer to [DTC B2545](#) .
2. Inspect the rearview camera and verify there is no debris on the lens and that the bezel or bezel seal is not damaged.
If debris is found on the lens, clean the lens. If the lens, bezel, or bezel seal are damaged, replace as necessary.
3. Vehicle ON and in PARK, verify the reversing lamps are off.
If the reversing lamps are illuminated, refer to [Reverse Lamps Malfunction](#) .
4. Vehicle ON, transmission in REVERSE, verify the reversing lamps are on.
If the reversing lamps are not illuminated, refer to [Reverse Lamps Malfunction](#) .
5. Vehicle ON, transmission in REVERSE, verify a clear rear vision image is displayed on the radio.
If a clear image is not displayed, refer to Circuit/System Testing.

Circuit/System Testing

Note: Circuit/System Verification must be performed before Circuit/System Testing.

1. Vehicle OFF, disconnect the harness connector at the rearview camera.
2. Test for less than 5 Ω between the ground circuit terminal 5 and ground.
If greater than the specified value, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify a test lamp illuminates between the ignition circuit terminal 6 and ground.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
4. Vehicle ON, park brake applied, transmission in REVERSE, test for greater than 11 V between the control circuit terminal 3 and ground.
If less than the specified value, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
5. Vehicle OFF, disconnect the X4 harness connector at the A11 Radio.
6. Vehicle in Service Mode, test for less than 0.3 V between the following signal circuit terminals at the rearview camera harness connector and ground:
 - Signal (+) circuit terminal 1

- Signal (-) circuit terminal 4
If greater than the specified value, test the signal circuit for a short to voltage.
7. Test for infinite resistance between the following circuit terminals at the rearview camera harness connector and ground:
 - Signal (+) circuit terminal 1
 - Signal (-) circuit terminal 4If not the specified value, test the circuit for a short to ground.
 8. Test for less than 5 Ω between the signal (+) circuit terminal 1 at the rearview camera harness connector and the signal (+) circuit terminal 5 X4 at the A11 Radio harness connector.
If greater than the specified value, test the signal circuit for an open/high resistance.
 9. Test for less than 5 Ω between the signal (-) circuit terminal 4 at the rearview camera harness connector and the signal (-) circuit terminal 15 X4 at the A11 Radio harness connector.
If greater than the specified value, test the signal circuit for an open/high resistance.
 10. If all circuits test normal, replace the rearview camera.
 11. Vehicle ON, transmission in REVERSE, verify a clear rear vision image is displayed on the radio.
If a clear rear vision image is not displayed, replace the A11 Radio.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Rearview Camera Image Display Module Replacement](#) : [Volt](#)
- [Control Module References](#) for body control module or radio replacement, programming and setup

Front and Rear Object Alarm Module Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .2. Remove the left quarter inner trim finish panel. Refer to Quarter Inner Trim Finish Panel Replacement .	

1	<p>Front And Rear Object Alarm Module Nuts (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 5 N·m(44 lb in)</p>
2	<p>Front And Rear Object Alarm Module</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connectors.2. For programming and set up, refer to Control Module References .

Front Parking Assist Alarm Sensor Replacement

[Removal Procedure](#)

1. Remove front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Disconnect electrical from the front object alarm sensor.
3. Lift the locking tabs on the housing and remove the front object alarm sensor.

[Installation Procedure](#)

Note: Do not refinish previously painted sensors. Excess paint build up will cause the sensor to be inoperative.

1. Paint the front object alarm sensor. Refer to [Basecoat/Clearcoat Paint Systems](#) .
2. Ensure the paint does not exceed 6 mils. Use a paint thickness gauge suitable for non-ferrous metals. Refer to [Paint Gauges](#) .

3. Insert the sensor into the housing.
4. Connect the electrical connector to the front object alarm sensor.
5. Install the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .

Rear Parking Assist Alarm Sensor Replacement

[Removal Procedure](#)

1. Remove rear bumper fascia. Refer to [Rear Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
2. Disconnect electrical from the rear object sensor.
3. Lift the locking tabs on the housing and remove the rear object sensor.

[Installation Procedure](#)

Note: Do not refinish previously painted sensors. Excess paint build up will cause the sensor to be inoperative.

1. Paint the rear object sensor. Refer to [Basecoat/Clearcoat Paint Systems](#) .
2. Ensure the paint does not exceed 6 mils. Use a paint thickness gauge suitable for non-ferrous metals. Refer to [Paint Gauges](#) .

3. Insert the sensor into the housing.
4. Connect the electrical connector to the rear object sensor.
5. Install the rear bumper fascia. Refer to [Rear Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .

Rearview Camera Image Display Module Replacement - Volt

Callout	Component Name
Preliminary Procedure	
Remove the rear bumper fascia. Refer to Rear Bumper Fascia Removal and Installation : Volt → Ampera .	
1	Rearview Camera Image Display Module Screw (Qty: 2)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Rearview Camera Image Display Module

2

Procedure

Disconnect the electrical connector.

Object Detection Description and Operation - UD5

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicle path when moving forward or reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 8 object sensors: 4 located in the rear bumper and 4 located in the front bumper. The parking assist system will notify the driver using an audible beep signal through the radio.

The parking assist system is made up of the following components:

- Parking assist control module
- Front object alarm sensors
- Rear object alarm sensors
- Parking assist switch
- Parking assist switch indicator

Parking Assist Control Module

The parking assist control module provides an 8 V reference and a low reference to the 8 object alarm sensors. The parking assist control module receives individual signals from each of the 8 sensors and determines the location and distance of an object based on these inputs. When an object is detected, the parking assist control module will send a data message via CAN-Bus to the radio requesting an audible alert.

Object Alarm Sensors

The object alarm sensors are located in the front and rear bumpers of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located in front of or behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor echo time, it is used to determine the distance to the object. The sensors report this information to the parking assist control module.

Parking Assist Switch

The parking assist can be activated and deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

Parking Assist Switch Indicator

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Parking Assist Operation

When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighbouring sensor. The sensor converts this signal into a voltage signal and sends this signal to the parking assist control module. The parking assist control module evaluates the sensor signals received. As soon as an object is within the measuring range, the parking assist control module sends a message via CAN-Bus to the radio in order to give out the acoustic distance signal.

The parking assist system can detect objects greater than 7.6 cm (3 in) wide and 25.4 cm (10 in) tall. The system cannot detect objects below the bumper, underneath the vehicle. If an object is detected, one of the following will occur:

- The measuring range of the front object alarm sensors is between 30-120 cm (11.8-47.2 in). From a distance of 120 cm (47.2 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.
- The measuring range of the rear object alarm sensors is between 30-250 cm (11.8-98.4 in). From a distance of 250 cm (98.4 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.

The parking assist can be activated and deactivated by pressing the parking assist switch. When REVERSE gear is selected, park assist is engaged automatically for both front and rear sensors. When the vehicle is put into DRIVE from REVERSE the front assist sensors will be active up to speeds of 8 km/h (5 MPH) to assist with parking manoeuvres. Once the vehicle is above 8 km/h (5 MPH) the front sensors are disabled and will not be enabled until either REVERSE gear is selected or the parking assist switch is pressed to activate the system. Once the parking assist switch is pressed during a key cycle the front sensors become active at speeds under 8 km/h (5 MPH). If the park assist switch is pressed again in the same key cycle the message "Park Assist Off" will be displayed in the driver information centre if the vehicle speed is under 8 km/h (5 MPH) and front sensors detect an object within 120 cm (47.2 in). The LED indicator on the parking assist switch provides the ON/OFF state of the system. If the indicator is ON, the system is active and ready to assist.

The parking assist control module carries out a self test and monitors the sensors for electrical and mechanical faults. Monitored is the power supply of each sensor and the sensor signals, which need to alter when the vehicle moves. If this is not the case, the sensor is acoustically blocked or faulty. Mud, ice and snow may cause obstruction of the function of the sensors. Besides that the parking assist control module checks whether the correct type of sensor is installed. If any of these tests fails, a DTC with corresponding symptom is set, the parking assist is deactivated and the parking assist indicator in the instrument panel cluster is activated.

Parking Assist System Driver Information Centre Messages

SERVICE PARK ASSIST

The driver information centre displays SERVICE PARK ASSIST when the parking assist control module detects a malfunction in the parking assist system and the system is disabled. The driver information centre also displays SERVICE PARK ASSIST when a loss of communication occurs with the parking assist control module.

PARK ASSIST OFF

The PARK ASSIST OFF message is displayed in the driver information centre when the parking assist system is disabled due to conditions that disable or inhibit the system. The parking assist control module requests the driver information centre display PARK ASSIST OFF when it detects one of the following conditions:

- The parking assist system is manually disabled using the parking assist switch.
- An object is attached to the rear of the vehicle, such as a trailer, bicycle rack, trailer hitch receiver, or tow bar. Also, an object extending beyond a lowered endgate will disable the system.
- The parking assist sensors are covered by snow, mud, dirt, slush, or ice.
- The vehicle bumper is damaged.
- Excessive paint thickness on a replacement parking assist sensor.
- The parking assist sensors are disrupted by vibrations, like those caused by a large nearby vehicle or from heavy equipment such as a jackhammer.

Object Detection Description and Operation - UVC

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicle path when moving forward or reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 8 object sensors: 4 located in the rear bumper and 4 located in the front bumper. The parking assist system will notify the driver using an audible beep signal through the radio.

The parking assist system is made up of the following components:

- Parking assist control module
- Front object alarm sensors
- Rear object alarm sensors
- Parking assist switch
- Parking assist switch indicator

Parking Assist Control Module

The parking assist control module provides an 8 V reference and a low reference to the 8 object alarm sensors. The parking assist control module receives individual signals from each of the 8 sensors and determines the location and distance of an object based on these inputs. When an object is detected, the parking assist control module will send a data message via CAN-Bus to the radio requesting an audible alert.

Object Alarm Sensors

The object alarm sensors are located in the front and rear bumpers of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located in front of or behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor echo time, it is used to determine the distance to the object. The sensors report this information to the parking assist control module.

Parking Assist Switch

The parking assist can be activated and deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

Parking Assist Switch Indicator

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Parking Assist Operation

When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighbouring sensor. The sensor converts this signal into a voltage signal and sends this signal to the parking assist control module. The parking assist control module evaluates the sensor signals received. As soon as an object is within the measuring range, the parking assist control module sends a message via CAN-Bus to the radio in order to give out the acoustic distance signal.

The parking assist system can detect objects greater than 7.6 cm (3 in) wide and 25.4 cm (10 in) tall. The system cannot detect objects below the bumper, underneath the vehicle. If an object is detected, one of the following will occur:

- The measuring range of the front object alarm sensors is between 30-120 cm (11.8-47.2 in). From a distance of 120 cm (47.2 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.
- The measuring range of the rear object alarm sensors is between 30-250 cm (11.8-98.4 in). From a distance of 250 cm (98.4 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.

The parking assist can be activated and deactivated by pressing the parking assist switch. When REVERSE gear is selected, park assist is engaged automatically for both front and rear sensors. When the vehicle is put into DRIVE from REVERSE the front assist sensors will be active up to speeds of 8 km/h (5 MPH) to assist with parking manoeuvres. Once the vehicle is above 8 km/h (5 MPH) the front sensors are disabled and will not be enabled until either REVERSE gear is selected or the parking assist switch is pressed to activate the system. Once the parking assist switch is pressed during a key cycle the front sensors become active at speeds under 8 km/h (5 MPH). If the park assist switch is pressed again in the same key cycle the message "Park Assist Off" will be displayed in the driver information centre if the vehicle speed is under 8 km/h (5 MPH) and front sensors detect an object within 120 cm (47.2 in). The LED indicator on the parking assist switch provides the ON/OFF state of the system. If the indicator is ON, the system is active and ready to assist.

The parking assist control module carries out a self test and monitors the sensors for electrical and mechanical faults. Monitored is the power supply of each sensor and the sensor signals, which need to alter when the vehicle moves. If this is not the case, the sensor is acoustically blocked or faulty. Mud, ice and snow may cause obstruction of the function of the sensors. Besides that the parking assist control module checks whether the correct type of sensor is installed. If any of these tests fails, a DTC with corresponding symptom is set, the parking assist is deactivated and the parking assist indicator in the instrument panel cluster is activated.

Parking Assist System Driver Information Centre Messages

SERVICE PARK ASSIST

The driver information centre displays SERVICE PARK ASSIST when the parking assist control module detects a malfunction in the parking assist system and the system is disabled. The driver information centre also displays SERVICE PARK ASSIST when a loss of communication occurs with the parking assist control module.

PARK ASSIST OFF

The PARK ASSIST OFF message is displayed in the driver information centre when the parking assist system is disabled due to conditions that disable or inhibit the system. The parking assist control module requests the driver information centre display PARK ASSIST OFF when it detects one of the following conditions:

- The parking assist system is manually disabled using the parking assist switch.
- An object is attached to the rear of the vehicle, such as a trailer, bicycle rack, trailer hitch receiver, or tow bar. Also, an object extending beyond a lowered endgate will disable the system.
- The parking assist sensors are covered by snow, mud, dirt, slush, or ice.
- The vehicle bumper is damaged.
- Excessive paint thickness on a replacement parking assist sensor.
- The parking assist sensors are disrupted by vibrations, like those caused by a large nearby vehicle or from heavy equipment such as a jackhammer.

[DTC Descriptors](#)

DTC B097B 02: Power Mode Start Switch Circuit Short to Ground

DTC B097B 05: Power Mode Start Switch Circuit High Voltage/Open

DTC B097B 08: Power Mode Start Switch Circuit Performance - Signal Invalid

DTC B097B 61: Power Mode Start Switch Circuit Stuck

[Circuit/System Description](#)

The keyless entry control module supplies the ignition mode switch a constant B+ signal on the ignition switch run signal circuit. The keyless entry control module monitors this signal to determine the igniting mode. When the ignition mode switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the ignition mode switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the keyless entry control module and indicating that the ignition mode switch is pressed.

[Conditions for Running the DTC](#)

Voltage supplied to the module is in the normal operating voltage range of 9-16 V.

[Conditions for Setting the DTC](#)

B097B 02

- The keyless entry control module detects a short to ground in the respective circuit, when the output is inactive.
- The above condition exists for more than 1 second.

B097B 05

- The keyless entry control module detects an open in the ignition mode circuit
- The above condition exists for more than 1 second.

B097B 08

- The keyless entry control module detects a change in the ignition mode without observing a switch press.
- The above condition occurs four consecutive times.

B097B 61

- The keyless entry control module detects a continuously closed ignition mode switch.
- The above condition exists for more than 1 minute.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Testing

1. Verify DTC B097B 08 or B097B 61 is not set.

If any of the DTCs are set

Test or replace the S38 ignition mode switch.

If none of the DTCs are set

2. Vehicle OFF, disconnect the X1 harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
3. Test for less than 1 V between the signal circuit terminal 11 and ground.

If 1 V or greater

3.1. Vehicle OFF, disconnect the harness connector at the S38 ignition mode switch, Vehicle in Service Mode.

3.2. Test for less than 1 V between the signal circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the S38 ignition mode switch.

If less than 1 V

4. Connect the X1 harness connector at the K84 keyless entry control module.
5. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S38 ignition mode switch. It may take up to 2 minutes for all vehicle systems to power down.
6. Test for less than 15 Ω between the low reference circuit terminal 7 and ground.

If 10 Ω or greater

6.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.

6.2. Test for less than 2 Ω in the low reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K84 keyless entry control module.

If less than 10 Ω

7. Verify that a test lamp illuminates between signal circuit terminal 3 and ground.

If the test lamp does not illuminate

- 7.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.

- 7.2. Test for infinite resistance between the signal circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

- 7.3. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω, replace the K84 keyless entry control module.

If the test lamp illuminates

8. Test or replace the S38 ignition mode switch.

Low Reference	--	B3101 00	--	--

[Circuit/System Description](#)

The body control module (BCM) communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the BCM, depending on which button is pressed on the transmitter. The BCM receives the message and performs the appropriate function.

[Conditions for Running the DTC](#)

A button is pressed on the keyless entry transmitter.

[Conditions for Setting the DTC](#)

No response is received from the remote control door lock receiver after the BCM requests information from or sends configuration commands to the remote control door lock receiver.

Action Taken When the DTC Sets

In the case of power loss, the remote control door lock receiver is disabled for 65 seconds. Otherwise no action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K77 remote control door lock receiver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal 1 and ground.
If 30 Ω or greater
 - 2.1. Vehicle OFF, disconnect the harness connector at the BCM.
 - 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the BCM.***If less than 30 Ω***
3. Vehicle in Service Mode.
4. Test for greater than 11.5 V between the B+ circuit terminal 4 and ground.
If 11.5 V or less
 - 4.1. Vehicle OFF, disconnect the harness connector at the BCM.
 - 4.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If Infinite resistance.
 - 4.3. Test for less than 2 Ω in the B+ circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the BCM.***If greater than 11.5 V***
5. Test for 3-6 V between the serial data circuit terminal 3 and ground.
If less than 3 V
 - 5.1. Vehicle OFF, disconnect the harness connector at the BCM.
 - 5.2. Test for infinite resistance between the serial data circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 5.3. Test for less than 2 Ω in the serial data circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the BCM.***If greater than 6 V***
 - 5.1. Vehicle OFF, disconnect the harness connector at the BCM, Vehicle in Service Mode.
 - 5.2. Test for less than 1 V between the serial data circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the BCM.***If within than 3-6 V***
6. Vehicle OFF, disconnect the X1 and X2 harness connectors at the K9 BCM, Vehicle in Service Mode.
7. Test for less than 1 V between the K9 BCM serial data circuit terminal 27 X2 and ground.

If 1 V or greater

Repair the short to voltage on the circuit.

If less than 1 V

8. Vehicle OFF.
9. Test for infinite resistance between the K9 BCM serial data circuit terminal 27 X2 and ground.

If less than infinite resistance

Repair the short to ground on the circuit.

If infinite resistance

10. Test for less than 2 Ω between the K9 BCM serial data circuit terminal 27 X2 and the K77 remote control door lock receiver serial data circuit terminal 2.

If 2 Ω or greater

Repair the open/high resistance in the circuit.

If less than 2 Ω

11. Replace the K77 remote control door lock receiver.
12. Verify DTC B3101 is not set as current.

If DTC B3101 is set as current

Replace the K9 BCM

If DTC B3101 is not set or is set as history

13. All OK.

DTC B3109-B3113

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3109 00: Keyless Entry Transmitter 1 Battery

DTC B3110 00: Keyless Entry Transmitter 2 Battery

DTC B3111 00: Keyless Entry Transmitter 3 Battery

DTC B3112 00: Keyless Entry Transmitter 4 Battery

DTC B3113 00: Keyless Entry Transmitter 5 Battery

[Circuit/System Description](#)

With each press of a keyless entry transmitter button, a message containing the current battery state of the transmitter is sent to the remote control door lock receiver, along with the commanded keyless entry function. The remote control door lock receiver sends this to the body control module (BCM) to perform the requested function.

[Conditions for Running the DTC](#)

A keyless transmitter button is pressed.

[Conditions for Setting the DTC](#)

3 consecutive low battery signals are received from the same transmitter.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

The DTC is cleared when a normal transmitter voltage signal is received from the transmitter that set the DTC.

Circuit/System Verification

1. Verify none of the DTCs listed below are set:
 - DTC B3109
 - DTC B3110

- DTC B3111
- DTC B3112
- DTC B3113

If any of the DTCs are set

1.1. Replace the battery in the appropriate keyless entry transmitter and operate the transmitter 3 consecutive times.

1.2. Verify the DTC does not set.

If the DTC sets, replace the keyless entry transmitter.

If the DTC does not set

1.3. All OK.

If none of the DTCs are set

2. All OK.

DTC B3119

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3119 02: Keyless Entry Aerial 1 Short to Ground

DTC B3119 05: Keyless Entry Aerial 1 High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Driver Door	B3119 02	B3119 05	B3119 05	-
Keyless Entry Aerial Low Reference - Driver Door	-	B3119 05	--	--

[Circuit/System Description](#)

The driver door handle aerial is located in the driver door handle assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle is pulled, the keyless entry control module communicates with the driver door handle keyless entry aerial.

[Conditions for Running the DTC](#)

- The touch pad in the driver door handle is touched within 15 minutes of last door closing.
- The front or rear door handle on the driver side is pulled.

[Conditions for Setting the DTC](#)

B3119 02

The keyless entry control module detects a short to ground on the driver door keyless entry aerial signal circuit.

B3119 05

The keyless entry control module detects a short to voltage or an open on the driver door keyless entry aerial signal circuit.

Action Taken When the DTC Sets

Doors will not unlock when front or rear driver handle is pulled. Doors will not lock with touch pad.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC B3122, B3123, or B3124 is not set.

If any of the DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If none of the DTCs are set

3. Refer to Circuit/System Testing.

Circuit/System Testing

Note: The A24D driver exterior door handle assembly has two harness connectors. Of these two harness connectors, make sure that only the T10M driver door handle keyless entry aerial harness connector is disconnected. Disconnecting both harness connectors will result in the inability to activate the aerial and cause an improper diagnosis.

1. Vehicle OFF, disconnect the harness connector at the T10M driver door handle keyless entry aerial, Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

2.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.

2.2. Test for less than 1 V between the signal circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Vehicle OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

5.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.

5.2. Test for infinite resistance between the signal circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

- 5.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

- 6.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
6.2. Test for less than 1 V between the low reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 9.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.
9.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

10. Replace the A24D driver exterior door handle assembly.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle.
12. Verify DTC B3119 is not set as current.

If DTC B3119 is set as current

Replace the K84 keyless entry control module.

If DTC B3119 is not set or is set as history

13. All OK.

Repair Instructions

[DTC Descriptors](#)

DTC B3120 02: Keyless Entry Aerial 2 Short to Ground

DTC B3120 05: Keyless Entry Aerial 2 High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Passenger Door	B3120 02	B3120 05	B3120 05	-
Keyless Entry Aerial Low Reference - Passenger Door	-	B3120 05	--	--

[Circuit/System Description](#)

The passenger front door handle aerial is located in the passenger front door handle assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle is pulled, the keyless entry control module communicates with the passenger front door handle keyless entry aerial.

[Conditions for Running the DTC](#)

- The touch pad in the passenger front door handle is touched within 15 minutes of the last change of door ajar status for any door.
- The front or rear door handle on the passenger side is pulled.

[Conditions for Setting the DTC](#)

B3120 02

The keyless entry control module detects a short to ground on the passenger front door keyless entry aerial signal circuit.

B3120 05

The keyless entry control module detects a short to B+ or an open on the passenger front door keyless entry aerial signal circuit.

Action Taken When the DTC Sets

Doors will not unlock when front passenger handle is pulled. Doors will not lock with passenger touch pad.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

Note: The A24P passenger exterior door handle assembly has two harness connectors. Of these two harness connectors, make sure that only the T10N passenger door handle keyless entry aerial harness connector is disconnected. Disconnecting both harness connectors will result in the inability to activate the aerial and cause an improper diagnosis.

1. Vehicle OFF, disconnect the harness connector at the T10N passenger door handle keyless entry aerial, Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

2.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.

2.2. Test for less than 1 V between the signal circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Vehicle OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

5.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.

5.2. Test for infinite resistance between the signal circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

- 5.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

- 6.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
6.2. Test for less than 1 V between the low reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 9.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.
9.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

10. Replace the A24D driver exterior door handle assembly.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle.
12. Verify DTC B3120 is not set as current.

If DTC B3120 is set as current

Replace the K84 keyless entry control module.

If DTC B3120 is not set or is set as history

13. All OK.

DTC Descriptors

DTC B3121 02: Keyless Entry Aerial 3 Short to Ground

DTC B3121 05: Keyless Entry Aerial 3 High Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Rear Fascia	B3121 02	B3121 05	B3121 05	-
Keyless Entry Aerial Low Reference - Rear Fascia	-	B3121 05	--	--

Circuit/System Description

The rear fascia aerial is located in the rear fascia assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior rear closure touch pad is pressed, the keyless entry control module communicates with the rear fascia keyless entry aerial.

Conditions for Running the DTC

- The rear closure touch pad is pressed.
- The scan tool activates a device control function to simulate the above action.

Conditions for Setting the DTC

B3121 02

The keyless entry control module detects a short to ground on the rear fascia keyless entry aerial signal circuit.

B3121 05

The keyless entry control module detects a short to B+ or an open on the rear fascia keyless entry aerial signal circuit.

Action Taken When the DTC Sets

Rear closure will not open when rear closure touch pad is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
If none of the DTCs are set
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the T10G rear fascia keyless entry aerial, Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
If 1 V or greater
 - 2.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
 - 2.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.**If less than 1 V**

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.
3. Vehicle OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pulling the driver exterior door handle. Activate the aerial by pressing the rear closure touch pad.
5. Verify the MAX voltage captured by the DMM is greater than 0.5 V.
If 0.5 V or less
 - 5.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.
 - 5.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 5.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 0.5V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

6. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
7. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the rear closure touch pad.
8. Verify the MAX voltage captured by the DMM is greater than 0.5 V.

If 0.5 V or less

- 8.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.
- 8.2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 0.5V

9. Replace the T10G rear fascia keyless entry aerial.
10. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the rear closure touch pad.
11. Verify DTC B3121 is not set as current.

If DTC B3121 is set as current

Replace the K84 keyless entry control module.

If DTC B3121 is not set or is set as history

12. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for keyless entry control module replacement, setup, and programming

DTC B3122

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3122 02: Keyless Entry Aerial 4 Short to Ground

DTC B3122 05: Keyless Entry Aerial 4 High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Centre Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Aerial Low Reference - Centre Console Front	-	B3122 05	--	--

[Circuit/System Description](#)

The front centre console aerial is located in front of the centre console assembly and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the front centre console aerial.

[Conditions for Running the DTC](#)

- The touch pad in the driver door or passenger door handle is touched within 15 minutes of any door ajar status changing.
- The last door becomes closed.
- Pressing the start/stop switch.

[Conditions for Setting the DTC](#)

B3122 02

The keyless entry control module detects a short to ground on the front centre console keyless entry aerial signal circuit.

B3122 05

The keyless entry control module detects a short to B+ or an open on the front centre console keyless entry aerial signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when start/stop button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10J centre console front keyless entry aerial, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

- 2.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module, ignition ON.
- 2.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 5.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module.
- 5.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 5.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

- 6.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module, ignition ON.
- 6.2. Test for less than 1 V between the low reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

9.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module.

9.2. Test for less than 2 Ω in the low reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

10. Replace the T10J centre console front keyless entry aerial.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
12. Verify DTC B3122 is not set as current.

If DTC B3122 is set as current

Replace the K84 keyless entry control module.

If DTC B3122 is not set or is set as history

13. All OK.

DTC B3123

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3123 02: Keyless Entry Aerial 5 Short to Ground

DTC B3123 05: Keyless Entry Aerial 5 High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Centre Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Aerial Low Reference - Centre Console Rear	-	B3123 05	--	--

[Circuit/System Description](#)

The rear centre console aerial is located in rear of the centre console assembly and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the rear centre console aerial.

[Conditions for Running the DTC](#)

- The touch pad in the driver door or passenger door handle is touched within 15 minutes of any door ajar status changing.
- The last door becomes closed.
- Pressing the start/stop switch.

[Conditions for Setting the DTC](#)

B3123 02

The keyless entry control module detects a short to ground on the rear centre console keyless entry aerial signal circuit.

B3123 05

The keyless entry control module detects a short to B+ or an open on the rear centre console keyless entry aerial signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when start/stop button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10K centre console rear keyless entry aerial, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

- 2.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module, ignition ON.
- 2.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 5.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module.
- 5.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 5.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

- 6.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module, ignition ON.
- 6.2. Test for less than 1 V between the low reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

9.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module.

9.2. Test for less than 2 Ω in the low reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

10. Replace the T10K centre console rear keyless entry aerial.

11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.

12. Verify DTC B3123 is not set as current.

If DTC B3123 is set as current

Replace the K84 keyless entry control module.

If DTC B3123 is not set or is set as history

13. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Ignition Lock Key Transmitter Aerial Replacement - Floor Console](#) : [Rear](#) → [Front](#)

DTC B3124

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3124 02: Keyless Entry Aerial 6 Short to Ground

DTC B3124 05: Keyless Entry Aerial 6 High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Rear Compartment	B3124 02	B3124 05	B3124 05	-
Keyless Entry Aerial Low Reference - Rear Compartment	-	B3124 05	--	--

[Circuit/System Description](#)

The rear compartment aerial is located on the rear compartment floor near the seat back, centred, and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the rear compartment aerial.

[Conditions for Running the DTC](#)

- The touch pad in the driver door or passenger door handle is touched within 15 minutes of any door ajar status changing.
- Any exterior door handle or handles is pulled.
- The last door becomes closed.
- Pressing the start/stop switch.

Conditions for Setting the DTC

B3124 02

The keyless entry control module detects a short to ground on the rear compartment keyless entry aerial signal circuit.

B3124 05

The keyless entry control module detects a short to B+ or an open on the rear compartment keyless entry aerial signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when start/stop button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10E rear compartment keyless entry aerial, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

- 2.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module, ignition ON.
- 2.2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 5.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module.
- 5.2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 5.3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

- 6.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module, ignition ON.
- 6.2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 9.1. Ignition OFF, disconnect the harness connector at the K84 keyless entry control module.
- 9.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

10. Replace the T10E rear compartment keyless entry aerial.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
12. Verify DTC B3124 is not set as current.

If DTC B3124 is set as current

Replace the K84 keyless entry control module.

If DTC B3124 is not set or is set as history

13. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Ignition Lock Key Transmitter Aerial Replacement - Floor Console](#) : [Rear](#) → [Front](#)
- [Control Module References](#) for keyless entry control module replacement, setup, and programming

Symptoms - Remote Functions

Note: The following steps must be completed before using the symptom tables.

1. Perform [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Keyless Entry System Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [No Remote Detected](#)
- [Keyless Entry System Malfunction](#) : [Passive](#) → [Active](#)
- [Remote Vehicle Start Malfunction](#)

No Remote Detected

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Aerial Signal - Front Console	B3122 02	B3122 05	B3122 05	-
Keyless Entry Aerial Low Reference - Front Console	-	B3122 05	--	--
Keyless Entry Aerial Signal - Centre Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Aerial Low Reference - Centre Console Rear	-	B3123 05	B3123 05	-
Keyless Entry Aerial Signal - Rear Compartment	B3124 02	B3124 05	B3124 05	-
Keyless Entry Aerial Low Reference - Rear Compartment	-	B3124 05	--	--

[Circuit/System Description](#)

When a transmitter authentication is requested, the front console, rear console, and rear compartment aerials simultaneously broadcast a challenge within the passenger compartment to the transmitter. If the response from the transmitter via radio frequency (RF) is a valid response, the body control module (BCM) determines there is a transmitter within the vehicle. If no response is received, the BCM determines that no transmitter is in the vehicle, and NO REMOTE DETECTED will be displayed on the DIC.

[Diagnostic Aids](#)

A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Conditions caused by external influences such as these are considered to be normal. Following this diagnostic will not diagnose an RF interference condition. If RF interference is suspected, question the customer about the conditions or location where the NO REMOTE DETECTED condition occurs.

- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Note: This condition may be caused by low vehicle battery voltage. If the battery is not sufficiently charged (above 10 volts), the system will have difficulties detecting the fob and the NO REMOTE DETECTED message will be displayed. Correct the low battery voltage condition to eliminate this condition.

1. Verify that DTC B3119, B3120, B3121, B3122, B3123, or B3124 is not set.

If any of the DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If none of the DTCs are set

2. Lock the vehicle using the keyless entry transmitter.
3. Verify that each door and tailgate unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective release handle/touch pad.

If both doors and the rear compartment do not unlock/unlatch and open

Refer to [Keyless Entry System Malfunction](#) : [Passive](#) → [Active](#) .

If both doors and the rear compartment unlocks/unlatches and opens

4. Verify the vehicle starts with the transmitter located in the transmitter pocket.

If the vehicle does not start

Perform the [Key with Integrated Transmitter Programming](#) procedure.

If the vehicle starts

5. Verify the NO REMOTE DETECTED message is not displayed on the DIC while attempting to start the vehicle, placing the keyless entry transmitter in various locations within the vehicle interior at each start attempt. The vehicle should start.

If the NO REMOTE DETECTED message is displayed at any time

Refer to Circuit/System Testing.

If the NO REMOTE DETECTED message is not displayed and the vehicle starts

6. Inspect for any sources of RF interference such as mobile phone chargers, power supplies, etc. that would interrupt transmitter and aerial communication. If inspection does not reveal any items causing RF interference, discuss with the customer the conditions or location where the NO REMOTE DETECTED condition occurs. Discuss any devices that are normally kept in the vehicle, such as a laptop or mobile phone charger, which may have been removed when the vehicle was brought in for service. It may be necessary to explain to the customer how RF interference degrades the performance of the system.

Circuit/System Testing

Note: To determine the appropriate T10 keyless entry aerial to disconnect and diagnose, place the transmitter in various location within the vehicle's interior and attempt to start. The location of the transmitter when the NO REMOTE DETECTED message occurs will correspond with the T10 keyless entry aerial that requires diagnosis.

1. Vehicle OFF, disconnect the harness connector at the appropriate T10 keyless entry aerial, Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

- 2.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
- 2.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Vehicle OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 5.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.
- 5.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance

- 5.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

- 6.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
6.2. Test for less than 1 V between the low reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

- 9.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.
9.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1V

10. Replace the appropriate T10 keyless entry aerial.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by pressing the ignition mode switch.
12. Verify the NO REMOTE DETECTED message is not displayed and the vehicle starts.

If the NO REMOTE DETECTED message is displayed and the vehicle does not start

Replace the K84 keyless entry control module.

If the NO REMOTE DETECTED message is not displayed and the vehicle starts

13. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Keyless Entry System Malfunction - Active

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The keyless entry will unlock the vehicle doors or open the rear compartment when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the keyless entry transmitter sending a radio frequency to the remote control door lock receiver, which then sends the signal to the body control module (BCM). The BCM interprets the signal and activates the requested function. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Circuit/System Testing

1. Verify that the transmitter is a correct transmitter for the vehicle. This can be accomplished by comparing the part number printed on the transmitter to the appropriate part number in the parts catalogue.

If the transmitter is incorrect

Replace the transmitter.

If the transmitter is correct

2. Operate the transmitter while observing the appropriate scan tool Key Fob Function parameter for the appropriate transmitter.
3. Verify the scan tool Key Fob Function parameter corresponds with the function selected on the transmitter.

If the Key Fob Function parameter does not correspond with the transmitter selection

3.1. Replace the transmitter.

3.2. Operate the transmitter while observing the appropriate scan tool Key Fob Function parameter for the appropriate transmitter.

3.3. Verify the scan tool Key Fob Function parameter correspond with the function selected on the transmitter.

If the Key Fob Function parameter does not correspond with the transmitter selection, replace the K9 BCM

If the Key Fob Function parameter corresponds with the transmitter selection

3.4. All OK.

If the Key Fob Function parameter corresponds with the transmitter selection

4. All OK.

Repair Instructions

- [Control Module References](#) for BCM replacement, setup, and programming

Keyless Entry System Malfunction - Passive

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The keyless entry aerials are used as short range low frequency transmitters. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle is pulled, the keyless entry aerial broadcasts a challenge to the transmitter in an approximate 1 metre range. If the response from the transmitter via radio frequency (RF) is valid, the locked door will be passively unlocked/unlatched and allow the door to be opened. The front doors will open with one pull of the front door handle. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify that DTC B3119, B3120, or B3121 is not set.
If any of the DTCs are set
Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
If none of the DTCs are set
3. Verify that the transmitter is a correct transmitter for the vehicle. This can be accomplished by comparing the part number printed on the transmitter to the appropriate part number in the parts catalogue.
If the transmitter is incorrect
Replace the transmitter.
If the transmitter is correct
4. Verify the scan tool Exterior Driver Door Handle Switch, Exterior Passenger Door Handle Switch, and Boot Lid Exterior Unlatch Switch parameters change between Active and Inactive while operating their respective release handle/touch pad.
If any of the parameters does change
Refer to [Exterior Door Handle Switch Malfunction - DTC B1474, B1534, B1535, or B3849](#) .
If all of the parameters change
5. Lock the vehicle using the keyless entry transmitter.
6. Verify that each door and rear compartment unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective release handle/touch pad.
If both doors and the rear compartment do not unlock/unlatch and open
Refer to Passive Transmitter Malfunction.
If only one door or the rear compartment does not unlock/unlatch and open
Refer to Aerial Circuit Malfunction.
If both doors and the rear compartment unlocks/unlatches and opens
7. All OK.

[Circuit/System Testing](#)

Passive Transmitter Malfunction

1. Lock the vehicle using the keyless entry transmitter.
2. Verify that each door and rear compartment unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective release handle/touch pad.

If both doors and the rear compartment do not unlock/unlatch and open

- 2.1. Replace the transmitter battery.
- 2.2. Lock the vehicle using the keyless entry transmitter.
- 2.3. Verify that each door and rear compartment unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective release handle/touch pad.

If both doors and the rear compartment do not unlock/unlatch and open, replace the transmitter.

If both doors and the rear compartment unlock/unlatch and open

- 2.4. All OK.

If both doors and the rear compartment unlock/unlatch and open

3. The concern may be caused by temporary RF interference. Discuss the conditions in which the concern occurs with the customer. RF interference from aftermarket devices such as 2-way radios, power inverters, mobile phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Aerial Circuit Malfunction

Note: The A24 exterior door handle assembly has two harness connectors. Of these two harness connectors, make sure that only the T10 door handle keyless entry aerial harness connector is disconnected. Disconnecting both harness connectors will result in the inability to activate the aerial and cause an improper diagnosis.

1. Vehicle OFF, disconnect the harness connector at the inoperative T10 keyless entry aerial, Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

- 2.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.
- 2.2. Test for less than 1 V between the signal circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Vehicle OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by operating the appropriate release handle/touch pad.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

5.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.

5.2. Test for infinite resistance between the signal circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

5.3. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1 V

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

If 1 V or greater

6.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module, Vehicle in Service Mode.

6.2. Test for less than 1 V between the low reference circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K84 keyless entry control module.

If less than 1 V

Note: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.

8. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by operating the appropriate release handle/touch pad.

9. Verify the MAX voltage captured by the DMM is greater than 1 V.

If 1 V or less

9.1. Vehicle OFF, disconnect the harness connector at the K84 keyless entry control module.

9.2. Test for less than 2 Ω in the low reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K84 keyless entry control module.

If greater than 1V

10. Replace the appropriate T10 keyless entry aerial.

11. Lock the vehicle doors using the keyless entry transmitter. Activate the aerial by operating the appropriate release handle/touch pad.

12. Verify that the door/rear compartment unlocks and opens when the release handle/touch pad is operated.

If the door/rear compartment does not unlock and open

Replace the K84 keyless entry control module.

If the door/rear compartment unlocks and opens

13. All OK.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Control Module References](#) for keyless entry control module replacement, setup, and programming

Remote Vehicle Start Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of each diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

Remote start begins as a radio frequency message received by the body control module (BCM) from a keyless entry transmitter. The BCM monitors system conditions such as content theft deterrent, bonnet ajar status, and body DTCs to determine if a remote start event will occur. If conditions are determined to be acceptable, the remote start message is sent to the engine control module (ECM). The ECM monitors system conditions such as engine control parameters and the immobiliser system to determine if engine starting will be allowed. If conditions are acceptable, the ECM will activate the appropriate vehicle systems.

[Diagnostic Aids](#)

- A remote start event will not always start the vehicle engine. If the high voltage battery state of charge is sufficient to operate the vehicle systems or the vehicle is plugged in, the engine will not start.
- If the vehicle has a current vehicle DTC that illuminates the malfunction indicator lamp, the cause of the DTC must be diagnosed before proceeding with the remote start malfunction diagnostic.

[Circuit/System Verification](#)

1. Verify that remote vehicle start is enabled through vehicle personalisation.
If remote vehicle start is not enabled through vehicle personalisation
Use vehicle personalisation to turn on remote vehicle start functionality. Refer to the vehicle owners manual.
If remote vehicle start is enabled
2. Verify that the keyless entry functions operate with all available keyless entry transmitters.
If the keyless entry functions do not operate properly
Refer to [Keyless Entry System Malfunction](#) : [Passive](#) → [Active](#) .
If the keyless entry functions operate properly
3. Verify none of the following conditions exist on the vehicle:
 - A current vehicle DTC that illuminates the malfunction indicator lamp (MIL)
 - The vehicle is in valet mode.
 - More than 2 remote starts have been attempted.
 - The hazard switch is in the ON position.
 - A current hazard switch DTC is set.
 - The vehicle bonnet is ajar.
 - A current bonnet ajar DTC is set.
 - The content theft deterrent system detects an alarm trigger.
 - Excessive engine RPM
 - Excessive coolant temperature
 - Accelerator pedal position greater than 0 percent

- Vehicle not in park
- Vehicle theft deterrent malfunction
- A current automatic transmission shift lock control system DTC is set.
- A vehicle speed sensor signal is detected by the ECM.

If any of the conditions are present

Refer to the appropriate subsection in which the failure occurred.

If none of the conditions are present

4. All OK.

Ignition Lock Key Transmitter Aerial Replacement - Instrument Panel

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel lower inner trim pad. Refer to Lower Trim Pad Retainer Replacement : Outer → Inner	
	Ignition Lock Key Transmitter Aerial Assembly

1

Procedure

1. Disconnect the electrical connector.
2. Using the appropriate tool, depress tabs and unsnap aerial from bracket.

Ignition Lock Key Transmitter Aerial Replacement - Floor Console - Front

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the front floor console rear cover. Refer to Front Floor Console Rear Cover Replacement</p>	
	<p>Ignition Lock Key Transmitter Aerial Assembly</p>

1

Procedure

1. Disconnect the electrical connector.
2. Unsnap aerial from the floor console.

Ignition Lock Key Transmitter Aerial Replacement - Floor Console - Rear

Callout	Component Name
Preliminary Procedure Remove the front floor rear console. Refer to Front Floor Rear Console Replacement	
	Ignition Lock Key Transmitter Aerial Assembly

1

Procedure

1. Disconnect the electrical connector.
2. Using the appropriate tool, unsnap tabs on the aerial from the bracket.

Keyless Entry Control Module Replacement

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none">1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .2. Remove the right side quarter inner trim panel. Refer to Quarter Inner Trim Finish Panel Replacement .	

Keyless Entry Control Module

1

Procedure

1. Disconnect the electrical connectors.
2. Unsnap the receiver from the bracket.
3. For programming and set up, refer to [Control Module References](#) .

Remote Control Door Lock Receiver Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the inside rear view mirror mount plate cover. Refer to Inside Rearview Mirror Mount Plate Cover Replacement</p>	
	<p>Remote Control Door Lock Receiver</p>

1

Procedure

1. Disconnect the electrical connector.
2. Unsnap the receiver from the windscreen bracket.
3. For programming and set up, refer to [Control Module References](#)

Garage Door Opener Transmitter Replacement

Callout	Component Name
Preliminary Procedure	
Remove the roof console. Refer to Roof Console Replacement .	
1	Garage Door Opener Transmitter Bolts (Qty: 2)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Garage Door Opener Transmitter

2

Procedure

1. Disconnect the electrical connectors.
2. Refer to [Control Module References](#) for programming and set-up procedures.

Garage Door Opener Transmitter Pushbutton Replacement

Callout	Component Name
Preliminary Procedure	
Remove the garage door opener transmitter. Refer to Garage Door Opener Transmitter Replacement .	
1	Garage Door Opener Transmitter Pushbutton

Keyless Entry System Description and Operation

Keyless Entry System Description and Operation - Active

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the door locks to unlock the vehicle. Keyless entry will lock/unlock the vehicle doors or open the rear compartment lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver aerial that has a direct link to the body control module (BCM). The BCM interprets the signal and activates the requested function or request the appropriate control module to activate the function via a serial data message. A low transmitter battery or radio frequency interference from aftermarket devices, such as 2-way radios, power inverters, computers, etc., may cause a system malfunction. High radio frequency traffic areas, such as gas stations that use pay-at-the-pump radio frequency transponders, may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following features:

- Door lock/unlock
- Remote start
- Charge port door release
- Illuminated entry lamps
- Panic alarm/Vehicle locator
- Remote vehicle start

Keyless Entry System Description and Operation - Passive

Passive keyless entry allows entry to a locked vehicle without pressing any buttons on the keyless entry transmitter. You must only have the transmitter with you. The passive entry system use low frequency aerials in several different areas on the vehicle to determine the location of the transmitter. When passively opening a locked door or the rear compartment, you must have a programmed transmitter with you in your pocket, purse, or briefcase.

When a door handle is pulled or the rear compartment touch pad is pressed, the low frequency aerial sends out a challenge to the keyless entry transmitter. Because of the low frequency, communication range is limited. The aerial will emit the challenged in a one metre range. The transmitter must be within this range to receive the challenge. The transmitter receives this challenge and emits it's response as an RF message, which is received by the remote control door lock receiver. If the response is correct, the door or rear compartment will unlock and open.

As a customer convenience feature, the keyless entry system will notify the driver if the transmitter has been left in the vehicle after exiting by chirping the vehicle horn three times. This may be turned off using vehicle personalisation. Also, if the transmitter is left in the vehicle after the central door lock switch has been used to lock the vehicle, the driver door will remain unlock after exiting the vehicle. This is intended to prevent locking the transmitter in the vehicle and being unable to access it.

Keyless Entry System Description and Operation - Keyless Start

The keyless start portion of the keyless entry system allows vehicle starting, having only the transmitter as your key. The keyless start system uses low frequency aeriels in three different locations on the vehicle to determine the location of the transmitter. Multiple aeriels are used to ensure complete coverage of the vehicle interior and rear compartment. When using the keyless start system, a programmed transmitter must be in the vehicle's interior, such as the driver's pocket, purse, or briefcase.

When the ignition mode switch is pressed, the low frequency aeriels emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits it's response as an RF message, which is received by the remote control door lock receiver. If the response is correct, vehicle starting will be allowed. If RF communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat. The immobiliser aerial coil is located directly beneath the transmitter slot. Placing the extended key blade in the slot will create a low powered coupling between the transmitter and immobiliser aerial, allowing communications to occur and enabling vehicle starting.

The keyless entry system has the following components:

- Vehicle key with integrated keyless entry transmitter
- Driver and front Passenger door aeriels (part of the door handle assembly)
- Driver and front Passenger door lock sensors (part of the door handle assembly)
- Rear fascia aerial
- Front instrument panel console aerial
- Centre console aerial
- Rear compartment aerial
- Body Control Module (BCM)
- Keyless entry control module
- Immobiliser aerial coil
- Remote control door lock receiver

[Keyless Entry Transmitters](#)

The keyless entry transmitters are used to lock and unlock the vehicle door while away from the immediate are of the vehicle. Vehicles without remote start will operate at a distance of up to 20 m (65 ft) away. Vehicles with remote start will operate at a distance of up to 60 m (195 ft) away. The keyless entry transmitter is an integral part of the vehicle key.

[Door Aerial](#)

The keyless entry door aeriels are used to transmit low frequency communications to the keyless entry transmitters.

The keyless entry door aeriels are located in the left front and right front exterior door handle bracket. The aeriels are serviced as part of the door handle assembly. The aeriels are controlled by the keyless entry control module. When the exterior door handle is operated, the respective aerial will send out a challenge to the keyless entry transmitter, which begins the passive entry communications.

[Rear Fascia Aerial](#)

The rear fascia aerial is used to transmit low frequency communication to the keyless entry transmitters for entry to rear compartment.

The rear fascia aerial is located behind the rear fascia. The aerial is controlled by the keyless entry control module. When the rear compartment touch pad is pressed, the aerial sends out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Front Console Passive (Instrument Panel) Aerial

This aerial is located in the lower instrument panel near the front of the centre console.

The front console aerial is used for vehicle starting functions. When the ignition mode switch is pressed, the aerial is energised or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Centre Console Aerial

This aerial is located in the rear of the centre console.

The rear console aerial is used for vehicle starting functions. When the ignition mode switch is pressed, the aerial is energised or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Rear Compartment Aerial

This aerial is located in the centre of the rear compartment metal floor pan, near the seatback.

The rear compartment aerial is used for vehicle starting functions. When the ignition mode switch is pressed, the aerial is energised or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Remote Control Door Lock Receiver

The remote control door lock receiver is located on the vehicle windscreen, directly in front of the inside rearview mirror.

The remote control door lock receiver is control by and directly communicates with the body control module (BCM). When the transmitter receives a low frequency challenge from an aerial, it responds with an RF message. This RF message is received by the remote control door lock receiver and communicated to the BCM. If the RF message is a valid response to the low frequency challenge, vehicle access or starting will be allowed.

Immobiliser Aerial Coil Assembly

The keyless entry immobiliser coil assembly is located in the upper instrument panel, directly beneath the upper instrument panel storage compartment. If the transmitter battery is dead, weak, or the RF signal is being interrupted, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat, to create a low powered coupling between the transmitter and immobiliser aerial, allowing communications to occur and enabling vehicle starting.

The immobiliser aerial coil is controlled by the BCM. The immobiliser control module is also active when learning vehicle keys.

Keyless Entry Control Module

The keyless entry control module is a multi-function module which performs the following keyless entry system functions:

- Activating vehicle aerials for passive keyless entry functions
- Activating vehicle aerials for keyless start functions
- Backup control for the ECM accessory wakeup and the run/crank relay
- If equipped, controls the electronic steering column lock
- Receiver of the door handle switch inputs and the lock sensor inputs and door open switch (not the door ajar switch)
- Control the door unlatch motors
- Ignition mode switch monitoring

Body Control Module (BCM)

The BCM is a multi-function module that performs the following functions:

- Receive and authenticate active transmitter and keyless start signals from the remote control door lock receiver
- Determines the functionality requested by the transmitter signal
- Performs the function requested by the transmitter signal

Unlock Driver Door Only - Active

Momentarily press the transmitter UNLOCK button to perform the following functions:

- Unlock only the driver door
- Illuminate the interior lamps for a determined length of time or until the ignition mode switch is pressed
- Flash the exterior lights, if enable through personalisation
- Disarm the content theft deterrent system
- Deactivate the content theft deterrent system when in the alarm mode

Unlock All Doors - Second Operation - Active

Momentarily press the transmitter UNLOCK button a second time, within 5 seconds of the first press, to perform the following function:

Unlock the remaining doors and rear compartment

Unlock Driver Door Only - Passive

If enabled through personalisation, approach the driver door with a valid keyless entry transmitter and touch the lock sensor on the front door handle to perform the following functions:

- Unlock and open only the driver door when door handle is operated
- Disarm the content theft deterrent system, if equipped
- Deactivate the content theft deterrent system when in the alarm mode

Unlock All Doors - Passive

Approach any non driver door (front or rear) or, if enabled through personalisation, the driver door with a valid keyless entry transmitter and touch the lock sensor on the front door handle to perform the following functions:

- Unlock all vehicle doors and rear compartment
- Disarm the content theft deterrent system, if equipped
- Deactivate the content theft deterrent system when in the alarm mode

Lock All Doors - Active

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors
- Immediately turn off the interior lamps
- Flash the exterior lights, if enabled through personalisation
- Chirp the horn, if enabled through personalisation
- Arm the content theft deterrent system

Lock All Doors - Passive

Exit the vehicle (with vehicle off) with the keyless entry transmitter to automatically perform the following functions, if equipped.

- Lock all vehicle doors and rear compartment after a delay
- Flash the exterior lights, if enabled through personalisation
- Chirp horn, if enabled through personalisation
- Arm the content theft deterrent system

When all doors are closed, they can also be locked from the exterior by touching the lock sensor on the outside of a front door handle while having a valid transmitter in range. This function is only active for several minutes after all doors are closed to save battery life.

If more than one keyless entry transmitter is within a vehicle and the keyless entry system detects that one or more transmitters have been left in the vehicle after vehicle is locked, any transmitter left within the vehicle will be temporarily deactivated until:

- A button on the deactivated transmitter is pressed (will only activate the transmitter whose button is pressed)
- A passive unlock of vehicle occurs
- Change in power mode occurs

Rear Compartment Release - Passive

Approach the rear of the vehicle with a valid keyless entry transmitter. Press the boot release touch pad. The boot will open.

Vehicle Locator/Panic Alarm/Active

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulses the horn three times
- Flashes the exterior lamps three times

A press and hold of the panic button performs the following functions:

- A press and hold of the panic button performs the following functions:
- Pulses the horn and flashes the parking lamps for 30 second or until the following conditions occur:
 - The panic button is pressed
 - The ignition mode switch is pressed with a valid key in the vehicle

Remote Start

The remote start function allows an operator to pre-condition the vehicle interior prior to entering the vehicle. Remote start will allow the HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. Remote start functions have an operating range of up to 195 feet, depending on conditions. The remote start sequence begins by pressing and releasing the lock button and then pressing and holding the remote start buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time a remote start is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter or vehicle key at any time. Once activated, the HVAC and vehicle systems are allowed to operate for 10 minutes. The remote start time may be extended by an additional 10 minute by again pressing and releasing the lock button and then pressing and holding the remote start buttons on the transmitter. This feature is called a remote start continue and allows a maximum of 20 minutes of system operation. If the remote start continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of systems operation would occur. The remote start event may be suspended at any time by pressing only the remote start button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two remote start events may occur or be attempted. Once two events or attempts have been made, future remote start events will be suspended until the vehicle is operated using the ignition mode switch.

Enable/Disable Remote Start

Using the driver information centre, remote start may be enabled or disabled as a part of vehicle personalisation. Refer to the vehicle owners manual for more information.

Remote Start System Disabled

If any of the conditions listed below occur, a remote start event may be aborted or cancelled:

- Vehicle is in valet mode
- Vehicle doors are ajar
- Rear compartment lid is ajar
- The bonnet is open
- The doors are not locked
- The hazard switch is ON
- Vehicle power mode is incorrect
- Vehicle speed is greater than 0
- Transmission is not in P
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- Engine crank time is greater than 30 seconds
- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobiliser system indicates a theft attempt
- Vehicle propulsion system fault conditions
- High voltage battery fault conditions

Keyless Entry Personalisation

Vehicle lock/unlock functions and remote start settings may be personalised for the vehicle. For functional descriptions and programming instructions, refer to the vehicle owners manual.

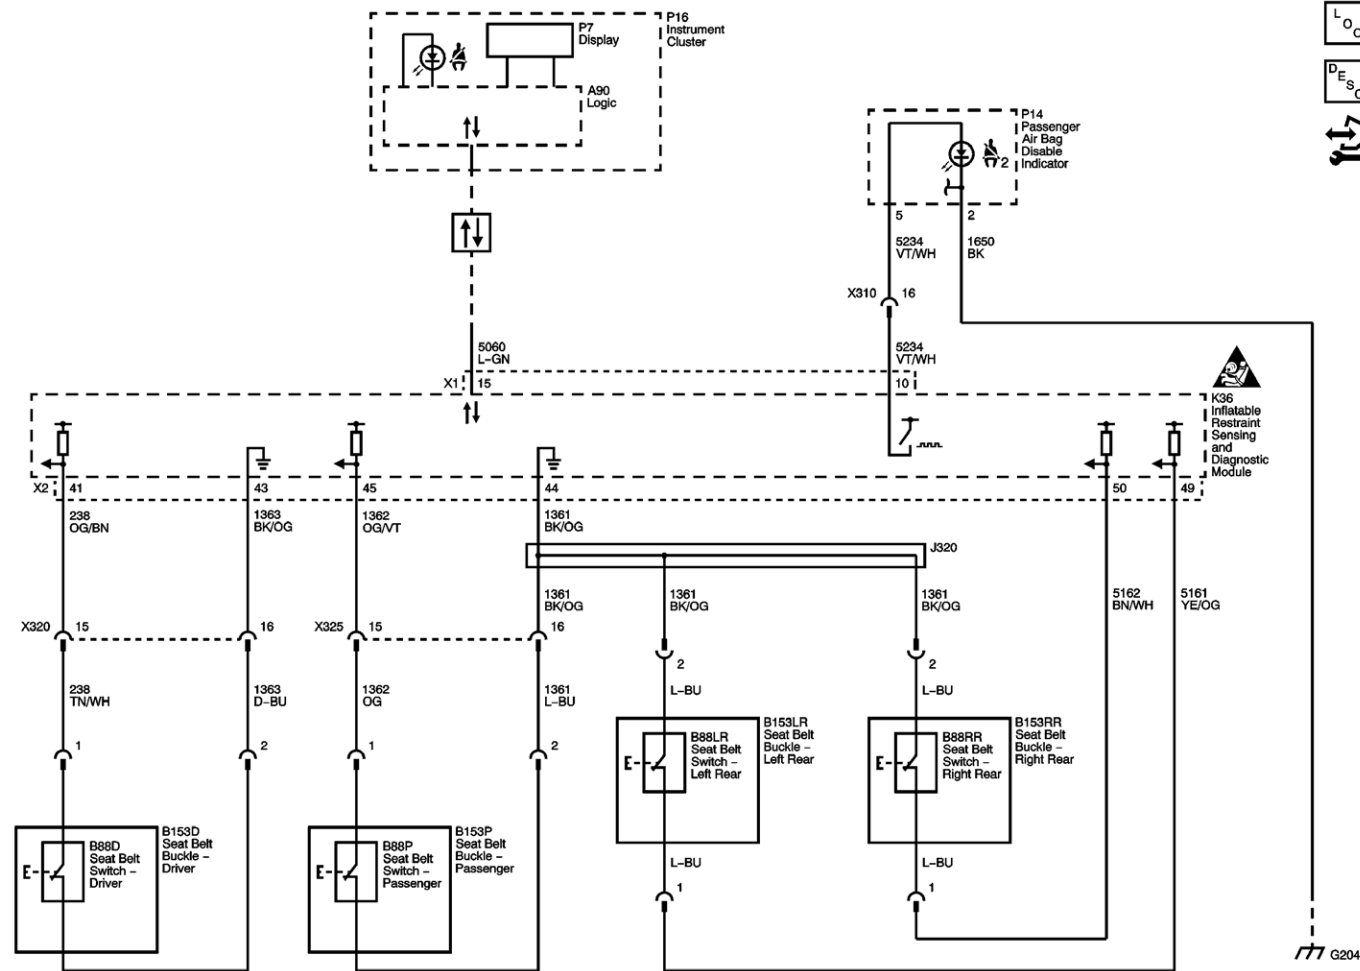

Replace Battery in Remote Key Message

A REPLACE BATTERY IN REMOTE KEY message may be seen on the driver information centre when the transmitter's battery voltage has been lower than 2.16 volts for three consecutive ignition cycles.

Symptoms - Seat Belts

Note: Review the seat belt system description and operation in order to familiarise yourself with the system and how it functions. Refer to [Seat Belt System Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to the following symptom diagnostic procedure in order to diagnose the symptom:

- [Seat Belt Indicator Circuit Malfunction - Driver](#)
- [Seat Belt Indicator Circuit Malfunction - Passenger](#)
- [Seat Belt Indicator Circuit Malfunction - Rear](#)

Seat Belt Indicator Circuit Malfunction - Driver

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Driver Seat Belt Switch Signal	1	2	2	2	-
Driver Seat Belt Switch Low Reference	-	2	2	2	-
1. Indicator will remain ON with seat belt buckled.					
2. Indicator will illuminate only for the bulb check.					

[Circuit/System Description](#)

The driver seat belt switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The SDM sends the status of the driver seat belt via serial data to the instrument panel cluster. After receiving the message, the instrument panel cluster controls the illumination of the driver seat belt indicator.

1. Command the instrument cluster all indicators ON and OFF with a scan tool. The driver seat belt indicator should turn ON and OFF as commanded.
If the driver seat belt indicator does not turn ON and OFF as commanded
Replace the P16 instrument cluster.
If the driver seat belt indicator does turn ON and OFF as commanded
2. Monitor the scan tool Driver Seat Belt Switch parameter while buckling and unbuckling the seat belt. The parameter should display Buckled and Unbuckled when changing seat belt states.
If the scan tool Driver Seat Belt Switch parameter does not display Buckled and Unbuckled when changing seat belt states
Refer to Circuit/System Testing.
If the scan tool Driver Seat Belt Switch parameter does display Buckled and Unbuckled when changing seat belt states
3. All OK.

[Circuit/System Testing](#)

Note: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- B88 Seat belt switch
- Seat belt switch harness connector
- K36 SDM
- SDM wiring harness connector

1. Vehicle OFF.
2. Disconnect the harness connector at the B88 seat belt switch.

3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If 5 Ω or greater
 - 3.1. Disconnect the harness connector at the K36 SDM.
 - 3.2. Test for less than 2 Ω in each control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.
If less than 5 Ω
4. Vehicle in Service Mode.
5. Verify the scan tool Driver Seat Belt Status parameter displays Buckled.
If the scan tool Driver Seat Belt Status parameter does not display Buckled
 - 5.1. Disconnect the harness connector at the K36 SDM.
 - 5.2. Test for infinite resistance between the seat belt switch signal circuit terminal 1 and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If less than 2 Ω , replace the K36 SDM.
If the scan tool Driver Seat Belt Status parameter does display Buckled
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
7. Verify the scan tool Driver Seat Belt Status parameter displays Unbuckled.
If the scan tool Driver Seat Belt Status parameter does not display Unbuckled
 - 7.1. Disconnect the harness connector at the K36 SDM.
 - 7.2. Vehicle in Service Mode.
 - 7.3. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
 - 7.4. Test for less than 2 Ω in each circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.
If the scan tool Driver Seat Belt Status parameter does display Unbuckled
8. Replace the B88 seat belt switch.

Component Testing

1. Vehicle OFF.
2. Disconnect the harness connector at the B88 seat belt switch.
3. B88 seat belt switch in the open position.
4. Test for infinite resistance between the signal circuit terminal 1 and the ground terminal 2 at the B88 seat belt switch.
If there is not infinite resistance
Replace the B88 seat belt switch.
If there is infinite resistance
5. B88 seat belt switch in the closed position.

6. Test for less than 1 Ω between the signal circuit terminal 1 and the ground terminal 2 at the B88 seat belt switch.

If 1 Ω or greater

Replace the B88 seat belt switch.

If less than 1 Ω

7. All OK.

If less than 2 Ω , replace the K36 SDM.***If the scan tool Passenger Seat Belt Status parameter does display Buckled***
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
7. Verify the scan tool Passenger Seat Belt Status parameter is Unbuckled.
If the scan tool Passenger Seat Belt Status parameter does not display Unbuckled
 - 7.1. Disconnect the harness connector at the K36 SDM.
 - 7.2. Vehicle in Service Mode.
 - 7.3. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
 - 7.4. Test for less than 2 Ω in each circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.***If the scan tool Passenger Seat Belt Status parameter does display Unbuckled***
8. Replace the B88 passenger seat belt switch.

Passenger Seat Belt Indicator Malfunction

1. Vehicle OFF.
2. Disconnect the harness connector at the P14 passenger air bag disable indicator.
3. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If 10 Ω or greater
Repair the open/high resistance in the circuit.
If less than 10 Ω
4. Vehicle in Service Mode.
5. With a scan tool, command the Passenger Seat Belt Reminder Indicator OFF.
6. Test for less than 11 V between the control circuit terminal 5 and ground.
If 11 V or greater
 - 6.1. Vehicle OFF.
 - 6.2. Disconnect the X1 harness connector at the K36 SDM.
 - 6.3. Vehicle in Service Mode.
 - 6.4. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 11 V

7. With a scan tool, command the Passenger Seat Belt Reminder Indicator ON.
8. Test for greater than 4 V between the control circuit terminal 5 and ground.

If 4 V or less

- 8.1. Vehicle OFF.
- 8.2. Disconnect the X 1 harness connector at the K36 SDM.
- 8.3. Test for infinite resistance between the control circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
- 8.4. Test for less than 2 Ω between the control circuit and ground.
If 2 Ω or greater repair the open/high resistance in the circuit.
If less than 2 Ω replace the K36 SDM.

If greater than 4 V

9. Replace the P14 passenger air bag disable indicator.

Component Testing

1. Vehicle OFF.
2. Disconnect the harness connector at the appropriate B88 seat belt switch.
3. Buckle the B88 seat belt switch.
4. Test for infinite resistance between the signal circuit terminal 1 and the low reference terminal 2 at the B88 seat belt switch.
If there is not infinite resistance
Replace the B88 seat belt switch.
If there is infinite resistance
5. Unbuckle the B88 seat belt switch.
6. Test for less than 1 Ω between the signal circuit terminal 1 and the low reference terminal 2 at the B88 seat belt switch.
If 1 Ω or greater
Replace the B88 seat belt switch.
If less than 1 Ω
7. All OK.

Repair Instructions

Seat Belt Indicator Circuit Malfunction - Rear

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Rear Seat Belt Switch Signal	1	2	2	2	-
Rear Seat Belt Switch Low Reference	-	2	2	2	-

1. Green indicator will illuminate only for the bulb check. The red indicator will remain ON with seat belt buckled.

2. Green indicator will illuminate only for the bulb check. The red indicator will never illuminate.

[Circuit/System Description](#)

The two rear seat belt switches are 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The SDM sends the status of the rear seat belt via serial data to the driver information centre (DIC). After receiving the message, the DIC controls the illumination of the rear seat belt indicators.

[Diagnostic Aids](#)

1. The mechanical stop in the buckle may prevent latching but the switch in the buckle may momentarily open and the SDM would interpret this as an occupant in the rear seat position and that the buckle was attempting to latch.
2. If a rear occupant attempts to latch the seat belt into the wrong buckle, the indicator may illuminate and the system assumes there is an occupant not buckled in that seat position.
3. An unseated connector can appear as a buckled seat belt connection.

Circuit/System Verification

1. Verify that all connectors are fully seated.
2. With a scan tool, monitor the appropriate 2nd Row Seat Belt Status parameter and P16 instrument cluster rear seat belt indicator while buckling and unbuckling the seat belt. The parameter should display Buckled when the rear seat belt is buckled and Unbuckled when the rear seat belt is unbuckled.
 - If the scan tool does not display the parameters as specified, refer to Circuit System Testing.
 - If the scan tool displays the parameters as specified but the P16 instrument cluster does not display the correct corresponding rear seat belt indicator, replace the P16 instrument cluster.

Circuit/System Testing

Note: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- B88 Seat belt switch
- Seat belt switch harness connector
- K36 SDM

- SDM wiring harness connector

1. Vehicle OFF.
2. Disconnect the harness connector at the appropriate B88 seat belt switch.
3. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
 - If 5 Ω or greater**
 - 3.1. Disconnect the harness connector at the K36 SDM.
 - 3.2. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 SDM.
 - If less than 5 Ω**
4. Vehicle in Service Mode.
5. Verify the scan tool 2nd Row Seat Belt Status parameter displays Buckled.
 - If the scan tool 2nd Row Seat Belt Status parameter does not display Buckled**
 - 5.1. Disconnect the harness connector at the K36 SDM.
 - 5.2. Test for infinite resistance between the seat belt switch signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than 2 Ω , replace the K36 SDM.
 - If the scan tool 2nd Row Seat Belt Status parameter does display Buckled**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
7. Verify the scan tool 2nd Row Seat Belt Status parameter displays Unbuckled.
 - If the scan tool 2nd Row Seat Belt Status parameter does not display Unbuckled**
 - 7.1. Disconnect the harness connector at the K36 SDM.
 - 7.2. Vehicle in Service Mode.
 - 7.3. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - 7.4. Test for less than 2 Ω in each circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 SDM.
 - If the scan tool 2nd Row Seat Belt Status parameter does display Unbuckled**
8. Replace the B88 seat belt switch.

Component Testing

1. Vehicle OFF.
2. Disconnect the harness connector at the appropriate B88 seat belt switch.
3. Buckle the B88 seat belt switch.
4. Test for infinite resistance between the signal circuit terminal 1 and the low reference terminal 2 at the B88 seat belt switch.

If there is not infinite resistance

Replace the B88 seat belt switch.

If there is infinite resistance

5. Unbuckle the B88 seat belt switch.
6. Test for less than 1 Ω between the signal circuit terminal 1 and the low reference terminal 2 at the B88 seat belt switch.

If 1 Ω or greater

Replace the B88 seat belt switch.

If less than 1 Ω

7. All OK.

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 45 N·m (33 lb ft)
2	Rear Seat Shoulder Belt Buckle Assembly Procedure Disconnect the electrical connector.

Seat Belt System Description and Operation

[Restraint System](#)

The vehicle has front and rear seat belts that are the primary means of occupant restraint. Seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following events:

- Frontal impact type crashes
- Rear impact type crashes
- Side impact type crashes
- Roll-over type crashes

All seat belt retractors have emergency locks. The retractors remain unlocked during normal operation and under normal driving conditions. The retractors remain unlocked during normal conditions in order to allow free movement of the upper body of each occupant. A pendulum locks the seat belt webbing into position. The pendulum causes a locking bar to engage a cog on the spool of the retractor mechanism when the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

The seat belts have an automatic locking (cinch) feature. The cinch feature is activated when the seat belt webbing is completely extended from the retractor. The cinch feature prevents the webbing from extending beyond the position from which it is allowed to retract. Use of the cinch feature is recommended for securing a child seat. The cinch feature may be cancelled by allowing the webbing to wind back completely into the retractor. After the cinch feature is cancelled, the webbing is unlocked. After the cinch feature is cancelled, the webbing will extend from the retractor. This vehicle is also equipped with a supplemental inflatable restraint (SIR) system. Refer to [SIR System Description and Operation](#).

[Front Seat Belt System](#)

The front seat belt system includes a driver and passenger seat belt pretensioner retractor and anchor. Both front seat belt pretensioners includes a seat belt switch in the seat buckle which controls a reminder lamp and a tone alarm.

Note: The front passenger seat is equipped with a passenger presence detection sensor, which detects an occupant. If the passenger presence detection sensor detects an

empty front passenger seat, then the passenger fasten safety belt indicator will be disabled.

- When the driver seat belt is buckled and the ignition switch is turned ON, the following events will occur:
 - The tone alarm will not operate.
 - The reminder lamp will not operate.
- When the passenger seat belt is buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the following events will occur:
 - The tone alarm will not operate.
 - The reminder lamp, which is located within the Passenger Air Bag Disable Indicator, will not be turned ON.
- When the driver seat belt is not buckled and the ignition switch is in the ON position, the following events will occur:
 - The tone alarm will operate for 4-8 seconds and then go OFF.
 - The fasten safety belt indicator will turn ON for 20 seconds, until the driver seat belt is buckled.
- When the passenger seat belt is not buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the following events will occur:
 - The tone alarm will operate for 4-8 seconds and then go OFF.
 - The reminder lamp, which is located within the Passenger Air Bag Disable Indicator, will be turned ON.

Rear Seat Belt System

The Rear Seat Belt System includes the following components:

- The rear seat belt retractor is located at the wheelhouse panel and attached to the floor panel by the rear seat shoulder belt retractor bracket.
- The rear seat belt buckles are attached to each seat.
- Each of the rear seat belts include a seat belt switch in the seat buckle which controls a reminder lamp and a tone alarm.
- If both rear seat belts are unbuckled when the vehicle is started the rear seat belt indicators show as red indicators in the DIC.
- If any rear seat belts are buckled when the vehicle is started, the corresponding indicators will be green for that seat.
- When the ignition switch is turned ON, a rear seat belt is buckled, the rear doors are closed and the speed exceeds 10 kph (6.5 mph) for a continuous 35 seconds the following events will occur:
 - The tone alarm will not operate.
 - The green rear seat belt indicators in the Driver Information Centre will illuminate for 35 seconds.
- When the ignition switch is turned ON, a rear seat belt is not buckled for the duration of the ignition cycle, the rear doors are closed and the speed exceeds 10 kph (6.5 mph) for a continuous 35 seconds the following events will occur:
 - The tone alarm will not operate.
 - The red rear seat belt indicator in the Driver Information Centre will remain illuminated.
- When the ignition switch is turned ON, a rear seat belt is buckled and during that ignition cycle is unbuckled with the rear doors closed at all times and the speed exceeding 10 kph (6.5 mph) for a continuous 35 seconds the following events will occur:
 - The tone alarm will operate for 3 seconds.
 - The red rear seat belt indicator in the Driver Information Centre will illuminate and remain on for a continuous 35 seconds until the seat belt is buckled again or the

ignition cycle ends.

Child Seat Restraint System

Warning: A child in a rear-facing child restraint can be seriously injured if the right-front passenger's air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owner's manual and the instruction that came with the child restraint.

A child in a rear-facing child restraint can be seriously injured if the right-front passenger's air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owner's manual and the instruction that came with the child restraint.

The child seat may only be used in a forward-facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

All vehicles are equipped with a dual-mode type retractor with emergency and automatic locking features. The automatic locking feature is for restraint of a child seat. The child seat can be secured by pulling the seat belt all the way out to lock it. Then tighten the seat belt around the child seat.

If a child seat is to be used in the second seat position, a special dealer-installed anchor must be used in order to anchor the child seat top strap. This only applies to the seats designed with the top strap provision and for the vehicles sold in Canada. In order to ensure the correct top strap angle, the child seat is only to be used at the seating position for which the top strap anchor is installed.

Fasten Safety Belt Indicators

There are three fasten safety belt indicators for this vehicle. The driver fasten safety belt reminder is displayed in the instrument cluster, the passenger fasten safety belt reminder is displayed in the passenger air bag disable indicator, and the rear fasten safety belt reminder is displayed in the driver information centre. The fasten safety belt indicator may only be ON during RUN. The fasten safety belt indicator illuminates under the following conditions:

- During the bulb check
- The inflatable restraint sensing and diagnostic module (SDM) sends the status of the driver seat belt to the instrument cluster via serial data. The passenger seat belt status is sent to the passenger air bag disable indicator via serial data. The rear seat belt status is sent to the driver information centre via serial data. If any of the seat belts are unfastened, the instrument cluster will send a message requesting a chime sound to be turned ON after a bulb check.

Circuit/System Description

During a frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the steering wheel air bag. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are 2 shorting bars used within the steering wheel air bag coil connector which will short together both steering wheel air bag stage 1 high control circuit and steering wheel air bag stage 1 low control circuit and both steering wheel air bag stage 2 high control circuit and steering wheel air bag stage 2 low control circuit when the connector is disconnected. This will help to prevent unwanted deployment of the steering wheel air bag during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0012 01 stage 1 or B0013 01 stage 2

The steering wheel air bag deployment loop is shorted to voltage for 2 seconds.

B0012 02 stage 1 or B0013 02 stage 2

The steering wheel air bag deployment loop is shorted to ground for 2 seconds.

B0012 04 stage 1 or B0013 04 stage 2

The steering wheel air bag deployment loop is open for 2 seconds.

B0012 0D stage 1 or B0013 0D stage 2

The steering wheel air bag deployment loop resistance is greater than 4.4 Ω for 2 seconds.

B0012 0E stage 1 or B0013 0E stage 2

The steering wheel air bag deployment loop resistance is less than 1.7 Ω for 2 seconds.

Action Taken When the DTC Sets

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployment.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

Note: The following diagnostic aids apply for both current and history DTCs.

A worn steering wheel air bag coil can cause a repeated history DTC to set. To verify this condition, turn the steering wheel 360 degrees in one direction then back 360 degrees in the other direction, multiple times, while viewing the scan tool Deployment Loop Resistance parameters.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Steering wheel air bag assembly
- Steering wheel air bag coil assembly
- Inline connectors - on the steering wheel air bag side of the harness connector
- Harness side of the SDM connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

If the steering wheel air bag has inflated under unexpected conditions and/or DTC with symptom byte 01 is set, check both control circuits for a short to voltage.

Circuit/System Verification

Note: Refer to [SIR Service Precautions](#)

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Driver Steering Wheel Air bag
- Driver steering wheel air bag coil
- SDM
- Air bag wiring harness connector
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.

If less than 2.1 or greater than 4.0 Ω

Refer to Circuit/System Testing.

If there are spikes or dropouts

Replace the X85 driver steering wheel air bag coil.

If within 2.1 and 4.0 Ω without any spikes or dropouts

2. DTC B0012 or B0013 should only be set as a history DTC.

If the DTC is set as current

Refer to Circuit/System Testing.

If the DTC is set as history

3. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any drop outs or spikes while moving the harness near each connector listed below.

- X85 Steering wheel air bag coil
- F107 Steering wheel air bag.
- Any harness inline
- K36 SDM

If the reading is erratic while moving the harness, perform the following

- Inspect each connector terminal for damage or corrosion and repair as necessary.
- Apply Nyogel lubricant 760G to each connector terminal.
- Insure each connector and CPA is correctly seated.

If within 2.1 and 4.0 Ω without any spikes or dropouts

4. All OK

Circuit/System Testing

1. Vehicle OFF, disconnect the scan tool and disconnect the harness connector X1 at the F107 driver steering wheel air bag then wait for 120 seconds.
2. Test for greater than 25 Ω between the control circuit terminals 1 X1 and 2 X1 (Stage 1) or terminals 1 X2 and 2 X2 (Stage 2).

If 25 Ω or less

2.1. Disconnect the harness connector X1 at the K36 SDM.

2.2. Test for infinite resistance between the two control circuits.

If less than infinite resistance, repair the short between the two circuits.

If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

3. Vehicle in Service Mode.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1 X1 (stage 1)
 - Control circuit terminal 2 X1 (stage 1)
 - Control circuit terminal 1 X2 (stage 2)
 - Control circuit terminal 2 X2 (stage 2)

If 11 V or greater

4.1. Vehicle OFF, disconnect the harness connector X1 at the K36 SDM, Vehicle in Service Mode.

4.2. Test for less than 1 V between the control circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K36 SDM.

If less than 11 V

5. Vehicle OFF.

6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:

- Control circuit terminal 1 X1 (stage 1)
- Control circuit terminal 2 X1 (stage 1)
- Control circuit terminal 1 X2 (stage 2)
- Control circuit terminal 2 X2 (stage 2)

If 25 Ω or less

6.1. Disconnect the harness connector at the K36 SDM.

6.2. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

7. Install a 3 A fused jumper wire between the control circuit terminals 1 X1 and 2 X1 (Stage 1) or terminals 1 X2 and 2 X2 (Stage 2).

8. Vehicle in Service Mode, verify the scan tool Deployment Loop Resistance parameter is consistently less than 2 Ω while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.

If the reading is erratic while turning the steering wheel

Replace the X85 driver steering wheel airbag coil.

If 2 Ω or greater

8.1. Vehicle OFF, disconnect the harness connector X1 at the K36 SDM.

8.2. Test for less than 2 Ω in the driver steering wheel airbag coil and each control circuit end to end.

If 2 Ω or greater, replace the coil or repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K36 SDM.

If less than 2 Ω

9. Replace the F107 driver steering wheel air bag.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
---------	-----------------	-----------------	------	------------------	--------------------

Driver Seat Side Air Bag High Control	B0014 02, B0014 0E	B0014 0D	B0014 04, B0014 0D	B0014 01	-
Driver Seat Side Air Bag Low Control	B0014 02, B0014 0E	B0014 0D	B0014 04, B0014 0D	B0014 01	-
Passenger Seat Side Air Bag High Control	B0021 02, B0021 0E	B0021 0D	B0021 04, B0021 0D	B0021 01	-
Passenger Seat Side Air Bag Low Control	B0021 02, B0021 0E	B0021 0D	B0021 04, B0021 0D	B0021 01	--

[Circuit/System Description](#)

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short together the control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

B0014 01, B0021 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0014 02, B0021 02

The air bag control circuit is shorted to ground for 2 seconds.

B0014 04, B0021 04

The air bag control circuit is open for 2 seconds.

B0014 0D, B0021 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0014 0E, B0021 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

[Action Taken When the DTC Sets](#)

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

Note: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Left and rear seat side air bags
- Left and right roof rail air bags
- Inline connectors - on the side of the harness connector
- Harness side of the SDM connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

If the retractor pretensioner, passenger instrument panel air bags, roof rail air bags, knee air bags, or seat side air bag has inflated under unexpected conditions and/or DTC with symptom byte 01 is set, check both control circuits for a short to voltage.

Circuit/System Verification

Note: Refer to [SIR Service Precautions](#) .

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Seat belt retractor pretensioner
- Passenger instrument panel air bag
- Side air bag
- Knee air bag
- Roof rail air bag
- SDM
- All wiring harness connectors
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector.
 - F106 side air bag
 - Any inline harness

- K36 SDM

If less than 2.1 or greater than 4.0 Ω

Refer to Circuit/System Testing.

If there are spikes or dropouts, perform the following

- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply Nyogel lubricant 760G to each connector terminal
- Insure each connector and CPA is correctly seated.

If within 2.1 and 4.0 Ω without any spikes or dropouts

2. All OK

Circuit/System Testing

1. Vehicle OFF, disconnect the scan tool and then disconnect the appropriate F106 side air bag harness connector and then wait for 120 seconds.
2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.

If 25 Ω or less

- 2.1. Disconnect the X2 harness connector at the K36 SDM.
- 2.2. Test for infinite resistance between the two control circuits.
If less than infinite resistance, repair the short between the two circuits.
If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

3. Vehicle in Service Mode.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 11 V or greater

- 4.1. Vehicle OFF, disconnect the X2 harness connector at the K36 SDM, Vehicle in Service Mode.
- 4.2. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 11 V

5. Vehicle OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 25 Ω or less

- 6.1. Disconnect the X2 harness connector at the K36 SDM.

6.2. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

7. Vehicle OFF, install a 3 A fused jumper wire between the control circuit terminals 1 and 2.

8. Vehicle in Service Mode, verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

If 2 Ω or greater

8.1. Vehicle OFF, disconnect the X2 harness connector at the K36 SDM.

8.2. Test for less than 2 Ω in each control circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K36 SDM.

If less than 2 Ω

9. Replace the appropriate F106 side air bag.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0015 01, B001A 01, B001B 01, B0022 01

The pretensioner control circuit is shorted to voltage for 2 seconds.

B0015 02, B001A 02, B001B 02, B0022 02

The pretensioner control circuit is shorted to ground for 2 seconds.

B0015 04, B001A 04, B001B 04, B0022 04

The pretensioner control circuit is open for 2 seconds.

B0015 0D, B001A 0D, B001B 0D, B0022 0D

The pretensioner deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0015 0E, B001A 0E, B001B 0E, B0022 0E

The pretensioner deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

Note: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger anchor or retractor pretensioners
- Inline connectors - on the side of the harness connector
- Harness side of the SDM connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

If the pretensioner, passenger instrument panel air bags or seat side air bag has inflated under unexpected conditions and/or DTC with symptom byte 01 is set, check both control circuits for a short to voltage.

Circuit/System Verification

Note: Refer to [SIR Service Precautions](#) .

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Seat belt retractor pretensioner
- Passenger instrument panel air bag
- Knee air bag
- Seat side air bag
- Roof rail air bag
- SDM
- Seat belt retractor pretensioner wiring harness connector
- Passenger instrument panel air bag wiring harness connector
- Seat side air bag wiring harness connector
- Roof rail air bag wiring harness connector
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
 - F112 Seat belt retractor pretensioner
 - F113 Seat belt anchor pretensioner
 - Any inline harness
 - K36 SDM

If less than 2.1 or greater than 4.0 Ω
Refer to Circuit/System Testing.

If there are spikes or dropouts, perform the following

 - Inspect each connector terminal and harness for damage or corrosion and repair as necessary
 - Apply Nyogel lubricant 760G to each connector terminal
 - Insure each connector and CPA is correctly seated.

If within 2.1 and 4.0 Ω without any spikes or dropouts
2. All OK

Circuit/System Testing

1. Vehicle OFF.
2. Disconnect the scan tool.
3. Disconnect the appropriate harness connector listed below:
 - F112 Seat belt retractor pretensioner
 - F113 Seat belt anchor pretensioner
4. Wait for 120 seconds.
5. Test for greater than 25 Ω between the appropriate control circuit terminals 1 and 2.

If 25 Ω or less

- 5.1. Disconnect the X2 harness connector at the K36 SDM.
- 5.2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

6. Vehicle in Service Mode.
7. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 11 V or greater

- 7.1. Vehicle OFF.
- 7.2. Disconnect the X2 harness connector at the K36 SDM.
- 7.3. Vehicle in Service Mode.
- 7.4. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 SDM.

If less than 11 V

8. Vehicle OFF.
9. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 25 Ω or less

- 9.1. Disconnect the X2 harness connector at the K36 SDM.
- 9.2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

10. Vehicle OFF.
11. Install a 3 A fused jumper wire between the appropriate control circuit terminals 1 and 2.
12. Vehicle in Service Mode.
13. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω.

If 2 Ω or greater

- 13.1. Vehicle OFF.
- 13.2. Disconnect the X2 harness connector at the K36 SDM.
- 13.3. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω, replace the K36 SDM.

If less than 2 Ω

14. Replace the appropriate F112 seat belt retractor pretensioner or F113 seat belt anchor pretensioner.

[Circuit/System Description](#)

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

B0016 01, B0023 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0016 02, B0023 02

The air bag control circuit is shorted to ground for 2 seconds.

B0016 04, B0023 04

The air bag control circuit is open for 2 seconds.

B0016 0D, B0023 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0016 0E, B0023 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

[Action Taken When the DTC Sets](#)

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

Note: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger instrument panel air bag
- Driver and passenger seat side air bags
- Knee air bags
- Left and right roof rail air bags
- Driver and passenger retractor pretensioners
- Inline connectors - on the side of the harness connector
- Harness side of the SDM connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat DTC can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

If the pretensioner, passenger instrument panel air bags or seat side air bag has inflated under unexpected conditions and/or DTC with symptom byte 01 is set, check both control circuits for a short to voltage.

Circuit/System Verification

Note: Refer to [SIR Service Precautions](#) .

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Seat belt retractor pretensioner
- Passenger instrument panel air bag
- Knee air bag
- Seat side air bag
- Roof rail air bag
- SDM
- Seat belt retractor pretensioner wiring harness connector
- Passenger instrument panel air bag wiring harness connector
- Seat side air bag wiring harness connector
- Roof rail air bag wiring harness connector
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
 - F105L Roof rail air bag - left
 - F105R Roof rail air bag - right
 - Any inline harness
 - K36 SDM

If less than 2.1 or greater than 4.0 Ω

Refer to Circuit/System Testing.

If there are spikes or dropouts, perform the following

- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply Nyogel lubricant 760G to each connector terminal
- Insure each connector and CPA is correctly seated.

If within 2.1 and 4.0 Ω without any spikes or dropouts

2. All OK

Circuit/System Testing

1. Vehicle OFF.
2. Disconnect the scan tool.
3. Disconnect the appropriate harness connector listed below:
 - F105L Roof rail air bag - left
 - F105R Roof rail air bag - right
4. Wait for 120 seconds.
5. Test for greater than 25 Ω between the control circuit terminals 1 and 2.

If 25 Ω or less

5.1. Disconnect the X2 harness connector at the K36 SDM.

5.2. Test for infinite resistance between the two control circuits.

If less than infinite resistance, repair the short between the two circuits.

If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

6. Vehicle in Service Mode.
7. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1

- Control circuit terminal 2

If 11 V or greater

- 7.1. Vehicle OFF.
- 7.2. Disconnect the X2 harness connector at the K36 SDM.
- 7.3. Vehicle in Service Mode.
- 7.4. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 SDM.

If less than 11 V

8. Vehicle OFF.
9. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 25 Ω or less

- 9.1. Disconnect the X2 harness connector at the K36 SDM.
- 9.2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

10. Vehicle OFF.
11. Install a 3 A fused jumper wire between the appropriate control circuit terminals 1 and 2.
12. Vehicle in Service Mode.
13. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

If 2 Ω or greater

- 13.1. Vehicle OFF.
- 13.2. Disconnect the X2 harness connector at the K36 SDM.
- 13.3. Test for less than 2 Ω in each control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K36 SDM.

If less than 2 Ω

14. Replace the appropriate F105L roof rail air bag - left or F015R roof rail air bag - right.

Driver Knee Air Bag Low Control	B0017 02, B0017 0E	B0017 0D	B0017 04, B0017 0D	B0017 01	-
Passenger Knee Air Bag High Control	B0024 02, B0024 0E	B0024 0D	B0024 04, B0024 0D	B0024 01	-
Passenger Knee Air Bag Low Control	B0024 02, B0024 0E	B0024 0D	B0024 04, B0024 0D	B0024 01	--

[Circuit/System Description](#)

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short together the control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

B0017 01, B0024 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0017 02, B0024 02

The air bag control circuit is shorted to ground for 2 seconds.

B0017 04, B0024 04

The air bag control circuit is open for 2 seconds.

B0017 0D, B0024 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0017 0E, B0024 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

[Action Taken When the DTC Sets](#)

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

Note: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger knee air bags
- Inline connectors - on the side of the harness connector
- Harness side of the SDM connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

If the retractor pretensioner, passenger instrument panel air bags, knee air bags, roof rail air bags, or seat side air bag has inflated under unexpected conditions and/or DTC with symptom byte 01 is set, check both control circuits for a short to voltage.

Circuit/System Verification

Note: Refer to [SIR Service Precautions](#) .

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Seat belt retractor pretensioner
- Passenger instrument panel air bag
- Knee air bag
- Seat side air bag
- Roof rail air bag
- SDM
- All wiring harness connectors
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
 - F114D Knee air bag - driver
 - F114P Knee air bag - passenger
 - Any inline harness

- K36 SDM

If less than 2.1 or greater than 4.0 Ω

Refer to Circuit/System Testing.

If there are spikes or dropouts, perform the following

- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply Nyogel lubricant 760G to each connector terminal
- Insure each connector and CPA is correctly seated.

If within 2.1 and 4.0 Ω without any spikes or dropouts

2. All OK

Circuit/System Testing

1. Vehicle OFF, disconnect the scan tool, disconnect the appropriate F114 knee air bag harness connector, and then wait for 120 seconds.
2. Test for greater than 25 Ω between the appropriate control circuit terminals 1 and 2.

If 25 Ω or less

- 2.1. Disconnect the X1 harness connector at the K36 SDM.
- 2.2. Test for infinite resistance between the two control circuits.
If less than infinite resistance, repair the short between the two circuits.
If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

3. Vehicle in Service Mode.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 11 V or greater

- 4.1. Vehicle OFF, disconnect the X1 harness connector at the K36 SDM, Vehicle in Service Mode.
- 4.2. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 11 V

5. Vehicle OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2

If 25 Ω or less

- 6.1. Disconnect the X1 harness connector at the K36 SDM.

6.2. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

7. Vehicle OFF, install a 3 A fused jumper wire between the control circuit terminals 1 and 2.

8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

If 2 Ω or greater

8.1. Vehicle OFF, disconnect the X1 harness connector at the K36 SDM.

8.2. Test for less than 2 Ω in each control circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K36 SDM.

If less than 2 Ω

9. Replace the appropriate F114 knee air bag.

Passenger Instrument Panel Air Bag Stage 2 Low Control	B0020 02, B0020 0E	B0020 0D	B0020 04, B0020 0D	B0020 01	--

[Circuit/System Description](#)

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

B0019 01, B0020 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0019 02, B0020 02

The air bag control circuit is shorted to ground for 2 seconds.

B0019 04, B0020 04

The air bag control circuit is open for 2 seconds.

B0019 0D, B0020 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0019 0E, B0020 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

[Action Taken When the DTC Sets](#)

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

Note: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger instrument panel air bag
- Inline connectors - on the side of the harness connector
- Harness side of the SDM connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

If the pretensioner, passenger instrument panel air bags or seat side air bag has inflated under unexpected conditions and/or DTC with symptom byte 01 is set, check both control circuits for a short to voltage.

Circuit/System Verification

Note: Refer to [SIR Service Precautions](#) .

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Seat belt retractor pretensioner
- Passenger instrument panel air bag
- Knee air bag
- Seat side air bag
- Roof rail air bag
- SDM
- Seat belt retractor pretensioner wiring harness connector
- Passenger instrument panel air bag wiring harness connector
- Seat side air bag wiring harness connector
- Roof rail air bag wiring harness connector
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:

- F105 Passenger instrument panel air bag
- Any inline harness
- K36 SDM

If less than 2.1 or greater than 4.0 Ω

Refer to Circuit/System Testing.

If there are spikes or dropouts, perform the following

- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply Nyogel lubricant 760G to each connector terminal
- Insure each connector and CPA is correctly seated.

If within 2.1 and 4.0 Ω without any spikes or dropouts

2. All OK

Circuit/System Testing

1. Vehicle OFF.
2. Disconnect the scan tool.
3. Disconnect the harness connector X225.
4. Test for greater than 25 Ω between the appropriate control circuit terminals listed below on the SDM side of the connector:
 - F105 Passenger instrument panel airbag stage 1 X225 terminal 1 and 2
 - F105 Passenger instrument panel airbag stage 2 X225 terminal 3 and 4

If 25 Ω or less

- 4.1. Disconnect the X1 harness connector at the K36 SDM.
- 4.2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

5. Vehicle in Service Mode.
6. Test for less than 11 V between the control circuit terminals listed below and ground:
 - X225 control circuit terminal 1
 - X225 control circuit terminal 2
 - X225 control circuit terminal 3
 - X225 control circuit terminal 4

If 11 V or greater

- 6.1. Vehicle OFF.
- 6.2. Disconnect the X1 harness connector at the K36 SDM.

6.3. Vehicle in Service Mode.

6.4. Test for less than 1 V between the control circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K36 SDM.

If less than 11 V

7. Test for greater than 25 Ω between the control circuit terminals listed below and ground:

- X225 control circuit terminal 1
- X225 control circuit terminal 2
- X225 control circuit terminal 3
- X225 control circuit terminal 4

If 25 Ω or less

7.1. Disconnect the X1 harness connector at the K36 SDM.

7.2. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K36 SDM.

If greater than 25 Ω

8. Vehicle OFF.

9. Install a 3 A fused jumper wire between the control circuit terminals listed below:

- F105 Passenger instrument panel airbag stage 1 X225 terminal 1 and 2
- F105 Passenger instrument panel airbag stage 2 X225 terminal 3 and 4

10. Vehicle in Service Mode.

11. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω .

If 2 Ω or greater

11.1. Vehicle OFF.

11.2. Disconnect the X1 harness connector at the K36 SDM.

11.3. Test for less than 2 Ω in each control circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K36 SDM.

If less than 2 Ω

12. Vehicle OFF.

13. Reconnect harness connector X225.

14. Disconnect the F105 Passenger instrument panel air bag harness connector X1.

15. Vehicle in Service Mode.

16. Test for less than 11 V between the control circuit terminals listed below and ground:

- Terminal 1
- Terminal 2

- Terminal 3
- Terminal 4

If 11 V or greater

Repair the short to voltage on the circuit.

If less than 11 V

17. Vehicle OFF.
18. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
 - Terminal 1
 - Terminal 2
 - Terminal 3
 - Terminal 4

If 25 Ω or less

Repair the short to ground on the circuit.

If greater than 25 Ω

19. Vehicle OFF.
20. Test for less than 5 Ω between the control circuit terminals listed below:
 - X225 control circuit terminal 1 and F105 Passenger Instrument Panel air bag harness connector control circuit terminal 1 X1
 - X225 control circuit terminal 2 and F105 Passenger instrument panel air bag harness connector control circuit terminal 2 X1
 - X225 control circuit terminal 3 and F105 Passenger instrument panel air bag harness connector control circuit terminal 3 X1
 - X225 control circuit terminal 4 and F105 Passenger instrument panel air bag harness connector control circuit terminal 4 X1

If greater than 5 Ω

Repair the open/high resistance in the circuit.

If less than 5 Ω

21. Replace the F105 passenger instrument panel air bag.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B0052 00: Deployment Commanded Malfunction

DTC B0052 56: Deployment Commanded Too Many Transitions

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) senses vehicle impacts and provides deployment signals to the air bags and anchor and/or retractor pretensioners when warranted. The SDM sets DTC B0052 after each command for deployment. DTC B0052 will latch and not clear until after 3 commanded deployments by the SDM. And therefore the SDM has to be replaced using end of life disposal procedure.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

- The SDM detects a frontal impact of sufficient force to warrant deployment of the frontal air bags.
- The SDM detects a side impact or rollover (if equipped) of sufficient force to warrant deployment of a seat side air bag and/or roof rail air bag.

Action Taken When the DTC Sets

The SDM requests the instrument cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- DTC B0052 00 is a clearable DTC and may be cleared with a scan tool without replacing the SDM.
- DTC B0052 56 is a latched DTC. The DTC cannot be cleared with the scan tool. Replacement of the SDM is required.

DTC B0084 39: Right Front Impact Sensor Internal Electronic Failure

DTC B0084A 3A: Right Front Impact Sensor Incorrect Component Installed

DTC B0084 71: Right Front Impact Sensor Invalid Serial Data Received

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
---------	-----------------	----------------------	------------------	--------------------

Left Front Impact Sensor High Signal	B0083 02	B0083 05	B0083 05	B0083 3A
Left Front Impact Sensor Low Reference	B0083 02	B0083 05	B0083 05	B0083 3A
Right Front Impact Sensor High Signal	B0084 02	B0084 05	B0084 05	B0084 3A
Right Front Impact Sensor Low Signal	B0084 02	B0084 05	B0084 05	B0084 3A

[Circuit/System Description](#)

The impact sensors are equipped on vehicles to supplement the supplemental inflatable restraint (SIR) system performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the sensing and diagnostic module (SDM). The impact sensors can assist in determining the severity of some frontal and side collisions. The SDM uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the SDM determines a deployment is warranted, the SDM will cause current to flow through the deployment loops deploying the air bags.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

Any of the following conditions exist for 10 seconds:

B0083 02, B0084 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0083 05, B0084 05

- The sensor circuit is open.
- The SDM has not received a message from the sensor for greater than 375 milliseconds.

B0083 39, B0084 39

- The SDM has received a Not OK message from the sensor.
- The SDM has not received a message.

B0083 3A, B0084 3A

- The SDM has received identification message from the sensor, which does not match the identification stored in the SDM memory.

- The SDM has reset the impact sensor twice without detecting the correct identification message.

B0083 71, B0084 71

The SDM has received invalid serial data from the sensor.

[Action Taken When the DTC Sets](#)

The SDM requests the instrument panel cluster to illuminate the AIR BAG indicator.

[Conditions for Clearing the DTC](#)

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

[Circuit/System Verification](#)

Note: Refer to [SIR Service Precautions](#) .

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Front impact sensor
- Side impact sensor
- SDM
- Front impact sensor wiring harness connector
- Side impact sensor wiring harness connector
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Vehicle in Service Mode. With a scan tool, verify that DTC B0083 or B0084 symptom byte 39 or 71 is not set as current.
If DTC B0083 or B0084 symptom byte 39 or 71 is set as current
Replace the appropriate B59 impact sensor.
If DTC B0083 or B0084 symptom byte 39 or 71 is not set as current
2. Verify that DTC B00083 or B0084 symptom byte 3A is not set as current.
If DTC B00083 or B0084 symptom byte 3A is set as current
Replace the incorrect B59 front impact sensor
If DTC B00083 or B0084 symptom byte 3A is not set as current
3. Verify that DTC B0083 or B0084 symptom byte 02 or 05 is not set as current.
If DTC B0083 or B0084 symptom byte 02 or 05 is set as current
Refer to Circuit/System Testing.
If DTC B0083 or B0084 symptom byte 02 or 05 is not set as current
4. All OK.

[Circuit/System Testing](#)

1. Vehicle OFF. Disconnect the harness connector at the appropriate B59 impact sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

If 10 Ω or greater

- 2.1. Vehicle OFF, disconnect the X2 harness connector at the K36 SDM.
- 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.

If less than 10 Ω

3. Vehicle in Service Mode.
4. Test for less than 11 V between the signal circuit terminal 1 and ground.

If 11 V or greater

- 4.1. Vehicle OFF. Disconnect the X2 harness connector at the K36 SDM. Vehicle in Service Mode.
- 4.2. Test for less than 1 V between the signal circuit terminal 1 and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 1 V

5. Vehicle OFF. Test for greater than 50k Ω between the signal circuit terminal 1 and ground.

If 50k Ω or less

- 5.1. Disconnect the X2 harness connector at the K36 SDM.
- 5.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the K36 SDM.

If greater than 50k Ω

6. Disconnect the X2 harness connector at the SDM.
7. Test for less than 2 Ω between the signal circuit end to end from the B59 front impact sensor terminal 1 and the K36 SDM terminal listed below:
 - Right front impact sensor terminal 26 X2
 - Left front impact sensor terminal 23 X2

If 2 Ω or greater

8. Repair the short to voltage or an open/high resistance in the circuit.

If less than 2 Ω

9. Verify that the K36 SDM calibrations match the VIN data, software part number, and calibration part number.

If the K36 SDM calibrations do not match the VIN data

Program the K36 SDM, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

If the K36 SDM calibrations match the VIN data

10. Replace the B59 front impact sensor.
11. Operate the vehicle under the conditions for setting the DTC. The DTC should not be set.

If the DTC sets

Replace the K36 SDM

If the DTC does not set

12. All OK.

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the supplemental inflatable restraint (SIR) system performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the sensing and diagnostic module (SDM). The impact sensors can assist in determining the severity of some frontal and side collisions. The SDM uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the SDM determines a deployment is warranted, the SDM will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0085 02, B0088 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0085 05, B0088 05

- The sensor circuit is open.
- The SDM has not received a message from the sensor for greater than 375 milliseconds.

B0085 39, B0088 39

- The SDM has received a Not OK message from the sensor.
- The SDM has not received a message.

B0085 3A, B0088 3A

- The SDM has received identification message from the sensor, which does not match the identification stored in the SDM memory.

- The SDM has reset the impact sensor twice without detecting the correct identification message.

B0085 71, B0088 71

The SDM has received invalid serial data from the sensor.

[Action Taken When the DTC Sets](#)

The SDM requests the instrument panel cluster to illuminate the AIR BAG indicator.

[Conditions for Clearing the DTC](#)

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

- [Testing for Intermittent Conditions and Poor Connections](#)
- [Connector Repairs](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Circuit/System Verification](#)

Note: Refer to [SIR Service Precautions](#)

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- Side impact sensor
- SDM
- Front impact sensor wiring harness connector
- Side impact sensor wiring harness connector
- SDM wiring harness connector

Note: The connector and connector position assurance (CPA) may seat independently of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify that DTC B0085 or B0088 symptom byte 39 or 71 is not set as current.

If DTC B0085 or B0088 symptom byte 39 or 71 is set as current

Replace the sensor listed below:

- B0085 - B63LF side impact sensor-left front
- B0088 - B63RR side impact sensor-right rear

If DTC B0085 or B0088 symptom byte 39 or 71 is not set as current

2. Verify that DTC B0085 or B0088 symptom byte 3A is not set as current.

If DTC B0085 or B0088 symptom byte 3A is set as current

Replace the incorrect B63 side impact sensor

If DTC B0085 or B0088 symptom byte 3A is not set as current

3. Verify that DTC B0085 or B0088 symptom byte 02 or 05 is set as current.

If only DTC B0085 symptom byte 02 or 05 is set as current

Refer to Circuit/System Testing - Only DTC B0085 or B0088 is set.

If only DTC B0088 symptom byte 02 or 05 is set as current

Refer to Circuit/System Testing - Only DTC B0085 or B0088 is set.

If both DTC B0085 or B0088 symptom byte 02 or 05 is set as current

Refer to Circuit/System Testing - Both DTC B0085 and B0088 are set.

If DTC B0085 or B0088 symptom byte 02 or 05 is not set as current

4. All OK.

Circuit/System Testing

Note: The signal circuit is shared at the K36 SDM between the B63LF side impact sensor left front and the B63RR side impact sensor right rear (DTC B0085 and DTC B0088). Therefore a short to ground or short to voltage in either of these signal circuits can set a DTC for both circuits, and an open in either circuit should only set its corresponding DTC.

Only DTC B0085 or B0088 is set

1. Vehicle OFF, disconnect the harness connector at the appropriate B63 side impact sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

If 10 Ω or greater

- 2.1. Disconnect the X2 harness connector at the K36 SDM.
- 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.

If less than 10 Ω

3. Disconnect the X2 harness connector at the K36 SDM.
4. Test for less than 2 Ω between the signal circuit terminal 1 at the B63 side impact sensor and the K36 SDM terminal listed below:
 - Left front signal terminal 19 X2
 - Right rear signal terminal 30 X2

If 2 Ω or greater

Repair the open/high resistance in the circuit.

If less than 2 Ω

5. Verify that the K36 SDM calibrations match the VIN data, software part number, and calibration part number.

If the K36 SDM calibrations do not match the VIN data

Program the K36 SDM, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

If the K36 SDM calibrations match the VIN data

6. Replace the B63 side impact sensor.
7. Verify the DTC does not set.

If the DTC sets

Replace the K36 SDM.

If the DTC does not set

8. All OK

Both DTC B0085 and B0088 are set

1. Vehicle OFF. Disconnect the X2 harness connector at the K36 SDM. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 1 V between the signal circuit terminals listed below and ground:
 - Left front signal circuit - terminal 19 X2
 - Right rear signal circuit - terminal 30 X2

If 1 V or greater

 - 2.1. Disconnect the harness connector at the B63 side impact sensor that failed the test.
 - 2.2. Test for less than 1 V between signal circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the B63 side impact sensor.

If less than 1 V
3. Test for greater than 50k Ω between each signal circuit listed below and ground:
 - Left front signal circuit - terminal 19 X2
 - Right rear signal circuit - terminal 30 X2

If 50k Ω or less

 - 3.1. Disconnect the harness connector at the B63 side impact sensor that failed the test.
 - 3.2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B63 side impact sensor.

If greater than 50k Ω
4. Verify that the K36 SDM calibrations match the VIN data, software part number, and calibration part number.

If the K36 SDM calibrations do not match the VIN data

Program the K36 SDM, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

If the K36 SDM calibrations match the VIN data
5. Replace the K36 SDM.

DTC Descriptors

DTC B0098 02: Passenger Air Bag Disable Switch Circuit Short Circuit to Ground

DTC B0098 05: Passenger Air Bag Disable Switch Circuit High Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag Disable Switch Signal	B0098 02	B0098 05	B0098 05	-
Passenger Air Bag Disable Switch Ground	-	B0098 05	B0098 05	--

Circuit/System Description

When the ignition switch is turned to ON, the sensing and diagnostic module (SDM) will perform turn-on test to diagnose critical malfunctions within SDM itself. The SDM continuously checks the disable switch position switch and circuit defect by letting the regular voltage flow through the disable switch circuit and verifying the current.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0098 02

The SDM detects a short to ground in the passenger air bag disable switch signal circuit.

B0098 05

The SDM detects a short to voltage or an open/high resistance in the passenger air bag disable switch signal circuit or the passenger air bag disable switch ground circuit.

Action Taken When the DTC Sets

The SDM will ignore the signal from the passenger air bag disable switch and will continuously enable the passenger air bag.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

Observe the scan tool Passenger Air Bag Disabled Switch parameter while commanding the passenger air bag ON and OFF by using the S40 passenger air bag disable switch. The value should change between On and Off

Circuit/System Testing

1. Vehicle OFF.
2. Disconnect the harness connector at the S40 passenger air bag disable switch.
3. Test for less than 30 Ω between the low reference circuit terminal 3 and ground.
If 30 Ω or greater
 - 3.1. Ignition OFF, disconnect the X1 harness connector at the K36 SDM.
 - 3.2. Test for less than 2 Ω in the S40 passenger air bag disable switch ground circuit end to end.
If 2 Ω or greater, replace the coil or repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.***If less than 30 Ω***
4. Vehicle in Service Mode, test for 4.75-5.25 V between the signal circuit terminal 1 and ground.
If less than 4.75 V
 - 4.1. Disconnect the X1 harness connector at the K36 SDM.
 - 4.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
 - 4.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.***If greater than 5.25 V***
 - 4.1. Vehicle OFF.
 - 4.2. Disconnect the X1 harness connector at the K36 SDM.
 - 4.3. Ignition ON.
 - 4.4. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.***If between 4.75-5.25 V***
5. Replace the S40 passenger air bag disable switch.

Component Testing

1. Disconnect the harness connector at the S40 passenger air bag disable switch.
2. With the switch open, test for 380-420 Ω between the signal terminal 1 and the ground terminal 3.
If not between 380-420 Ω
Replace the S40 passenger air bag disable switch.
If between 380-420 Ω
3. With the switch closed, test for 95-105 Ω , between the signal terminal 1 and the ground terminal 3.
If not between 95-105 Ω
Replace the S40 passenger air bag disable switch.
If between 95-105 Ω
4. All OK.

Passenger Air Bag Disable Indicator Ground	-	B067F 04, B0680 04	1	--

[Circuit/System Description](#)

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag.

When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the inflatable restraint sensing and diagnostic module (SDM) receives the appropriate serial data message from the passenger presence module the SDM will then provide voltage to the appropriate indicator.

Conditions for Running the DTC

- The Vehicle is in Service mode
- Ignition Voltage is between 9-16 V

Conditions for Setting the DTC

The SDM detects improper voltage on the control circuit of the passenger air bag ON or OFF indicator

Actions Taken When the DTC Sets

Passenger air bag ON and OFF indicators are disabled.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

[Circuit/System Verification](#)

Note: The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.

1. Vehicle in Service Mode.
2. With a scan tool command the passenger air bag ON indicator and passenger air bag OFF indicator ON and OFF. The respective indicators should turn ON and OFF as commanded.

[Circuit/System Testing](#)

Note: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- Passenger air bag disable on/off indicator.
- Passenger air bag disable on/off indicator wiring harness.

1. Vehicle OFF, disconnect the harness connector at the P14 passenger air bag disable indicator. Test for less than 10 Ω between the ground circuit terminal 2 and ground.

If 10 Ω or greater

Repair the open/high resistance in the circuit.

If less than 10 Ω

2. Vehicle in Service Mode, with a scan tool, command the passenger air bag OFF indicator OFF. Test for less than 11 V between the control circuit terminal 3 and ground.

If 11 V or greater

2.1. Vehicle OFF.

2.2. Disconnect the X1 harness connector at the K36 SDM.

2.3. Vehicle in Service Mode.

2.4. Test for less than 1 V between the control circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K36 SDM.

If less than 11 V

3. With a scan tool, command the passenger air bag OFF indicator ON. Test for greater than 4 V between the control circuit terminal 3 and ground.

If 4 V or less

3.1. Disconnect the X1 harness connector at the K36 SDM. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

- 3.2. Test for less than 2 Ω in each control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.

If greater than 4 V

4. With a scan tool, command the passenger air bag ON indicator OFF. Test for less than 11 V between the control circuit terminal 1 and ground.

If 11 V or greater

- 4.1. Vehicle OFF.
- 4.2. Disconnect the X1 harness connector at the K36 SDM.
- 4.3. Vehicle in Service Mode.
- 4.4. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 11 V

5. With a scan tool, command the passenger air bag ON indicator ON. Test for greater than 4 V between the control circuit terminal 1 and ground.

If 4 V or less

- 5.1. Disconnect the X1 harness connector at the K36 SDM.
- 5.2. Test for infinite resistance between the control circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
- 5.3. Test for less than 2 Ω in each control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.

If greater than 4 V

6. Replace the P14 passenger air bag disable indicator.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Inflatable Restraint Instrument Panel Module Indicator Replacement](#)
- [Control Module References](#) for K36 SDM replacement, programming and setup

DTC B1001

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category

[DTC Descriptor](#)

DTC B1001 00: Option Configuration

[Circuit/System Description](#)

The inflatable restraint sensing and diagnostic module (SDM) stores a primary data key, which is a 4-digit number. When the ignition is turned ON, the SDM compares this information to the information stored in the body control module (BCM) via the serial data. If there is a mismatch between the information stored in the SDM and BCM, DTC B1001 will set.

[Conditions for Running the DTC](#)

System voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

The 4-digit Primary Data Key stored in the SDM does not match the 4 digits stored in the BCM.

[Action Taken When the DTC Sets](#)

- The SDM requests the instrument cluster to illuminate the AIR BAG indicator.
- The SDM disables all deployments.

[Conditions for Clearing the DTC](#)

The last 4-digit Primary Data Key in the SDM matches the last 4 digits stored in the BCM.

Diagnostic Aids

This DTC is an indication that an incorrect SDM is installed in the vehicle, or that the SDM and/or the BCM was replaced without reprogramming the BCM with the new information.

DTC B1019

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B1019 00: System Configuration Error

[Circuit/System Description](#)

The inflatable restraint sensing and diagnostic module (SDM) monitors the number of safety components installed on the vehicle. When the ignition is turned ON, the SDM evaluates the number of safety components installed and compares it to the number of components the SDM expects to see on the vehicle with its current calibration. If there is a mismatch between detected components and the components programmed with the SDM calibration, DTC B1019 will set. The components (if equipped) that the SDM will detect include inflatable restraint deployment loops, impact sensors, passenger presence system components, seat position sensors, disable switches, and seat belt switches.

[Conditions for Running the DTC](#)

Ignition voltage is between 9-16 V.

[Conditions for Setting the DTC](#)

The setup for the SDM has not been completed and the SDM does not detect the correct number of sensors or deployment loops than is expected with this calibration.

[Action Taken When the DTC Sets](#)

- The SDM requests the instrument cluster to illuminate the AIR BAG warning indicator.
- The DTC must be cleared before running the setup SDM.

- Air bag indicator will continue to flash until SDM setup procedure is complete.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

The SDM scan tool deployment loop and impact sensor data will match what the SDM has been programmed to expect to see on the vehicle. B1019 DTC will set if a deployment loop or impact sensor is added or removed from the system.

DTC B1019 will set when an open/high resistance DTC sets for a deployment loop or impact sensor. This causes mismatch between the learned and actual components connected to the SDM.

DTC B1019 can set with no other DTCs if an unused deployment loop or impact sensor circuit is shorted to ground. This causes a mismatch between the learned and actual components connected to the SDM.

- [Testing for Intermittent Conditions and Poor Connections](#)
- [Connector Repairs](#)

- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Note: DTC B1019 can set after SDM has been replaced and/or reprogrammed before the setup procedure is completed. The setup procedure cannot be completed if DTC B1019 is set as current or history. If a short or open is detected in a deployment circuit prior to the setup procedure being performed the SDM will set DTC B1019.

1. Vehicle in Service Mode.
2. Verify no other SDM DTCs are set.
If other SDM DTCs are set
Diagnose those DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
If no other SDM DTCs are set
3. Observe the SDM impact sensor configuration scan tool data list using the scan tool. Verify that the impact sensors called out in the scan tool data list match the number of actual impact sensors the vehicle is built with.
If the number of impact sensors do not match
Verify the correct SDM calibration file is loaded in the SDM.
If the SDM calibration file is correct, the vehicle contains less/more sensors than it is supposed to. Modify the vehicle to match the SDM impact sensor calibration scan tool data list.
If the number of impact sensors match
4. Observe the SDM enabled deployment loop configuration scan tool data list using the scan tool. Verify that the enabled deployment loops called out in the scan tool data list match the deployment loops the vehicle is built with.
If the number of enabled deployment loops do not match
Verify the correct SDM calibration file is loaded in the SDM.
If the SDM calibration file is correct, modify the vehicle to match the SDM enabled deployment loop calibration scan tool data list.
If the number of enabled deployment loops match
5. Replace the K36 SDM.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [SIR/SRS Wiring Repairs](#)
- [Control Module References](#) for SDM replacement, programming and setup

Symptoms - SIR

Note: Complete the following steps before using the symptom tables:

1. Perform [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The inflatable restraint sensing and diagnostic module (SDM) can communicate via the serial data link.
2. Review the SIR system description and operation in order to familiarise yourself with the system functions. Refer to [SIR System Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the SIR system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Air Bag Indicator Circuit Malfunction](#) : [Driver](#) → [Passenger](#) in order to diagnose the symptom.

Air Bag Indicator Circuit Malfunction - Passenger

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag OFF Indicator Control	2	2*	4	-
Passenger Air Bag ON Indicator Control	3	3*	5	-
Passenger Air Bag Disable Indicator Ground	--	1	1	--

1. Both indicators always OFF

2. The OFF indicator will not illuminate

3. The ON indicator will not illuminate

4. The OFF indicator always ON

5. The ON indicator always ON

* High resistance may cause the appropriate indicator to illuminate less bright than normal

[Circuit/System Description](#)

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the inflatable restraint sensing and diagnostic module (SDM) receives the appropriate serial data message from the passenger presence module the SDM will then provide voltage to the appropriate indicator.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Note: The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.

1. Vehicle in Service Mode.
2. With a scan tool command the passenger air bag ON indicator and passenger air bag OFF indicator ON and OFF. The respective indicators should turn ON and OFF as commanded.

[Circuit/System Testing](#)

Note: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- Passenger air bag disable on/off indicator.
- Passenger air bag disable on/off indicator wiring harness.

1. Vehicle OFF.

2. Disconnect the harness connector at the P14 passenger air bag disable indicator.
3. Test for less than 10 Ω between the ground circuit terminal 2 and ground.

If 10 Ω or greater

Repair the open/high resistance in the circuit.

If less than 10 Ω

4. Vehicle in Service Mode.
5. With a scan tool, command the passenger air bag OFF indicator OFF.
6. Test for less than 11 V between the control circuit terminal 3 and ground.

If 11 V or greater

- 6.1. Vehicle OFF.
- 6.2. Disconnect the X1 harness connector at the K36 SDM.
- 6.3. Vehicle in Service Mode.
- 6.4. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 11 V

7. With a scan tool, command the passenger air bag OFF indicator ON.
8. Test for greater than 4 V between the control circuit terminal 3 and ground.

If 4 V or less

- 8.1. Disconnect the harness connector at the K36 SDM.
- 8.2. Test for infinite resistance between the control circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
- 8.3. Test for less than 2 Ω in each control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K36 SDM.

If greater than 4 V

9. With a scan tool, command the passenger air bag ON indicator OFF.
10. Test for less than 11 V between the control circuit terminal 1 and ground.

If 11 V or greater

- 10.1. Vehicle OFF.
- 10.2. Disconnect the X1 harness connector at the K36 SDM.
- 10.3. Vehicle in Service Mode.
- 10.4. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K36 SDM.

If less than 11 V

11. With a scan tool, command the passenger air bag ON indicator ON.

12. Test for greater than 4 V between the control circuit terminal 1 and ground.

If 4 V or less

12.1. Disconnect the harness connector at the K36 SDM.

12.2. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

12.3. Test for less than 2 Ω in each control circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K36 SDM.

If greater than 4 V

13. Replace the P14 passenger air bag disable indicator.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Inflatable Restraint Instrument Panel Module Indicator Replacement](#)
- [Control Module References](#) for K36 SDM replacement, programming and setup

Air Bag Indicator Circuit Malfunction - Driver

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

With the Vehicle in Service Mode, during the bulb check, the driver air bag indicator will flash, and then turn OFF after the bulb check. The inflatable restraint sensing and diagnostic module (SDM) performs diagnostic tests on the SIR system during the bulb check. If any malfunction exists the SDM will request the instrument cluster to illuminate the air bag indicator steady, via serial data. If a preexisting malfunction exists, the air bag indicator will illuminate steady immediately after the ignition is turned ON. If the ignition 1 voltage is outside of the normal operating voltage range of 9-16 V, the SDM will command the instrument cluster to illuminate the air bag indicator ON, even with no DTCs present, and then disable all deployment loops.

[Diagnostic Aids](#)

- A DTC B1370 may set if the ignition 1 circuit is outside the 9-16 V range.
- A flashing driver air bag indicator is displayed if the inflatable restraint sensing and diagnostic module was programmed but did not fully complete the programming. For a flashing driver airbag indicator, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

If the driver air bag indicator is flashing, refer to [Inflatable Restraint Sensing and Diagnostic Module Programming and Setup](#) .

[Circuit/System Testing](#)

1. Vehicle in Service Mode. With a scan tool, verify SDM DTCs are not set.

If SDM DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If SDM DTCs are not set

2. With a scan tool command the Instrument Cluster to turn all instrument cluster indicators ON and OFF. The air bag indicator should turn ON and OFF as commanded.

If air bag indicator does not turn on or off

If the air bag indicator does not turn ON and OFF as expected, replace the P16 instrument cluster.

If air bag indicator does turn on or off

3. Replace the K36 SDM.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [SIR/SRS Wiring Repairs](#)
- [Control Module References](#) for instrument cluster or SDM replacement, programming and setup

SIR Disabling and Enabling

SIR component location affects how a vehicle should be serviced. There are parts of the SIR system installed in various locations around a vehicle. To find the location of the SIR components refer to [SIR Identification Views](#) .

There are several reasons for disabling the SIR system, such as repairs to the SIR system or servicing a component near or attached to an SIR component. There are several ways to disable the SIR system depending on what type of service is being performed. The following information covers the proper procedures for disabling/enabling the SIR system.

Condition	Action
If the vehicle was involved in an accident with an air bag deployment.	Disconnect the negative battery cable(s)
When performing SIR diagnostics.	Follow the appropriate SIR service manual diagnostic procedure(s) *
When moving, removing or replacing an SIR component or a component attached to an SIR component. (Anytime you remove fasteners.)	Disconnect the negative battery cable(s) *
If the vehicle is suspected of having shorted electrical wires.	Disconnect the negative battery cable(s) *
When performing electrical diagnosis on components other than the SIR system.	Remove the SIR/Airbag fuse(s) when indicated by the diagnostic procedure to disable the SIR system
* DTCs will be lost when the negative battery cable is disconnected.	

SIR Service Precautions

Warning: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Failure to observe the correct procedure could cause deployment of the SIR components. Serious injury can occur. Failure to observe the correct procedure could also result in unnecessary SIR system repairs.

The inflatable restraint sensing and diagnostic module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the air bags if the SDM loses battery power during a collision. Deployment power is available for as much as 1 minute after disconnecting the vehicle power. Waiting 1 minute before working on the system after disabling the SIR system prevents deployment of the air bags from the reserved energy supply.

General Service Instructions

The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 65°C (149°F).

- Verify the correct replacement part number. Do not substitute a component from a different vehicle.
- Use only original GM replacement parts available from your authorised GM dealer. Do not use salvaged parts for repairs to the SIR system.

Discard any of the following components if it has been dropped from a height of 92 cm (3 feet) or greater:

- Inflatable restraint sensing and diagnostic module (SDM)
- Any air bag
- Driver steering wheel air bag coil
- Any impact sensor
- Seat belt anchor and/or retractor pretensioners
- Passenger presence module and/or occupant sensor

Disabling Procedure - Air Bag Fuse

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Vehicle OFF.

Note: The SDM may have more than one fused power input. To ensure there is no unwanted SIR deployment, personal injury, or unnecessary SIR system repairs, remove all fuses supplying power to the SDM. With all SDM fuses removed and the ignition switch in the ON position, the AIR BAG warning indicator illuminates. This is normal operation, and does not indicate a SIR system malfunction.

3. Locate and remove the fuse(s) supplying power to the SDM. Refer to [SIR Schematics](#) or [Electrical Centre Identification Views](#) .
4. Wait 1 minute before working on the system.

Enabling Procedure - Air Bag Fuse

1. Vehicle OFF.
2. Install the fuse(s) supplying power to the SDM. Refer to [SIR Schematics](#) or [Electrical Centre Identification Views](#) .
3. Vehicle in Service Mode. The AIR BAG indicator will flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to [Diagnostic System Check - Vehicle](#) .

Disabling Procedure - Negative Battery Cable

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Vehicle OFF.
3. Disconnect the negative battery cable from the battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .
4. Wait 1 minute before working on system.

Enabling Procedure - Negative Battery Cable

1. Vehicle OFF.
2. Connect the negative battery cable to the battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Vehicle in Service Mode. The AIR BAG indicator will flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to [Diagnostic System Check - Vehicle](#) .

SIR Service Precautions

[General Service Instructions](#)

Warning: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

Note: The inflatable restraint sensing and diagnostic module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the SIR air bags. Deployment power may be available for up to 60 seconds after disconnecting the vehicle power. Disabling the SIR system prevents deployment of the SIR air bags from the reserved energy supply.

Note: The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 65°C (149°F)
- Verify the correct replacement part number. Do not substitute a component from a different vehicle
- Use only original GM replacement parts available from your authorised GM dealer. Do not use salvaged parts for repairs to the SIR system

Note: Discard any of the following components if it has been dropped from a height of 92 cm (3 ft) or greater:

- SDM
- Passenger instrument panel air bag
- Driver steering wheel air bag
- Driver steering wheel air bag coil
- Roof rail air bags
- Front and /or side impact sensors
- Seat belt anchor and/or retractor pretensioners
- Front seat side air bag

Front End Inflatable Restraint Discriminating Sensor Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedures	
1. Disable the supplemental inflatable restraint (SIR) system. Refer to SIR Disabling and Enabling .	

2. Remove the front sight shield. Refer to [Front Compartment Front Sight Shield Replacement](#) : [Volt](#) → [Ampera](#) .

1	<p>Inflatable Restraint Front End Sensor Adaptor Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Inflatable Restraint Front End Discriminating Sensor Nut</p> <p>Tighten 9 N·m (80 lb in)</p>
3	<p>Inflatable Restraint Front End Discriminating Sensor Bracket (Qty: 2)</p>
4	<p>Inflatable Restraint Front End Discriminating Sensor Assembly (Qty: 2)</p> <p>Procedure</p> <ol style="list-style-type: none">1. Loosen the bolts and slide the sensor out of the keyhole slots.2. The bolts are integral to the sensor assembly and DO NOT remove separately. <p>Tighten 7.5 N·m (66 lb in)</p>

Inflatable Restraint Side Impact Sensor Replacement

Callout

Component Name

Warning: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

Warning: Do not strike or jolt the inflatable restraint side impact sensor (SIS). Before applying power to the SIS make sure that it is securely fastened. Failure to observe the correct installation procedures could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

Preliminary Procedures

1. Disable the supplemental inflatable restraint (SIR) system. Refer to [SIR Disabling and Enabling](#) .
2. Remove the front side door trim panel. Refer to [Front Side Door Trim Replacement](#) .

Inflatable Restraint Side Impact Sensor Assembly

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

1

1. Loosen the fasteners and slide the sensor out of the keyhole slots.
2. The bolts are integral to the sensor assembly, DO NOT remove separately.

Tip

The sensor is located on the inside of the front door inner panel.

Tighten

7.5 N·m (66 lb in)

Inflatable Restraint Sensing and Diagnostic Module Replacement

Callout

Component Name

Warning: Do not strike or jolt the inflatable restraint sensing and diagnostic module (SDM). Before applying power to the SDM, make sure that it is securely fastened with the arrow facing toward the front of the vehicle. Failure to observe the correct installation procedure could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

Warning: Refer to [SIR Warning](#) in the Preface section.

Preliminary Procedures

1. Disable the supplemental inflatable restraint (SIR) system. Refer to [SIR Disabling and Enabling](#) .
2. Remove the console. Refer to [Front Floor Console Replacement](#) .
3. Disconnect the electrical connector.

1	Inflatable Restraint Sensing and Diagnostic Module Fastener (Qty: 3) Caution: Refer to Fastener Caution in the Preface section. Tighten 10 N·m (89 lb in)
2	Inflatable Restraint Diagnostic Energy Reserve Module Fastener Tape Note: This foil tape should be installed on the top of the SDM module whenever you are installing a replacement SDM module that was equipped with foil tape.
3	Inflatable Restraint Sensing and Diagnostic Module Assembly Note: <ul style="list-style-type: none">• When installing, ensure the arrow on the module is pointed towards the front of the vehicle.• If installing a replacement module, program the module. Refer to Control Module References .

Steering Wheel Inflatable Restraint Module Replacement

[Removal Procedure](#)

Warning: Refer to [SIR Inflator Module Handling and Storage Warning](#) in the Preface section.

Warning: When carrying a live inflator module, make sure the bag opening is pointed away from you. This minimises the chance of injury in the case of an accidental deployment. Never carry the inflator module by the wires. Never carry the inflator module by the connector on the underside of the module.

Make sure that the bag and trim cover are facing up whenever you place a live inflator module on any surface. This is necessary to provide a free space for the bag to expand in the unlikely event of accidental deployment.

Never rest the steering column assembly on the steering wheel with the inflator module face down, and the column vertical. This may result in personal injury.

Warning: Refer to [SIR Warning](#) in the Preface section.

1. Disable the supplemental inflatable restraint (SIR) system. Refer to [SIR Disabling and Enabling](#) .
2. Turn steering wheel 180 degrees to access holes (2).
3. Insert suitable tools to the openings (2) on both sides of the steering wheel (1).
4. Release the springs in direction of the arrows.
5. Release the connector position assurance (CPA) retainer.
6. Disconnect the electrical connectors.

[Installation Procedure](#)

1. Connect the electrical connectors (1).

2. Align the steering wheel module fasteners to the steering column fastener holes.
3. Push the steering wheel module (1) firmly into the steering column in order to engage the fasteners.
4. Enable the SIR system. Refer to [SIR Disabling and Enabling](#) .
5. After replacing the module, fully deploy the old module before disposal. If the module was replaced under warranty, fully deploy and dispose of the module after the required retention period. Refer to [Inflatable Restraint Module Handling and Scrapping](#) .

Steering Wheel Airbag Coil Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the steering wheel. Refer to [Steering Wheel Replacement](#) .
2. Remove the steering column upper trim cover. Refer to [Steering Column Upper Trim Cover Replacement](#) .
3. Remove the steering column lower trim cover. Refer to [Steering Column Lower Trim Cover Replacement](#) .

1	<p>Steering Wheel Inflatable Restraint Module Coil Bolt (Qty: 4)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 1.5 N·m(13 lb in)</p>
2	<p>Steering Wheel Inflatable Restraint Module Coil</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect any electrical connectors as necessary.2. Use tape in order to secure the old coil in the centre position.3. Remove the old coil from the steering column.4. Transfer the steering angle sensor. Refer to Steering Angle Sensor Replacement .5. Ensure the coil is centred during installation. If you are installing a NEW coil, ensure the centring tab is on the coil. If the coil is not centred, refer to Inflatable Restraint Steering Wheel Module Coil Centring .

Inflatable Restraint Steering Wheel Module Coil Centring

Caution: The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.

1. Verify the following conditions before centring the supplemental inflatable restraint (SIR) steering wheel module coil:
 - The wheels on the vehicle are straight ahead.
 - The centring mark (1) of the steering shaft is in the 6 o'clock position.

2. Turn the lobe of the clock spring clockwise until the coil ribbon stops. Do not force.
3. Turn the lobe of the clock spring counterclockwise approximately 3 turns to the Neutral position.

4. Properly align until the centring window turns yellow (1). This indicates the CENTER position.

Instrument Panel Inflatable Restraint Module Replacement

Callout

Component Name

Warning: Refer to [SIR Inflator Module Handling and Storage Warning](#) in the Preface section.

Warning: Refer to [SIR Warning](#) in the Preface section.

Preliminary Procedure

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Remove the right side instrument panel upper outer trim panel. Refer to [Instrument Panel Upper Outer Trim Panel Replacement - Right Side](#) .

1	Instrument Panel Inflatable Restraint Module Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section.
2	Instrument Panel Inflatable Restraint Module Assembly Procedure <ol style="list-style-type: none">1. Ensure that the instrument panel inflatable restraint module is fully deployed before disposal. If the module was replaced under warranty, fully deploy and dispose of the module after the required retention period. Refer to Inflatable Restraint Module Handling and Scrapping .2. Enable the SIR system. Refer to SIR Disabling and Enabling . Note: The instrument upper outer trim panel must be replaced if the passenger airbag is replaced.

Inflatable Restraint Instrument Panel Lower Module Replacement - Driver Side

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedure	
Disable the SIR system. Refer to SIR Disabling and Enabling .	

1	Inflatable Restraint Instrument Panel Lower Module Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten: 9 N·m (80 lb in)
2	Inflatable Restraint Instrument Panel Lower Driver Side Module Assembly Procedure Disconnect electrical connector.

Inflatable Restraint Instrument Panel Lower Module Replacement - Passenger Side

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedures	
1. Disable the SIR system. Refer to SIR Disabling and Enabling .	

2. Remove the right side instrument panel side trim panel. Refer to [Instrument Panel Side Trim Panel Replacement](#) .
3. Remove the front side door opening floor carpet retainer. Refer to [Front Side Door Opening Floor Carpet Retainer Replacement](#) .

1	Instrument Panel Lower Airbag Fastener
2	Inflatable Restraint Instrument Panel Lower Module Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
3	Inflatable Restraint Instrument Panel Lower Passenger Side Module Assembly Procedure Slide the connector from the data link connector bracket to disconnect the electrical connector.

Driver or Passenger Seat Side Inflatable Restraint Module Replacement

Callout

Component Name

Warning: Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary:

- The seat cushion frame
- The seat recliner, if equipped
- The seat adjuster

- The seat back frame

Failure to do so may cause future personal injury.

Warning: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.

Preliminary Procedure

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. Remove the driver or passenger seat. Refer to [Driver or Passenger Seat Replacement](#) .
3. Remove the driver or passenger seat back cushion cover and pad. Refer to [Driver or Passenger Seat Back Cushion Cover and Pad Replacement](#) .

Driver or Passenger Seat Side Inflatable Restraint Module

Procedure

1

1. Remove the module out of the chute by removing it through the top opening of the chute.
2. When installing the airbag module into the seat trim cover chute, ensure there is no twisting of the chute by fitting the module studs through the chute holes for proper alignment. The chute should then be folded into the pad opening and the airbag should be secured to the seat back frame.

Inflatable Restraint Rear Side Door Side Impact Sensor Replacement

Callout

Component Name

Warning: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

Warning: Do not strike or jolt the inflatable restraint side impact sensor (SIS). Before applying power to the SIS make sure that it is securely fastened. Failure to observe the correct installation procedures could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

Preliminary Procedures

1. Disable the supplemental inflatable restraint (SIR) system. Refer to [SIR Disabling and Enabling](#) .
2. Remove the rear side door trim panel. Refer to [Rear Side Door Trim Replacement](#) .

1	<p>Inflatable Restraint Rear Side Door Impact Sensor Assembly</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Loosen the fasteners and slide sensor out of key hole slots.2. The bolts are integral to the sensor assembly, DO NOT remove separately. <p>Tip The sensor is located on the inside of the rear door inner panel.</p> <p>Tighten 7.5 N·m (66 lb in)</p>
---	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Inflatable Restraint Instrument Panel Module Indicator Replacement

Callout	Component Name
Preliminary Procedure	
Remove the roof console. Refer to Roof Console Replacement .	
	Inflatable Restraint Instrument Panel Module Indicator Assembly

1

Procedure

Unsnap the indicator from the roof console bezel.

Roof Side Rail Inflatable Restraint Module Replacement

Callout

Component Name

Warning: In order to prevent SIR deployment, personal injury, or unnecessary SIR system repairs, do not strike the door or the door pillar in the area of the side impact sensor (SIS). Turn OFF the ignition and remove the key when performing service in the area of the SIS.

Warning: When installing the roof rail airbag, do not twist or turn the airbag 360 degrees. Securing the roof rail airbag with an airbag twisted or turned 360 degrees may cause the airbag not to deploy correctly and could cause personal injury.

Warning: Refer to [SIR Warning](#) in the Preface section.

Warning: Refer to [SIR Inflator Module Handling and Storage Warning](#) in the Preface section.

Preliminary Procedures

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .
2. It is only necessary to lower the headliner. Only do those steps in headliner replacement that will lower the headliner enough to gain access to the part. Refer to [Headlining Trim Panel Replacement](#) .

1	<p>Roof Side Rail Inflatable Restraint Module Fastener (Qty: 6)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>
2	<p>Roof Side Rail Inflatable Restraint Module Clips (Qty: 4)</p> <p>Procedure</p> <p>Press the locking tabs together to remove the clip.</p>
3	<p>Roof Side Rail Inflatable Restraint Module Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connector.2. Remove the 4 push in retainers securing the roof side rail inflatable restraint module to the vehicle.3. Remove the roof side rail inflatable restraint module from the vehicle.4. Fully deploy the module before disposal. If the module was replaced under warranty, fully deploy and dispose of the module after the required retention period. Refer to Inflatable Restraint Module Handling and Scrapping . <p>Tip The bolts and the push in fasteners are an integral part of the module and should remain with the module.</p>

Front Seat Belt Anchor Plate Tensioner Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Warning: Refer to SIR Seatbelt Pretensioner Handling Warning in the Preface section.	
Warning: In order to prevent accidental deployment and the risk of personal injury, do not dispose of an undeployed inflatable restraint seat belt pretensioner as normal shop waste. Undeployed seat belt pretensioners contain substances that could cause severe illness or personal injury if their sealed containers are damaged during disposal. Use	

the following deployment procedures to safely dispose of an undeployed seat belt pretensioner. Failure to observe the following disposal methods may be a violation of federal, state, or local laws.

Preliminary Procedures

1. Move the front seat to the full forward and full up position.
2. Disable the SIR. Refer to [SIR Disabling and Enabling](#) .
3. Remove the driver or passenger seat cushion closeout cover. Refer to [Driver or Passenger Seat Cushion Closeout Cover Replacement](#) .

1	Front Seat Belt Anchor Plate Tensioner Cover Assembly
2	Front Seat Belt Anchor Plate Tensioner Fastener Caution: Refer to Fastener Caution in the Preface section. Tighten 7.5 N·m (66 lb in)
3	Front Seat Belt Anchor Plate Tensioner Assembly Fastener Tighten 45 N·m (33 lb ft)
4	Front Seat Belt Anchor Plate Tensioner Assembly Procedure Disconnect the electrical connector.

Driver or Passenger Seat Retractor Side Belt Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Warning: Refer to SIR Inflator Module Handling and Storage Warning in the Preface section.	
Preliminary Procedures	

1. Move the front seat to a full forward and full up position.
2. Disable the SIR. Refer to [SIR Disabling and Enabling](#) .
3. Remove the centre pillar trim panel. Refer to [Centre Pillar Trim Panel Replacement](#) .

1	Driver or Passenger Seat Belt Tensioner Cover Assembly
2	<p>Driver or Passenger Seat Belt Tensioner Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 7.5 N·m (66 lb in)</p>
3	<p>Driver or Passenger Seat Shoulder Belt Fastener</p> <p>Tighten 45 N·m (33 lb ft)</p>
4	<p>Driver or Passenger Shoulder Belt Retractor Fastener</p> <p>Tighten 45 N·m (33 lb ft)</p>
5	<p>Driver or Passenger Seat Belt Push On Retainer</p> <p>Procedure</p> <p>Use a flat-bladed tool to remove locking pin in retainer.</p>
6	<p>Driver or Passenger Seat Shoulder Belt Retractor Assembly</p> <p>Procedure</p> <p>Disconnect the electrical connector.</p>

Inflatable Restraint Module Handling and Scrapping

[Live and Undeployed Air Bag](#)

Warning: Refer to [SIR Inflator Module Handling and Storage Warning](#) in the Preface section.

Take special care when handling or storing an undeployed air bag. An air bag deployment produces a rapid generation of gas. This may cause the air bag, or an object in front of the air bag, to project through the air in the event of an unlikely deployment.

[Dual Stage Air Bags](#)

Dual stage air bags have two deployment stages. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. Therefore, a deployed dual stage air bag must be treated as an active air bag. If disposal of a dual stage air bag is required, both deployment loops must be energised to deploy the air bag.

[Scrapping Procedure](#)

At the end of a vehicle's useful life, certain situations may arise which will require the disposal of a live and undeployed air bag. Do NOT dispose a live and undeployed air bag through normal disposal channels until the air bag has been deployed.

Do not deploy the air bag in the following situations:

- After replacement of an air bag under warranty--the air bag may need to be returned undeployed to the manufacturer.
- If the vehicle is the subject of a product liability claim, related to the SIR system and is subject to a preliminary investigation -- do NOT alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the air bags -- follow the instructions in the campaign service bulletin for proper SIR handling procedures.

[Deployment Procedures](#)

Note: Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.

You can only deploy the air bag inside of the vehicle.

Deployment Inside Vehicle - Vehicle Scrapping Procedure

Deploy the air bags inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes, but is not limited to, the following situations:

- The vehicle has completed all useful life.
- Irreparable damage occurred to the vehicle in a non-deployment type accident.
- Irreparable damage occurred to the vehicle during a theft.
- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN, as opposed to rebuilding as the same VIN.

Warning: Refer to [SIR Inflatable Module Deployment Outside Vehicle Warning](#) in the Preface section.

1. Lower the driver and passenger windows.
2. Turn the ignition switch to the OFF position and remove the ignition key.
3. Check that all air bags which will be deployed are mounted securely.
4. Remove all loose objects from the front seats.

Warning: A deployed dual stage inflator module will look the same whether one or both stages were used. Always assume a deployed dual stage inflator module has an active stage 2. Improper handling or servicing can activate the inflator module and cause personal injury.

5. Disconnect the steering wheel air bag yellow connector (1) from vehicle harness yellow connector (3).

Note: If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to [Component Connector End Views](#) for determining high and low circuits.

6. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
7. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

8. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. Use these wires to fabricate the driver deployment harness.
9. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
10. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the air bag.

11. Twist together the 2 connector wire leads from the high circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to [Component Connector End Views](#) in order to determine the correct circuits.
12. Inspect that the 3-wire connection is secure.
13. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.

14. Twist together the 2 connector wire leads from the low circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to [Component Connector End Views](#) in order to determine the correct circuits.
15. Inspect that the 3-wire connection is secure.
16. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
17. Connect the deployment harness to the connector on the steering wheel air bag.
18. Route the deployment harness out of the driver side of the vehicle.
19. Disconnect the yellow left roof rail harness connector from the vehicle harness connector.
20. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
21. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
22. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
23. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
24. Twist together one end from each of the wires in order to short the wires.
25. Twist together one connector wire lead to one deployment wire.
26. Secure and insulate the connection using electrical tape.
27. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
28. Connect the deployment harness to the yellow connector of the roof rail air bag.
29. Route the deployment harness out of the driver side of the vehicle.

30. Disconnect the instrument panel air bag yellow harness connector (1) from the vehicle harness connector (2).

Note: If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to [Component Connector End Views](#) for determining high and low circuits.

31. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
32. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
33. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
34. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
35. Twist together one end from each of the wires in order to short the wires.
36. Twist together the 2 connector wire leads from the high circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to [Component Connector End Views](#) in order to determine the correct circuits.
37. Inspect that the 3-wire connection is secure.
38. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
39. Twist together the 2 connector wire leads from the low circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to [Component Connector End Views](#) in order to determine the correct circuits.
40. Inspect that the 3-wire connection is secure.
41. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
42. Connect the deployment harness to the instrument panel air bag in-line connector.
43. Route the deployment harness out of the passenger side of the vehicle.
44. Disconnect the yellow harness connector to the right roof rail air bag from the vehicle harness connector.
45. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.

46. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
47. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
48. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
49. Twist together one end from each of the wires in order to short the wires.
50. Twist together one connector wire lead to one deployment wire.
51. Secure and insulate the connection using electrical tape.
52. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
53. Connect the deployment harness to the roof rail air bag yellow connector.
54. Route the deployment harness out of the passenger side of the vehicle.
55. Completely cover the windscreen and the front door window openings with a drop cloth.
56. Stretch to the full length all of the deployment harness wires on the right side of the vehicle.
57. Deploy each deployment loop one at a time.
58. Place a power source, 12 V minimum/2A minimum, such as a vehicle battery, near the shorted end of the harnesses.
59. Separate one set of wires and touch the wire ends to the power source in order to deploy the selected air bag.
60. Disconnect the deployment harness from the power source and twist the wire ends together.
61. Continue the same process with the remaining deployment harnesses.
62. Disconnect all harnesses from the vehicle.
63. Discard the harnesses.
64. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.
65. If one or all of the air bags did not deploy, remove the undeployed air bags from the vehicle.

Pretensioner Handling and Scrapping

[Scrapping Procedure](#)

During the course of a vehicle's service life, certain situations may arise which will necessitate the disposal of a live (undeployed) pretensioner. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner. Do not dispose of a live (undeployed) pretensioner through normal disposal channels until the pretensioner has been deployed. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner.

- After replacement of a pretensioner under warranty. The pretensioner may need to be returned undeployed to the original manufacturer of pretensioner.
- If the vehicle is the subject of a Product Liability report related to the SIR system and is subject to a Preliminary Investigation (GM-1241). Do not alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the pretensioners. Follow the instructions in the Campaign Service Bulletin for proper SIR handling procedures.

[Deployment Procedures](#)

Note: Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.

The pretensioner can only be deployed inside of the vehicle. Refer to [Inflatable Restraint Module Handling and Scrapping](#) for deploying the pretensioner inside vehicle under Vehicle Scrapping Procedure.

SIR System Description and Operation

[SIR System Overview](#)

The supplemental inflatable restraint (SIR) system supplements the protection offered by the seat belts. The SIR system contains an inflatable restraint sensing and diagnostic module (SDM), air bags, seat belt pretensioners (anchor and retractor), and impact sensors. The SDM determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. When the SDM detects a collision, the SDM will process the information provided by the impact sensors to further support air bag or pretensioner deployment. The SDM will deploy the air bags and pretensioners if it detects a collision of sufficient force. If the force of the impact is not sufficient to warrant air bag deployment, the SDM may still deploy the seat belt pretensioners. The SDM contains a sensing device that converts vehicle velocity changes to an electrical signal. The SDM compares these signals to values stored in memory. If the signals exceed a stored value, the SDM will determine the severity of the impact and either cause current to flow through the frontal deployment loops deploying the frontal air bags and pretensioners, or it will deploy the pretensioners only. The SDM continuously monitors the deployment loops for malfunctions and illuminates the AIR BAG indicator if a fault is detected. The SDM performs continuous diagnostic monitoring of the SIR system electrical components. Upon detection of a circuit malfunction, the SDM will set a DTC and inform the driver by illuminating the AIR BAG indicator. The steering column and knee bolsters are designed to absorb energy and compress during frontal collisions in order to limit leg movement and decrease the chance of injury to the driver and passenger.

[AIR BAG Indicator \(Driver\)](#)

The AIR BAG indicator, located in the instrument cluster, is used to notify the driver of SIR system malfunctions and to verify that the inflatable restraint sensing and diagnostic module (SDM) is communicating with the instrument cluster. When the ignition is turned ON, the SDM is supplied with ignition positive voltage. The instrument cluster will momentarily turn on the AIR BAG indicator. While the indicator is on, the SDM conducts tests on all SIR system components and circuits. If no malfunctions are detected the SDM will communicate with the instrument cluster through the serial data circuit and command the AIR BAG indicator OFF. The SDM provides continuous monitoring of the air bag circuits by conducting a sequence of checks. If a malfunction is detected the SDM will store a diagnostic trouble code (DTC) and command the instrument cluster to illuminate the AIR BAG indicator via serial data. The presence of a SIR system malfunction could result in non-deployment of the air bags or deployment in conditions less severe than intended. The AIR BAG indicator will remain ON until the malfunction has been repaired.

[Inflatable Restraint Sensing and Diagnostic Module \(SDM\)](#)

The inflatable restraint sensing and diagnostic module (SDM) is a microprocessor and the control center for the supplemental inflatable restraint (SIR) system. The SDM contains internal sensors along with external impact sensors, mounted at strategic locations on the vehicle. In the event of a collision, the SDM compares the signals from the internal and external impact sensors to a value stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the appropriate deployment loops to deploy the air bags. The SDM records the SIR system status when a deployment occurs and illuminates the AIR BAG indicator located in the instrument cluster. The SDM performs continuous diagnostic monitoring of the SIR system electrical components and circuitry when the ignition is turned ON. If the SDM detects a malfunction, a DTC will be stored and the SDM will request the instrument cluster to illuminate the AIR BAG indicator, notifying the driver that a malfunction exists. In

the event that ignition positive voltage is lost during a collision, the SDM maintains a 23-volt loop reserve for deployment of the air bags. It is important when disabling the SIR system for servicing or rescue operations to allow the 23-volt loop reserve to dissipate, which could take up to 1 minute.

[Air Bags](#)

This vehicle contains 8 air bags. The 8 air bags are located in the steering wheel (dual air bags), instrument panel (passenger side) (dual air bags), driver seat side (B-pillar), passenger seat side (B-pillar), left roof rail, right roof rail, driver knee (instrument panel), passenger knee (instrument panel). To view the locations of the air bags refer to [SIR Identification Views](#) . Air bags contain a housing, inflatable air bag, two initiating devices (if dual air bag), canister of gas generating material and, in some cases, stored compressed gas. The deployment loops supply current through the air bags to deploy the air bags. The steering wheel and passenger instrument panel air bags have two stages of deployment, which varies the amount of restraint to the occupant according to the collision severity. For moderate frontal collisions the air bags deploy at less than full deployment which consists of stage 1 of the air bag. For more severe frontal collisions a full deployment is initiated which consists of stage 1 and stage 2 of the air bag. The current passing through the air bags ignites the material in the canister producing a rapid generation of gas and in some cases, the release of compressed gas. The gas produced from this reaction rapidly inflates the air bag. Once the air bag is inflated it quickly deflates through the air bag vent holes and/or the bag fabric. Each air bag is equipped with a shorting bar located in the connectors of the air bag. The shorting bar shorts the air bag deployment loop circuitry to prevent unwanted deployment of the air bag when it is disconnected.

[Seat Belt Pretensioners \(Anchor and Retractor\)](#)

The seat belt pretensioners (driver and passenger) consist of a housing, seat belt retractor (located in the B-pillar), seat belt anchor (located on the floor), seat belt webbing, an initiator, and a canister of gas generating materials. To view the locations of the seat belt pre-tensioners refer to [SIR Identification Views](#) . The initiator is part of the seat belt pretensioner deployment loop. When the vehicle is involved in a collision of sufficient force, the SDM causes current to flow through the seat belt deployment loops to the initiator. Current passing through the initiator ignites the material in the canister producing a rapid generation of gas. The gas produced from this reaction deploys the seat belt pretensioners which removes all of the slack in the seat belts. Depending on the severity of the collision, the seat belt pretensioners may deploy without the frontal air bags deploying, or they will deploy immediately before the frontal air bags deploy. Each seat belt pretensioner is equipped with a shorting bar that is located in the connector of the seat belt pretensioner. The shorting bar shorts the seat belt pretensioner circuitry to prevent unwanted deployment of the seat belt pretensioner when the connector is disconnected.

[Impact Sensors](#)

This vehicle contains 6 impact sensors. The 6 impact sensors are located in the front of the vehicle (2, left and right), and one in each of the four doors. To view the locations of the impact sensors refer to [SIR Identification Views](#) . The impact sensors contain a sensing device which monitors vehicle acceleration and velocity changes to detect side collisions that are severe enough to warrant air bag deployment. The impact sensors are not part of the deployment loop, but instead provide input to the SDM. The SDM contains a microprocessor that performs calculations using the measured accelerations and compares these calculations to a value stored in memory. When the generated calculations exceed the stored value, the SDM will cause current to flow through the deployment loops deploying the appropriate air bags.

[Passenger Presence Detection System and Air Bag Indicator \(Passenger\)](#)

Note: The passenger presence system (PPS) is a calibrated unit. When replacing the assembly all parts in the service kit must remain together. Do not mix any of the old parts with the new parts. After repairing or replacing the PPS, the preload test must be performed in order to function properly.

The passenger presence detection system (PPS) is used to monitor the type of occupant that is sitting in the front passenger seat and communicate the status to the inflatable

restraint sensing and diagnostic module (SDM). The SDM then uses this information to determine whether to enable or suppress the deployment of the passenger instrument panel air bag. The PPS consists of an electronic control module, a sensor mat in the seat, a harness, and PASSENGER AIR BAG ON/OFF indicators. The PPS transmits and receives a low-level electric field. The measured capacitance value of this field is used to determine the type of occupant sitting in the front passenger seat. If the measured capacitance is less than a calibrated value, then the passenger presence module will send a serial data signal to the SDM to disable the passenger instrument panel air bag. If the measured capacitance is greater than a calibrated value, then the passenger presence module will send a serial data signal to the SDM to enable the passenger instrument panel air bag. The SDM will notify the customer of the enable/disable status by illuminating one of the PASSENGER AIR BAG ON/OFF indicator. PPS monitors itself for faults and will displays diagnostic trouble codes (DTCs) on the scan tool. When a fault is detected, the passenger presence module sends out a message to the SDM. The SDM responds by sending a command message to the IPC to illuminate the AIR BAG indicator.

Seat Belt Indicators

The seat belt indicators are controlled through the inflatable restraint sensing and diagnostic module (SDM). For further information on seat belt indicators refer to [Seat Belt System Description and Operation](#) .

Symptoms - Theft Deterrent

Note: The following steps must be completed before using the symptom tables.

1. Perform [Diagnostic System Check - Vehicle](#) in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following [Theft Systems Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Theft Deterrent System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Content Theft Deterrent Malfunction](#)
- [Inclination/Intrusion Sensor Malfunction](#)
- [Theft Deterrent Alarm Malfunction](#)

Content Theft Deterrent Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The content theft deterrent system is a software based system in which the body control module (BCM) actively monitors certain inputs to determine if unauthorised vehicle access is being attempted. Based on inputs such as the door ajar switches, the rear compartment ajar switch, and the bonnet ajar switch, the BCM determines whether a content theft deterrent alarm is warranted. If unauthorised access is being detected, the BCM will pulse the vehicle horn and flash the exterior lamps as a means of theft deterrence.

[Diagnostic Aids](#)

The scan tool BCM Content Theft Deterrent Trigger History 1, 2, and 3 parameters can be used to help isolate an intermittent unwanted content theft deterrent alarm. These parameters are a rolling history of the previous three causes of a theft deterrent alarm. If all three parameters are indicating the same alarm trigger, the indicated input should be the starting point when diagnosing an intermittent concern.

1. Vehicle OFF.
2. Verify the intrusion sensor disable indicator turn ON and OFF when pressing and releasing the intrusion/inclination sensor disable switch.
If the indicator does not turn ON and OFF
Refer to [Inclination/Intrusion Sensor Malfunction](#)
If the indicator turns ON and OFF
3. Verify each indicator/message transition between the ajar and closed state while opening and closing each vehicle door, bonnet, and rear compartment.
If the indicator/message does not change
Refer to [Door Ajar Indicator Malfunction](#) or [Rear Hatch/Gate Ajar Indicator Malfunction](#) .
If each indicator/message changes
4. Vehicle in Service Mode, completely lower the driver door window and close all vehicle doors, vehicle OFF.
5. Arm the content theft deterrent system by locking the door with the keyless entry transmitter.
6. Verify the scan tool BCM Content Theft Deterrent Alarm Status parameter is Armed.
If not Armed
Refer to [Keyless Entry System Malfunction](#) : [Passive](#) → [Active](#) .
If Armed
7. Without disarming the system, reach in through the open driver window and open the driver door.
8. Verify the scan tool BCM Content Theft Deterrent Alarm Status parameter is Alarm.
If not Alarm
Replace the K9 BCM.
If Alarm
9. Verify the theft deterrent alarm is sounding.
If the theft deterrent alarm is not sounding
Refer to [Theft Deterrent Alarm Malfunction](#)

If the theft deterrent alarm is sounding

10. All OK.

[Circuit/System Description](#)

The content theft deterrent intrusion/inclination sensor is a multifunction sensor which detects motion inside the vehicle (intrusion), as well as change in the vehicle level (inclination). The intrusion/inclination sensor is supplied power and ground for operation and communicates with the body control module (BCM) via a dedicated LAN circuit. The sensor may be turned on or off using the disable switch and will display its status through the status LED.

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify the intrusion sensor disable indicator turn ON and OFF when pressing and releasing the intrusion/inclination sensor disable switch.

If the indicator does not turn ON and OFF

Refer to Circuit/System Testing.

[Circuit/System Testing](#)

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S48B multi-function switch - overhead console. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.

If 10 Ω or greater

2.1. Vehicle OFF

2.2. Test for less than 2 Ω in the ground circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

3. Connect the harness connector at the S48B multi-function switch - overhead console. Disconnect the harness connector at the B67 ultrasonic intrusion sensor. It may take up to 2 minutes for all vehicle systems to power down.
4. Test for less than 10 Ω between the ground circuit terminal 5 and ground.

If 10 Ω or greater

- 4.1. Vehicle OFF
- 4.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω, repair the open/high resistance in the ground connection.

If less than 10 Ω

5. Vehicle in Service Mode.
6. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.

If the test lamp does not illuminate and the circuit fuse is good

- 6.1. Vehicle OFF.
- 6.2. Test for less than 2 Ω in the B+ circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

If the test lamp does not illuminate and the circuit fuse is open

- 6.1. Vehicle OFF.
- 6.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the B67 ultrasonic intrusion sensor.

If the test lamp illuminates

7. Test for less than 1 V between the signal circuit terminal 1 and ground.

If 1 V or greater

- 7.1. Vehicle OFF, disconnect the harness connector at the S48B multi-function switch - overhead console, vehicle in Service Mode.
- 7.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage in the circuit.
If less than 1 V, replace the S48B multi-function switch - overhead console.

If less than 1 V

8. Vehicle OFF.
9. Test for infinite resistance between the signal circuit terminal 1 and ground.

If less than infinite resistance

- 9.1. Vehicle OFF, disconnect the harness connector at the S48B multi-function switch - overhead console.
- 9.2. Test for infinite resistance between the signal circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the S48B multi-function switch - overhead console.

If infinite resistance

10. Test for less than 10 Ω between the signal circuit terminal 1 and ground with the intrusion/inclination sensor switch pressed.

If 10 Ω or greater

10.1. Vehicle OFF, disconnect the harness connector at the S48B multi-function switch - overhead console.

10.2. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the S48B multi-function switch - overhead console.

If less than 10 Ω

11. Vehicle in Service Mode.
12. Verify the intrusion/inclination sensor indicator is not illuminated.

If the indicator is illuminated

Repair the short to voltage in the circuit.

If the indicator is not illuminated

13. Install a 3 A fused jumper wire between the control circuit terminal 2 and B+.
14. Verify the intrusion/inclination sensor indicator is illuminated.

If the indicator is not illuminated

14.1. Vehicle OFF, disconnect the harness connector at the S48B multi-function switch - overhead console.

14.2. Test for infinite resistance between the signal circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance.

14.3. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the S48B multi-function switch - overhead console.

If the indicator is illuminated

15. Vehicle OFF, disconnect the X6 harness connector at the K9 BCM, vehicle in Service Mode.
16. Test for less than 1 V between the serial data circuit terminal 16 X2 and ground.

If 1 V or greater

Repair the short to voltage in the circuit.

If less than 1 V

17. Test for infinite resistance between the serial data circuit terminal 16 X2 and ground.

If less than infinite resistance

Repair the short to ground in the circuit.

If infinite resistance

18. Test for less than 2 Ω between the serial data circuit terminal 16 at the K9 BCM X2 harness connector and the serial data circuit terminal 4 at the B67 ultrasonic intrusion sensor.

If 2 Ω or greater

Repair the open/high resistance in the circuit.

If less than 2 Ω

19. Test or replace the B67 ultrasonic intrusion sensor.

If infinite resistance, replace the B67 ultrasonic intrusion sensor.

If the test lamp illuminates

5. Vehicle OFF, disconnect the X6 harness connector at the K9 BCM, vehicle in Service Mode.
6. Test for less than 1 V between the serial data circuit terminal 9 X6 and ground.

If 1 V or greater

Repair the short to voltage in the circuit.

If less than 1 V

7. Test for infinite resistance between the serial data circuit terminal 9 X6 and ground.

If less than infinite resistance

Repair the short to ground in the circuit.

If infinite resistance

8. Test for less than 2 Ω between the serial data circuit terminal 9 at the K9 BCM X6 harness connector and the serial data circuit terminal 3 at the P25 power sounder content theft deterrent alarm module.

If 2 Ω or greater

Repair the open/high resistance in the circuit.

If less than 2 Ω

9. Test or replace the P25 power sounder content theft deterrent alarm module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for BCM replacement, programming and setup

Theft Systems Description and Operation

When armed, the content theft deterrent system is designed to deter vehicle content theft by pulsing the horns and exterior lamps for approximately 30 seconds when an unauthorised vehicle entry is detected. However, the content theft deterrent system does not affect engine starting.

An unauthorised entry can be any of the following with the content theft deterrent system armed:

- Unauthorized entry into the underbonnet area
- Unauthorised entry into the rear compartment
- When any door is opened without using the UNLOCK command from a keyless entry transmitter.
- After a battery reconnect, if the battery was disconnected with the content theft deterrent system armed

The components of the content theft deterrent system are:

- Body Control Module (BCM)
- Keyless entry control module
- Remote control door lock receiver
- Security indicator
- Door ajar switches
- Tailgate ajar switch
- Bonnet ajar switch
- Intrusion sensor (RPO UA2 or UTC)
- Intrusion sensor disable switch (RPO UA2 or UTC)
- Glass breakage sensor (RPO UA2 or UTC)
- Alarm siren (RPO UA2 or UTC)

[Arming the Content Theft Deterrent System](#)

Use the following procedure in order to arm the system:

1. Place the gear lever in P (park).
2. Turn OFF the vehicle.
3. Open any door.

Note: The system is not armed if the doors are locked manually; the power door lock switch or remote keyless entry transmitter must be used to arm the content theft deterrent system.

4. Lock the doors with the power door lock switch or by pressing the LOCK button on the transmitter. The system is in standby mode and will not start the arming timer until all doors are closed.
5. The system will begin the arm sequence immediately after the last door is closed. If the keyless entry transmitter is used the arm the system after the vehicle doors are closed, the arm sequence will begin as soon as the LOCK command is received by the transmitter.
6. Pressing the LOCK button on the keyless entry transmitter a second time will bypass the delayed arming function and force the system to arm.

Locking the Vehicle Without Arming the Content Theft Deterrent System

Locking the vehicle may be accomplished without arming the content theft deterrent system. Use of the manual door locks will lock the vehicle, but will not arm the content theft deterrent system.

Disarming an Armed System/Silencing an Alarm

If system arming has been requested by the power door lock switch or the keyless entry transmitter, it must be disarmed.

Note: Disconnecting the battery or removing fuses does not disable the arm or alarm modes, since the BCM stores the content theft deterrent mode status in memory.

- To disarm the content theft deterrent system in standby mode, perform one of the following:
 - Press the UNLOCK button on the keyless entry transmitter.
 - Approach the vehicle with a valid keyless entry transmitter and pull the vehicle door handle (RPO ATH).
 - Press the ignition mode switch with a valid key in the vehicle
- To disarm the content theft deterrent system in the armed mode (non-event) or when activated (during an alarm event):
 - Press the UNLOCK button on the keyless entry transmitter.
 - Press the ignition mode switch with a valid key in the vehicle

Content Theft Deterrent Circuit Description

The following is a description of each component used in the content theft deterrent system:

Body Control Module

The content theft deterrent system is an internal function of the BCM which utilises serial data and various switch inputs information to perform content theft deterrent functions. When the BCM detects an unauthorized entry, it activates the horns and exterior lamps. The BCM has 4 basic modes (disarmed, standby, armed, and alarm) for operating the content theft deterrent system. The different modes are described below.

1. The BCM has the content theft deterrent system in a disarmed mode until the doors locked by either the power door lock switch or the LOCK button on the transmitter.

2. The BCM enters the standby mode when the above conditions are detected. If a door was already opened when the arm mode was requested, the standby mode does not start the timer until the last door is closed.
3. When the last door is closed, a 15 second timer is activated. Once the timer has expired, the BCM enters the armed mode. After this delay, any unauthorised entry will activate the alarm mode.
4. When the BCM detects an unauthorised entry, the BCM enters the alarm mode. The BCM activates the horns and exterior lamps for 30 seconds. This is followed by a three minute time-out with the horn no longer active. If no new intrusions are detected after the time-out, the horn is not active. The system must be disarmed or the intrusion condition removed after the time-out for the system to exit alarm mode.

Keyless Entry Control Module

The passive keyless entry system can arm and disarm the content theft deterrent system. When a valid keyless entry transmitter is detected while attempting to passively access the vehicle, the keyless entry module will send a message via serial data to disarm the content theft deterrent system.

Remote Control Door Lock Receiver

The keyless entry system can arm and disarm the content theft deterrent system. When the remote control door lock receiver receives a door lock or unlock signal from the transmitter, the remote control door lock receiver sends a message to the BCM via serial data to perform the appropriate arm/disarm functions.

Security Indicator

The security LED is illuminated on the upper I/P by the BCM. The content theft deterrent system uses the security LED to inform the driver of system status prior to arming.

Door Ajar Switches

The content theft deterrent system uses the door ajar switches as a status indicator to activate the alarm. The door ajar switches are monitored by the body control module via a discrete input from each door ajar switch. If the BCM receives a signal indicating a door is opened when the content theft deterrent system is armed, the BCM activates the alarm.

Bonnet Ajar Switch

The content theft deterrent system uses the bonnet ajar switch as a status indicator to activate the alarm. The BCM monitors the bonnet ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the bonnet has been opened when the content theft deterrent system is armed, the BCM activates the alarm.

Tailgate Ajar Switch

The content theft deterrent system uses the tailgate ajar switch as a status indicator to activate the alarm. The BCM monitors the tailgate ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the tailgate has been opened when content theft deterrent system is armed, the BCM activates the alarm.

Intrusion Sensor (RPO UTT)

The intrusion sensor is located in the overhead console and uses two ultrasonic sensors to detect any motion inside the vehicle. If motion is detected inside the vehicle while the content theft deterrent system is armed, the system will transition to the alarm mode. The intrusion sensor also acts as an inclination sensor. The inclination sensor determines the vehicles level when the content theft deterrent system is armed. If the vehicle level is changed while the system is armed, such as being lifted by a tow truck or raised with a jack, the alarm will be activated. The intrusion sensor can be disabled using the intrusion sensor disable switch. The intrusion sensor disable switch also shows the intrusion sensor status using a status LED.

Alarm Siren (RPO UTT)

The content theft deterrent system uses the alarm siren as an audible alert device to alert individuals near the vehicle that a vehicle intrusion is occurring. The siren is supplied power and ground for operation and communicates with the body control module (BCM) via a dedicated LAN circuit.

Inputs

The BCM monitors the following inputs for content theft deterrent:

- Door ajar switches
- Keyless entry transmitter LOCK/UNLOCK buttons; a message from the remote control door lock receiver
- Immobiliser status--The BCM uses the immobiliser status for disarming the system or silencing an alarm when the correct vehicle key is used to start the vehicle
- Tailgate ajar switch
- Bonnet ajar switch
- Intrusion sensor (RPO UTT)

Outputs

The BCM controls the following for content theft deterrent:

- Horn relay
- Exterior lamps
- Alarm siren (RPO UTT)

Driver or Passenger Seat Replacement

Callout

Component Name

Warning: Refer to [SIR Warning](#) in the Preface section.

Preliminary Procedures

1. Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

2. Disconnect the front seat belt tensioner fastener by removing the cap, bolt, and cover. Refer to [Driver or Passenger Seat Retractor Side Belt Replacement](#) .

Front Seat Bolt (Qty: 4)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

- 1
 1. Adjust the seat to the full forward position to gain access to the rear bolts.
 2. Remove the foot cover by pulling up on the rear of the cover and then pushing forward to gain access to the rear outboard bolts.
 3. Re-cut the threads of the body. Refer to [Thread Inserts](#) .
 4. Bolts are microencapsulated. Install NEW front seat bolts. DO NOT reuse the old bolts.

Tighten

45 N·m (33 lb ft)

Front Seat Assembly (Qty: 2)

Procedure

- 2
 1. Disconnect the electrical.
 2. With the aid of an assistant remove the front seat, by tilting the seat forward and then lifting and pulling the seat rearwards to disengage the front hooks.
 3. Transfer components as necessary.

Driver or Passenger Seat Cushion Outer Finish Panel Replacement

Callout

Component Name

Preliminary Procedure

1. Remove the seat belt from the seat belt anchor. Refer to [Driver or Passenger Seat Retractor Side Belt Replacement](#) .
2. Remove the driver or passenger seat adjuster vertical actuator handle. Refer to [Driver or Passenger Seat Adjuster Vertical Actuator Handle Replacement](#) .
3. Remove the driver or passenger seat recliner handle. Refer to [Driver or Passenger Seat Recliner Handle Replacement](#) .

1	<p>Driver or Passenger Seat Outer Adjuster Finish Cover Rear Fastener</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Make sure the seat is in the full up position. 2. After removal of the fastener, using a flat bladed tool, pry upward on the tab connecting the inner and outer panels..
2	<p>Driver or Passenger Seat Outer Adjuster Finish Cover Side Fastener</p> <p>Procedure</p> <p>After removal of the fastener, using a flat bladed tool, pry upward on the two tabs connectng the inner and outer panels.</p>
3	<p>Driver or Passenger Seat Outer Adjuster Finish Cover Front Fastener</p>
4	<p>Driver or Passenger Seat Outer Adjuster Finish Cover</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Push downward on the front hidden clip to release the panel from the frame. 2. Pull upward on the finish trim top edge to release the panel ribs from the frame. 3. Disconnect any electrical connector, if equipped. 4. If replacing the cover, transfer components as necessary.

Driver or Passenger Seat Wiring Harness Replacement - Seat Back

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front seat cushion cover and pad. Refer to Front Seat Cushion Cover and Pad Replacement .2. Remove the front seat back cushion cover and pad. Refer to Driver or Passenger Seat Back Cushion Cover and Pad Replacement .	

Driver or Passenger Seat Wiring Harness

1

Procedure

1. Remove the wiring harness from front seat back frame.
2. Note location and routing of the wiring harness prior to ensure proper reinstallation.

Driver or Passenger Seat Wiring Harness Replacement - Cushion

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the front seat cushion cover and pad. Refer to Front Seat Cushion Cover and Pad Replacement .2. Remove the front seat back cushion cover and pad. Refer to Driver or Passenger Seat Back Cushion Cover and Pad Replacement .	

Driver or Passenger Seat Wiring Harness

1

Procedure

1. Remove the wiring harness from front seat frame.
2. Note location and routing of the wiring harness prior to ensure proper reinstallation.

Driver or Passenger Seat Adjuster Vertical Actuator Handle Replacement

Callout	Component Name
1	Driver or Passenger Seat Adjuster Vertical Actuator Handle Cover
	Procedure
	Use a flat-bladed tool to push inward on the three tabs to release the handle cover from the handle assembly.

2	Driver or Passenger Seat Adjuster Vertical Actuator Handle Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section.
3	Driver or Passenger Seat Adjuster Vertical Actuator Handle Procedure Use a flat-bladed tool to release the adjuster handle from the seat frame assembly.

Driver or Passenger Seat Adjuster Handle Replacement

Callout	Component Name
1	Driver or Passenger Seat Adjuster Handle Fastener Caution: Refer to Fastener Caution in the Preface section.
2	Driver or Passenger Seat Adjuster Handle

Front Seat Adjuster Track Finish Cover Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the driver or passenger seat. Refer to Driver or Passenger Seat Replacement
	Front Seat Adjuster Track Finish Cover

Caution: Do not twist the cover during removal. Twisting the cover may cause the component to break.

1

Procedure

1. Firmly grasp both sides of the finish cover pulling the sides outward to disengage the top of the cover off of the track.
2. Pull down on the finish cover and disengage it from the front seat hooks and track.

Driver or Passenger Seat Head Restraint Replacement

Callout	Component Name
1	<p>Driver or Passenger Seat Head Restraint Bezel (Qty: 2)</p> <p>Procedure</p> <p>1. Raise the headrest to gain access to the head restraint bezel.</p>

	2. Twist the bezel counter clockwise and push the bezel upward on the head restraint adjuster rod.
2	Driver or Passenger Seat Head Restraint Clip (Qty: 2) Procedure Using a suitable pointed or flat bladed tool, push the metal clip rearward while pulling upward on the head restraint.
3	Driver or Passenger Seat Head Restraint

Front Seat Head Restraint Adjust Rod Guide Replacement

Callout	Component Name
Preliminary Procedure	
Remove the driver or passenger seat head restraint. Refer to Driver or Passenger Seat Head Restraint Replacement .	
Front Seat Head Restraint Adjuster Rod Guide	

1

Procedure

Using a suitable flat-bladed tool, slide the tool on the outside of the guide until it finds the slot. Then push the plastic slot inward and pull upward to remove the guide from the seat back frame.

Front Seat Head Restraint Adjust Knob Replacement

Callout	Component Name
1	Front Seat Head Restraint Adjuster Knob Bezel
	Procedure
	Use a flat-bladed tool to push inward on the adjuster bezel tabs to release the bezel from the front seat head restraint.

Front Seat Head Restraint Adjuster Knob Replacement

2

Procedure

Use a flat-bladed tool to push inward on the adjuster knob tabs to release it from the bezel.

Driver or Passenger Seat Cushion Closeout Cover Replacement

Callout	Component Name
1	<p>Driver or Passenger Seat Cushion Closeout Cover</p> <p>Procedure</p> <p>1. Raise the seat to the highest seat position.</p>

2. Unclip the seat tensioner wiring harness from the finish cover.
3. Release the rear tab of the finish cover.
4. Release the middle tabs of the finish cover by gently pulling up on the finish cover.
5. Slide the finish cover forward off the tensioner rod.

Driver or Passenger Seat Outer Recliner Finish Cover Replacement

Callout

Component Name

Preliminary Procedure

1. Remove the driver or passenger seat. Refer to [Driver or Passenger Seat Replacement](#) .
2. Remove the driver or passenger seat cushion outer finish panel. Refer to [Driver or Passenger Seat Cushion Outer Finish Panel Replacement](#) .

1	Driver or Passenger Seat Outer Recliner Finish Cover Fastener Caution: Refer to Fastener Caution in the Preface section.
2	Driver or Passenger Seat Outer Recliner Finish Cover Procedure Firmly grasp the upper portion of the finish cover that folds over the seat cushion frame, this area needs to be flexed inward while sliding the finish cover rearward.

Driver or Passenger Seat Inner Recliner Finish Cover Replacement

Callout	Component Name
1	Driver or Passenger Seat Inner Recliner Finish Cover Fastener
	Driver or Passenger Seat Inner Recliner Finish Cover
2	Caution: Refer to Fastener Caution in the Preface section.

Procedure

Firmly grasp the upper area of the finish cover that folds over the seat cushion frame, pull upward and then outboard to disengage the finish cover from the seat cushion frame.

Driver or Passenger Seat Cushion Frame Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedures	
1. Remove the front seat. Refer to Driver or Passenger Seat Replacement .	

2. Remove the front seat belt tensioner. Refer to [Front Seat Belt Anchor Plate Tensioner Replacement](#) .
3. Remove the front seat belt buckle. Refer to [Front Seat Belt Buckle Replacement](#) .
4. Remove the front seat cushion and pad. Refer to [Front Seat Cushion Cover and Pad Replacement](#) .
5. Remove the front seat outer recliner finish cover. Refer to [Driver or Passenger Seat Outer Recliner Finish Cover Replacement](#) .
6. Remove the front seat cushion wiring harness. Refer to [Driver or Passenger Seat Wiring Harness Replacement - Cushion](#) .

1	<p>Driver or Passenger Seat Back Cushion Frame Bolt (Qty: 4)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 35 N·m (26 lb ft)</p>
2	<p>Driver or Passenger Seat Cushion Frame</p> <p>Procedure</p> <p>If replacing with a new front seat cushion frame, transfer components as necessary.</p>

Front Seat Cushion Cover and Pad Replacement

Callout

Component Name

Warning: Refer to [SIR Warning](#) in the Preface section.

Preliminary Procedures

1. Remove the driver or passenger seat. Refer to [Driver or Passenger Seat Replacement](#).

2. Remove the driver or passenger seat cushion outer finish panel. Refer to [Driver or Passenger Seat Cushion Outer Finish Panel Replacement](#) .
3. Remove the driver or passenger seat inner recliner finish cover. Refer to [Driver or Passenger Seat Inner Recliner Finish Cover Replacement](#) .

1	<p>Front Seat Cushion Cover</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disengage the J-channel retainers from the seat cushion frame. 2. Disconnect the electrical connectors that attach to the seat cushion, if equipped. 3. Remove the seat cushion cover and pad from the seat cushion frame as an assembly. 4. Separate the seat cushion from the seat cushion pad by pulling the cover away from the pad.
2	<p>Front Seat Cushion Heater, if equipped</p> <p>Procedure</p> <p>Remove the driver or passenger seat cushion heater. Refer to Driver Seat Cushion Heater Replacement or Passenger Seat Cushion Heater Replacement .</p>
3	<p>Front Seat Cushion Pad</p>

Driver or Passenger Seat Cushion Pad Wire Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedure	
1.	Remove the front seat cushion cover and pad. Refer to Front Seat Cushion Cover and Pad Replacement .

2. Remove the driver or passenger seat outer recliner finish cover. Refer to [Driver or Passenger Seat Outer Recliner Finish Cover Replacement](#) .

1	Driver or Passenger Seat Cushion Pad Wire Procedure Disconnect electrical connectors.
---	----------------------------------------------------------------------------------------------------

Driver or Passenger Seat Back Cushion Cover and Pad Replacement

Callout

Component Name

Warning: Refer to [SIR Warning](#) in the Preface section.

Warning: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.

Preliminary Procedure

1. Remove the driver or passenger seat. Refer to [Driver or Passenger Seat Replacement](#) .
2. Remove the driver or passenger seat back cushion finish panel. Refer to [Driver or Passenger Seat Back Cushion Finish Panel Replacement](#) .
3. Remove the driver or passenger seat cushion outer finish panel. Refer to [Driver or Passenger Seat Cushion Outer Finish Panel Replacement](#) .
4. Remove the driver or passenger seat outer recliner finish cover. Refer to [Driver or Passenger Seat Outer Recliner Finish Cover Replacement](#) .
5. Remove the front seat head restraint. Refer to [Driver or Passenger Seat Head Restraint Replacement](#) .

1	<p>Seat Back Cushion Cover</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disengage the J-channel retainers and tabs at the bottom of the seat back cover from the seat back cushion frame.2. Disconnect the electrical connector that is attached to the seat back cushion, if equipped.3. Remove the inflatable restraint side impact module nuts (2) from the seat back frame.4. Remove the connector position assurance (CPA) from the SIR module electrical connector.5. Disconnect the SIR electrical connector.6. Remove the seat back cushion cover, airbag module and pad from the seat cushion frame as an assembly.
2	<p>Driver or Passenger Seat Side Inflatable Restraint Module Nut (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 5.5 N·m (49 lb in)</p>
3	<p>Front Seat Back Cushion Pad</p> <p>Procedure</p> <ol style="list-style-type: none">1. Slide the inflatable restraint side impact module out of the chute. Refer to Driver or Passenger Seat Side Inflatable Restraint Module Replacement2. Separate the seat cushion from the seat cushion pad by pulling the cover away from the pad.3. Transfer the seat heater, if equipped. <p>Tip Seat back cover can be damaged upon reinstalling cover to seat back pad. When reinstalling the seat cushion cover to the seat pad, start in upper outboard corner and install outboard side of the cover. Then start at the upper inboard corner and install inboard side of cover.</p>

Driver or Passenger Seat Back Cushion Pad Wire Replacement

Callout	Component Name
Preliminary Procedure	Remove the driver or passenger seat back cushion finish cover. Refer to Driver or Passenger Seat Back Cushion Finish Panel Replacement
	Driver or Passenger Seat Back Cushion Pad Wire Rivet (Qty: 2)

Warning: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.

1

Procedure

1. Unhook seat back cushion cover J-hooks.
2. Disengage the seat back lumbar wire from the cushion wire.
3. Drill out all of the guide rivets before removing the pad wire.

Driver or Passenger Seat Back Cushion Pad Wire

2

Procedure

When re-installing the cushion pad wire, re-rivet at the same location on the cushion frame with new rivets.

Driver or Passenger Seat Back Cushion Frame Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedures	
1. Remove the front seat. Refer to Driver or Passenger Seat Replacement .	

2. Remove the front seat back cushion cover and pad. Refer to [Driver or Passenger Seat Back Cushion Cover and Pad Replacement](#) .
3. Remove the front seat head restraint adjust rod guide. Refer to [Front Seat Head Restraint Adjust Rod Guide Replacement](#) .
4. Remove the front seat back cushion wiring harness. Refer to [Driver or Passenger Seat Wiring Harness Replacement - Cushion](#) .

1	<p>Driver or Passenger Seat Back Cushion Frame Bolt (Qty: 4)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 35 N·m(26 lb ft)</p>
2	<p>Driver or Passenger Seat Back Cushion Frame</p> <p>Procedure</p> <p>If replacing with a new front seat back cushion frame, transfer components as necessary.</p>

Driver or Passenger Seat Recliner Handle Replacement

Callout	Component Name
1	Driver or Passenger Recliner Handle
	Procedure
	Use a flat-bladed tool to remove the recliner handle from the torsion bar.

Driver or Passenger Seat Back Cushion Finish Panel Replacement

Callout	Component Name
1	<p data-bbox="263 1373 790 1414">Front Seat Back Cushion Filler Panel</p> <p data-bbox="263 1455 424 1495">Procedure</p> <ol data-bbox="298 1536 935 1576" style="list-style-type: none"><li data-bbox="298 1536 935 1576">1. Recline seat back to full forward tilt angle.

2. Disengage the J-channel at the bottom of the finish panel.
3. Use a flat-bladed to disengage the tabs securing the panel to the bottom of the seat back frame. Push up on the tabs to disengage.
4. For panel removal, turn panel counter-clockwise to release lower left tab and then rotate clockwise to release the right side of panel.

Rear Seat Latch Striker Bezel Replacement

Callout	Component Name
1	<p>Rear Seat Latch Striker Bezel</p> <p>Procedure</p> <ol style="list-style-type: none">1. Lay the rear seat back down before trying to remove the bezel cover.

2. Use a flat bladed tool to release the top tab to avoid breakage.

Rear Seat Head Restraint Guide Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat head restraint. Refer to Rear Seat Head Restraint Replacement .	
Rear Seat Head Restraint Guide	

1

Procedure

Using a suitable flat-bladed tool, slide the tool between the cushion and the guide until you find the slot on the outboard side of the guide. Push inward on the guide slot tab, while pulling upward to remove the guide from the seat back frame.

Rear Seat Back Cushion Pivot Support Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat back cushion. Refer to Rear Seat Back Cushion Replacement .	
	Rear Seat Back Outer Pivot Bolt

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 23 N·m (17 lb ft)
2	Rear Seat Back Cushion Outer Pivot Bushing
3	Rear Seat Back Cushion Outer Pivot Bolt Spring
4	Rear Seat Back Cushion Pivot Support Housing
5	Rear Seat Back Centre Finish Cover

Rear Seat Cushion Cover and Pad Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat cushion. Refer to Rear Seat Cushion Replacement	
	Rear Seat Cushion Cover

1	<p>Procedure</p> <p>Remove the push pin retainers and u-clips that secure the rear seat cushion cover to the pad.</p> <p>Tip</p> <p>When installing the rear seat cushion cover, pull the cover tightly in all corners to ensure that no creasing occurs.</p>
2	Rear Seat Cushion Pad

Rear Seat Cushion Replacement

Callout	Component Name
1	<p>Rear Seat Cushion (Qty: 2)</p> <p>Procedure</p> <p>1. Lift up on the front of the seat cushion to disengage the cushion from the floor retainers.</p>

2. Push down on the rear of the seat to unhook the cushion from the lower cross bar.
3. Transfer components as necessary.

2

Rear Seat Cushion Retainer (Qty: 6)

Passenger Heated Seat Cushion Temperature Sensor Low Reference	-	B2170 05	-	B2345 13

[Circuit/System Description](#)

The heated seat temperature sensor that set this diagnostic trouble code (DTC) is located in the seat cushion just under the seat cover with the seat heating element. The seat heating control module supplies a 5 V reference voltage through the temperature sensor signal circuit and a ground through the low reference circuit to the sensor. The module monitors the voltage of the sensor signal circuit to determine the temperature of the seat. The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the seat reaches the set temperature, the module will then cycle the control circuit of the heating elements ON and OFF in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Conditions for Running the DTC

- DTC B1325 must not be present.
- The seat heating control module must be powered.

Conditions for Setting the DTC

B1925 02 or B2170 02

The temperature sensor voltage drops below 0.6 V for more than 1 second.

B1925 05 or B2170 05

The temperature sensor voltage is greater than 5 V for more than 1 second.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the vehicle is cycled Vehicle OFF then back to Vehicle ON or Vehicle in Service Mode.
- The history DTC will clear after 40 consecutive fault-free Vehicle On cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion heating element.
2. Test for less than 10 Ω between the low reference circuit terminal D and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit test normal, replace the K29 seat heating control module.
3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the signal circuit terminal C and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K29 seat heating control module.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K29 seat heating control module.
4. If all circuits test normal, test or replace the E14 seat cushion heating element.

Component Testing

E14B or E14D Seat Cushion Heating Element

1. Vehicle OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion heating element.
2. Test for 500 Ω - 300 k Ω between the signal circuit terminal C and the low reference circuit terminal D.
If not within the specified range, replace the E14 seat cushion heating element.

Passenger Heated Seat Cushion Temperature Sensor Low Reference	-	B2170 05	-	B2345 13

[Circuit/System Description](#)

The seat heating control module controls seat heating operation for both the driver and front passenger seats. The heating elements are controlled through individual high side and low side control circuits. The low side control circuits for both seats are connected to a common reference point internal to the module. This reference point is biased to approximately 2.5 V. Before the seat heating control module will allow heated seat operation, it checks to see if this biased voltage is shorted to ground or voltage. Once the module verifies that it is not closing to a shorted heating element, it allows for heated seat operation. The module will then continue to monitor the heating elements for a shorted circuit.

Conditions for Running the DTC

- DTC B1325 must not be present.
- The seat heating control module must be powered.

Conditions for Setting the DTC

B2345 13

Any temperature sensor input that remains below 1.5 V for more than 1 second.

Action Taken When the DTC Sets

The heated seat function for both front seats will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the vehicle is cycled Vehicle OFF then back to Vehicle ON or Vehicle in Service Mode.
- The history DTC will clear after 40 consecutive fault-free Vehicle On cycles have occurred.

Passenger Heated Seat Cushion Temperature Sensor Low Reference	-	B2170 05	-	B2345 13

Circuit/System Description

The driver and front passenger heated seats are controlled by the seat heating control module that is located under the driver seat cushion. When the heated seat is active, the module applies power through a common voltage supply circuit to the seat heater elements. The module controls the seat temperature by providing a pulse width modulation (PWM) ground through the seat heater element control circuit to the heater elements. The module then monitors the current flow through the heating elements and the rate of change of the temperature sensor to verify correct heated seat operation.

Conditions for Running the DTC

- DTC B1325 must not be present.
- The seat heating control module must be powered and the heated seat must be enabled.

Conditions for Setting the DTC

B2425 0D or B2430 0D

By measuring current and voltage output to the seat heating elements every 10 seconds, the seat heating control module calculates that the heating element resistance is above the maximum resistance.

B2425 0B, B2425 0E, B2430 0B, or B2430 0E

By measuring current and voltage output to the seat heating elements every 10 seconds, the seat heating control module calculates that the heating element resistance is below the minimum resistance.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the vehicle is cycled Vehicle OFF then back to Vehicle ON or Vehicle in Service Mode.
- The history DTC will clear after 40 consecutive fault-free Vehicle On cycles have occurred.

[Circuit/System Description](#)

The seat heating control module controls the seat heating operation for both the driver and front passenger seats. The module controls the heating elements through individual high side and low side control circuits. The low side control circuits for both seats are connected to a common reference point internal to the module. This reference point is biased to approximately 2.5 V. Before the seat heating control module will allow heated seat operation, it checks to see if this biased voltage is shorted to ground or

voltage. Once the module verifies that it is not closing to a shorted heating element, it allows for heated seat operation. The module will then continue to monitor the heating elements for a shorted circuit.

Conditions for Running the DTC

- DTC B1325 must not be present.
- The seat heating control module must be powered.

Conditions for Setting the DTC

B242A 01

The seat heating control module detects a short to voltage on the heater element control circuits.

B242A 02

The seat heating control module detects a short to ground on the heater element control circuits.

Action Taken When the DTC Sets

The heated seat function for both seats will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the vehicle is cycled Vehicle OFF then back to Vehicle ON or Vehicle in Service Mode.
- The history DTC will clear after 40 consecutive fault-free Vehicle On cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K29 seat heating control module.
2. Test for infinite resistance between the control circuit terminal 3 and ground.
If not the specified value, test the control circuit for a short to ground.
3. Test for infinite resistance between the control circuit terminal 5 and ground.
If not the specified value, test the control circuit for a short to ground.
4. Vehicle in service mode, verify that a test lamp does not illuminate between the control circuit terminal 3 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage.
5. Verify that a test lamp does not illuminate between the control circuit terminal 5 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage.
6. If all circuits test normal, replace the K29 seat heating control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for seat heating control module replacement, setup, and programming

Symptoms - Seat Heating and Cooling

Note: The following steps must be completed before using the symptom tables.

1. When diagnosing a heated seat system condition perform the [Diagnostic System Check - Vehicle](#) , before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control module(s) can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Heated Seats Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power seats. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the seat adjuster track for conditions which may cause binding or objects within the seat adjustment range which obstruct movement or interfere with wiring.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to the [Front Heated Seat Malfunction](#) diagnostic procedure in order to diagnose the symptom.

Front Heated Seat Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Heated Seat Element Voltage Control	B242A 02	B2425 0D	B242A 01	B2425 0B, B2425 0E
Driver Heated Seat Element Ground Control	B242A 02	B2425 0D	B242A 01	B2425 0B, B2425 0E
Driver Heated Seat Cushion Temperature Sensor Signal	B1925 02	B1925 05	B1925 05	B2345 13

Passenger Heated Seat Cushion Temperature Sensor Low Reference	-	B2170 05	-	B2345 13

[Circuit/System Description](#)

The driver and passenger heated seats are controlled by separate heated seat switches that are located in the HVAC control. When a heated seat switch is pressed, a serial data message is sent from the HVAC control to the HVAC control module indicating the heated seat command. The HVAC control module serves as a gateway to transmit the message to the heated seat control module via the serial data line. In response to this message, the seat heating control module applies battery positive voltage through the element supply voltage circuit to the appropriate seat heating elements. The seat heating control module then sends a serial data message back to the HVAC control module to gateway the information to the HVAC control to either illuminate or turn off the appropriate temperature indicator.

- [Control Module References](#) for seat heating control module replacement, setup, and programming

Front Seat Heater Control Module Replacement

Callout	Component Name
Preliminary Procedure	
Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .	
	Front Seat Heater Control Module Fastener (Qty: 2)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 3 N·m(27 lb in)</p>
2	<p>Front Seat Heater Control Module</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connector.2. Disconnect the module from the bracket, then pull downward away from the bottom of the seat.3. Refer to Control Module References for programming and setup information.

Driver or Passenger Seat Back Cushion Heater Replacement

Callout

Component Name

Warning: Refer to [SIR Warning](#) in the Preface section.

Warning: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.

Preliminary Procedure

1. Remove the driver or passenger seat. Refer to [Driver or Passenger Seat Replacement](#)
2. Remove the driver or passenger seat back cushion cover and pad. Refer to [Driver or Passenger Seat Back Cushion Cover and Pad Replacement](#)

1	<p>Seat Back Cushion Cover</p> <p>Procedure</p> <p>Separate the seat cushion from the seat cushion pad.</p>
2	<p>Driver or Passenger Seat Back Cushion Pad</p>
3	<p>Driver or Passenger Seat Back Cushion Heater</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the electrical connector.2. Remove the heater element leaving the old adhesive strips intact on the seat cushion. The new seat heater adhesive strips will be placed over the old adhesive strips.

Driver Seat Cushion Heater Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedure	
1. Remove the driver seat. Refer to Driver or Passenger Seat Replacement .	

Preliminary Procedure

1. Remove the driver seat. Refer to [Driver or Passenger Seat Replacement](#) .

2. Remove the driver seat cushion cover and pad. Refer to [Front Seat Cushion Cover and Pad Replacement](#) .

1	<p>Driver Seat Cushion Cover</p> <p>Procedure</p> <p>Separate the seat cushion cover from the seat cushion pad by pulling the cover away from the pad.</p>
2	<p>Driver Seat Cushion Pad</p>
3	<p>Driver Seat Cushion Heater</p> <p>Procedure</p> <ol style="list-style-type: none">1. The heater is retained to the pad with adhesive, carefully peel the heater from the seat cushion to remove.2. Note the routing of the wiring harness and connector location for installation.

Passenger Seat Cushion Heater Replacement

Callout	Component Name
Warning: Refer to SIR Warning in the Preface section.	
Preliminary Procedure	
1. Remove the passenger seat. Refer to Driver or Passenger Seat Replacement	

2. Remove the passenger seat cushion cover and pad. Refer to [Front Seat Cushion Cover and Pad Replacement](#)

1	<p>Passenger Seat Cushion Cover</p> <p>Procedure</p> <p>Separate the seat cushion cover from the seat cushion pad by pulling the cover away from the pad.</p>
2	<p>Passenger Seat Cushion Heater Assembly</p> <p>Procedure</p> <p>The heater and seat cushion pad must be replaced as a unit.</p> <p>Tip</p> <p>Note the routing of the wiring harness and connector location for installation.</p>

Heated Seats Description and Operation

[Heated Seat Components](#)

The driver and passenger heated seats consist of the following components:

- Left heated seat switch
- Right heated seat switch
- HVAC control
- Seat heating control module
- Driver seat cushion heating element
- Driver seat backrest heating element
- Driver seat cushion temperature sensor
- Passenger seat cushion heating element
- Passenger seat backrest heating element
- Passenger seat cushion temperature sensor

[Power and Ground](#)

Battery positive voltage is supplied at all times to the seat heating control module through a 30 A fuse located in the underbonnet fuse block. This voltage is used by the module to supply power to the seat heating elements. Ground for the module is provided at G307.

[Heated Seat Operation](#)

The driver and passenger heated seats are controlled by a single seat heating control module that is located under the driver seat cushion. Both heated seats are controlled by separate heated seat switches that are located in the HVAC control. When a heated seat switch is pressed, a serial data message is sent from the HVAC control to the HVAC control module indicating the heated seat command. The HVAC control module serves as a gateway to transmit the message to the heated seat control module via the serial data line. In response to this signal, the seat heating control module applies battery positive voltage through the element supply voltage circuit to the appropriate seat heating elements. The seat heating control module then sends a serial data message back to the HVAC control module to gateway the information to the HVAC control to either illuminate or turn off the appropriate temperature indicator.

[Temperature Regulation](#)

When the engine is ON, the heated seats will initialise in the OFF state. With each activation of the heated seat switch, the seat heating control module will cycle the temperature setting in the following manner: HIGH, MEDIUM, LOW, and OFF.

The seat heating control module monitors the seat temperature through the temperature sensor signal circuit and the temperature sensor (thermistor) that is located in the seat cushion. The temperature sensor is a variable resistor, its resistance changes as the temperature of the seat changes. When the temperature sensor resistance indicates to the seat heating control module that the seat has reached the desired temperature, the module opens the ground path of the seat heating elements through the heated seat element control circuit. The module will then cycle the element control circuit open and closed in order to maintain the desired temperature.

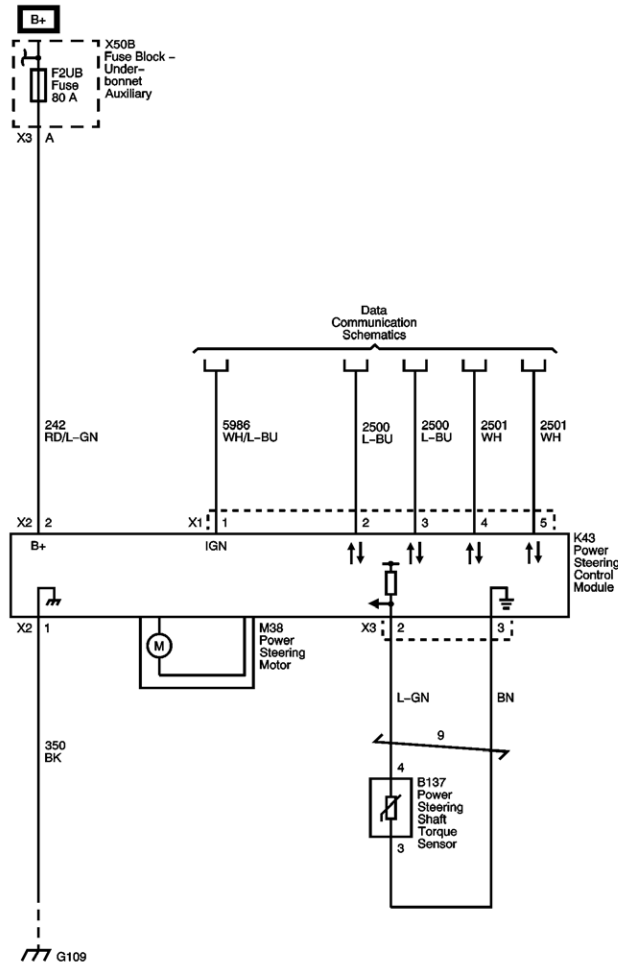

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Power Steering Assist Motor Bolt	8 N·m	71 lb in
Steering Gear Bolt (1)		
First Pass	110 N·m	81 lb ft
Final Pass	160 degrees	
Steering Linkage Inner Tie Rod	100 N·m	74 lb ft
Steering Linkage Outer Tie Rod Nut (2)	35 N·m	26 lb ft
1. Use a NEW bolt. 2. Use a NEW nut.

DTC C0176

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC C0176 54: Control Module Temperature Sensor High Temperature

Circuit/System Description

The power steering control module monitors the temperature of the Power Steering System. The power steering control module uses voltage, current levels and input from an internal temperature sensor to calculate an estimated system temperature. If the power steering control module detects a high system temperature event is occurring, the amount of assist is decreased to reduce system temperature, in effort to prevent thermal damage to the power steering components.

Conditions for Running the DTC

- Vehicle ON.
- Power steering system voltage is 9-16 volts.
- Repetitive steering input applied.

Conditions for Setting the DTC

The power steering control module detects a high system temperature.

Action Taken When the DTC Sets

- DTC C0176 54 is stored in memory.
- Steering assist is reduced.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction free ignition cycles.

Diagnostic Aids

- DTC C0176 54 does not indicate that a malfunction has occurred. Rather that the power steering control module had to limit current to the power steering motor to avoid thermal damage to the power steering system components. Discuss with the customer about driving conditions when the steering assist was reduced.
- Ensure that no steering components down stream of the power steering column assembly, such as ball joints, track rod ends, universal joints, or the steering gear assembly, are mechanically binding.

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify that the DTC sets outside of the conditions for running and setting. Since most occurrences of this DTC are caused by excessive driver inputs, review with the customer the conditions under which the DTC set.

If the DTC set within the normal conditions for running and setting, the power steering is operating as designed.

2. Operate the vehicle within the conditions that the customer experienced, avoiding excessive inputs, and verify the DTC does not reset.

If the DTC resets, replace the K43 Power Steering Control Module.

DTC C0475

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC C0475 00: Electric Steering Motor Circuit Malfunction

DTC C0475 59: Electric Steering Motor Circuit Protection Time-Out

[Circuit/System Description](#)

C0475 00

The power steering control module continuously monitors the voltage and current levels being commanded to the 3-phase steering motor. The power steering control module compares the desired and actual current levels to detect malfunctions in the power steering motor, or the circuits to the motor.

C0475 59

The power steering control module continuously monitors the thermal cycle counter of the steering gear. If the thermal cycle counter exceeds the maximum allowable limit, the steering gear has reached its end of life and must be replaced.

[Conditions for Running the DTC](#)

The ignition is ON.

[Conditions for Setting the DTC](#)

C0475 00

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal motor circuits.

C0475 59

The power steering control module detects the thermal cycle counter has exceeded the maximum allowable limit and the whole steering gear system must be replaced.

Action Taken When the DTC Sets

- The DTC is stored in memory.
- The driver information centre displays the SERVICE POWER STEERING warning message.
- No steering assist.

Conditions for Clearing the DTC

C0475 00

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

C0475 59

This DTC cannot be cleared.

DTC Descriptor

DTC C047A: Electric Steering Motor Position Sensor Circuit Malfunction

Circuit/System Description

The power steering control module continuously monitors the motor position sensor voltage signals. The voltage signals of the motor position sensor and the digital torque sensor index current signal are both processed by the power steering control module to detect and calculate the steering wheel angle.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal motor position sensor circuits.

Action Taken When the DTC Sets

- No steering assist.
- The driver information centre displays the SERVICE POWER STEERING warning message.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.

DTC Descriptor

DTC C0545 00: Steering Wheel Torque Sensor Malfunction

Circuit/System Description

The power steering control module continuously monitors the digital torque sensor's torque and index current signals. As the steering wheel is turned and torsional twist is applied to the steering shaft, the steering input and output shafts are monitored via the torque signal circuit and then processed by the power steering control module to calculate the steering torque.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal motor position sensor circuits.

Action Taken When the DTC Sets

- DTC C0545 is stored in memory.
- The driver information centre displays the SERVICE POWER STEERING warning message.
- No steering assist.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

[Circuit/System Description](#)

The power steering control module monitors the steering angle sensor signal via the GMLAN serial data circuit. The power steering control module utilizes this signal to determine a center point for Active Return and Soft End Stops. Upon detecting an invalid steering angle sensor signal, the power steering control module will disable Active Return and Soft End Stops, then set a DTC.

Note: To most drivers the loss of Active Return and Soft End Stops may not be noticeable as there is no visual indicator activated on the instrument cluster or driver information display.

There is no cause that can be diagnosed with the power steering control module when this DTC is set, DO NOT REPLACE POWER STEERING CONTROL MODULE OR STEERING GEAR DUE TO THIS DTC.

For diagnosis of an invalid steering angle sensor signal, refer to Antilock Brake System Diagnostic Information and Procedures.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

The power steering control module has received one of the following serial data messages listed below from the external steering angle sensor.

- Steering angle range is exceeded
- Steering angle sensor is not calibrated
- Steering angle sensor is initialized
- Steering angle sensor message: Roll Counter is INVALID
- Steering angle sensor message: Present Bit is FALSE (not common)
- Steering angle sensor message: Error Flag is set to TRUE

Action Taken When the DTC Sets

- The electronic brake control module disables the stability control for the duration of the ignition cycle.
- Active Return and Software End Stops are deactivated.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- When the steering angle sensor signal becomes valid, the fault will set to History and can be cleared with a scan tool.

Diagnostic Aids

The car should not pull in either direction causing the steering wheel to be OFF center while driving straight ahead on a level surface.

Circuit/System Verification

1. Ignition ON.
2. With a scan tool, verify that DTC C0710 71 is not set.
If DTC C0710 71 is set
Refer to [DTC C0710](#) in Antilock Brake System Diagnostic Information and Procedures.
If DTC C0710 71 is not set
3. All OK.

Rattle, Clunk, or Shudder Noise from the Power Steering System

Step	Action	Yes	No
1	Review the system description and operation in order to familiarize yourself with the system functions. Did you review the Power Steering System Description and Operation?	Go to Step 2	Go to Power Steering System Description and Operation : Electronic Power Steering
2	1. Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom. 2. Inspect for aftermarket devices which could affect the operation of the power steering system. 3. Verify that a rattle, clunk or shudder noise is present. Is a rattle, clunk or shudder noise present?	Go to Step 3	System OK
3	Inspect the power steering gear for the proper installation. Refer to Steering Gear Replacement . Is the power steering gear installation incorrect?	Go to Step 6	Go to Step 4
4	Inspect the intermediate shaft. Is the intermediate shaft worn?	Go to Step 8	Go to Step 5
5	Inspect the suspension. Is the suspension worn?	Go to Step 7	—
6	Install the power steering gear correctly. Refer to Steering Gear Replacement . Did you complete the repair?	Go to Step 9	—
7	Replace the worn suspension components. Did you complete the repair?	Go to Step 9	—
8	Replace the intermediate shaft. Refer to Intermediate Steering Shaft Replacement . Did you complete the repair?	Go to Step 9	—
	Operate the system in order to verify the repair.

Steering Linkage Outer Track rod Replacement

Callout

Component Name

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the front tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Steering Linkage Outer Tie Rod Nut

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

1. Remove the steering linkage outer track rod nut.
Discard the nut.
2. Install a NEW steering linkage outer track rod nut.

Tighten

35 N·m (26 lb ft)

Steering Linkage Inner Track rod Nut

Procedure

2.
 1. Use paint in order to place match marks on the steering linkage inner track rod nut and on the steering linkage inner track rod.
 2. During installation, align the match marks.
 3. Do not tighten the nut during installation. Tighten the nut after adjusting the front toe. Refer to [Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment](#) .

Steering Linkage Outer Track rod

Caution: Do not free the ball stud by using a pickle fork or a wedge-type tool. Damage to the seal or bushing may result.

Procedure

3.
 1. Use the *CH-24319-B* puller in order to separate the steering linkage outer tie rod from the steering knuckle.
 2. Inspect the steering linkage inner track rod for bent or damaged threads.
 3. Clean the tapered surface of the steering knuckle.
 4. After installation, measure and adjust the front toe. Refer to [Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment](#) .
 5. Centre the steering angle sensor. Refer to [Steering Angle Sensor Centreing](#) .

Special Tools

CH-24319-B Steering Linkage and Track Rod Puller

For equivalent regional tools, refer to [Special Tools](#) .

Steering Gear Boot Replacement

Special Tools

CH-22610 Keystone Clamp Pliers

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the steering linkage outer track rod. Refer to [Steering Linkage Outer Track rod Replacement](#) .
3. Remove the steering linkage inner track rod nut.

4. Remove the outer boot clamp (1).

Discard the clamp.

5. Cut the inner boot clamp (3).

Discard the clamp.

6. Remove the steering gear boot (2).

7. Clean the steering linkage inner tie rod and the steering gear boot contact area of any lubricant or debris.

[Installation Procedure](#)

Note:

- The steering linkage inner tie rod and the steering gear boot must be free from moisture and debris.
- Ensure that the larger end of the steering gear boot is firmly seated in the correct location on the steering gear.

1. Install the steering gear boot with the NEW inner boot clamp (3) loosely attached.

2. Use the *CH-22610* pliers in order to install the NEW inner boot clamp (1).

Note: Ensure that the small end of the steering gear boot is firmly seated in the correct location on the steering linkage inner tie rod.

3. Install the NEW outer boot clamp (2).
4. Install the steering linkage inner track rod nut (1).
5. Install the steering linkage outer track rod. Refer to [Steering Linkage Outer Track rod Replacement](#) .
6. Measure and adjust the front toe. Refer to [Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment](#) .
7. Lower the vehicle.

Steering Gear Replacement

Callout

Component Name

Caution: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD-susceptible components may or may not be labelled with the ESD-symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to discharge your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible to ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.

- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

Caution: With wheels of the vehicle facing straight ahead, secure the steering wheel utilising steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

Preliminary Procedures

1. With the front wheels in the straight ahead position, pull the driver's seatbelt between the spokes on the steering wheel and buckle the seatbelt in order to lock the steering column.
2. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
3. Disconnect the outer tie rods from the steering knuckles. Refer to [Steering Linkage Outer Track rod Replacement](#) .
4. Disconnect the intermediate steering shaft from the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .
5. Disconnect the steering column dash seal from the dash panel.
6. Lower the drivetrain and front suspension frame in order to gain clearance for the steering gear. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .
7. Disconnect the front stabiliser shaft insulator clamps from the frame and reposition the shaft in order to gain clearance for the steering gear. Refer to [Stabiliser Shaft Replacement](#) .

Steering Gear Nut (Qty: 2)

Caution: Refer to [Fastener Caution](#) in the Preface section.

1 Procedure

1. Remove the 2 steering gear nuts.
2. Install 2 steering gear nuts. Hold the steering gear nuts while tightening the steering gear bolts.

2	Steering Gear Washer (Qty: 2)
	<p data-bbox="236 74 626 110">Steering Gear Bolt (Qty: 2)</p> <p data-bbox="236 142 2540 215">Warning: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause bodily injury and damage to the vehicle or component.</p> <p data-bbox="236 261 405 293">Procedure</p> <ol data-bbox="276 342 806 375" style="list-style-type: none"> 1. Disconnect the electrical connectors. Refer to FEP Connectors : Steering Gear . 2. After the installation is complete, measure the wheel alignment and adjust the alignment as necessary. Refer to Wheel Alignment Measurement . 3. Programme the power steering control module. Refer to Power Steering Control Module Programming and Setup . 4. Centre the steering angle sensor and learn the software end stops. Refer to Power Steering Control Module Calibration .

Steering Linkage Inner Tie Rod Replacement

[Removal Procedure](#)

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the steering gear boot. Refer to [Steering Gear Boot Replacement](#) .
3. Turn the steering wheel in order to position the steering gear rack so that only 2 rack teeth and the flat surface of the rack are visible outside the steering gear housing.

4. Place a soft jaw pipe wrench or soft jaw pliers on the flat surface of the steering gear rack (3) between the steering gear housing (4) and the inner tie rod housing (2).
5. Place a crow's foot spanner on the flats of the inner tie rod housing.

Caution: Do not change the steering gear preload adjustment before moving the inner tie rod from the steering gear. Changing the steering gear preload adjustment before moving the inner tie rod could result in damage to the pinion and the steering gear.

6. Rotate the steering linkage inner tie rod housing counter-clockwise while holding the steering gear rack stationary until the steering linkage inner tie rod separates from the steering gear rack.

Installation Procedure

1. Install the steering linkage inner tie rod to the steering gear rack.

2. Place a soft jaw pipe wrench or soft jaw pliers on the flat surface of the steering gear rack (3) between the steering gear housing (4) and the inner tie rod housing (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Place a torque spanner with a crow's foot spanner attachment on the flats of the inner tie rod housing and tighten to **100 N·m (74 lb ft)**.
4. Install the steering gear boot. Refer to [Steering Gear Boot Replacement](#).
5. Lower the vehicle.

Steering Gear Drive Coupling Replacement

Callout	Component Name
Preliminary Procedure	

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the power steering assist motor. Refer to [Power Steering Assist Motor Replacement](#) .

1

Steering Gear Coupling

Tip

The steering gear coupling connects the power steering assist motor to the steering gear.

Power Steering Assist Motor Replacement

Callout

Component Name

Caution: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labelled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible to ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.

- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

Preliminary Procedures

1. Capture the data from the old power steering assist motor. Refer to [Power Steering Control Module Programming and Setup](#) .
2. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
3. Remove the steering gear. Refer to [Steering Gear Replacement](#) .

Power Steering Assist Motor Bolt (Qty: 3)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

1. Remove the 3 power steering assist motor bolts.
Discard the bolts.
2. Install 3 NEW power steering assist motor bolts.

Tighten

8 N·m (71 lb in)

Power Steering Assist Motor

Procedure

1. Remove the O-ring from the steering gear housing.
Discard the O-ring.
2. Install a NEW O-ring around the steering gear housing.
3. Install the steering gear coupling to the assist motor armature.
4. Align the steering gear coupling on the assist motor armature to the steering gear.
5. Align the power steering assist motor bolts to the steering gear while pressing the motor over the gear housing O-ring.
6. After the installation is complete, transfer the data from the old power steering assist motor to the new power steering assist motor. Refer to [Power Steering](#)

Power Steering Control Module Calibration

[Steering Angle Sensor Centring and Software Endstop Learning](#)

Warning: An inaccurate or not centred steering angle sensor could limit the operation of the electric power steering (EPS) and result in personal injury.

Centring of the steering angle sensor and software endstop learning might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering angle sensor replacement
- Steering gear replacement
- Power steering assist motor replacement
- Steering column replacement
- Steering linkage inner track rod replacement
- Steering linkage outer track rod replacement

Note: It is necessary to perform the steering angle sensor centring before the software endstop learning.

Steering Angle Sensor Centreing

For the centring procedure of the external steering angle sensor (electronic stability program) refer to [Steering Angle Sensor Centreing](#) . The centring procedure of the internal steering angle sensor (w/o electronic stability program) can be completed with the following steps:

Conditions: Front axle measured and set, engine running, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is activated.

1. Using the steering wheel, align the front wheels in the center forward position.
2. Using a scan tool, perform the Configuration/Reset Functions, Steering Wheel Angle Sensor Centring procedure.
3. Steer from the centre position slowly 90° to the left.
4. Steer slowly back to the centre position and then slowly 90° to the right.
5. Steer slowly back to the centre position.
6. Perform the steering movements again.
7. Centring procedure is completed.

Software Endstop Learning

The software endstop learning procedure can be completed with the following steps:

Conditions: Front axle measured and set, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is calibrated or external steering angle sensor sends a valid CAN signal.

1. Using a scan tool, perform the Configuration/Reset Functions, Power Steering Softstops Reset procedure and follow the on-screen instructions.
2. Using a scan tool, perform the Configuration/Reset Functions, Power Steering Softstops Learn procedure and follow the on-screen instructions.
3. Software endstop learning procedure is completed.

Power Steering System Description and Operation — Electronic Power Steering

The power steering system consists of the following components:

- The power steering control module
- The power steering motor
- The power steering motor rotational sensor
- The torque sensor
- The steering gear (rack and dual pinion)

The rack and dual pinion electric power steering system reduces the amount of effort needed to steer the vehicle utilising the power steering control module to control the power steering motor to manoeuvre the steering gear. The power steering control module also uses a combination of the torque sensor, motor rotational sensor, battery voltage circuit and GMLAN serial data circuit to perform the system functions. The power steering control module monitors vehicle speed and engine speed from the engine control module via the GMLAN serial data circuit to determine the amount of steering assist needed to steer the vehicle. At low speeds more assist is provided for easy turning during parking manoeuvres. At higher speeds less assist is provided for improved road feel and directional stability.

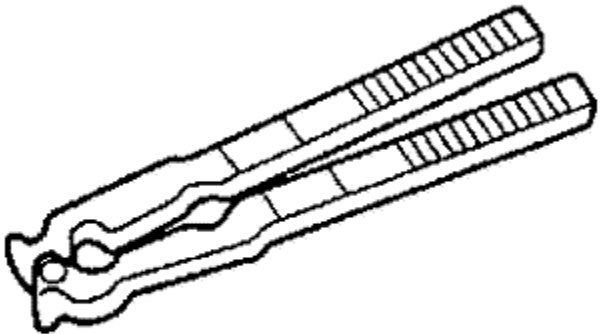

The power steering control module uses a combination of the torque sensor, motor rotational sensor, vehicle speed, and calculated system temperature inputs to determine the amount of assist needed. The power steering control module continuously monitors the digital torque sensor's torque and index current signals. As the steering wheel is turned and torsional twist is applied to the steering shaft, the steering input and output shafts are monitored via the torque signal circuit and then processed by the power steering control module to calculate the steering torque. The voltage signals of the motor position sensor and the digital torque sensor's index current signal are both processed by the power steering control module to detect and calculate the steering wheel angle.

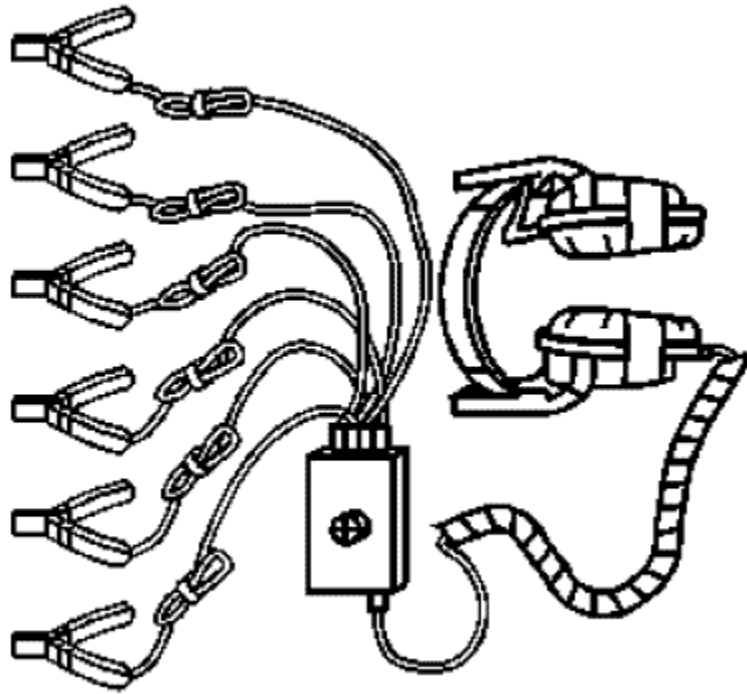

The power steering control module responds to the change in the digital torque sensor signals as well as the motor rotational sensor's voltage signals by commanding current to the power steering motor. The power steering control module controls the pulse width modulated motor drive circuit to drive the 3-phase motor. The power steering control module and motor assembly is attached to the base of the steering gear housing and assists the steering gear pinion to manoeuvre the rack from left to right according to turning the steering wheel.

The power steering control module has the ability to calculate an internal system temperature to protect the power steering system from damage caused by high temperature. To reduce a high system temperature, the power steering control module will reduce the amount of current commanded to the power steering motor, which reduces the amount of steering assist. The power steering control module has the ability to detect malfunctions within the electric power steering system. Any malfunction detected that disables steering assist will cause the SERVICE POWER STEERING message to be displayed on the driver information centre.

DTC B1023

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B1023 00: Integral Switch Malfunction

Circuit/System Description

The vehicle theft deterrent subsystem provides the capability to lock or unlock the steering electrically. The steering column lock control module is allowed to unlock when power mode transitions to a non off power mode and an authenticated driver identification device is present. Once the column is unlocked, a crank request can be allowed.

Conditions for Running the DTC

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.

Conditions for Setting the DTC

The steering column lock control module detects an internal sensor malfunction resulting in lock status of invalid to be transmitted on serial data.

Action Taken When the DTC Sets

- DTC B1023 is stored in memory.
- The driver information centre displays the service column lock system warning message.
- The steering column lock indicator is ON.

Conditions for Clearing the DTC

- No steering column lock control module internal sensor malfunction so lock status of valid is transmitted on serial data.
- The condition for setting the DTC is no longer present.

Off/Accessory Voltage	B144C 06	B144C 06	B144C 01	—

[Circuit/System Description](#)

The vehicle theft deterrent subsystem provides the capability to lock or unlock the steering column electrically. The steering column lock control module is allowed to unlock when power mode transitions to a non off power mode and an authenticated driver identification device is present. Once the column is unlocked, a crank request can be allowed.

[Conditions for Running the DTC](#)

- The system voltage is between 9–16 V.
- The DTC can only run when the steering column lock control module is awake.

[Conditions for Setting the DTC](#)

B144C 01

The steering column lock control module detects a short to voltage when the power mode is in the RUN or CRANK for greater than 5 seconds.

B144C 06

The steering column lock control module detects a short to ground or an open in the Off/Accessory circuit when the power mode is in the OFF/ACC for greater than 3 seconds.

Action Taken When the DTC Sets

- The steering column lock control module will command the driver information centre to display the service column lock warning message.
- The steering column lock control module indicator is ON.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- The DTC will be a history DTC when the voltage is present and the power mode is OFF or ACC or when voltage is not present and the power mode is RUN or CRANK.
- A history DTC will clear after 50 ignition cycles.

Diagnostic Aids

Verify that DTC B144B is not set prior to performing extensive electrical diagnostics.

Circuit/System Testing

1. Ignition OFF, disconnect the KR73 RUN/CRNK relay.
2. Ignition ON, verify that a test lamp does not illuminate between the control circuit terminal 87A and ground.
If the test lamp illuminates, test the control circuit for a short to voltage. If the circuit tests normal, replace the K60 Steering Column Lock Control Module.
3. Verify that a test lamp illuminates between the B+ circuit terminal 30 and ground.
If the test lamp does not illuminate, test the B+ circuit for an open/high resistance.
4. Ignition OFF, disconnect the harness connector at the K60 steering column lock control module.
5. Connect a test lamp between the voltage circuit terminal 3 and ground.
6. Ignition ON, connect a 5 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87A. Verify the test lamp is illuminated.
If the test lamp is not illuminated and the control circuit fuse is good, test the control circuit for an open/high resistance.
If the test lamp is not illuminated and the control circuit fuse is open, test the control circuit for a short to ground. If the circuit tests normal, replace the K60 steering column lock control module.
7. If all circuits test normal, test or replace the KR73 RUN/CRNK relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR73 RUN/CRNK relay.
2. Test for 60-200 Ω between terminals 85 and 86.
If not within the specified range, replace the KR73 RUN/CRNK relay.
3. Test for infinite resistance between the following terminals:
 - 30 and 86
 - 30 and 87
 - 30 and 85

- 85 and 87

If not the specified value, replace the KR73 RUN/CRNK relay.

4. Test for less than 2 Ω between terminals 30 and 87A.

If greater than the specified range, replace the KR73 RUN/CRNK relay.

5. Install a 3 A fused jumper wire between the relay terminal 85 and 12 V. Install a jumper wire between the relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

If greater than specified range, replace the KR73 RUN/CRNK relay.

DTC B2515

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B2515 5A: Steering Column Lock Motor Feedback Circuit Not Plausible

Circuit/System Description

The vehicle theft deterrent subsystem provides the capability to lock or unlock the steering electrically. The steering column lock control module is allowed to unlock when power mode transitions to a non off power mode and an authenticated driver identification device is present. Once the column is unlocked, a crank request can be allowed.

Conditions for Running the DTC

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.

Conditions for Setting the DTC

The body control module (BCM) detects a not plausible feedback from the steering column lock control module.

Action Taken When the DTC Sets

- DTC B2515 is stored in memory.
- The driver information centre displays the service column lock system warning message.
- The steering column lock indicator is ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The BCM detects a plausible feedback from the steering column lock control module.

DTC B2897

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B2897 02: Steering Column Lock Motor Lock Circuit Short to Ground

DTC B2897 05: Steering Column Lock Motor Lock Circuit High Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Steering Column Lock Motor Lock Signal	B2897 02	B2897 05	B2897 05	—

[Circuit/System Description](#)

The vehicle theft deterrent subsystem provides the capability to lock or unlock the steering electrically. The steering column lock control module is allowed to unlock when power mode transitions to a non off power mode and an authenticated driver identification device is present. Once the column is unlocked, a crank request can be allowed.

[Conditions for Running the DTC](#)

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.

[Conditions for Setting the DTC](#)

B2897 02

The steering column lock enable input circuit is shorted to ground.

B2897 05

The steering column lock enable input circuit is open or shorted to battery.

Action Taken When the DTC Sets

- DTC B2897 is stored in the steering column lock control module memory.
- The steering column lock control module will command the driver information centre to display the service column lock warning message.
- The steering column lock control module indicator is ON.

Conditions for Clearing the DTC

The steering column lock control module has received a lock command and detects no longer a malfunction in the steering column lock circuit.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the K60 Steering Column Lock Control Module.
2. Test for less than 10 Ω between the ground circuit terminals 6 and 7 and ground.
If greater than the specified value, test the ground circuit for an open/high resistance.
3. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 3 and ground
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. Test for less than 0.3 V between the control circuit terminal 4 and ground.
If greater than the specified value, test the control circuit for a short to voltage.
6. Disconnect the connector at the K84 Keyless Entry Control Module.
7. Test for less than 5 Ω between the K60 Steering Column Lock Control Module circuit terminal 4 and the K84 Keyless Entry Control Module circuit terminal 1.
If greater than the specified range, test the control circuit for a open/high resistance.
8. If all circuits test normal, test or replace the K60 Steering Column Lock Control Module. If the DTC resets replace the K84 Keyless Entry Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC Descriptor

DTC B2910 00: Steering Column Lock Password Incorrect

Circuit/System Description

The vehicle theft deterrent subsystem provides the capability to lock or unlock the steering electrically. The steering column lock control module is allowed to unlock when power mode transitions to a non off power mode and an authenticated driver identification device is present. Once the column is unlocked, a crank request can be allowed.

Conditions for Running the DTC

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.

Conditions for Setting the DTC

The steering column lock control module has not received the correct password or did not receive a password with the command to unlock the steering column.

Action Taken When the DTC Sets

- DTC B2910 is stored in memory.
- The driver information centre displays the service column lock system warning message.
- The steering column lock indicator is ON.
- The engine will not crank.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The steering column lock control module has received the correct password with the command to unlock the steering column.

Diagnostic Aids

This DTC may set if the BCM was replaced and the steering column lock control module was not reprogrammed.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B305A 00: No Response From Steering Column Lock Received

Circuit/System Description

The vehicle theft deterrent subsystem provides the capability to lock or unlock the steering electrically. The steering column lock control module is allowed to unlock when power mode transitions to a non off power mode and an authenticated driver identification device is present. Once the column is unlocked, a crank request can be allowed.

Conditions for Running the DTC

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.

Conditions for Setting the DTC

The body control module (BCM) has not received any response from the steering column lock control module.

Action Taken When the DTC Sets

- DTC B305A is stored in the BCM memory.
- The driver information centre displays the service column lock system warning message.
- The steering column lock indicator is ON.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The BCM has received response from the steering column lock control module.

Intermediate Steering Shaft Replacement

Callout

Component Name

Caution: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)

- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tyres and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centred and cause possible damage to the SIR coil. If you think the SIR coil has become uncentred, refer to your specific SIR coil's centring procedure to re-centre SIR Coil.

Preliminary Procedures

1. With the front wheels in the straight ahead position, pull the driver's seat belt between the spokes on the steering wheel and buckle the seat belt in order to secure the steering wheel.
2. Use paint in order to place match marks on the steering gear pinion shaft and on the intermediate steering shaft.
3. Use paint in order to place match marks on the steering column shaft and on the intermediate steering shaft.

1	<p>Intermediate Steering Shaft Upper Bolt</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove all traces of the original adhesive patch. 2. Clean the threads of the bolt with denatured alcohol, or equivalent, and allow to dry. 3. Apply thread locking adhesive. Refer to Adhesives, Fluids, Lubricants, and Sealers . <p>Tighten 34 N·m (25 lb ft)</p>
2	<p>Intermediate Steering Shaft Lower Bolt</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove all traces of the original adhesive patch. 2. Clean the threads of the bolt with denatured alcohol, or equivalent, and allow to dry. 3. Apply thread locking adhesive. Refer to Adhesives, Fluids, Lubricants, and Sealers . <p>Tighten 34 N·m (25 lb ft)</p>
3	<p>Intermediate Steering Shaft</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. If you are replacing the intermediate steering shaft, copy the match marks from the old intermediate steering shaft to the new intermediate steering shaft. 2. After installation, center the steering angle sensor. Refer to Steering Angle Sensor Centreing .

Steering Column Upper Trim Cover Replacement

Callout

Component Name

Note: The instrument panel cluster trim plate and the steering column upper trim cover must be removed as an assembly, do not attempt to separate.

Preliminary Procedures

Disable the SIR system. Refer to [SIR Disabling and Enabling](#) .

Instrument Panel Cluster Trim Plate and Steering Column Upper Trim Cover Assembly

Procedures

- 1
1. Turn the steering wheel to the left in order to release the left tab securing the upper trim cover to the lower trim cover.
 2. Release the retainers along the left side of the upper trim cover securing it to the lower trim cover.
 3. While holding the left side of the trim cover up, turn the steering wheel enough to release the right retainer tab securing the right side of the upper trim cover to the lower trim cover.
 4. Release the retainers along the right side of the upper trim cover securing it to the lower trim cover.
 5. Grasp the instrument panel cluster trim plate and steering column upper trim cover assembly and pull rearward releasing the clips securing the assembly to the instrument panel.

2 Instrument Panel Cluster Trim Plate Assembly

Steering Column Upper Trim Cover

3 **Procedure**

When replacing either the instrument panel cluster trim plate or the steering column upper trim cover snap the two pieces together prior to installing them into the vehicle.

Steering Column Lower Trim Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel cluster trim plate and steering column upper trim cover assembly. Refer to Steering Column Upper Trim Cover Replacement .	
	Steering Column Lower Trim Cover Fastener (Qty: 3)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Turn the steering wheel right or left enough to access the fasteners.</p>
2	Steering Column Lower Trim Cover

Steering Column Lock Control Module Replacement

Callout

Component Name

Preliminary Procedures

1. Ensure that the steering wheel and the front wheels are in the straight ahead position.
2. Remove the steering column opening lower filler. Refer to [Steering Column Opening Lower Filler Replacement](#) .
3. With your foot off of the brake pedal and the shift lever in the PARK position, press the ignition and start switch once. This will place the ignition system in the

- ACCESSORY (ACC) mode and unlock the steering column for 5 minutes.
4. Turn the steering wheel in order to verify the steering column is not locked.
 5. Disconnect any electrical connectors as necessary.
 6. With your foot off of the brake pedal and the shift lever in the PARK position, press the ignition and start switch once. This will place the ignition system in the OFF mode. With the electrical connector disconnected, the steering column lock module will remain in the unlocked position.

1	<p>Steering Column Lock Control Module Bolt (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Note: The 2 steering column lock control module bolts on the forward end of the steering column lock control module are shear bolts.</p> <ol style="list-style-type: none"> 1. Use any of the following common tools in order to remove the bolts: <ul style="list-style-type: none"> • An angle grinder and a screwdriver • A hammer and a chisel • A screw extractor • A centre punch 2. Discard the old bolts. 3. Install 2 NEW bolts and tighten until the bolt heads break off.
2	<p>Steering Column Lock Control Module Bolt (Qty: 2)</p> <p>Note: The 2 steering column lock control module bolts on the left and right sides of the steering column lock control module are standard bolts.</p> <p>Tighten 9.5 N·m (84 lb in)</p>
3	<p>Steering Column Lock Control Module</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disconnect any electrical connectors as necessary. 2. After installation is complete, programme and setup the steering column lock control module. Refer to Control Module References .

Turn Signal Switch Bracket Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the steering wheel. Refer to Steering Wheel Replacement .	
2. Remove the upper trim cover and the lower trim cover from the steering column. Refer to Steering Column Lower Trim Cover Replacement .	

Turn Signal Switch Bracket

Procedure

1. Disconnect any electrical connectors as necessary.
2. Release the 2 tabs in order to release the direction indicator switch bracket from the steering column.
3. Transfer any parts as necessary. Refer to the following procedures:
 - [Turn Signal Multifunction Switch Replacement](#)
 - [Windscreen Wiper and Washer Switch Replacement](#)
 - [Steering Wheel Airbag Coil Replacement](#)
 - [Steering Angle Sensor Replacement](#)

Turn Signal Multifunction Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the upper trim cover and the lower trim cover from the steering column. Refer to Steering Column Lower Trim Cover Replacement .	
	Indicator Switch

1

Procedure

1. Disconnect any electrical connectors as necessary.
2. Release the plastic retaining tabs and remove the direction indicator multifunction switch from the direction indicator switch bracket.

Steering Wheel Replacement

Callout	Component Name
Preliminary Procedure	
Remove the steering wheel inflatable restraint module. Refer to Steering Wheel Inflatable Restraint Module Replacement .	
2	Steering Wheel Bolt

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 30 N·m (22 lb ft)</p>
2	<p>Steering Wheel</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect any electrical connectors as necessary.2. Loosen the steering wheel bolt until 2 to 3 threads are left engaged.3. Wiggle the steering wheel until the steering wheel disengages completely.4. Remove the steering wheel bolt.5. Ensure that there are match marks on the steering wheel and on the steering column shaft.6. Remove the steering wheel.7. Transfer any parts as necessary. Refer to Steering Wheel Spoke Lower Cover Replacement as necessary.

Steering Wheel Spoke Lower Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the steering wheel inflatable restraint module. Refer to Steering Wheel Inflatable Restraint Module Replacement .	
Steering Wheel Lower Cover	

Procedure

1

1. Use a trim tool in order to remove the steering wheel lower cover and the components covering the spokes of the steering wheel.
2. Disconnect any electrical connectors as necessary.
3. Remove the cruise control switch. Refer to [Cruise Control Switch Replacement](#) .
4. Remove the radio and telephone control switch. Refer to [Radio and Telephone Control Switch Replacement](#) .
5. Transfer any parts as necessary.

Steering Column Replacement

Callout

Component Name

Caution: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The steering shaft coupling

- The intermediate shaft(s)

After disconnecting these components, do not rotate the steering wheel or move the front tyres and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centred and cause possible damage to the SIR coil. If you think the SIR coil has become uncentred, refer to your specific SIR coil's centring procedure to re-centre SIR Coil.

Preliminary Procedures

1. With the front wheels in the straight ahead position, secure the steering wheel.
2. Disable the supplemental inflatable restraint system. Refer to [SIR Disabling and Enabling](#) .
3. Remove the upper trim cover and the lower trim cover from the steering column. Refer to [Steering Column Lower Trim Cover Replacement](#) .
4. Remove the driver's knee air bag and the steering column opening lower filler. Refer to [Steering Column Opening Lower Filler Replacement](#) .
5. Use paint in order to place match marks on the steering column shaft and on the intermediate steering shaft.
6. Disconnect the intermediate steering shaft from the steering column. Refer to [Intermediate Steering Shaft Replacement](#) .

Steering Column Nut (Qty: 4)

Caution: Refer to [Fastener Caution](#) in the Preface section.

1

Tip

The steering column nut attaches to a stud that is welded to a bracket.

Tighten

22 N·m (16 lb ft)

Steering Column

Caution: Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on the end could collapse the steering shaft or loosen the plastic injections, which maintain column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the column's collapsible design. Do NOT hammer on the end of the shaft, because hammering could loosen the plastic injections, which maintain column rigidity. If you need to remove the steering wheel, refer to the Steering Wheel Replacement procedure in this section.

Procedure

2

1. Disconnect any electrical connectors as necessary.
2. Push the steering column down on the lower instrument panel retainer in order to clear the studs.
3. Transfer any parts as necessary. Refer to the following procedures as necessary:
 - [Steering Wheel Inflatable Restraint Module Replacement](#)
 - [Steering Wheel Replacement](#)
 - [Turn Signal Switch Bracket Replacement](#)
 - [Turn Signal Multifunction Switch Replacement](#)

- [Windscreen Wiper and Washer Switch Replacement](#)

- [Steering Wheel Airbag Coil Replacement](#)

- [Steering Angle Sensor Replacement](#)

4. If you are replacing the steering column, copy the match marks from the old steering column to the new steering column.

5. After installation, center the steering angle sensor. Refer to [Steering Angle Sensor Centreing](#) .

Steering Angle Sensor Replacement

Callout	Component Name
Preliminary Procedure	
Remove the steering wheel airbag coil. Refer to Steering Wheel Airbag Coil Replacement .	
	Steering Angle Sensor

1

Procedure

1. Press in the clip on the steering wheel airbag coil in order to remove the steering angle sensor.
2. After the installation is complete, centre the steering angle sensor. Refer to [Steering Angle Sensor Centring](#) .

Steering Wheel and Column Description and Operation

[Steering Column Lock](#)

The Steering Column Lock Module (SCLM) controls the steering wheel theft deterrent lock function, which allows the column to be electronically locked. When a valid key is used to start the vehicle, the BCM recognises this and will send the encrypted password to the SCLM. The SCLM will compare its own stored password to the encrypted password sent by the BCM. If the data matches, the steering column will be unlocked.

In order for the steering column to be locked the SCLM has to see 3 inputs.

1. The BCM power mode is OFF.
2. The vehicle is stationary based on zero speed reported from all ABS wheel speed sensors.
3. The driver or passenger door is opened reported by the PEPS module.

When the SCLM receives these inputs, the steering column will be locked.

The SCLM monitors the column lock system and will set DTC codes when the module detects malfunctions within the system. When a malfunction occurs the driver information centre (DIC) will display the Service Column Lock Now message indicating DTC codes are set within the SCLM.

[Driver Safety](#)

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column: The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident.

[Heated Steering Wheel](#)

The heated steering wheel system consists of a heated steering wheel, a heated steering wheel switch, and a steering wheel heat module. The heated steering wheel includes non-serviceable heating elements and a temperature sensor. The heating elements and sensor are located in the left and right sides of the rim of the steering wheel. The heated steering wheel switch is located in the left steering wheel control switch assembly. The steering wheel heat control module is located at the bottom of the steering wheel centre hub. When the switch is pressed, the switch signal circuit is earthed and the heat module turns the heated steering wheel on. The system then remains on until the customer turns it off. The wheels normal operating temperature is 32°C (89.6°F). The wheel takes approximately 3 to 4 minutes to reach the normal operating temperature. The wheel will take longer to heat up if the vehicle temperature is below -21°C (-5.8°F). The built-in temperature sensor provides input to the controller to limit the temperature to normal operating temperature. The wheel will not operate if the vehicle temperature is at or above 32°C (89.6°F).

Stabiliser Shaft Replacement

Callout

Component Name

Preliminary Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the stabiliser shaft link from the stabiliser shaft. Refer to [Stabilizer Shaft Link Replacement](#) .

Front Stabiliser Shaft Insulator Clamp Bolt (Qty: 2)

Warning: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause bodily injury and damage to the vehicle or component.

Caution: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause damage to the vehicle or component.

Caution: Refer to [Fastener Caution](#) in the Preface section.

1 **Procedure**

Lower the Drivetrain and Front Suspension Frame Assembly. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .

Tip

Lower the front suspension frame assembly enough to gain access to the stabiliser shaft insulator bolts.

Tighten

1. First Pass: 22 N·m (16 lb ft).
2. Final Pass: 40 degrees.

2 Front Stabiliser Shaft

Tip

The stabiliser shaft insulator and the clamps are serviced with the stabiliser shaft. They are Not service separately.

Stabilizer Shaft Link Replacement

Callout

Component Name

Preliminary Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .

Front Stabiliser Shaft Nut (Qty: 2)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

1

1. Using the proper size allen key, hold the stabiliser shaft link ball stud while removing the stabiliser shaft nut.
2. Remove and discard the nut. DO NOT re-use the nut, replace with NEW only.

Tighten

65 N·m (48 lb ft)

Front Stabiliser Shaft Link

2

Caution: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause damage to the vehicle or component.

Front Wheel Bearing and Hub Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .2. Remove the tyre and wheel assembly. Refer to Tyre and Wheel Removal and Installation .3. Remove the wheel speed sensor. Refer to Front Wheel Speed Sensor Replacement .	

4. Remove the front brake rotor. Refer to [Front Brake Disc Replacement](#) .
5. Remove the wheel drive shaft nut from the wheel drive shaft. Refer to [Front Wheel Drive Shaft Replacement](#) .

1	<p>Front Wheel Hub Bolt (Qty: 3)</p> <p>Warning: Refer to Torque-to-Yield Fastener Warning in the Preface section.</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Remove and discard the bolt and replace with NEW only.</p> <p>Tighten</p> <ol style="list-style-type: none"> 1. Steering Knuckle Replacement

[Removal Procedure](#)

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Remove the wheel bearing and hub assembly. Refer to [Front Wheel Bearing and Hub Replacement](#) .
4. Remove the front suspension strut bolts from the knuckle. Refer to [Strut Assembly Removal and Installation](#) .

5. Remove and discard the lower ball joint nut (1) and the bolt (2) from the steering knuckle. Replace with NEW only.

Caution: Do not free the ball stud by using a pickle fork or a wedge-type tool. Damage to the seal or bushing may result.

Caution: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause damage to the vehicle or component.

6. DO NOT use any type of pry bars or power tools to separate ball joint from the steering knuckle.
7. Remove the steering knuckle (3) from the vehicle.

Installation Procedure

1. Position the steering knuckle in the front suspension strut and in the lower control arm.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Caution: This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause damage to the vehicle or component.

2. Install the lower ball joint nut (1) and the NEW bolt (2) in the steering knuckle and tighten:
 - **First Pass: 50 N·m (37 lb ft)**
 - **Second Pass: loosen 120 degrees**
 - **Third Pass: 50 N·m (37 lb ft)**
 - **Final Pass: additional 35 degrees**

3. Ensure that the ball joint boot (1) is properly seated between the lower control arm and the knuckle.
4. Install the front suspension strut bolts in the steering knuckle. Refer to [Strut Assembly Removal and Installation](#) .
5. Install the wheel bearing and hub assembly. Refer to [Front Wheel Bearing and Hub Replacement](#)
6. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
7. Remove the supports and lower the vehicle.

Procedure

- 5
1. Remove the speed sensor electrical harness from the front lower control arm.
 2. Remove the lower control arm from the knuckle. Refer to [Steering Knuckle Replacement](#) .

Note: If removing the lower control arm to service the lower control arm bushing, loosen the bolt before removing the lower control arm.

3. If removing the lower control arm to service the bushing, refer to [Front Lower Control Arm Bush Replacement](#) .

Front Lower Control Arm Bush Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front lower control arm. Refer to Lower Control Arm Replacement .	
1	<p>Front Lower Control Arm Bushing Bolt</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Install the lower control arm in a soft jawed vice. 2. Discard the front lower control arm bushing bolt and replace with new ONLY. 3. Tighten the bolt to specifications when the vehicle is sitting on a level surface. <p>Tighten</p>

	<ol style="list-style-type: none">1. First Pass: 55 N·m (41 lb ft)2. Final Pass: additional 100 degrees

Wheel Stud Replacement

Callout

Component Name

Preliminary Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
3. Remove the front wheel bearing and hub. [Front Wheel Bearing and Hub Replacement](#) .

Wheel Stud (Qty: 5)

Procedure

1

1. Rotate the wheel hub so that the wheel stud to be removed is located where the front brake caliper mounts to the knuckle.
2. Using the *CH 43631* remover, remove and discard the wheel stud from the wheel hub. Replace with NEW only.
3. When installing the wheel stud, use the proper amount of washers to allow the wheel stud to be fully seated against the wheel bearing flange.
4. Use a wheel nut with the flat side of the wheel nut facing the washers to fully seat the wheel stud.

Special Tools

CH 43631 Ball Joint Remover

For equivalent regional tools, refer to [Special Tools](#)

Strut Assembly Removal and Installation

Special Tools

CH 35669 Wrench

For regional equivalent tools, refer to [Special Tools](#) .

Removal Procedure

1. Remove the air inlet grille panel. Refer to [Air Inlet Grille Panel Replacement](#) .
2. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
3. Remove the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
4. Remove the stabilizer shaft link from the front strut. Refer to [Stabilizer Shaft Link Replacement](#) .
5. Remove the front brake hose from the front strut. Refer to [Front Brake Hose Replacement](#) .

6. Using the *CH 35669* spanner (2) and the Torx® (1), loosen the upper strut nut.

7. Remove the front strut nuts (4) and the front suspension strut mount (3).

Note: Before removing the front strut assembly, place a clean workshop towel over the wheel drive shaft boot.

8. Remove the front suspension strut mount nut (1) and the front suspension strut mount (2).

9. Remove the front suspension strut assembly (1).

[Installation Procedure](#)

1. Position the front suspension strut assembly (1) in the vehicle.

Note: Finger tighten the nut to hold the front suspension strut assembly in place.

2. Install the front suspension strut mount upper mount nut (1) and the front suspension strut mount (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the front suspension strut nuts (4) and bolts (3) and tighten the nuts to:

3.1. First Pass: **85 N·m (63 lb ft)**.

3.2. Final Pass: **additional 65 degrees**.

4. Using the *CH 35669* spanner (2) and the TORX® (1), tighten the front suspension strut mounting nut (1) to **45 N·m (33 lb ft)**.
5. Install the stabiliser shaft link to the front suspension strut. Refer to [Stabilizer Shaft Link Replacement](#) .
6. Install the front brake hose to the front suspension strut. Refer to [Front Brake Hose Replacement](#)
7. Install the tyre and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
8. Remove the support and lower the vehicle.
9. Install the air inlet grille panel. Refer to [Air Inlet Grille Panel Replacement](#)

Volt

Suspension Shock/Strut Disposal

Warning: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.

1. Clamp the strut in a vice horizontally with the rod (1) completely extended.
2. Drill a hole in the strut at the centre of the end cap (3) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the strut. Use

workshop towels in order to contain the escaping oil.

3. Remove the strut from the vice.
4. Hold the strut over a drain pan vertically with the hole down.
5. Move the rod (1) in and out of the tube (2) to completely drain the oil from the strut.

Strut, Strut Component, or Spring Replacement

Special Tools

- *CH 6066* Strut Spring Compressor
- *CH 35669* Spanner

For equivalent regional tools, refer to [Special Tools](#)

[Disassembly Procedure](#)

1. Remove the front suspension strut from the vehicle. Refer to [Strut Assembly Removal and Installation](#) .

2. Install the front suspension strut (2) in the *CH 6066* compressor (1).

Note: The spring is compressed when the strut moves freely.

3. Using the *CH 6066* compressor , compress the front spring.

4. Using a TORX® bit (1) and the *CH 35669* spanner (2), remove the front suspension strut nut.

5. Remove the front suspension strut (2) from the *CH 6066* compressor .
6. Remove the front suspension strut mount and the front spring from the *CH 6066* compressor .

[Assembly Procedure](#)

1. Install the front spring and front suspension strut mount (2) to the *CH 6066* compressor (1).
2. Using the *CH 6066* compressor (1), compress the front spring (2).
3. Hand-tighten the front suspension strut nut.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Use the proper size TORX® bit, hold the strut shaft.

4. Using the *CH 35669* spanner (2) and the TORX® bit (1), tighten the front suspension strut nut to **70 N·m (52 lb ft)**.
5. Remove the front suspension strut from the *CH 6066* compressor .
6. Install the front suspension strut to the vehicle. Refer to [Strut Assembly Removal and Installation](#) .

Front Suspension Description and Operation

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tyres travelling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tyre and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tyre's horizontal relationship to the road.

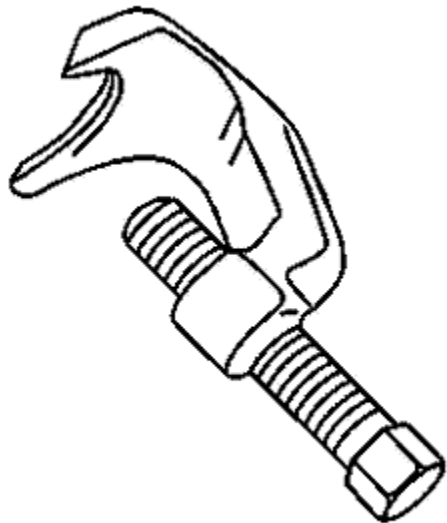

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushes. The upper portion of the steering knuckle is attached to a strut assembly. The strut assembly then connects to the vehicle body by way of an upper bearing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A strut is a basic hydraulic cylinder. The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabiliser shaft. The anti-roll bar connects between the left and right lower control arm assemblies through the stabiliser link and stabiliser shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.
