13. Install the front wheelhouse panel splash shield. Refer to [Front Wheelhouse Front Liner Replacement](#) .
14. Install the tire and wheel assembly. Refer to [Tyre and Wheel Removal and Installation](#) .
15. Lower the vehicle.
16. Check the fluid level of the transmission. Refer to [Transmission Fluid Level and Condition Check](#) .

Front Wheel Drive Shaft Inner Joint Boot Replacement

Special Tools

DT 35910 Drive Axle Seal Clamp Pliers

For equivalent regional tools, refer to [Special Tools](#)

[Disassemble Procedure](#)

1. Remove the wheel drive shaft from the vehicle. Refer to [Front Wheel Drive Shaft Replacement](#) .

2. Install the wheel drive shaft in a soft-jawed vise.

3. Using a pair of side cutters, remove and discard the small boot clamp (4) from the boot (3).
4. Using the appropriate tool, remove and discard the large boot clamp (2) from the boot (3).

5. Remove the boot (3) from the tripod housing (1).
6. Remove the inner tripod housing (1) from the wheel drive shaft and the tripod (2).

7. Using the appropriate tool, remove the tripot spider retaining ring (1) from the wheel drive shaft (4).
8. Remove the tripot spider (2) from the wheel drive shaft (4).
9. Remove the wheel drive shaft boot (3) from the wheel drive shaft (4).

Note: If there is any sign of damage or excessive wear, replace the wheel drive shaft as an assembly. There are no service parts available for the inner joint assembly.

10. Inspect the wheel drive shaft inner joint.

[Assemble Procedure](#)

1. Install the boot and the boot clamp (1) on the wheel drive shaft (3).
2. Ensure that the boot (1) is properly seated in the groove (2) in the wheel drive shaft.

3. Install the tripot spider (2) until just touches the shoulder on the wheel drive shaft (4).
4. Using the appropriate tool, install the outer tripot spider retaining ring (1).

5. Using the *DT 35910* pliers (1), close the boot clamp (2) until the gap (3) measures **1.6 mm (0.06 in)**.

6. Install the tripot housing (1) on the wheel drive shaft (2).
7. Install the wheel drive shaft boot (3) on the tripot housing (1).
8. Place approximately **160 grams (5.7 ounces)** of the lubricant in the boot and the remaining half in the tripot housing. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .

9. Using the *J 35910* pliers (3), ratchet wrench (4) and a breaker bar (5), close the boot clamp (1) until the gap (6) measures **2.0 mm (0.07 in)**.
10. Remove any excess lubricant from the tripot housing and wheel drive shaft.
11. Move the tripot joint housing in a circular motion to distribute the lubricant in the tripot housing.
12. Remove the wheel drive shaft from the vice.
13. Install the wheel drive shaft in the vehicle. Refer to [Front Wheel Drive Shaft Replacement](#) .

Front Wheel Drive Shaft Outer Joint Boot Replacement

Special Tools

- *DT-35910* Drive Axle Seal Clamp Pliers
- *GE-396* Snap Ring Pliers

For equivalent regional tool, refer to [Special Tools](#) .

[Disassemble Procedure](#)

1. Remove the wheel drive shaft from the vehicle. Refer to [Front Wheel Drive Shaft Replacement](#) .

2. Install the drive axle shaft in a soft-jawed vice.

Caution: Do not cut through the wheel drive shaft inboard or outboard boot during service. Cutting through the boot may damage the sealing surface of the housing and the tripod or the constant velocity joint bushing. Damage to the sealing surface may lead to water and dirt intrusion and premature wear of the constant velocity joint.

3. Use a flat-bladed tool, remove the boot clamp (2) from the constant velocity (CV) joint (1) and the boot (3).
4. Using a pair of side cutters, remove the boot clamp (4) from the boot (3) and the wheel drive shaft (5).
5. Discard the boot clamps (2) and (4). Use only NEW clamps.

Warning: Use of eye goggles is necessary to prevent personal injury.

6. If equipped with a small swage ring, use a hand grinder to cut through the swage ring, taking care not to damage the halfshaft bar, in order to remove the swage ring. Otherwise, remove the small seal retaining clamp with a side cutter. DISCARD the retaining clamp.
7. Separate the boot (4) from CV joint outer race (1) at large diameter.
8. Slide the boot (4) away from joint along half shaft bar (5).
9. Wipe the grease from the face of the CV joint inner race (2).
10. Spread the ears on the race retaining ring (3) with GE-396 pliers (6).

11. Using a block of wood and a hammer, remove the CV joint (2) from the half shaft bar (1).

12. Remove and DISCARD the boot (1) from the half shaft bar (2).

Note: If there is any sign of damage or excessive wear, replace the wheel drive shaft as an assembly. There are no service parts available for the outer joint assembly.

13. Clean the following items thoroughly with cleaning solvent. Remove all traces of old grease and any contaminates.

- The inner and outer race assemblies
- The CV joint cage
- The chrome alloy balls

14. Clean the halfshaft bar. Use a wire brush to remove any rust in the seal mounting area (grooves).

[Assemble Procedure](#)

1. Position the boot and the clamp (1) on the half shaft bar (2).

2. Ensure that the boot (1) is properly seated in the grooved (2) half shaft bar (3).
3. Place approximately **95 grams (3.4 ounces)** of lubricant inside the outboard boot and pack the CV joint with the remaining lubricant. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .

4. Using a block of wood and a hammer, install the CV joint (1) on the half shaft bar.

5. Install the boot clamp (2) on the CV joint housing (1).

Note: Ensure that the boot clamp is properly positioned around the entire circumference of the boot.

6. Using the *DT-35910* pliers with a breaker bar and a ratchet spanner (1), tighten the boot clamp (2) until the gap (3) in the boot clamp measure **1.6 mm (0.06 in)**.

7. Using the *DT-35910* pliers (3), breaker bar (5), and the torque spanner or ratchet spanner (4), tighten the boot clamp (1) until the gap (6) in the boot clamp measure **2.0 mm (0.08 in)**.
8. Distribute the lubricant within the outer CV joint by moving it in a circular motion at least four to five times.
9. Remove the wheel drive shaft from the bench vice.
10. Install the wheel drive shaft assembly. Refer to [Front Wheel Drive Shaft Replacement](#) .

Wheel Drive Shafts Description and Operation

Front wheel drive axles are flexible assemblies.

Front wheel drive axles consist of the following components:

- A front wheel drive shaft tripod joint (inner joint)
- A front wheel drive shaft constant velocity joint (outer joint)
- A front wheel drive shaft

The front wheel drive shaft connects the front wheel drive shaft tripod joint and the front wheel drive shaft constant velocity joint.

The front wheel drive shaft tripod joint is completely flexible. The front wheel drive shaft tripod joint can move in and out.

The front wheel drive shaft constant velocity joint is flexible, but the front wheel drive shaft constant velocity joint cannot move in and out.

Boots And Clamps

The front wheel drive shaft constant velocity joint and the front wheel drive shaft tripod joint boots in the front wheel drive axle are made of a thermoplastic material.

The clamps in the front wheel drive axle are made of stainless steel.

The boot provides the following functions:

- Protection of the internal parts of the front wheel drive shaft constant velocity joint and the front wheel drive shaft tripod joint
The boot protects the grease from the following sources of damage:
 - Harmful atmospheric conditions, such as extreme temperatures or ozone gas
 - Foreign material, such as dirt or water
- Allows angular movement and the axial movement of the front wheel drive shaft tripod joint
- Allows angular movement of the front wheel drive shaft constant velocity joint

Note: Protect the boots from sharp tools and from the sharp edges of the surrounding components. Any damage to the boots or the clamps will result in leakage. Leakage will allow water to leak into the front wheel drive shaft tripod joint and the front wheel drive shaft constant velocity joints. Leakage will also allow grease to leak out of the front wheel drive shaft tripod joints and the front wheel drive shaft constant velocity joints. Leakage may cause noisy front wheel drive axle operation and eventual failure of the internal components.

The clamps provide a leak proof connection for the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joint at the following locations:

- The housing
- The front wheel drive shaft

The thermoplastic material performs well under normal conditions and normal operation. However, the material is not strong enough to withstand the following conditions:

- Abusive handling
- Damage from sharp objects, such as sharp tools or any sharp edges of the surrounding components in the vehicle

Front Wheel Drive Shaft Tripot Joint (Inner Joint)

The front wheel drive shaft tri-pot joint is made with the tripot design without an over-extension limitation retainer.

The joint is constructed as follows for vehicles that are equipped with an automatic transmission:

- The left front wheel drive axle has a female spline. The female spline installs over a stub shaft that protrudes from the transaxle.
- The right front wheel drive axle has a female spline. The right front wheel drive axle uses barrel type snap rings in order to interlock with the intermediate shaft.

Front Wheel Drive Shaft Constant Velocity Joint (Outer Joint)

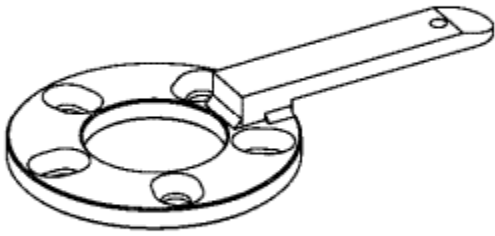

The front wheel drive shaft constant velocity joint is made with the Rzeppa joint design.

The shaft end (which mates with the knuckle/hub) has a helical spline. The helical spline ensures a tight, press-type fit.

This design prevents end play between the hub bearing and the front wheel drive axle.

Special Tools

DTC B0000

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B0000 5A: Vehicle Speed Information Circuit Not Plausible

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal Terminal 20 X4	B0000 5A	B0000 5A	B0000 5A	B0000 5A

[Circuit/System Description](#)

The radio receives a vehicle speed signal from the electronic brake control module (EBCM) in order to correlate actual vehicle speed to the movement of the vehicle calculated by the navigation system and reported serial data.

[Conditions for Running the DTC](#)

- Radio ON.
- Battery voltage must be between 9-16 V.

[Conditions for Setting the DTC](#)

- Vehicle speed from serial data is more than 5 km/h (3 mph) and vehicle speed pulse from the EBCM is 0 km/h (0 mph).
- Vehicle speed calculated from the navigation processing software is more than 36 km/h (22 mph) and vehicle speed pulse from the EBCM is 0 km/h (0 mph) for 10 seconds continuously.

Action Taken When the DTC Sets

- Turn by turn route navigation may be inoperative.
- Vehicle indicated location may be inaccurate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC clears after 100 malfunction-free ignition cycles.

Circuit/System Testing

Note: Diagnose any antilock brake system (ABS) related DTCs before performing this diagnostic.

1. Vehicle OFF, disconnect the X4 harness connector at the A11 radio.
2. Vehicle ON, operate the vehicle drive wheels at 5 mph. Test for 3-7 Hertz between the signal circuit terminal 20 and ground.
If not within the specified range, test the signal circuit terminal 20 for an open, high resistance, short to ground or short to voltage. If the circuit tests normal replace the K17 EBCM.
3. If the circuit tests normal, replace the A11 radio.

[DTC Descriptor](#)

DTC B1020 00: Auxiliary Electronic Control Unit (ECU) Performance

[Circuit/System Description](#)

The radio communicates with the radio/HVAC control via serial data. This DTC indicates a fault in the radio/HVAC control. No external circuits are involved. The radio may continue to respond normally to faceplate functions when this DTC is set.

[Conditions for Running the DTC](#)

- Ignition is ON or in the ACC position.
- The system voltage is at least 9.5 V and no more than 15.5 V.
- All the above conditions are present for greater than 10 seconds.

[Conditions for Setting the DTC](#)

The radio receives an improper status response indicating an internal ECU fault in the radio/HVAC control.

[Action Taken when the DTC Sets](#)

No action is taken.

[Conditions for Clearing the DTC](#)

- A current DTC clears when the radio receives a proper status response message back from the radio control assembly.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the radio/HVAC control.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the radio/HVAC control.
- If this DTC is retrieved as both a current and history DTC, replace the radio/HVAC control.

Right Rear Audio Signal Circuit	B1055 02*	B1055 04**	B1055 01*	--

* Noticeable audio distortion possible.

** No or reduced sound from speaker.

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio and audio amplifier has a DC bias voltage that is approximately one half of battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centred around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Diagnostic Aids

Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting. If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.

Conditions for Running the DTC

- Ignition is ON or in the ACC position
- The system voltage is 9-16 V
- The test is run once during radio wake up

Conditions for Setting the DTC

B1025 01, B1035 01, B1045 01, B1055 01

The radio detects a short to voltage on the specified audio (+) or (-) circuit.

B1025 02, B1035 02, B1045 02, B1055 02

The radio detects a short to ground on the specified audio (+) or (-) circuit.

B1025 04, B1035 04, B1045 04, B1055 04

The radio detects an open on the specified audio (+) or (-) circuit.

Action Taken When the DTC Sets

The radio continues to send the output signal to the speaker signal circuit with the current fault.

Conditions for Clearing the DTC

- A current DTC clears when the conditions for setting the DTC are no longer present and the ignition has been cycled from OFF to ON.
- A history DTC clears after 50 malfunction-free ignition cycles.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate P19 speaker.
2. Radio ON, test for 5.0-7.5 V between the signal circuit terminal 1 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
3. Test for 5.0-7.5 V between the signal circuit terminal 2 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
4. If all circuits test normal, replace the appropriate P19 speaker.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Speaker Replacement Reference](#)
- [Control Module References](#) for radio replacement, setup, and programming.

DTC B125A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B125A 02: Aerial Signal Circuit Short to Ground

DTC B125A 04: Aerial Signal Circuit Open Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Aerial Coax	B125A 02	B125A 04	1	--
Ground	--	1	--	--
1. May exhibit possible AM/FM interference.				

[Circuit/System Description](#)

The AM/FM aerial is part of the multi-band aerial is located on the roof of the vehicle. The radio provides battery voltage to the AM/FM amplifier in the aerial base using the centre conductor of the aerial coaxial cable. When a 12 V signal is seen by the amplifier, both AM and FM signals are amplified.

[Conditions for Running the DTC](#)

- Vehicle in Service Mode.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B125A 02

The radio detects a short to ground in the aerial signal circuit centre conductor.

B125A 04

The radio detects an open in the aerial signal circuit centre conductor.

Action Taken When the DTC Sets

Radio reception may be poor or not available.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles have occurred.

[Circuit/System Verification](#)

Vehicle in Service Mode, radio ON, tune to a strong AM or FM station. Verify that the AM or FM reception is clear.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the radio aerial coax from the A11 radio and the T4G aerial.
2. Test for infinite resistance between the aerial coax centre terminal and ground.
If less than the specified value, replace the aerial coax.
3. Test for infinite resistance between the coax centre terminal and the outer shield.
If less than the specified value, replace the aerial coax.
4. Test for less than 5 Ω on the aerial coax centre circuit from end to end.
If greater than the specified range, replace the aerial coax.
5. Vehicle in Service Mode, test for less than 1 V between the aerial coax centre terminal and ground.
If greater than the specified range, replace the aerial coax.
6. Connect the aerial coax to the A11 radio. Test for 12-15 V between the aerial coax centre terminal and ground at the T4G aerial connector.
If not within the specified range, replace the A11 radio.
7. If all circuits test normal, replace the T4G aerial.

DTC B1265

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B1265 02: Switched 14 Volt Performance Short to Ground

Circuit/System Description

When the radio is on, a discrete 12 V signal is supplied on the entertainment remote enable circuit to the Audio Amplifier and the Information Display Module. This signal is used to control the power state of the components.

Conditions for Running the DTC

The following are conditions that must be present in order for the radio to enable diagnostics:

- The radio is ON.
- The system voltage is 9 - 16 V

Conditions for Setting the DTC

- The radio detects a short to ground on the entertainment remote enable circuit circuit.
- The above condition is present for greater than 250 mS.

Action Taken When the DTC Sets

- The radio implements a current limiting mode and disables the output on the entertainment remote enable circuit.

- All components connected on the entertainment remote enable circuit will be inoperative.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- After the ignition has been OFF for a sufficient amount of time to allow the radio to enter a low power/sleep state, the radio will re-enable the output on the following ignition cycle and the DTC will become history.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the radio/infotainment systems.
- The radio's current limiting logic will not re-enable the output on the entertainment remote enable circuit until after the radio performs a full power-down. It may be necessary to wait 5 minutes with the key OFF and retained accessory power OFF for the radio to re-enable this output.

Circuit/System Testing

1. Vehicle OFF, radio OFF, radio B+ fuse removed, disconnect all of the connectors listed below:
 - T3 Audio Amplifier X2
 - P17 Information Display Module X1 (display screen)
2. Reinstall the radio B+ fuse. Vehicle in Service Mode, radio ON, verify that a test lamp illuminates between the entertainment remote enable circuit terminals listed below and ground:
 - T3 Audio Amplifier X2 terminal 14
 - P17 Information Display Module X1 terminal 6

If the test lamp does not illuminate, test the entertainment remote enable circuit for a short to ground or an open/high resistance. If the circuit tests normal replace the radio.
3. Re-connect the X2 harness connector at the T3 audio amplifier. Verify that DTC B1265 does NOT set as current.

If DTC B1265 sets as current, replace the T3 audio amplifier.
4. Re-connect the X1 harness connector at the P17 information display module. Verify that DTC B1265 does NOT set as current.

If DTC B1265 sets as current, replace the P17 information display module.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B1271 00: Theft Protection Active

[Circuit/System Description](#)

When the radio is initially installed in the vehicle, the radio receives VIN information via serial data. The radio stores a portion of the VIN and compares this sequence to the VIN information received each time the radio powers on. The VIN in the radio is a single one-time learn.

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. This DTC is generated by the module when the Theft Protection is activated.

[Conditions for Running the DTC](#)

This DTC test runs when the radio changes from OFF to ON.

[Conditions for Setting the DTC](#)

The radio has learned a correct VIN sequence and the VIN information received via serial data does NOT match the learned VIN sequence.

[Action Taken When the DTC Sets](#)

The radio may be disabled or have limited functionality. The radio display will indicate that theft protection is active.

Conditions for Clearing the DTC

The radio receives the correct VIN information via serial data.

Diagnostic Aids

A possible cause of incorrect VIN info could be the radio was originally installed in another vehicle.

DTC B1278 or B1279

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B1278 01: Left Auxiliary Input Signal Circuit Short to Battery

DTC B1278 02: Left Auxiliary Input Signal Circuit Short to Ground

DTC B1279 01: Right Auxiliary Input Signal Circuit Short to Battery

DTC B1279 02: Right Auxiliary Input Signal Circuit Short to Ground

Circuit/System Description

A remote 3.5 mm auxiliary stereo jack allows playback of audio signals from remote devices (e.g., laptop computer, IPOD, MP3 player, etc.). When a remote device audio mini-plug is inserted in the remote auxiliary jack, an internal mechanical switch opens. The radio detects the device, switches to AUX as the audio source, and the device begins playing. Audio signals from the device are sent to the radio from the auxiliary input jack via the left, right, and common audio signal circuits.

Conditions for Running the DTC

- Ignition in RUN or ACC position.
- The system voltage is at least 9.5 V and no more than 15.5 V.

Conditions for Setting the DTC

The radio detects a short to battery or short to ground on the left auxiliary audio signal circuit.

B 1279

The radio detects a short to battery or short to ground on the right auxiliary audio signal circuit.

The above conditions are present for greater than 250 mS.

Action Taken When the DTC Sets

No audio is heard from the remote audio device.

Conditions for Clearing the DTC

- The conditions for setting the DTC are no longer present on the auxiliary input signal circuits.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the module.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the X83 auxiliary audio jack.
2. Vehicle in Service Mode, test for less than 1 V between the terminals listed below and ground:
 - signal terminal 1
 - signal terminal 2

If greater than the specified value, test the circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.

3. Vehicle OFF, disconnect the X1 harness connector at the radio. Test for infinite resistance between the circuits listed below and ground:
 - auxiliary audio common circuit terminal 23
 - left auxiliary audio circuit terminal 24
 - right auxiliary audio circuit terminal 10

If not the specified value, test the signal circuit for a short to ground.

4. If all circuits test normal, replace the X83 auxiliary audio jack.

DTC Descriptors

DTC B1287 01: Amplifier Control Signal Circuit Short to Battery

DTC B1287 02: Amplifier Control Signal Circuit Short to Ground

DTC B1287 04: Amplifier Control Signal Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Amplifier Control	B1287 02,**	B1287 04,**	B1287 01,*	-

* No audio output.

** 4 Channel unmute, possible noise in speakers when radio muted or turned off

Circuit/System Description

The radio amplifier control circuit provides varying pulse width modulated (PWM) signals to control overall muting of the amplifier. The PWM signals are varying duty cycle percentages ranging from 0-100 percent. A low duty cycle unmutes all amplifier channels and a high duty cycle mutes all amplifier channels. The amplifier control circuit will measure less than 1 V when the mute function is OFF, and approximately 8 V DC when at full mute. The radio monitors the amp control circuit for faults.

Conditions for Running the DTC

The following are conditions that must be present in order for the radio to enable the diagnostics.

- The radio is in ACCESSORY, RUN, or RAP power mode.
- The system voltage is 9-16 V.
- The radio performs the test once during wakeup.

[Conditions for Setting the DTC](#)

The radio detects a fault on the amplifier control circuit 400 ms after radio activates the remote enable circuit.

[Action Taken When the DTC Sets](#)

Radio sets the DTC and continues to output correct state.

[Conditions for Clearing the DTC](#)

- The condition must no longer be present.
- A history DTC clears after 50 malfunction-free ignition cycles.

Circuit/System Testing

Note: To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.

1. Vehicle OFF, disconnect the X2 harness connector at the T3 amplifier.
2. Vehicle in Service Mode, radio ON, mute ON, test for 7.5-8.5 V between the amplifier control circuit terminal 12 and ground.
If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
3. Mute OFF, test for less than 1 V between the amplifier control circuit terminal 12 and ground.
If greater than the specified range, replace the A11 radio.
4. If all circuits test normal, replace the T3 amplifier.

DTC B2462

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B2462 01: Global Positioning System Short to Battery

DTC B2462 02: Global Positioning System Short to Ground

DTC B2462 04: Global Positioning System Open

Circuit/System Description

The navigation aerial is connected to the navigation radio. The radio supplies 5 V to the aerial to power the internal amplifier through the centre conductor of the aerial coax cable.

Conditions for Running the DTC

- Radio On.
- System voltage is greater than 9 V and less than 16 V.
- The navigation radio tests the GPS aerial every 10 seconds.

Conditions for Setting the DTC

B2462 01

The radio detects a short to B+ on the GPS aerial signal circuit.

B2462 02

The radio detects a short to ground on the GPS aerial signal circuit.

B2462 04

The radio detects an open/high resistance on the GPS aerial signal circuit.

Action Taken When the DTC Sets

- The radio uses the last reported position and the vehicle speed signal to calculate the vehicle position.
- Route guidance may be inaccurate.
- Turn by turn navigation may be inaccurate or inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Special Tools

EL-49903 OnStar Aerial Diagnostic Tool Kit

[Circuit/System Testing](#)

Without UE1

1. Ignition OFF, disconnect the navigation aerial coax cable from the A11 radio.
2. Connect the EL-49903 to the A11 radio, place the test aerial on the roof of the vehicle.
3. Ignition ON, verify DTC B2462 is not set in the A11 radio.
If DTC B2462 is set as current, replace the A11 radio.
4. Ignition OFF, reconnect the navigation aerial coax cable at the A11 radio.
5. Disconnect the aerial coax cable from the T4G navigation aerial.
6. Ignition ON, test for 4.5-5.5 V between the coax cable centre conductor and the outer shield.
If not within the specified range, test or replace the coax cable.
7. If all circuits test normal, replace the T4G navigation aerial.

[Component Testing](#)

Caution: Refer to [Test Probe Caution](#) in the Preface section.

Note: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the centre coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between both ends of the coax cables centre terminals.
If greater than the specified range, replace the coax cable
3. Test for less than 5 Ω between both ends of the coax cable outer shield.
If greater than the specified range, replace the coax cable

4. Test for infinite resistance between the coax cable centre wire and the outer coax shield.
If less than the specified range, replace the coax cable.

DTC B2470

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B2470 01: Mobile Phone Aerial Circuit Short to Battery

DTC B2470 02: Mobile Phone Aerial Circuit Short to Ground

DTC B2470 04: Mobile Phone Aerial Circuit Open

[Circuit/System Description](#)

The mobile phone aerial is connected to the Mobile Telephone Control Module. This module supplies 5 V to the mobile phone aerial to power the internal amplifier.

[Conditions for Running the DTC](#)

- The vehicle is ON.
- System voltage is between 9.5-15.5 V.
- The above conditions are present for greater than 1 s.

[Conditions for Setting the DTC](#)

The Mobile Telephone Control Module does not detect the presence of a mobile phone aerial.

[Action Taken When the DTC Sets](#)

Mobile telephone communication cannot be established.

Conditions for Clearing the DTC

- The Mobile Telephone Control Module detects the presence of a mobile phone aerial.
- A history DTC clears after 50 malfunction free ignition cycles.

Circuit/System Verification

Verify that the Mobile Phone Aerial assembly is not damaged.

If the antenna assembly is damaged, replace the T4F Mobile Phone Antenna or T4E Mobile Phone and Navigation Antenna.

Circuit/System Testing

Note: The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.

1. Vehicle OFF, disconnect the mobile coax cable connector at the T4F Mobile Phone Aerial or T4E Mobile Phone and Navigation Aerial.
2. Vehicle ON, Test for 5 V between the coax cable centre wire and the outer coax shield.
If less than the specified range, test the coax cable for an open/high resistance or a short to ground. If the coax cable tests normal, replace the K82 Mobile Telephone Control Module.
If greater than the specified range, test the coax cable for a short to voltage. If the coax cable tests normal, replace the K82 Mobile Telephone Control Module.
3. If all circuits test normal, replace the T4F Mobile Phone Antenna or T4E Mobile Phone and Navigation Antenna.

Component Testing

Caution: Refer to [Test Probe Caution](#) in the Preface section.

Note: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the centre coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Vehicle OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between both ends of the coax cables centre terminals.
If greater than the specified range, replace the failed coax cable.
3. Test for greater than infinite resistance between the coax cable centre wire and the outer coax shield.
If less than the specified range, replace the coax cable.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Radio Aerial Base Replacement](#)

DTC B2485

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B2485 02: Wireless Communication Aerial Circuit Short to Ground

DTC B2485 04: Wireless Communication Aerial Circuit Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2485 02	B2485 04	--	--

[Circuit/System Description](#)

The Bluetooth aerial is a small fixed aerial connected directly to the mobile telephone control module and is used to send and receive signals from a Bluetooth enabled cellular phone. The aerial is external to the vehicle.

[Conditions for Running the DTC](#)

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.
- The mobile telephone control module tests the aerial once every second.

[Conditions for Setting the DTC](#)

B2485 02

- The signal voltage is less than 1 V.
- The above conditions must be met for 500 ms.

B2485 04

- The signal voltage is greater than 2 V.
- The above conditions must be met for 500 ms.

Action Taken When the DTC Sets

The Bluetooth communication can not be establish.

Conditions for Clearing the DTC

The DTC will become history when the condition for setting the DTC is no longer present.

Description and Operation

[Cellular Telephone Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Circuit/System Testing

1. Replace the T4S Wireless Communication Aerial - Bluetooth.
2. Clear the DTCs and operate the vehicle within the conditions for running the DTC. Verify DTC B2485 does not set.
If the DTC sets, replace the K82 Mobile Telephone Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for mobile telephone control module replacement, programming and setup

Symptoms - Mobile Communication

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) .
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to [Cellular Telephone Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the mobile telephone control module. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Cellular Telephone Conversation Partner Does Not Hear You](#)
- [Cellular Telephone Conversation Partner Cannot Be Heard](#)
- [Cellular Telephone Charging Malfunction](#)

Symptoms - Entertainment

Important: The following steps must be completed before using the symptom table.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Radio/Audio System Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Auxiliary Audio Input Malfunction](#)
- [No Global Positioning System \(GPS\) Reception](#)
- [Radio Controls Malfunction](#)
- [Radio Information Display Malfunction - DTC U0257](#)
- [Radio Poor Reception](#)
- [Speaker Malfunction](#)

Auxiliary Audio Input Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[Circuit/System Description](#)

Auxiliary Audio Input Jack

The 3.5 mm (1/8 in.) auxiliary audio input jack is located in the console. All circuits from the auxiliary jack are connected directly to the radio. When a portable audio playback device is connected to the auxiliary jack an internal switch opens. The radio detects the device and switches to AUX as the audio source. Audio signals from the device are sent to the radio from the auxiliary input jack via the left, right, and common audio signal circuits.

USB Port

The vehicle may be equipped with a USB port in the console. This port allows USB connectivity to the infotainment system from portable media players or a USB storage device (memory stick/ flash drive). When a device is connected to the USB port, the system detects the device and switches to USB as the audio source. Once connected, the device can be controlled from the radio controls.

The USB port is connected to the radio via a standard USB cable. Mini type USB connectors are used to connect the cable at the USB port and the radio. Standard USB male to female connections are typically used for connecting USB cables together where an in-line connection is required. An in-line cable connection is typically found between the console and I/P harness.

Not all portable media player devices are compatible. Memory stick/ flash drive capability is limited to MP3 and WMA file types only. Video transfer from any device is not supported. Refer to the owner's manual for information on USB devices, control, and operation.

[Diagnostic Aids](#)

Auxiliary Audio Input Jack

- When a device is first connected to the 3.5 mm (1/8 in.) input jack the infotainment system automatically switches to that device. If an auxiliary device has already been

connected, press the AUX or CD/AUX button to select the device.

- If the system detects the device, but the audio is not heard or is not clear, attempt to connect the device using a different cable; cables can deteriorate over time or become damaged.
- Playback of an audio device that is connected to the 3.5 mm jack can only be controlled using the controls on the device.
- The volume control on the device may need to be adjusted to ensure sufficient playback volume through the infotainment system.

USB

- When a device is first connected to the USB port, the infotainment system automatically switches to that device. If an auxiliary device has already been connected, press the AUX or CD/AUX button to select the device.
- A low battery condition in a portable media player may not allow the device to connect to the system, or can create communication issues with the device. Verify the device battery state of charge and re-charge or replace as needed.
- Connect the device directly to the USB port if possible. Only use a cable if it is required to connect the device. The use of extension cables can cause communication issues.
- If a cable is required for connection, attempt to connect the device using a different cable; cables can deteriorate over time or become damaged.
- Attempt audio playback from multiple USB devices when diagnosing USB concerns. Device compatibility can vary based on vehicle equipment. If the infotainment system is capable of operating any USB type device, the cause of the concern is not with the vehicle system. The inoperative device(s) may be incompatible or contain no recognised media types.
- If a 'Device Not Supported' or similar type error message is displayed, this indicates the system has connected to the device but cannot communicate with it properly. This does not indicate an issue with the vehicle system. The device may be incompatible, may require a 'reset', or may require an update to its software/firmware.
- If a 'No Supported Data Found' or similar type error message is displayed, this indicates the system has connected to the device and is communicating, but cannot find any compatible files/data. This does not indicate an issue with the vehicle system. Verify the device contains compatible media/ file types.
- Poor connections or damaged USB cables can cause intermittent or no operation of USB devices. Inspect connectors, terminals, and cables for damage and replace components as necessary. Ensure all USB inline connections and connections at components are fully seated and connector position retainers/locks are secure.

Special Tools

EL-50334-50 USB Cable and Adapter Kit

Circuit/System Verification

Auxiliary Audio Input Jack

1. Verify no DTCs are present.
If any DTCs are present, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle in Service Mode, radio ON, connect a portable audio playback device to the auxiliary audio input jack. Verify the infotainment system switches to AUX as the audio source.
If the infotainment system does not switch to AUX as the audio source, refer to Circuit/System Testing.
3. Operate the device to begin audio playback, adjusting the volume on the device if necessary. Verify the audio from the device is heard through the vehicle infotainment system.
If audio is not heard from the device, attempt to playback audio from another device. If audio cannot be heard from any device connected to the auxiliary audio input jack, refer to Circuit/System Testing.

USB Port

1. Verify no DTCs are present.
If any DTCs are present, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Inspect the USB port for damage.
If damage is noted, replace the USB port.
3. Vehicle in Service Mode, radio ON, connect a device to the USB port. Verify the infotainment system switches to USB as the audio source.
If the infotainment system does not switch to USB as the audio source, refer to Circuit/System Testing.
4. Operate the radio controls to play audio from the device. Verify the audio from the device is heard through the vehicle infotainment system.
If audio is not heard from the device, attempt to playback audio from another device. If audio cannot be heard from any device connected to the USB port, or the audio

heard is not clear, refer to Circuit/System Testing.

Circuit/System Testing

Auxiliary Audio Input Jack

1. Vehicle OFF, disconnect the X1 harness connector at the X83 auxiliary audio input.
2. Vehicle in Service Mode, radio ON, test for 2.5-3.5 V between the auxiliary detection terminal 5 and ground.
If less than specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
3. Vehicle OFF, disconnect the X1 harness connector at the A11 radio. Test for infinite resistance between the circuits listed below and ground:
 - auxiliary audio common circuit terminal 23
 - left auxiliary audio circuit terminal 24
 - right auxiliary audio circuit terminal 10If not the specified value, test the circuit for a short to ground.
4. Test for less than 5 Ω between the A11 radio X1 terminal 24 and the X83 auxiliary audio input X1 terminal 1.
If greater than the specified value, test the signal circuit for an open/high resistance.
5. Test for less than 5 Ω between the A11 radio X1 terminal 10 and the X83 auxiliary audio input X1 terminal 2.
If greater than the specified value, test the signal circuit for an open/high resistance.
6. Test for less than 5 Ω between the A11 radio X1 terminal 23 and the X83 auxiliary audio input X1 terminal 3.
If greater than the specified value, test the signal circuit for an open/high resistance.
7. Reconnect the X1 harness connector at the A11 radio.
8. Vehicle in Service Mode, test for less than 1 V between the circuits listed below and ground:
 - auxiliary audio common circuit X83 auxiliary audio input X1 terminal 3
 - left auxiliary audio circuit X83 auxiliary audio input X1 terminal 1
 - right auxiliary audio circuit X83 auxiliary audio input X1 terminal 2If greater than the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
9. If all circuits test normal, replace the X83 auxiliary audio input and reconnect all harness connectors. Connect and operate the portable audio playback device. If audio cannot be heard from the device, replace the A11 radio.

USB Port

1. Vehicle OFF, disconnect the USB cable connection at the A11 radio.

Note: USB cables and adapters for the following tests are found in the *EL-50334-50 USB Cable and Adapter Kit* .

2. Connect the EL-50334-1 Type A male to Mini A male USB Cable to the A11 radio.
3. Connect the EL-50334-3 Type A female to Type A female adapter to the EL-50334-1 Cable.

4. Vehicle in Service Mode, radio ON, connect a USB device to the EL-50334-3 adapter. Verify the infotainment system switches to USB as the audio source.
If the infotainment system does not switch to USB as the audio source, replace the A11 radio.
5. Vehicle OFF, reconnect the vehicle USB cable to the A11 radio.
6. Disconnect the X316 I/P to floor console harness USB connector.

Note: The EL-50334-3 Type A female to Type A female adapter may be required for the following test.

7. Vehicle in Service Mode, radio ON, connect a USB device to the I/P side of the X316 connector. Verify the infotainment system switches to USB as the audio source.
If the infotainment system does not switch to USB as the audio source, replace the I/P USB cable assembly.
8. Vehicle OFF, reconnect the X316 harness connector.
9. Disconnect the USB cable at the X83 auxiliary audio input.
10. Connect the EL-50334-4 Type A female to Mini B female adapter to the USB cable.
11. Vehicle in Service Mode, radio ON, connect a USB device to the EL-50334-4 adapter. Verify the infotainment system switches to USB as the audio source.
If the infotainment system does not switch to USB as the audio source, replace the console USB cable assembly.
12. If all circuits test normal, replace the X83 auxiliary audio input.

[Circuit/System Testing](#)

Note: You must perform the [Circuit/System Verification](#) before proceeding with [Circuit/System Testing](#).

1. Vehicle OFF, disconnect the X1 connector at the K82 Mobile Telephone Control Module and the X1 connector at the A11 Radio.
2. Vehicle ON, test for less than 0.3 V between the audio signal circuit terminal 6 X1 at the K82 Mobile Telephone Control Module and ground.
If greater than the specified range, test the audio signal circuit for a short to voltage.
3. Vehicle ON, test for less than 0.3 V between the audio signal circuit terminal 15 X1 at the K82 Mobile Telephone Control Module and ground.
If greater than the specified range, test the audio signal circuit for a short to voltage.
4. Test for infinite resistance between the audio signal circuit terminal 6 X1 at the K82 Mobile Telephone Control Module and ground.
If less than the specified range, test the audio signal circuit for a short to ground.
5. Test for infinite resistance between the audio signal circuit terminal 15 X1 at the K82 Mobile Telephone Control Module and ground.
If less than the specified range, test the audio signal circuit for a short to ground.
6. Test for less than 5 Ω between the audio signal circuit terminal 6 X1 at the K82 Mobile Telephone Control Module and the audio signal circuit terminal 20 X1 at the A11 Radio.
If greater than the specified range, test the audio signal circuit for an open/high resistance.
7. Test for less than 5 Ω between the audio signal circuit terminal 15 X1 at the K82 Mobile Telephone Control Module and the audio signal circuit terminal 6 X1 at the A11 Radio.
If greater than the specified range, test the audio signal circuit for an open/high resistance.
8. Test for infinite resistance between the shield ground circuit terminal 5 X1 at the K82 Mobile Telephone Control Module and audio signal circuit terminal 6 X1 and the

audio signal circuit terminal 15 X1.

If less than the specified range, test short circuit between each signal circuit and the shield ground circuit.

9. If all circuits test normal, replace the K82 Mobile Telephone Control Module and verify that the customer concern is not still present.
If the customer concern is still present, replace the A11 Radio.

[Circuit/System Verification](#)

Vehicle ON, connect the mobile phone to the cradle observe the scan tool Phone in Cradle parameter. The reading should be Yes.

If the reading is No, refer to Connecting Malfunction.

If the reading is Yes, refer to Charging Inoperative.

[Circuit/System Testing](#)

Note: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

Connecting Malfunction

1. Vehicle OFF, disconnect the X2 connector at the K82 Mobile Telephone Control Module and the X1 connector at the X91 Mobile Telephone Connector.
2. Vehicle ON, test for less than 0.3 V between the signal circuit terminal 13 X2 at the K82 Mobile Telephone Control Module and ground.
If greater than the specified range, test the signal circuit terminal 13 X2 at the K82 Mobile Telephone Control Module for a short to voltage.
3. Vehicle ON, test for less than 0.3 V between the signal circuit terminal 15 X2 at the K82 Mobile Telephone Control Module and ground.
If greater than the specified range, test the signal circuit terminal 15 X2 at the K82 Mobile Telephone Control Module for a short to voltage.
4. Vehicle OFF, test for infinite resistance between the signal circuit terminal 13 X2 at the K82 Mobile Telephone Control Module and ground.
If less than the specified range, test the signal circuit terminal 13 X2 at the K82 Mobile Telephone Control Module for a short to ground.
5. Vehicle OFF, test for infinite resistance between the signal circuit terminal 15 X2 at the K82 Mobile Telephone Control Module and ground.
If less than the specified range, test the signal circuit terminal 15 X2 at the K82 Mobile Telephone Control Module for a short to ground.
6. Vehicle OFF, test for less than 5 Ω between the signal circuit terminal 13 X2 at the K82 Mobile Telephone Control Module and the signal circuit terminal 10 X1 at the X91 Mobile Telephone Connector.
If less than the specified range, test the signal circuit terminal 13 X2 at the K82 Mobile Telephone Control Module for an open/high resistance.

7. Vehicle OFF, test for less than 5 Ω between the signal circuit terminal 15 X2 at the K82 Mobile Telephone Control Module and the signal circuit terminal 2 X1 at the X91 Mobile Telephone Connector.
If less than the specified range, test the signal circuit terminal 15 X2 at the K82 Mobile Telephone Control Module for an open/high resistance.
8. If all circuits test normal, replace the X91 Mobile Telephone Connector and verify that the customer concern is not still present.
If the customer concern is still present, replace the K82 Mobile Telephone Control Module.

Charging Inoperative

1. Vehicle OFF, disconnect the X1 and X2 connector at the K82 Mobile Telephone Control Module.
2. Vehicle OFF, test for less than 5 Ω between the low reference circuit terminal 2 X1 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
3. Vehicle ON, test for greater than 11 V between the 12 V reference circuit terminal 1 X1 and ground.
If less than the specified range, test the 12 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
4. Vehicle ON, test for less than 0.3 V between the low reference circuit terminal 8 X2 at the K82 Mobile Telephone Control Module and ground.
If greater than the specified range, test the low reference circuit terminal 8 X2 at the K82 Mobile Telephone Control Module for a short to voltage.
5. Vehicle ON, test for less than 0.3 V between the signal circuit terminal 16 X2 at the K82 Mobile Telephone Control Module and ground.
If greater than the specified range, test the signal circuit terminal 16 X2 at the K82 Mobile Telephone Control Module for a short to voltage.
6. Vehicle OFF, test for infinite resistance between the low reference circuit terminal 8 X2 at the K82 Mobile Telephone Control Module and ground.
If less than the specified range, test the low reference circuit terminal 8 X2 at the K82 Mobile Telephone Control Module for a short to ground.
7. Vehicle OFF, test for infinite resistance between the signal circuit terminal 16 X2 at the K82 Mobile Telephone Control Module and ground.
If less than the specified range, test the signal circuit terminal 16 X2 at the K82 Mobile Telephone Control Module for a short to ground.
8. Vehicle OFF, test for less than 5 Ω between the signal circuit terminal 8 X2 at the K82 Mobile Telephone Control Module and the signal circuit terminal 4 X1 at the X91 Mobile Telephone Connector.
If less than the specified range, test the signal circuit terminal 8 X2 at the K82 Mobile Telephone Control Module for an open circuit/high resistance.
9. Vehicle OFF, test for less than 5 Ω between the signal circuit terminal 16 X2 at the K82 Mobile Telephone Control Module and the signal circuit terminal 8 X1 at the X91 Mobile Telephone Connector.
If less than the specified range, test the signal circuit terminal 16 X2 at the K82 Mobile Telephone Control Module for an open/high resistance.
10. If all circuits test normal, replace the X91 Mobile Telephone Connector and verify that the customer concern is not still present.
If the customer concern is still present, replace the K82 Mobile Telephone Control Module.

Without Navigation Radio

1. Vehicle OFF, disconnect the harness connector at the B24 Mobile Phone Microphone.
2. Vehicle OFF, test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
3. Vehicle ON, test for 9-11 V between the signal circuit terminal 3 and ground.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
4. If all circuits test normal, replace the B24 Mobile Telephone Microphone.

With Navigation Radio

1. Vehicle OFF, disconnect the X4 harness connector at the navigation radio and the harness connector at the B24 Mobile Phone Microphone.
2. Vehicle OFF, test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
3. Vehicle ON, test for 9-11 V between the signal circuit terminal 3 and ground.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K82 Mobile Telephone Control Module.
4. If all circuits test normal, replace the B24 Mobile Telephone Microphone.
If condition still exists, replace the navigation radio.

No Global Positioning System (GPS) Reception

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) Strategy Based Diagnosis for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) Diagnostic Procedure Instructions provides an overview of each diagnostic category.

[Circuit/System Description](#)

The navigation aerial is connected to the radio by a coax cable. The radio supplies 5 V through the centre conductor of the coax cable to power aerial.

[Diagnostic Aids](#)

- Inaccurate or aged GPS position concerns which are no longer present may have been due to the temporary loss of GPS signal reception by the vehicle. Conditions such as tunnels or parking structures will restrict the navigation aerial from a clear view of the satellites in the sky and may have caused this temporary data loss.
- The global positioning system (GPS) requires a clear line of sight to the sky to operate properly. In most cases the GPS will not have reception near tall buildings or inside structures.

Special Tools

EL-49903 EL-49903 GM OnStar Aerial Diagnostic Tool Kit

Circuit/System Verification

Note: The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 minutes after turning key on for the GPS satellites to acquire vehicle signal.

1. Verify the Navigation Radio functions while driving the vehicle.
If the navigation radio does not function, refer to Circuit System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the navigation aerial coax cable connector at the A11 radio.
2. Connect the EL-49903 EL-49903 to the A11 radio, place the test aerial on the roof of the vehicle.
3. Ignition ON, verify DTC B2462 is not set in the A11 radio.
If DTC B2462 is set as current, replace the A11 radio.
4. Ignition OFF, disconnect the aerial coax cable from the T4G mobile phone, navigation and digital radio aerial.
5. Perform the coax cable test on the coax cable between the A11 radio and the T4G mobile phone, navigation and digital radio aerial, refer to Component Testing. The coax cable should pass the test.
If the coax cable does not pass the test, replace the coax cable.
6. Reconnect the navigation aerial coax cable connections at the A11 radio.
7. Ignition ON, test for 4.5-5.5 V between the coax cable centre conductor and the outer shield at the T4G mobile phone, navigation and digital radio aerial.
If not within the specified range, replace the the A11 radio.
8. If all circuits test normal, replace the T4G mobile phone, navigation and digital radio aerial.

Component Testing

Caution: Refer to [Test Probe Caution](#) in the Preface section.

Note: Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the centre coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between both ends of the coax cables centre terminals.
If greater than the specified range, replace the coax cable
3. Test for less than 5 Ω between both ends of the coax cable outer shield.
If greater than the specified range, replace the coax cable
4. Test for infinite resistance between the coax cable centre wire and the outer coax shield.
If less than the specified range, replace the coax cable.

Wireless Communication Interface Aerial Malfunction - UHP

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[Circuit/System Description](#)

The wireless communication interface aerial is a small fixed aerial connected directly to the mobile telephone control module and is used to send and receive signals from a wireless communication interface enabled mobile telephone. The aerial utilises no cabling and is not external to the vehicle.

In order to use hands-free calling, the mobile telephone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the wireless communication interface functionality of their phone. The pairing process must only be done one time for each phone, unless that phone's information is deleted. For safety reasons, the pairing process is disabled while the vehicle is moving.

[Diagnostic Aids](#)

- The purpose of this diagnostic is to verify the ability of the K82 mobile telephone control module to pair to a wireless communication interface device.
- Before performing this test, verify compatibility of the mobile telephone the customer is attempting to use with the vehicle. Based on the mobile phone's service provider and the manufacturer's implementation of Bluetooth®, not all phones support all available wireless communication interface functionality.
- If the vehicle passes the following tests and a compatible device is being used, the concern may be due to a device malfunction or an incomplete/improper pairing attempt.
- A wireless communication interface test tool or equivalent can also be used to verify the ability of the customers mobile phones to pair with another device.

Circuit/System Verification

1. Verify no DTCs are set as current.
If any DTCs are set as current, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle in Service Mode, radio ON, verify the radio/HVAC controls backlighting illuminates and that all controls perform the correct function.
If some, but not all, controls operate normally, replace the radio/HVAC control.
If all controls are inoperative, refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the A20 radio/HVAC controls.
2. Test for less than 10 Ω between the ground circuit terminal 17 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Test for less than 20 Ω between the data shield circuit terminal 3 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance. If the circuit tests normal, replace the A11 radio.
4. Verify that a test lamp illuminates between the B+ circuit terminal 10 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
5. Vehicle in Service Mode, test for 2.4-2.75 V between the data circuit terminal 1 and ground.
If less than the specified range, test the data circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the data circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
6. Test for 2.4-2.75 V between the data circuit terminal 2 and ground.
If less than the specified range, test the data circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the data circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
7. Test for less than 1 V between the wake signal terminal 4 and ground.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
8. Test for less than 1 V between the reset signal terminal 15 and ground.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
9. Vehicle OFF, reconnect the harness connector at the A20 radio/HVAC controls.
10. Disconnect the X1 harness connector at the A11 radio.
11. Install a DMM between wake signal terminal 13 and ground.

12. Vehicle in Service Mode, verify the DMM reading is 4.5-5.5 V DC.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A20 radio/HVAC controls.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A20 radio/HVAC controls.
13. Press the power button on the radio controls. Verify the DMM reading is momentarily less than 1 V and returns to 4.5-5.5 V DC each time the power button is pressed
If not the specified value, replace the A20 radio/HVAC controls.
14. Test for 4.5-5.5 V between the reset signal terminal 27 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A20 radio/HVAC controls.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A20 radio/HVAC controls.
15. If all circuits test normal, replace the A20 radio/HVAC controls and reconnect all harness connectors. Vehicle in Service Mode, radio ON, verify the radio/HVAC controls backlighting illuminates and that all controls perform the correct function. If the radio/HVAC controls are still inoperative, replace the A11 radio.

[Circuit/System Verification](#)

1. Verify DTC B1265 is not set as current.
If DTC B1265 is set as current, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle in Service Mode, radio ON, verify the info display module turns on and information is shown on the display.
If the info display is inoperative, refer to Circuit/System Testing.

[Circuit/System Testing](#)

1. Vehicle OFF, verify the video interface cable is properly connected at the display X2 and radio X5 connections and there is no damage to the cable or connections.
Perform the appropriate repair or replacement to correct any issues found with the video interface cable or it's connections.
2. Vehicle OFF, disconnect the X1 harness connector at the P17 info display module.
3. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground for an open/high resistance.
4. Test for less than 20 Ω between the data shield circuit terminal 7 and ground.
If greater than the specified range, test the data shield circuit for an open/high resistance. If the circuit tests normal, replace the A11 radio.
5. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
6. Vehicle in Service Mode, verify that a test lamp illuminates between the entertainment remote enable circuit terminal 6 and ground.
If the test lamp does not illuminate, test the remote enable circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
7. Test for 2-3 V between the touch screen data high circuit terminal 4 and ground.
If less than the specified range, test the data circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the data circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
8. Test for 2-3 V between the touch screen data low circuit terminal 8 and ground.
If less than the specified range, test the data circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the data circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
9. Vehicle OFF, reconnect the harness connector at the P17 info display module.
10. Disconnect the X4 harness connector at the A11 radio.
11. Vehicle in Service Mode, test for 3-5 V between the display reset signal circuit terminal 10 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the P17 info display module.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the P17 info display module.
12. If all circuits test normal, replace the video interface cable. Reconnect all harness connectors.

13. Vehicle in Service Mode, radio ON, verify the info display module turns on and information is shown on the display.

If the information display still malfunctions, replace the P17 information display module. Vehicle in Service Mode, radio ON, verify the info display module turns on and information is shown on the display. If the information display still malfunctions, replace the A11 radio.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

Each of the audio output channel circuits (+) and (-), at the radio and audio amplifier (if equipped) have a DC bias voltage that is approximately one half of battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centred around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

[Diagnostic Aids](#)

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting. If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.
- When equipped with an amplifier, it is possible for some individual circuit faults to affect more than one speakers operation. Perform diagnostic tests in the sequence listed to avoid misdiagnosis.
- The amplifier control circuit will measure less than 1 V when the mute function is OFF, and approximately 8 V DC when at full mute. When mute is active, the radio stops sending the varying AC voltage to the amplifier/speakers.

Special Tools

EL-50334-50 USB Cable and Adapter Kit

Circuit/System Verification

Without Amplifier

Radio ON, Mute OFF, verify clear audio is heard from each audio speaker.

If audio is inoperative from all speakers, replace the radio.

If audio is inoperative from one or more, but not all, speakers or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction - without Amplifier.

With Amplifier

Radio ON, Mute OFF, verify clear audio is heard from each audio speaker.

If audio is not heard from all speakers, or the audio emitted from the speakers is not clear, refer to Speaker Circuit Malfunction- with Amplifier.

Circuit/System Testing

Speaker Circuit Malfunction - without Amplifier

Note: In the following tests, audio signal frequencies (Hz) will be tested. To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.

1. Vehicle OFF, disconnect the harness connector at the appropriate P19 speaker.
2. Radio ON, mute OFF, test for 5.0-7.5 volts between each audio signal circuit terminal 1 and terminal 2 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the radio.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the radio.
3. Insert the EL-50334-6 Audio Test CD from the *EL-50334-50* USB Cable and Adapter Kit .
4. Play track number three (50 Hz bass test tone) from the test CD. Test for 49-51 Hz AC between each signal circuit terminal 1 and terminal 2 and ground.
If not the specified value, replace the A11 radio.
5. If all circuits test normal, replace the speaker.

With Amplifier

Note: In the following tests, audio signal frequencies (Hz) will be tested. To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.

1. Vehicle OFF, disconnect the X1 harness connector at the T3 audio amplifier.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Disconnect the X2 harness connector at the T3 audio amplifier.
5. Vehicle in Service Mode, radio ON, verify a test lamp illuminates between the remote enable signal circuit terminal 14 and ground.
If the test lamp does not illuminate, test the remote enable signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
6. Radio ON, mute OFF, test for less than 1 V between the amplifier control circuit terminal 12 and ground.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
7. Mute ON, test for less than 7.5-8.5 V between the amplifier control circuit terminal 12 and ground.
If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.
8. Vehicle OFF, disconnect the X3 harness connector at the T3 audio amplifier.
9. Radio ON, mute OFF, test for 5-7 V between the audio signal circuit terminals listed below and ground:
 - Left front low level audio signal (+) terminal 14
 - Left front low level audio signal (-) terminal 6
 - Right front low level audio signal (+) terminal 5
 - Right front low level audio signal (-) terminal 2
 - Left rear low level audio signal (+) terminal 12

-
- Left rear low level audio signal (-) terminal 4
- Right rear low level audio signal (+) terminal 3
- Right rear low level audio signal (-) terminal 11

If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the A11 radio.

If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the A11 radio.

10. Insert the EL-50334-6 Audio Test CD from the *EL-50334-50* USB Cable and Adapter Kit .

11. Play track number three (50 Hz bass test tone) from the test CD. Test for 49-51 Hz AC between the audio signal circuit terminals listed below and ground.

- Left front low level audio signal (+) terminal 14
- Left front low level audio signal (-) terminal 6
- Right front low level audio signal (+) terminal 5
- Right front low level audio signal (-) terminal 2
- Left rear low level audio signal (+) terminal 12
- Left rear low level audio signal (-) terminal 4
- Right rear low level audio signal (+) terminal 3
- Right rear low level audio signal (-) terminal 11

If not the specified value, replace the A11 radio.

12. Vehicle OFF, reconnect all harness connectors at the T3 audio amplifier.

13. Disconnect the harness connector at the appropriate P19 speaker.

14. Radio ON, mute OFF, test for 5-7 V between the appropriate speaker signal terminals listed below and ground:

- Door speakers or front tweeter speakers: speaker control (-) circuit terminal 1
- Door speakers or front tweeter speakers: speaker control (+) circuit terminal 2
- Subwoofer speaker control (-) circuit terminal A
- Subwoofer speaker control (+) circuit terminal B

If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the T3 audio amplifier.

If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the T3 audio amplifier.

15. Play track number three (50 Hz bass test tone) from the test CD. Test for 49-51 Hz AC between the appropriate speaker signal circuit terminals listed below and ground.

- Door speakers or front tweeter speakers: speaker control (-) circuit terminal 1
- Door speakers or front tweeter speakers: speaker control (+) circuit terminal 2
- Subwoofer speaker control (-) circuit terminal A
- Subwoofer speaker control (+) circuit terminal B

If not the specified value, replace the T3 audio amplifier.

16. If all circuits test normal, replace the appropriate P19 speaker.

Cellular Telephone Description and Operation

The mobile telephone control module offers the opportunity to hold phone conversations using a cellular telephone via a vehicle microphone and vehicle speaker system and to operate the most important cellular telephone functions via the infotainment system in the vehicle. The mobile telephone control module provides the features listed below:

- Call lists
- Call handling
- Steering wheel control
- Status messages
- Phone book
- Bluetooth
- Speech recognition, including adaptive echo and noise reduction algorithm

An additional base plate and cradle is available for specific cellular telephones, available as an option. It provides charging of the cellular telephone and a connection to the outside antenna. All cellular telephone interaction and data transmission to mobile telephone control module is done via Bluetooth. In order to create a connection between the mobile telephone control module and the infotainment system, the mobile telephone control module must be switched on and the cellular telephone logged in. The mobile telephone control module switches itself on and off via the ignition. If the ignition is switched off the mobile telephone control module can be switched on and off via the infotainment system. When a telephone connection is active, the radio sound is switched off. When the telephone connection has ended, the radio sound is switched on again.

Speech Recognition

The speech recognition enables the operation of some cellular telephone functions by voice input. It recognises commands and sequences of numbers independently of the person speaking. The commands and sequences of numbers can be spoken without a break between the individual words. It is also possible to save telephone numbers using a name randomly chosen by the user. The telephone connection can be created using the proper name.

Radio/Audio System Description and Operation

The entertainment system on this vehicle may have several different configurations available to it. To determine the specific configuration of the vehicle, please see the Service Parts ID Label, and refer to [RPO Code List](#).

Each item in the list below represents topics covered in detail below.

- Radio Circuit Operation
- Radio/HVAC Communications
- Radio/HVAC Controls
- Aerial System
- AM/FM Reception
- Speaker Operation
- Audio Amplifier (If equipped)
- Radio Data System (RDS)
- Theft Deterrent
- Steering Wheel Controls (If equipped)
- Auxiliary Audio Input Jack (If equipped)
- USB Port (If equipped)
- Auto Volume Control
- Navigation System Components and Features (if equipped)

[Radio Circuit Operation](#)

Radio Power

The radio does not use a discrete ignition feed circuit for power moding. The power mode master provides the system power mode to the radio via serial data messages. The power mode master determines the system power mode by processing power mode information from ignition switch inputs. Serial data power modes supported by the radio are OFF, ACCESSORY, RUN, and CRANK REQUEST.

Radio Grounds

The vehicle harness provides a ground for the radio circuits. The radio may also be case grounded.

Radio Data Link Communication

The radio communicates with other modules via serial data.

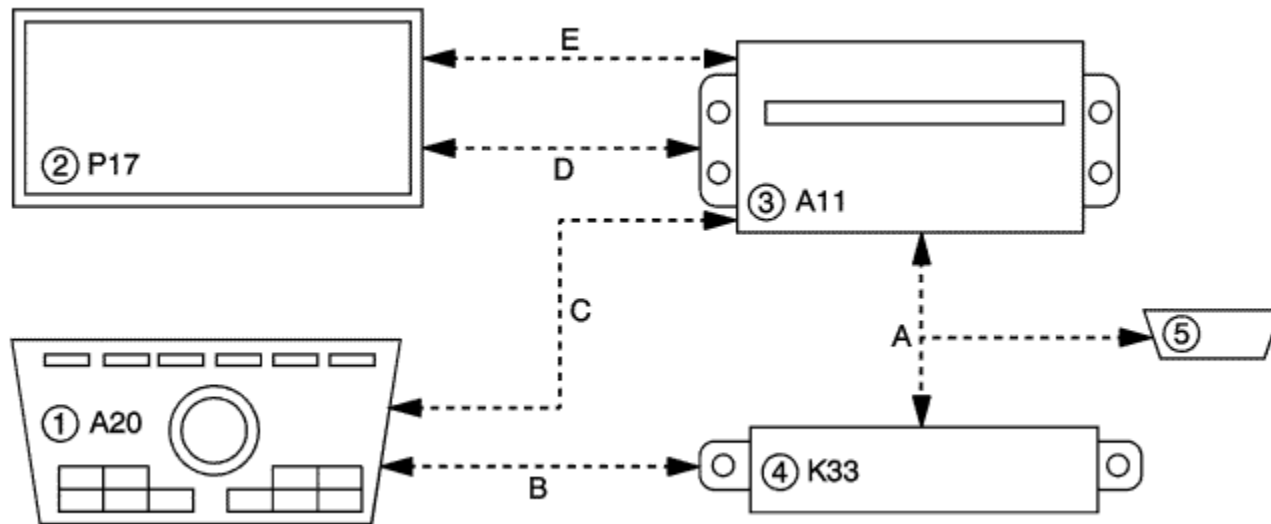

Radio Audio Outputs

Each of the audio output channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of battery voltage. The audio being played on the system is produced by a varying AC voltage that is centred around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Remote Enable Output

The remote enable circuit is a discrete 12 V signal supplied to infotainment system components when the radio is producing audio, needs the front display on, needs video entertainment system components on, or needs to produce chimes. This signal is used to control the power state of the components. There is no output on radio the remote enable circuit when the vehicle is in the CRANK powermode, this is to minimise current consumption from the attached modules and also to avoid audio pops during crank events.

Navigation Radio Communications Diagram

(1) Radio/HVAC Controls

(2) Info Display Module

- (3) Radio
- (4) HVAC Control Module
- (5) Data Link Connector
 - (a) GMLAN
 - (b) Local Interconnect Network
 - (c) CAN Graphical Interface
 - (d) Digital Video
 - (e) Touch Screen Serial Data

Info Display Module

The info display module has continuous power and ground. When the radio is on, a discrete 12 V signal is supplied on the remote enable circuit to the colour display module. This signal is used to control the power state of the module, which is active when the signal is high and inactive when the signal is low.

The info display module receives digital video data from the radio for on-screen display information through the video signal circuits. The radio communicates with the info display module over the touch screen serial data circuits for touch screen inputs and back lighting dimming level.

Radio/HVAC Controls

The radio/HVAC controls communicate radio control inputs directly to the radio through the CAN Graphical Interface (CGI) data circuits. After receiving the message the radio will perform the requested function. Messages communicated between the radio and the radio/HVAC controls include the following:

- Button presses/knob rotations
- Commands for the state of indicators
- Radio control back lighting

HVAC data for controls and status indicators is communicated between the radio/HVAC controls and the HVAC control module with a separate LIN serial data circuit. HVAC status screen information from the HVAC control module is transmitted to the radio on the GMLAN serial data circuit. The radio then displays the desired screen information on the info display using the video data circuits.

Aerial System

Multi-Band Aerial

The multi-band antenna is located on the roof of the vehicle. This type of aerial may be used with the AM/FM radio, but is primarily for OnStar® mobile and GPS signals and the XM™ Satellite Radio Service System, if the vehicle has these features. Keep this aerial clear of snow and ice build up for clear reception. If the vehicle has a sunroof, the performance of the system may be affected if the sunroof is open. Loading items onto the roof of the vehicle can interfere with the performance of the system, ensure the multi-band aerial is not obstructed.

Active Aerial

The active aerial system uses two integral aerials applied as appliqués to the rear glass. Each aerial is part of the rear window and looks similar to the demister grid. One aerial receives AM signals while the other aerial receives FM signals. Any damage to the aerial requires replacing the glass.

The radio aerial module is enabled when the radio is turned on. The radio provides battery voltage to the aerial module using the centre conductor of the aerial coaxial cable. This DC voltage does not affect the incoming radio signal. When a 12 V signal is seen by the module on the centre conductor of the aerial coax, both AM and FM signals are amplified.

[AM/FM Reception](#)

Radio Signal

The radio signal is sent from a broadcast station and is then received by an aerial. The strength of the signal received depends on the following:

- The power output (wattage) of the broadcasting station
- The location of the vehicle (or receiver) relative to the broadcast tower.
- Obstacles between the tower and the receiver
- Atmospheric conditions
- What band (AM or FM) the station is broadcasting
- Type of aerial and the ground plane

AM Reception

The AM band has a lower frequency range than the FM band. These longer wavelengths:

- Bend around Obstacles
- Follow the curvature of the ground
- May reflect off the ionosphere (skip)

The AM frequencies have longer range due to the ground wave. The ground wave follows the curvature of the ground and is effected by its conductivity. Greater conductivity equates to less signal loss thus transmission over water is better than over land. The AM band has a range of 80-320 km (50-200 miles).

FM Reception

The shorter wavelengths of the higher frequency FM band:

- Reflect off obstacles
- Are absorbed by the ground
- Penetrate the ionosphere

Broadcasts in the FM band are limited to line of sight reception which is typically 40 km (25 miles). Even when out of a direct line of sight, the signal may be reflected into areas that would be in a shadow otherwise. Factors which affect the line of sight include:

- Height of the broadcast aerial
- Height of the receiving aerial
- Terrain and buildings in the broadcast path

Speaker Operation

Speakers turn electrical energy into mechanical energy to move air, using a permanent magnet and an electromagnet. The electromagnet is energised when the radio or amplifier (if equipped) delivers current to the voice coil on the speaker. The voice coil will form a north and south pole that will cause the voice coil and the speaker cone to move in relation to the permanent magnet. The current delivered to the speaker is rapidly changing alternating current (A/C). This causes the speaker cone to move in two directions producing sound.

Audio Amplifier (If equipped)

Amplifier Interface

A fused battery voltage circuit provides the main amplifier power. A switched 12 V output from the radio is used to control the power - state of the amplifier. To respond quickly to audio input and control signals, the amplifier is ON in all vehicle power modes except OFF and CRANK Request. The internal amplifier bridges are fully powered and unmuted when the amplifier receives the switched 12 V input.

Amplifier Operation

The purpose of the amplifier is to increase the power of a voltage or current signal. The output signal of an amplifier may consist of the same frequencies as the input signal or it may consist of only a portion of the frequencies as in the case of a subwoofer or midrange speaker. The radio creates a low level stereo audio output signal, which is sent at the user-defined volume level to the audio amplifier. The audio amplifier amplifies the signal and sends it to the appropriate speakers. Each of the audio output channel circuits (+) and (-), from the amplifier have a DC bias voltage that is approximately one half of battery voltage. The audio being played on the system is produced by a varying AC voltage that is centred around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Radio Data System (RDS)

The radio may be equipped with the Radio Data System (RDS). The RDS feature is available only on FM stations that broadcast RDS information. This system relies upon receiving specific information from these stations and only works when the information is available. While the radio is tuned to an FM-RDS station, the station name or call letters display.

RDS data is carried in what is known as a "subcarrier". A subcarrier is a frequency that the FM broadcaster is authorised to use to send data that is not audible in the main audio program.

- RDS functions will only work with FM broadcast stations that are broadcasting RDS data.
- Not all FM Broadcast stations broadcast RDS data or offer all of the RDS services.
- The information displayed is dependent upon the information broadcast by the particular station. The information may vary greatly between stations.
- RDS functions may not work properly when reception is weak, reception is of poor quality, or RDS is not implemented properly by the FM Broadcaster.
- In some cases, a radio station broadcasting incorrect information may cause the RDS features of the radio to appear to work improperly.

With RDS, the radio can do the following:

- Seek to stations broadcasting the selected type of programming
- Receive announcements concerning local and national emergencies
- Display messages from radio stations
- Receive alert warnings of local or national emergencies. When an alert announcement comes on the current radio station, ALERT! displays. You will hear the announcement, even if the volume is low or a CD is playing. If a CD is playing, play stops during the announcement. Alert announcements cannot be turned off. ALERT! is not affected by tests of the emergency broadcast system. This feature is not supported by all RDS stations.

RDS may display text information such as:

- The name of the station.
- The type of program.
- General information such as artist and song title, call in phone numbers, etc.

Theft Deterrent

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. The radio receives this information via serial data. A possible cause of incorrect VIN info could be the radio was originally installed in another vehicle.

The radio has the following theft operating modes as part of the theft deterrent system:

- Normal Mode: The radio has learned a correct VIN sequence and the VIN information received via serial data matches the learned VIN sequence. In this mode the radio has full functionality.
- No VIN Mode: The radio has not received or learned a correct VIN sequence. In this mode the radio has limited functionality.
- Theft Detected Mode: The radio has learned a correct VIN sequence and the VIN information received via serial data does NOT match the learned VIN sequence. In this mode the radio may be disabled or have limited functionality. The radio display will indicate that theft protection is active.

Steering Wheel Controls (If equipped)

Some audio functions are available using the steering wheel controls. The steering wheel controls duplicate the function of the primary controls available on the radio.

For additional information on steering wheel controls, refer to [Steering Wheel Controls Description and Operation](#) .

Auxiliary Audio Input Jack (If equipped)

The infotainment system may have a 3.5mm (1/8 in.) auxiliary audio input jack located in the centre console. The auxiliary audio input jack interfaces directly with the radio. When a portable audio playback device is connected to the auxiliary jack, an internal switch detects the connection and the radio will switch to AUX as the audio source. Audio signals from the device are sent to the radio from the auxiliary jack via the left, right, and common audio signal circuits.

- When a device is first connected to the 3.5mm (1/8 in.) input jack the infotainment system automatically switches to that device. If an auxiliary device has already been connected, press the AUX or CD/AUX button to select the device.
- Playback of an audio device that is connected to the 3.5mm jack can only be controlled using the controls on the device.
- The volume control on the device may need to be adjusted to ensure sufficient playback volume through the infotainment system.

USB Port (If Equipped)

The infotainment system may have a USB connector located in the centre console. The USB connector interfaces directly with the radio. The USB connector supports both USB standards 1.1 and 2.0.

USB Supported Devices:

- USB Flash Sticks (Thumb Drives)
- Portable USB Hard Drives
- Portable Digital Media Players (iPod®, ZUNE®, etc)

Depending on the USB device, some devices may not be recognised, or some features/functions may not be able to be controlled with the radio controls. USB HUB devices are not supported.

Speed Compensated Volume

With Auto Volume Control, the audio system will adjust automatically to make up for road and wind noise as you drive, by increasing the volume as vehicle speed increases. To use auto volume control, set the volume at the desired level, and then select either Low, Medium, or High. To turn SCV off, select the Off screen button.

Navigation System Components and Features (if equipped)

The navigation system, if equipped, provides the following:

- Connection to the global positioning system (GPS) aerial, which provides the vehicle position information.
- Route guidance with verbal prompts to the operator.
- Map data for navigation and map route guidance, stored on the internal hard drive.
- Traffic and weather information for display on the navigation system map (with active subscription, where available).

Global Positioning System (GPS) Aerial

The global positioning system (GPS) aerial is part of the multi-band aerial located on the roof of the vehicle. The GPS aerial is used to collect the signals of the orbiting GPS satellites. Within the aerial is housed a low noise amplifier that allows for a more broad and precise reception of this data. The GPS aerial amplifier is powered through the coaxial cable.

The aerial is connected to the navigation radio through a signal splitter. The signal splitter is a component for dividing the navigation signal into two paths without any transmission loss. This allows the use of a single GPS aerial to provide a signal to both the navigation radio and the telematics communication interface module.

Route Guidance

The map will display the route to the selected destination. Voice prompts alert the operator of upcoming events (turns) and arrivals at the destination. The navigation system will automatically recalculate if the route is not followed. The navigation radio uses data received from the global positioning system (GPS) satellites, the vehicle speed signal, and serial data information to accurately display the current position of the vehicle.

Points of Interest

The map database provides point of interest information. Points of interests are locations that are frequently visited. Points of interest can be displayed on the map or set as a destination. The following are some of the available Points of interests:

- Gas Station
- Restaurant
- College
- Police Station

Traffic Information

XM NavTraffic™ is a subscription based service that enhances the navigation system with live traffic information. The service provides information on traffic conditions such as traffic speed, accidents, disabled vehicles, construction and road closings.

The integrated XM satellite radio receives the information. When Traffic Information is turned ON in the configuration menu, the available information will be displayed on the map screen.

The traffic information can vary based upon coverage in the area, and coverage is not available in all areas. No information will be displayed if coverage is not available, if there is no traffic information for the area, or if there is no subscription to receive the information.

A subscription fee is required in order to receive the XM NavTraffic™ service. No traffic data will be displayed without a current subscription.

Weather Information

XM NavWeather™ is a subscription based service that transmits weather information to the integrated XM satellite radio. Real time information such as current and future weather and road conditions, atmospheric conditions, and National Weather Service warnings is provided, as well as 3 day forecasts for some cities. Received information is

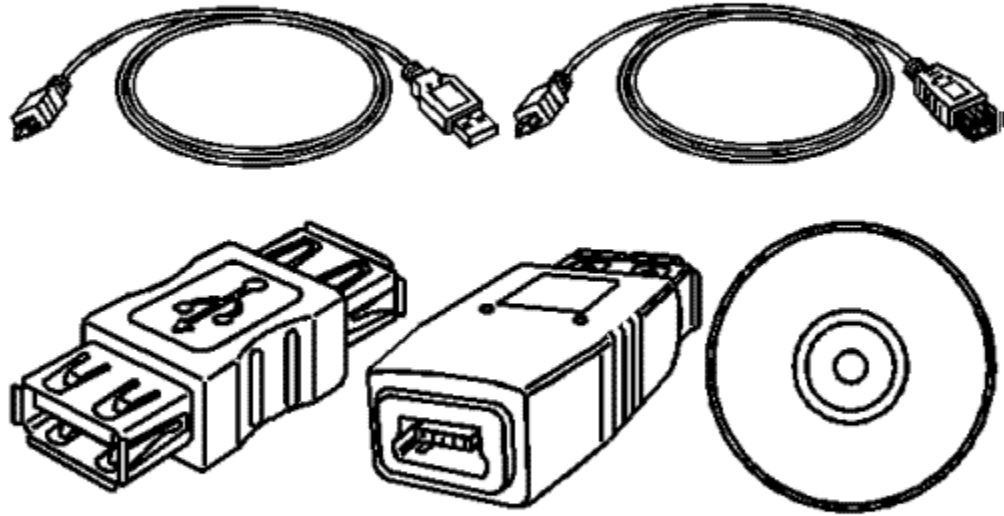

available to be displayed on the Weather Info screen.

A subscription fee is required in order to receive the XM NavWeather™ service. No weather data will be displayed without a current subscription.

DTC B0550

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC B0550 32: Odometer Circuit General Memory Malfunction

[Circuit/System Description](#)

The instrument cluster is equipped with odometers that indicate the distance traveled by the vehicle. One type of odometer is the season odometer where the travelled distance can not be reset by the driver. This information is also stored in the body control module (BCM). In addition to storing the season odometer value for the vehicle, the instrument cluster and the BCM store the VIN. Software checks are performed to ensure these modules, and their stored season odometer information, can not be moved or transferred between different vehicles.

[Conditions for Running the DTC](#)

The ignition is ON.

[Conditions for Setting the DTC](#)

The BCM has detected an internal memory malfunction.

[Action Taken When the DTC Sets](#)

DTC B0550 32 is stored in the BCM memory.

[Conditions for Clearing the DTC](#)

The BCM no longer detects a malfunction.

Symptoms - Displays and Gauges

Note: The following steps must be completed before using the symptom diagnostic tables.

1. Before using the symptom diagnostic tables, perform the [Diagnostic System Check - Vehicle](#) .
2. Review the system operation in order to understand the system functions. Refer to the following description and operations:
 - [Instrument Cluster Description and Operation](#)
 - [Indicator/Warning Message Description and Operation](#)
 - [Driver Information Centre \(DIC\) Description and Operation](#)
 - [Audible Warnings Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the instrument panel cluster or the audible warning systems. Refer to [Checking Aftermarket Accessories](#)
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.
- Inspect for the proper fluid levels.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Gauges and Odometer

- [Instrument Cluster Display Malfunction](#)
- [Instrument Cluster Gauges Malfunction](#)
- [Fuel Gauge Malfunction - DTC P0461-P0464](#)
- [Speedometer and/or Odometer Malfunction](#)

Circuit/System Verification

Note: Before performing this diagnostics, make sure no indicators are illuminated after the instrument cluster performs a lamp test. If any indicators are illuminated after the bulb test, perform the indicator diagnostics before this diagnostics.

1. Vehicle in Service Mode, radio ON, adjust the radio balance and fade to each speaker.
If any speaker does not operate properly, refer to [Speaker Malfunction](#) .
2. Vehicle in Service Mode, buckle up driver seat belt, verify the scan tool Driver Seat Belt Status parameter is Buckled.
If not Buckled refer to [Seat Belt Indicator Circuit Malfunction - Driver](#) .
3. Vehicle in Service Mode, headlamp switch OFF, verify the scan tool Headlamp On Switch parameter is Inactive.
If not Inactive, refer to [Headlamps Malfunction](#) .
4. Vehicle in Service Mode, parking lamp switch OFF, verify the scan tool Parklamp Switch parameter is Inactive.
If not Inactive, refer to [Park, License, and/or Tail Lamps Malfunction](#) .
5. Vehicle in Service Mode, indicator switch OFF, verify the scan tool Left Indicator Switch parameter and the scan tool Right Indicator Switch parameter is Inactive.
If not Inactive, refer to [Indicator Lamps and/or Indicators Malfunction](#) .
6. Vehicle in Service Mode, doors closed, verify that all scan tool parameters listed below are Inactive.
 - Driver Door Ajar Switch
 - Passenger Door Ajar Switch
 - Left Rear Door Ajar Switch
 - Right Rear Door Ajar SwitchIf any are not Inactive, refer to [Door Ajar Indicator Malfunction](#) .
7. Vehicle in Service Mode, verify that the scan tool Park Assist Switch parameter is Active when the parking assist is active and Inactive when the parking assist is Inactive.
If the scan tool parameter does not operate properly, refer to [Parking Assist System Malfunction](#) .
8. If all tests operate properly, replace the A11 radio.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for BCM or Radio replacement, programming and setup

Driver Information Centre Switch Malfunction - DTC B3567

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B3567 01: Info Display Select Switch Circuit Short to Battery

DTC B3567 02: Info Display Select Switch Circuit Short to Ground

DTC B3567 04: Info Display Select Switch Circuit Open

DTC B3567 59: Info Display Select Switch Circuit Protection Time-Out

Circuit/System Description

The driver information centre switch is a multiplexed switch. The Select, Back, and Config buttons are a series of momentary contact switches that connect a series of resistors in a resistor ladder format. The Select, Back, and Config buttons utilise a 12 V signal and the instrument cluster determines which button is pressed by the voltage drop across the resistors when the button is pressed.

Conditions for Running the DTC

- The ignition is in OFF, ACCESSORY or RUN position.
- The system voltage is between 9–16 V.

Conditions for Setting the DTC

The instrument cluster detects that the driver information centre switch signal circuit is shorted to battery.

B3567 02

The instrument cluster detects that the driver information centre switch signal circuit is shorted to ground.

B3567 04

The instrument cluster detects that the driver information centre switch signal circuit is open.

B3567 59

The instrument cluster detects that the driver information centre switch is stuck.

Action Taken When the DTC Sets

The instrument cluster ignores the driver information centre switch inputs.

Conditions for Clearing the DTC

The DTC will become history if the instrument cluster no longer detects a malfunction.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool Driver Information Centre Switch parameter, that when the S16 driver information centre switch, Select, Back, and Config are pressed and released the scan tool parameter toggles between Select, Back, and Config and Inactive.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the S16 driver information centre switch.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal replace the P16 instrument cluster.
3. Vehicle in Service Mode, test for 10-12 V between the signal S16 driver information centre switch signal circuit terminal 1 and ground.
If less than the specified range, test the signal for an open/high resistance or a short to ground. If the circuit tests normal replace the P16 instrument cluster.
If greater than the specified range, test the signal circuit for a short to high voltage. If the circuit tests normal, replace the P16 instrument cluster.
4. If all circuits tests normal, test or replace the S16 driver information centre switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Driver Information Display and Multifunction Switch Replacement](#)

Engine Oil Pressure Indicator Malfunction - DTC P0520

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0520 00: Engine Oil Pressure Switch Circuit Malfunction

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0520	1	1	--
1. Engine Oil Pressure Indicator Malfunction				

[Typical Scan Tool Data](#)

[ECM - Engine Oil Pressure Switch](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: OK			
Signal	Low	OK	OK
Ground	--	OK	--

[Circuit/System Description](#)

The engine oil pressure switch is a normally closed switch that opens with the proper oil pressure. With the ignition switch turned ON and the engine not running, the engine control module (ECM) should detect a low signal voltage input. With the engine running, the engine oil pressure switch opens and the ECM should detect a high signal voltage input. When the oil pressure is low, the ECM sends a message via High Speed CAN-Bus to the body control module (BCM). The BCM then sends a message via Low Speed CAN-Bus to the instrument cluster requesting the engine oil pressure indicator turned ON.

[Conditions for Running the DTC](#)

The engine is running.

[Conditions for Setting the DTC](#)

- The ECM detects that the engine oil pressure switch signal circuit is pulled low.
- The above condition is present for greater than 10 seconds.

[Action Taken When the DTC Sets](#)

The instrument cluster illuminates the service vehicle soon indicator and the oil pressure low indicator.

[Conditions for Clearing the DTC](#)

The DTC becomes history when the conditions for setting the DTC are no longer present.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool Engine Oil Pressure Switch parameter with the ignition switch turned ON and the engine not running the reading should be Low, with the engine running the reading should be OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B37 engine oil pressure switch.
2. Vehicle in Service Mode, verify the scan tool ECM - Engine Oil Pressure Switch parameter is OK.
If not the specified value, test for the signal circuit terminal A for a short to ground. If the circuit tests normal, replace the K20 ECM.
3. Install a 3 A fused jumper wire between the signal circuit terminal A and ground. Verify the scan tool ECM - Engine Oil Pressure Switch is Low.
If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
4. Command the All Indicators test ON and OFF with the scan tool. The engine oil pressure indicator should turn ON and OFF when changing between the commanded states.
If the engine oil pressure indicator always on or always off, replace the P16 instrument cluster.
5. If all circuits test normal, test or replace the B37 engine oil pressure switch.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Engine Oil Pressure Indicator Switch Replacement](#)

Fuel Gauge Malfunction - DTC P0461-P0464

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0461: Fuel Level Sensor Performance

DTC P0462: Fuel Level Sensor Circuit Low Voltage

DTC P0463: Fuel Level Sensor Circuit High Voltage

DTC P0464: Fuel Level Sensor Circuit Intermittent

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Level Sensor 1 Signal	P0462	P0463	P0463	P0461
Low Reference	--	1	P0463, P0464	P0461
1. Fuel Gauge Malfunction				

[Circuit/System Description](#)

The fuel level sensor changes resistance based on fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full, the resistances of the fuel level sensor is low and the ECM senses a low signal voltage on the signal circuit of the fuel level sensor. When the fuel tank is empty, the resistance of the fuel level sensor is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via High Speed CAN-Bus to the body control module (BCM). The BCM then sends the fuel level percentage via Low Speed CAN-Bus to the instrument cluster in order to control the fuel gauge. When the fuel level falls below approximately

11% the instrument cluster illuminates the low fuel level indicator.

Conditions for Running the DTC

- The engine is running
- The system voltage is between 11-16 V

Conditions for Setting the DTC

P0461

- The ECM detects a difference between the fuel consumed by the engine and change of the fuel level signal of less than 1 L (0.26 gal) over a range of 30 L (7.92 gal) or 45.6% of the primary fuel tank.
- The above condition is present for about 300 seconds.

P0462

- The signal voltage is less than 0.25 V.
- The above conditions must be met for 5 seconds.

P0463

- The signal voltage is greater than 4.7 V.
- The above conditions must be met for 5 seconds.

P0464

- The fuel level change is greater than 10%.
- The above conditions must be met for 30 seconds.
- DTC P0464 runs and fails 2 out of 3 test cycles.

Action Taken When the DTC Sets

- P0461, P0462, P0463, and P0464 are Type B DTCs
- The fuel gauge defaults to empty
- The low fuel indicator illuminates

Conditions for Clearing the DTC

- P0461, P0462, P0463, and P0464 are Type B DTCs
- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Circuit/System Verification

1. Vehicle in Service Mode, perform the Instrument Cluster Gauge Sweep test with the scan tool, verify that the instrument cluster performs a screen test sequence.

Note: Since there are no gauges, the instrument cluster will go through a screen test sequence instead of sweeping the gauges.

If the instrument cluster does not perform the screen test sequence, replace the P16 instrument cluster.

2. Perform the Driver Information Centre Segments test for each colour, White, Blue, Green, Red, Black and Off with a scan tool, verify there are no stuck or dead pixels in any colour.

If there are any stuck or dead pixels in any colour, replace the P16 instrument cluster.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for instrument cluster replacement, programming and setup

Speedometer and/or Odometer Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The instrument cluster displays the engine coolant temperature, fuel level, vehicle speed and the engine speed based on the information from the engine control module (ECM). The ECM sends information via a High Speed CAN-Bus signal to the body control module (BCM). The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to display the engine coolant temperature, fuel level, the engine speed, the vehicle speed and the distance travelled, either in kilometers or miles, based on the vehicle requirements. The instrument cluster will display dashes when its VIN does not match the VIN received from the BCM.

[Diagnostic Aids](#)

If the VIN mismatch is corrected the odometer will once again be displayed in the instrument cluster. If the vehicle is driven for a calibrated distance with a VIN mismatch, it will cause the instrument cluster odometer to enter into an error mode and lock itself. When this occurs the dashes will remain on the display even after correcting the VIN mismatch. The vehicle odometer status data display on the scan tool can be used to identify a locked odometer. The only way to unlock the instrument cluster (clear the dashes from the display) is to perform an SPS programming event. Failure to follow the diagnostic and programming procedures may result in either an improper odometer value or a module replacement.

[Component Connector End Views](#)

Description and Operation

[Instrument Cluster Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Verify no DTC is set.
If any DTC is set, diagnose this first.
2. Vehicle in Service Mode, perform the Instrument Cluster Gauge Sweep test with the scan tool, verify that the instrument cluster performs a screen test sequence.

Note: Since there are no gauges, the instrument cluster will go through a screen test sequence instead of sweeping the gauges.

If the instrument cluster does not perform the screen test sequence, replace the P16 instrument cluster.

3. Drive the vehicle, verify the speedometer value matches the Vehicle Speed parameter on the scan tool.
If the values do not match, replace the P16 instrument cluster.
4. Drive the vehicle, verify the odometer display, the displayed distance counts up while driving.
If the odometer displays only "----" (dashes), go to circuit/system testing.
If the odometer display does not count up, verify the scan tool Body Control Module Odometer parameter and scan tool Engine Control Module Odometer parameter are functioning correctly. If the Engine Control Module Odometer parameter does not count up while driving, replace the K20 engine control module. If the Body Control Module Odometer parameter does not count up while driving, replace the K9 BCM. If the K9 BCM and K20 Engine Control Modules are working correctly, replace the P16 instrument cluster.

Circuit/System Testing

Note: If there are multiple modules not original to the vehicle and are not new correctly configured service parts, SPS may not be able to properly read or recover the vehicle odometer value. Follow government rules and documentation (including vehicle identification) regarding inaccurate/unknown odometer values.

Instrument Cluster is Showing "----" (Dashes, Correcting VIN mismatch - odometer is still unlocked.)

1. Verify the vehicle odometer lock status with a scan tool. The reading should be Inactive.
If the reading is Active, go to correcting VIN mismatch - odometer is locked.
2. Using the scan tool, verify the BCM VIN matches the vehicle VIN placard. If the VIN does not match, reprogram the BCM.
3. Using the scan tool, verify the instrument cluster VIN matches the vehicle VIN placard. If the VIN does not match, reprogram the instrument cluster.
If the instrument cluster is still displaying "----" (dashes), replace the P16 instrument cluster.

Instrument Cluster is Showing "----" (Dashes, Correcting VIN mismatch - odometer is locked)

1. Using the scan tool, verify the instrument cluster VIN matches the vehicle's VIN placard. If the VIN does not match, reprogram the instrument cluster.
2. Perform the BCM setup procedure in SPS.
3. Vehicle in Service Mode, verify the instrument cluster is displaying the correct odometer value.
If the instrument cluster is still displaying "----" (dashes), replace the P16 instrument cluster.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

1.	Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
2.	Remove the instrument panel cluster trim plate and steering column upper trim cover assembly. Refer to Instrument Panel Cluster Trim Plate Replacement .

1	Instrument Cluster Fasteners (Qty: 4) Caution: Refer to Fastener Caution in the Preface section.
2	Instrument Cluster Assembly Procedure Refer to Control Module References for programming and setup information.

Battery Charge Indicator Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .	
	Battery Charge Indicator

1

Procedure

1. Twist and pull up to remove.
2. Disconnect electrical connector.

Accessory Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the roof console. Refer to Roof Console Replacement .	
	Accessory Switch

1

Procedure

Disconnect the electrical connector.

Audible Warnings Description and Operation

The audible warnings alert the driver of a system concern or a critical vehicle condition. The radio generates the audible warnings through the speakers. The radio receives audible warning requests via the serial data circuit. If the radio receives multiple audible warning requests, the warning with the highest priority sounds first. On vehicles without a radio, a chime module generates the audible warnings and receives audible warning requests via the serial data circuit. Either the radio or the chime module is the chime producer. The following lists the audible warning sounds:

1. Single pulse gong
2. Multiple pulse gong
3. Single pulse beep
4. Multiple pulse beep
5. Click
6. Clack

[Auto Stop Mode](#)

The chime producer activates when the vehicle comes to a stop (vehicle is running and engine is off) and the driver or passenger door is opened as requested by the body control module.

[Fasten Safety Belt Warning](#)

The chime producer activates the fasten safety belt audible warning as requested by the body control module (BCM). The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The fasten safety belt warning sounds and the fasten safety belt indicator illuminates when the following occurs:

- The ignition switch transitions to ON.
- The inflatable restraint sensing and diagnostic module (SDM) detects that the drivers seat belt is not buckled and the signal is low. The SDM sends a serial data message to the BCM indicating the seat belt status. The instrument cluster receives a serial data message from the BCM indicating the driver seat belt status.

If the seat belt is buckled when the ignition is turned ON, the chime does not sound. If the seat belt is buckled while the chime is sounding, the chime stops. If the seat belt is unbuckled after the initial transition to ON, the chime does not sound.

[Lights On Warning](#)

The chime producer activates the lights on warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The lights on warning sounds when the following occurs:

- The ignition is OFF.
- The BCM determines that the driver door is open and the signal circuit is low.
- The BCM determines that the headlamp switch is in the park or head position.

Brake Warning

The chime producer activates the brake audible warning as requested by multiple control modules. The BCM, electronic brake control module or the handbrake control module sends a serial data message to the chime producer indicating the chime as a multiple gong. The brake warning sounds and the BRAKE indicator illuminates when the following occurs:

- The ignition is ON.
- The vehicle speed is greater than 8 km/h (4.9 MPH). The instrument cluster receives a serial data message from the engine control module (ECM) indicating the vehicle speed.
- The BCM determines that the handbrake is engaged and the signal circuit is low.
- The brake fluid is low.

Door Ajar Warning

The chime producer activates the door ajar audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime frequency of a medium rate and continuous duration. The door ajar warning sounds and the appropriate door ajar indicator illuminates in the driver information centre when the following occurs:

- The BCM determines that a door (driver door, passenger door, left rear door, right rear door) is open and the signal circuit is low. The instrument cluster also receives a serial data message from the BCM indicating the door ajar status.
- The vehicle is not in PARK. The BCM receives a serial data message from the ECM/BCM indicating the gear position.

Object Detection

The chime producer activates the object detection audible warning as requested by the object alarm module. When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighbouring sensor. The sensor converts this signal into a voltage signal and sends this signal to the object alarm module. The object alarm module evaluates the received sensor signals. As soon as an object is within the measuring range, the object alarm module sends a message via CAN-Bus to the chime producer in order to give out the acoustic distance signal. The measuring range is between 30-120 cm (11.81-47.24 in). From a distance of 120 cm (47.24 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.81 in), the sound becomes continuous.

Additional Warnings

The following warnings have an associated instrument cluster indicator or driver information centre message:

- Turn Signal Indicators - The chime producer activates the audible warning as requested by the BCM. The chime produces two different chimes, one when the indicator turns off and another when the indicator turns on.
- Vehicle Overspeed Message - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Fuel Level Low Message - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Oil Pressure Indicator - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Park Assist Fault Clean Rear Bumper Message - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Tire Pressure Low Indicator - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.

Refer to [Indicator/Warning Message Description and Operation](#) .

Driver Information Centre (DIC) Description and Operation

The Driver Information Centre display is in the instrument cluster. The Driver Information Centre displays information about the vehicle. It also displays warning messages if a system problem is detected. For more information on Indicators and Warning messages, refer to [Indicator/Warning Message Description and Operation](#).

There are 3 switch functions for the driver information centre:

- CONFIG: Press to select either the Simple or Enhanced instrument cluster configuration display.
- BACK: Press to return to the previous screen, exit a screen, or return to the main menu. Press BACK to minimise the DIC menu display.
- SELECT: Press the centre of the knob to select the highlighted item. Turn the knob to scroll through the menu items.

[Menu](#)

Turn the SELECT knob to scroll through the possible menus. Press the centre of the SELECT knob when a menu is highlighted to enter that menu. The possible Driver Information Centre menu's are:

- Trip A
- Trip B
- Oil Life
- Tyre Pressure
- Vehicle Messages
- Units
- Tutorial Mode

[Trip A and Trip B](#)

The trip displays show fuel used, average fuel economy, and distance travelled since the last trip reset.

Reset the trip data by pressing and holding the SELECT button when either Trip A or Trip B is displayed.

[Oil Life](#)

This displays the percentage of remaining oil life. The lower the percentage, the closer the vehicle is to needing an oil change.

When the oil life is depleted, the CHANGE ENGINE OIL SOON message displays. Change the oil as soon as possible.

The oil life must be reset after each oil change. Avoid accidental resetting of the Engine Oil Life System. It cannot be reset accurately until the next oil change. To reset the Engine Oil Life System, refer to [GM Oil Life System Resetting](#) . The system is reset when 100% displays.

Outside Air Temperature

The outside air temperature can be accessed through the driver information centre Trip/Fuel switch function. The driver information centre shows the outside air temperature as a damped value. The time and rate of the temperature update is based on an algorithm in the instrument cluster. Factors such as last temperature reading, current temperature reading, length of time the vehicle was off, current vehicle speed, and the distance driven effect when the displayed temperature is updated. To get the vehicle to display the most accurate temperature faster, drive the vehicle. Constant moving traffic will update the display to the correct temperature more quickly than stop and go traffic.

Tyre Pressure

The display will show a vehicle with the approximate pressures of all four tyres. Tyre pressure is displayed in either kilopascal (kPa) or in pounds per square inch (psi).

If a low or high tyre pressure is detected, a message is displayed advising to check the tyre pressure in the specified tyre.

Vehicle Messages

Turn the SELECT knob to scroll through any active warning messages. Press SELECT to review the messages.

Units

Turn the SELECT knob to change the unit display to METRIC or US when the display is active. Press SELECT to confirm the setting. This will change the displays on the cluster and DIC to either metric or English (US) measurements.

Tutorial Mode

Select this menu item to view a screen that explains some of the unique features of the cluster.

Language

The driver information centre is capable of displaying in different languages, corresponding to the radio language settings. The instrument cluster receives a GMLAN message with language information from the radio. This message is only sent one time, after a new language is selected. To set the language, see the owners manual.

Indicator/Warning Message Description and Operation

[Indicator LIGHT ON](#)

Refer to the owner's manual for the descriptions and explanations of all indicator lights.

For diagnosis and repair information related to an indicator light, refer to the System Diagnosis and the Description of Operation that the message relates to.

[Message Displayed](#)

Refer to the owner's manual for descriptions and explanations of all messages displayed.

For diagnosis and repair information related to a displayed message, refer to the System Diagnosis and the Description of Operation that the message relates to.

Instrument Cluster Description and Operation

[Displays Test](#)

The instrument cluster displays a preview of information that includes electric range, charging, odometer, and battery status. This happens when the driver door is first opened, and following the welcome animation before starting the vehicle.

A CHARGING OVERRIDE/INTERRUPTION OCCURRED message may display on the lower left of the screen to indicate that a charging override or interruption has occurred due to:

- Override of charging settings by vehicle owner via OnStar.
- Unintended interruption of AC power at the vehicle's charge port.
- Interruption of charging by the utility company via OnStar as authorised by vehicle owner.

Refer to the owners manual for a complete list of vehicle charging status screen messages.

[Indicators and Warning Messages](#)

Refer to [Indicator/Warning Message Description and Operation](#) .

[Engine Coolant Temperature Gauge](#)

The instrument cluster displays the engine coolant temperature as determined by the engine control module (ECM). The ECM sends the engine coolant temperature information via a High Speed CAN-Bus signal to the body control module (BCM). The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to display the engine coolant temperature. The engine coolant temperature gauge defaults to 40°C (104°F) or below if:

- The ECM detects a malfunction in the engine coolant temperature sensor circuit.
- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

[Fuel Level Gauge](#)

The instrument cluster displays the fuel level based on the information from the ECM. The ECM converts the data from the fuel level sensors to a fuel level signal. The ECM sends the fuel level signal via a High Speed CAN-Bus signal to the BCM. The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to

display the fuel level. If the fuel level falls under 11% the instrument cluster switches on the low fuel level indicator. The fuel gauge defaults to empty if:

- The ECM detects a malfunction in the fuel level sensor circuit.
- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Speedometer

The instrument cluster displays the vehicle speed based on the information from the ECM. The ECM sends the vehicle speed information via a High Speed CAN-Bus signal to the BCM. The BCM then sends the vehicle speed information via a Low Speed CAN-Bus signal to the instrument cluster in order to display the vehicle speed, either in kilometres or miles, based on the vehicle requirements. The speedometer defaults to 0 km/h (0 MPH) if:

- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Odometer

The instrument cluster displays the vehicle odometer in the driver information centre. The ECM send a distance rolling count message on GMLAN to the body control module (BCM). The BCM uses this information to calculate the vehicle odometer. This odometer value is then sent to the instrument cluster on GMLAN. The instrument cluster does not calculate the odometer. The odometer displays miles or kilometres as selected in the Units menu.

The odometer value is stored in multiple modules. The instrument cluster is a secondary storage module for the odometer, while the BCM is the primary storage and accumulator.

In addition to storing the odometer value for the vehicle, the instrument cluster and the BCM store the VIN. Software checks are performed to ensure these modules, and their stored odometer information, cannot be moved or transferred between different vehicles.

If the VINs do not match, the instrument cluster will go into an error mode and display "----" (dashes). If the VIN mismatch exists over a calibrated distance, the instrument cluster will "lock" the odometer display and only show dashes, even if the VIN mismatch is subsequently correct. The only way to clear or "unlock" the instrument cluster is to perform a BCM programming event using SPS.

Tachometer

The instrument cluster displays the engine speed based on the information from the ECM. The ECM converts the data from the engine speed sensor to an engine revolution signal. The ECM sends the engine speed information via a High Speed CAN-Bus signal to the BCM. The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to display the engine speed. The tachometer defaults to 0 RPM if:

- The ECM detects a malfunction in the engine speed sensor circuit.
- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Compass

The vehicle may have a compass display on the Driver Information Centre. The compass receives its heading and other information from the Global Positioning System (GPS) aerial. If applicable, the GPS aerial is located with the telematics communication interface control module. For GPS diagnostic information refer to 149623

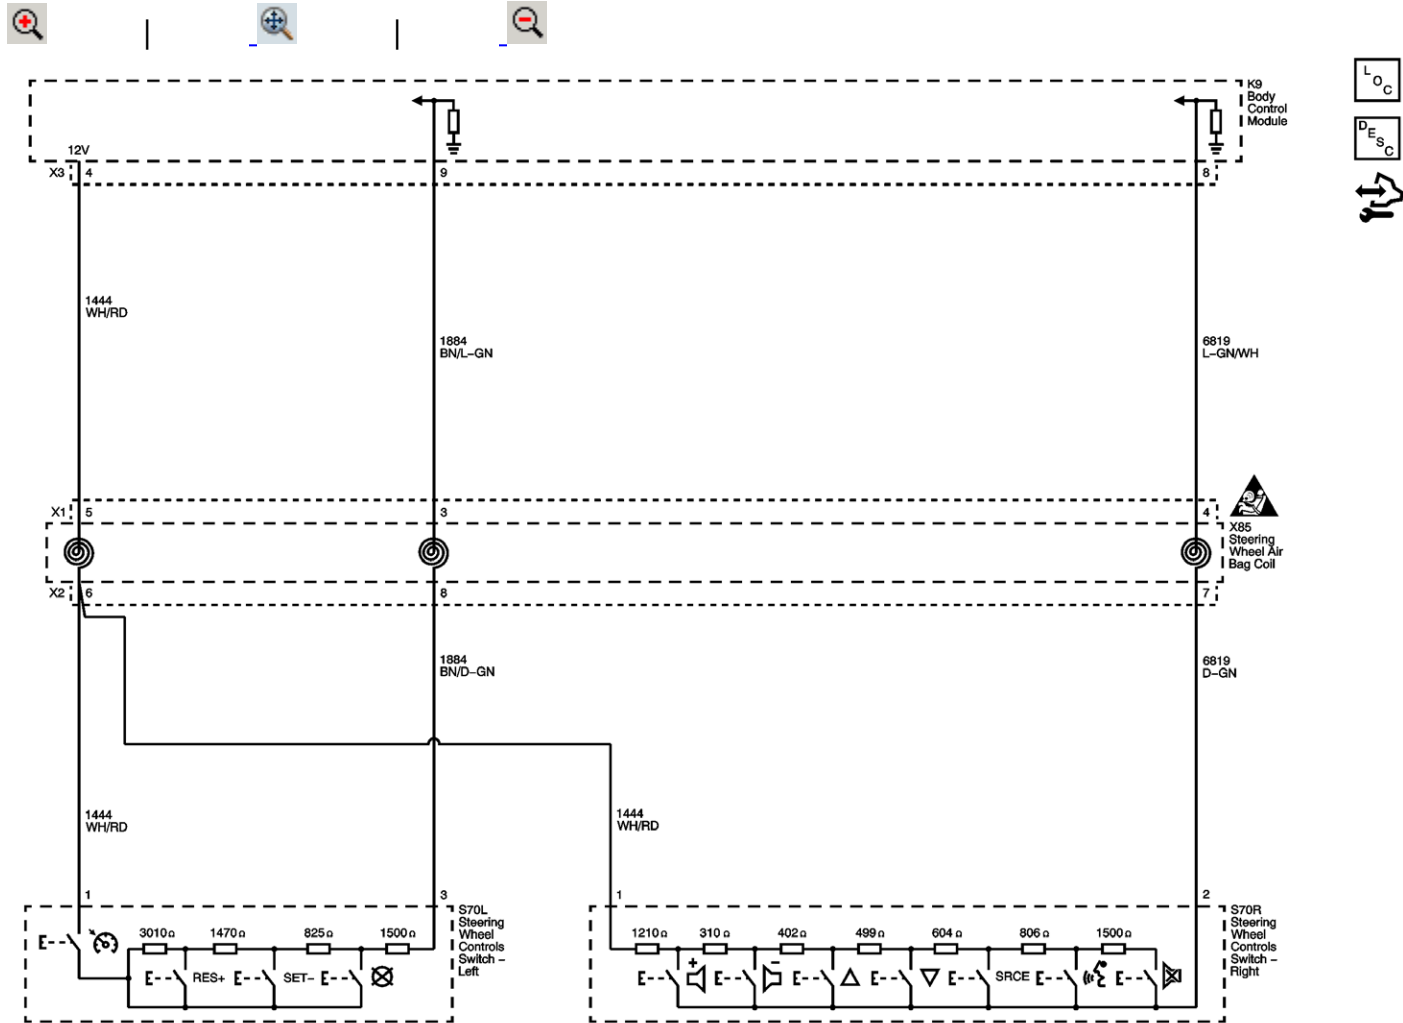

Driver Information Centre Display

In the lower middle of the instrument cluster, an additional display is installed. Its task is to give additional information, such as an odometer or error codes. This part of the instrument cluster is available in 4 different variants, mostly depending on the assembled engine. For further information refer to [Driver Information Centre \(DIC\) Description and Operation](#) .

Steering Wheel Secondary/Configurable Control Schematics

Steering Wheel Controls

[Master Electrical Component List](#)

[Steering Wheel Controls Description and Operation](#)

[Master Electrical Schematic Icons](#)

Symptoms - Secondary and Configurable Customer Controls

Important: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to [Steering Wheel Controls Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel controls. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Refer to [Steering Wheel Controls Malfunction](#) in order to diagnose the symptom.

Steering Wheel Controls Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ Voltage Reference	1	1	--	--
Signal	1	1	1	--
1. Steering Wheel Controls Inoperative				

[Circuit/System Description](#)

The body control module (BCM) supplies voltage to the audio steering wheel control switches and monitors the reindicator. Each switch state is associated to a set resistance value and when pressed a specific voltage drop occurs across the resistor unique to the switch. The BCM identifies the switch selection and activates the feature.

[Diagnostic Aids](#)

- This diagnostic is for the audio steering wheel controls.
- Before diagnosis of the steering wheel controls, ensure the primary controls of the associated component are functioning properly.
- If a single switch function is inoperative, test the suspect switch. Refer to component testing.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Vehicle in Service Mode, observe the scan tool SWC Bank 1 status while pressing and releasing the switches. The reading should be SW1-SW7 identifying the switch pressed, and Idle when released.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the S70R steering wheel control switch - right.
2. Vehicle in Service Mode, test for B+ between the voltage reference circuit terminal 1 and ground.
If less than the specified value, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 body control module.
3. Test for B+ between the voltage reference circuit terminal 1 and the signal circuit terminal 2.
If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K9 body control module.
4. Vehicle OFF, disconnect the X3 harness connector at the K9 body control module.
5. Test for infinite resistance between the signal circuit terminal 2 and ground.
If less than the specified value, test the signal circuit for a short to ground.
6. If all circuits test normal, test or replace the S70R steering wheel control switch - right.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Radio and Telephone Control Switch Replacement](#)
- [Control Module References](#) for BCM replacement, programming and setup

Steering Wheel Controls Description and Operation

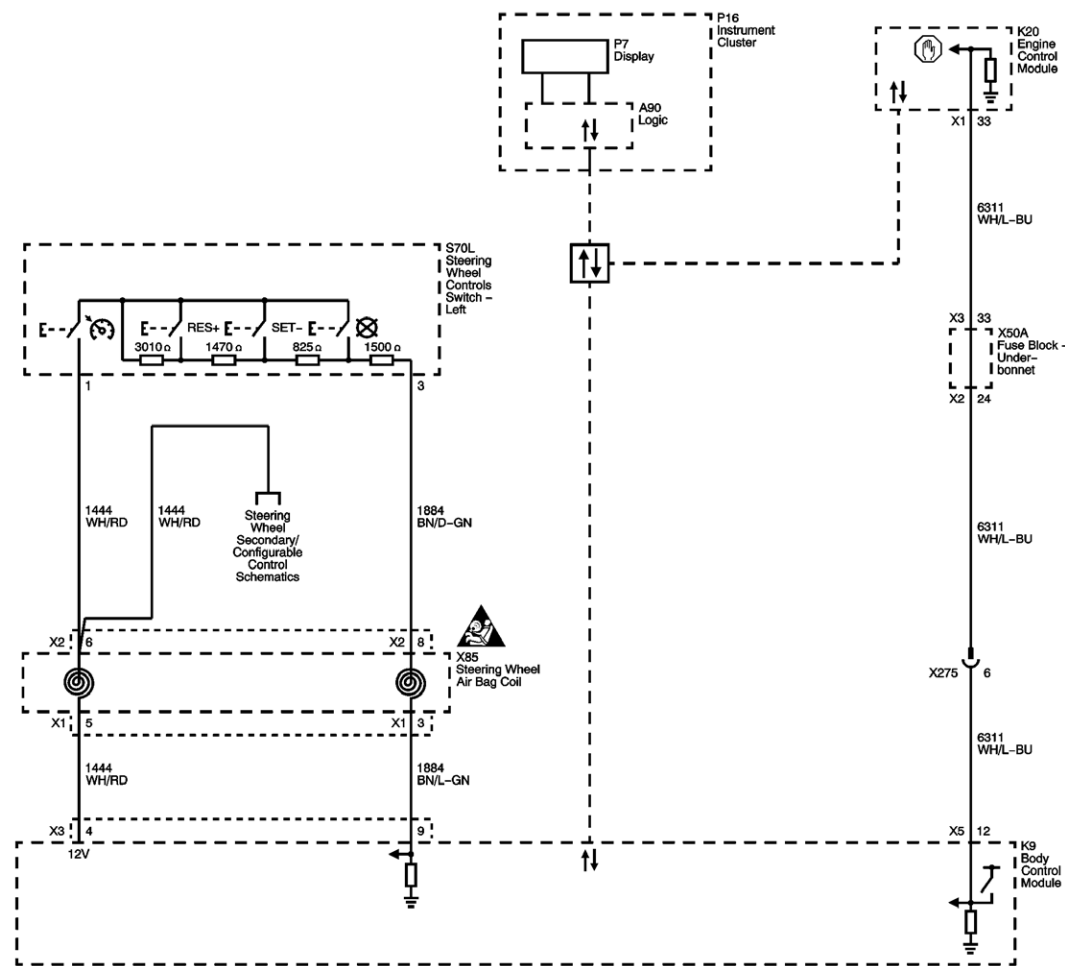

The steering wheel control switches duplicate the function of the primary controls of the associated component, through a network of momentary contact switches and a series of resistors. The body control module (BCM) supplies voltage to the switches and monitors the reindicator. When a switch is pressed, a specific voltage drops across the resistor unique to that switch. The BCM identifies the switch selected and sends a serial data message to the component controlled by the switch, activating the feature.

This section is intended to diagnose the circuits between the BCM and the steering wheel control switches. If the primary control for the device is inoperative, refer to the appropriate section for the component the steering wheel control switch is used for.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC B3794 01: Cruise Control Function Request Circuit Short To B+

DTC B3794 08: Cruise Control Function Request Circuit Signal Invalid

DTC B3794 59: Cruise Control Function Request Circuit/Component Protection Time Out

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ Voltage Reference	1	B3794 08	B3794 59	B3794 08
Cruise Control Switch Signal	1	B3794 08	B3794 01	B3794 08
1. Cruise Control Malfunction				

[Circuit/System Description](#)

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The engine control module (ECM) receives the requested cruise control switch function from the BCM via a serial data message.

[Conditions for Running the DTC](#)

- The engine is running.
- The cruise switch is ON.

Conditions for Setting the DTC

- The BCM detects an invalid voltage signal on the cruise control switch signal circuit.
- The above condition is present for greater than 1 second.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

DTC P0571

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0571: Cruise Control Brake Switch Circuit

Circuit/System Description

The engine control module (ECM) monitors the brake pedal position sensor. When the brake pedal is applied, the ECM detects a predetermined voltage signal. The ECM sends a serial data message to the engine control module (BCM) indicating the status of the brake lamps.

This diagnostic test functions on the assumption that a sudden decrease in vehicle speed is caused by a brake pedal application. When the ECM detects that there is a 4.2 km/h (2.6 mph) or greater decrease in vehicle speed within 0.25 seconds without a transition of the stop lamp switch, the ECM sets DTC P0571.

Conditions for Running the DTC

- The engine speed is greater than 700 RPM.
- The traction control system or the antilock brake system are not active and have not failed.
- The vehicle speed is greater than 48 km/h (30 mph).
- The diagnostic will disable when the wheel speed is less than 16 km/h (10 mph).

Conditions for Setting the DTC

The BCM detects either a low voltage signal on the brake lamp switch signal circuit when the serial data message from the ECM indicates the brakes are applied, or a high voltage signal on the brake lamp switch signal circuit when the serial data message from the ECM indicates the brakes are not applied.

Actions Taken When the DTC Sets

- The cruise control system is disabled.
- The malfunction indicator lamp (MIL) will not illuminate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

DTC P0703

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0703: Brake Switch Circuit 2

[Circuit/System Description](#)

The engine control module (ECM) monitors the brake pedal position sensor. When the brake pedal is applied, the ECM detects a predetermined voltage signal. The ECM sends a serial data message to the body control module (BCM) indicating the status of the stop lamps.

[Conditions for Running the DTC](#)

The engine is ON.

[Conditions for Setting the DTC](#)

- The BCM receives an invalid brake pedal status serial data message from the ECM.
- This diagnostic runs continuously.

[Actions Taken When the DTC Sets](#)

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

[Conditions for Clearing the DTC](#)

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Symptoms - Cruise Control

Note: The following steps must be completed before using the symptom tables.

1. Before using the symptom diagnostic table, perform the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) in order to verify the following conditions:
 - There are no DTCs set.
 - The module can communicate via the serial data.
2. Review the system operation in order to understand the system functions. Refer to [Cruise Control Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the cruise control system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to [Cruise Control Malfunction](#) in order to diagnose the symptom.

Cruise Control Indicator Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The instrument panel cluster (IPC) illuminates the cruise control engaged indicator based on serial data messages received from the engine control module (BCM) or the powertrain control module (ECM). The indicator is commanded ON when the cruise control switch is turned ON and turned OFF with the system disengaged.

[Diagnostic Aids](#)

This diagnostic assumes the cruise control system is functioning normally and there are no DTCs set. If the cruise control system is malfunctioning, refer to [Cruise Control Malfunction](#).

1. Cruise Control Malfunction				

[Circuit/System Description](#)

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The engine control module (ECM) receives the requested cruise control switch function from the BCM via a serial data message.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Engine ON, while rotating the steering wheel to both steering stops, observe the scan tool Cruise Control Switch parameter while pressing each of the cruise control switches. The parameter should toggle between On, Off, Resume and Set as the applicable switch is pressed.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the K20 steering wheel control switch-left.
2. Vehicle in Service Mode, test for B+ between the voltage reference circuit and ground.
If less than the specified value, test the voltage reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
3. Test for B+ between the voltage reference circuit and the signal circuit.
If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the BCM.
4. Vehicle OFF, disconnect the X3 harness connector at the K9 BCM.
5. Test for infinite resistance between the signal circuit terminal 9 and ground.
If less than the specified value, test the signal circuit for a short to ground.
6. If all circuits test normal, test or replace the K20 steering wheel control switch-left.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for BCM replacement, programming and setup

Cruise Control Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the steering wheel lower cover. Refer to Steering Wheel Spoke Lower Cover Replacement .	
1	Steering Wheel Lower Cover Fastener (Qty: 2)

Caution: Refer to [Fastener Caution](#) in the Preface section.

Cruise Control Switch Assembly

2

Procedure

Disconnect the electrical connector.

Cruise Control Description and Operation

Cruise control is a speed control system that maintains a desired vehicle speed under normal driving conditions at speeds above 40 km/h (25 mph). Steep grades may cause variations in the selected vehicle speeds.

The following are the main components of the cruise control system:

- The accelerator pedal
- The brake pedal position (BPP) sensor
- The body control module (BCM)
- The cruise control on/off switch
- The cruise control cancel switch
- The + RES switch
- The - SET switch
- The engine control module (ECM)
- The throttle actuator control (TAC) motor
- The vehicle speed sensor (VSS)

The body control module (BCM) monitors the signal circuit of the cruise control switches, which are located on the steering wheel. The BCM relays the cruise control switch status to the engine control module (ECM) via the serial data circuit. The ECM uses the status of the cruise control switch to determine when to capture and maintain the vehicle speed. The ECM monitors the vehicle speed signal circuit in order to determine the desired vehicle speed. The ECM uses the TAC motor in order to maintain the vehicle speed.

Voltage is supplied to the cruise control switch via the steering wheel control switch reference voltage circuit supplied by the BCM. The cruise control function switches are arranged in a resistive ladder design, with each cruise control function switch having a different resistance value. The BCM detects a specific voltage value that is associated with the cruise control function switch being activated. When the normally open cruise control on/off switch is turned ON, the switch closes and the BCM supplies a ground to the cruise control switch ON indicator circuit as it becomes illuminated. The BCM sends a GMLAN serial data message to the ECM indicating that the on/off switch is active. Similarly, when the normally open + RES switch or the normally open - SET switch are pressed, the switch closes and the BCM detects the predetermined voltage signal on the cruise control resume/accel and set/coast switch signal circuit. The BCM sends a GMLAN serial data message to the ECM indicating that the + RES switch or the - SET switch is active. The + RES switch or the - SET switch will remain inactive when the BCM has not received the predetermined voltage signal from the on/off switch.

Cruise Control Engaged

The cruise control system will engage and adjust vehicle speeds, based on the activation of the following cruise control switches:

- On/off
- + RES
- - SET

To engage the Cruise Control System, ensure that the vehicle speed is above 40.2 km/h (25 mph), turn the cruise On/Off switch ON and momentarily press the - SET switch. The ECM will engage the Cruise Control System and record the vehicle speed. The ECM sends a GMLAN serial data message to the instrument panel cluster (IPC) in order to illuminate the Cruise Engaged indicator in the IPC.

Pressing the accelerator pedal while the cruise control system is engaged, allows the driver to override the cruise control system in order to accelerate the vehicle beyond the current set vehicle speed. When the accelerator pedal is released, the vehicle will decelerate and resume the current set vehicle speed. The driver can also override the current set vehicle speed via the - SET switch and the + RES switch. When the cruise control system is engaged, pressing and holding the - SET switch will allow the vehicle to decelerate from the current set vehicle speed without deactivating the cruise control system. When the - SET switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the cruise control system is engaged, momentarily pressing the - SET switch will allow the vehicle to decelerate at 1.6 km/h (1 mph) increments for each time that the - SET is momentarily pressed, with a minimum vehicle speed of 37 km/h (23 mph).

Pressing and holding the + RES switch, when the cruise control system is engaged, will allow the vehicle to accelerate to a greater vehicle speed than the current set vehicle speed. When the + RES switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the cruise control system is engaged, momentarily pressing the + RES switch will allow the vehicle to accelerate at 1.6 km/h (1 mph) increments for each time that the + RES switch is momentarily pressed, with the maximum acceleration total of 16 km/h (10 mph) over the current set vehicle speed. Momentarily activating the + RES switch will recall the previous vehicle speed, after the cruise control system is disengaged by pressing the brake pedal or CANCEL switch.

Cruise Control Disengaged

The engine control module (ECM) disengages the cruise control operation based on the signals from the following switches:

- The brake pedal position (BPP) sensor
- The cruise control on/off switch
- The cruise control cancel switch

The Cruise Control System will disengage when the brake pedal is applied. The body control module (BCM) monitors the BPP sensor via the BPP sensor signal circuit as the voltage signal increases while the pedal reaches the fully applied position. The ECM monitors the BPP signal through a discrete input and a GMLAN serial data message signal from the BCM indicating the brake status. When both signals indicate the brake pedal is applied, the ECM will disengage the cruise control system.

The Cruise Control System will also disengage when the cruise control on/off switch is switched OFF, or the cruise control cancel switch is activated. The body control module (BCM) determines when the cruise control cancel switch is activated. When the normally open cancel switch is closed, the BCM detects the predetermined voltage signal on the cruise control function switch circuit. The vehicle speed stored in the memory of the engine control module will be erased when the cruise control On/Off switch is turned OFF, or the ignition switch is turned OFF. The BCM sends a GMLAN serial data message to the ECM in order to disengage the cruise control system. The Cruise Control System will disengage when the ECM detects that a driver override function has been active for approximately 60 seconds. When the Cruise Control System has been disengaged, the ECM sends a GMLAN serial message to the instrument panel cluster (IPC) in order to turn OFF the Cruise Engaged indicator.

Every time the cruise control system is disengaged, the ECM will keep track of the reason for system disengagement. The last 8 disengagement reasons will be recorded

within the ECM memory. The scan tool will display the last 8 Cruise Disengage History parameters, in which one out of approximately 50 possible reasons will be displayed in each of these 8 parameters. For the disengagement reason to be displayed within the scan tool parameter either the cruise control system is active and disengagement is requested, or engagement of the system is requested but a fault is present. For a list of each disengagement reason along with each definition, refer to [Engine Control Module Scan Tool Information](#) .

Cruise Control Inhibited

The engine control module (ECM) inhibits the cruise control operation when any of the following conditions exist:

- A cruise control system DTC has been set.
- The vehicle speed is less than 40.2 km/h (25 mph).
- The vehicle speed is too high.
- The vehicle is in PARK, REVERSE, NEUTRAL, or 1st gear.
- The engine RPM is too low.
- The engine RPM is too high.
- The system voltage is not between 9-16 V.
- The antilock brake system (ABS) / traction control system (TCS) is active for more than 2 seconds.

Exhaust Actuator Solenoid Low Reference	-	P0013, P0014	-	P0014

[Circuit/System Description](#)

The camshaft position (CMP) actuator system enables the engine control module (ECM) to change the timing of the camshaft while the engine is operating. The ECM controls the camshaft position actuator magnet duty cycle by controlling the amount of ON time. The magnet controls the amount of engine oil flow to the CMP actuator by extending a pintle within the solenoid. The pintle acts against a spool valve in the CMP actuator mechanism which is attached to the front of the camshaft. As the spool valve is moved, oil is directed to the CMP actuator, which rotates the camshaft. The ECM can only command the camshaft position actuator to retard the valve timing from the camshaft park position, or advance the valve timing back to the park position. The ECM controls the camshaft position actuator magnet by supplying a 12 V pulse width modulated (PWM) signal. The ECM supplies a ground to the low reference circuit.

[Conditions for Running the DTC](#)

- The engine is running.
- The ignition voltage is greater than 11 V.
- The camshaft position actuator is commanded ON.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P0010 and P0013 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0010 and P0013 are Type B DTCs.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors, with the engine running, while monitoring the scan tool Camshaft Position Actuator Solenoid Valve Control Circuit status parameters. The circuit status parameters will change from OK, or Not Run, to Malfunction if there is a condition with the circuit or connection.

Circuit/System Verification

1. Engine running, observe the scan tool control circuit status parameters listed below:
 - Inlet/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status
 - Inlet/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status
 - Inlet/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test StatusEach parameter should display OK or Not Run.
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate Q6 camshaft position actuator solenoid valve.

Note: A test lamp must be used for this test. The control circuit is pulled-up to a low current voltage. The current is too low to illuminate a test lamp. A voltage on the control circuit is normal.

2. Vehicle in Service Mode, verify that a test lamp does not illuminate between the control circuit terminal 2 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
3. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
4. Connect the DMM negative lead to the control circuit terminal 2. Connect the DMM positive lead to B+. Set the DMM on the diode setting. Command the CMP Actuator Solenoid Valve ON and OFF with a scan tool. The DMM should transition from OL when commanded OFF to less than 1 V when commanded ON.
If the circuit voltage does not correspond to the specified values, test the control circuit for an open/high resistance or a short to ground. If the circuit tests normal,

replace the ECM.

5. If all circuits/connections test normal, test or replace the Q6 camshaft position actuator solenoid valve.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the appropriate Q6 camshaft position actuator solenoid valve.
2. Test for 5.0-9.0 Ω between the solenoid control terminal 2 and the low reference terminal 1 at the camshaft position actuator solenoid valve.
If not within the specified range, replace the Q6 camshaft position actuator solenoid valve.
3. Test for infinite resistance between each terminal of the solenoid and the solenoid housing.
If not the specified value, replace the Q6 camshaft position actuator solenoid valve.

Dynamic Test

1. Remove the appropriate Q6 camshaft position actuator solenoid valve.
2. Install a 10 A fused jumper wire between the control circuit terminal 2 and 12 V. Momentarily install a jumper wire between the low reference terminal 1 and ground. The pintle should extend.

Note:

- The camshaft position actuator solenoid pintle should be facing downward for this test.
- Do not allow electrical current to flow through the camshaft position actuator solenoid for greater than 1-2 s.

If the function does not perform as specified, replace the Q6 camshaft position actuator solenoid valve.

Repair Instructions

[Circuit/System Description](#)

The camshaft position (CMP) actuator system enables the engine control module (ECM) to change the timing of the camshaft while the engine is operating. The ECM controls the camshaft position actuator magnet duty cycle by controlling the amount of ON time. The magnet controls the amount of engine oil flow to the CMP actuator by extending a pintle within the solenoid. The pintle acts against a spool valve in the CMP actuator mechanism which is attached to the front of the camshaft. As the spool valve is moved, oil is directed to the CMP actuator, which rotates the camshaft. The ECM can only command the camshaft position actuator to retard the valve timing from the camshaft park position, or advance the valve timing back to the park position. The ECM controls the camshaft position actuator magnet by supplying a 12 V pulse width modulated (PWM) signal. The ECM supplies a ground to the low reference circuit.

[Conditions for Running the DTC](#)

- DTCP0010, P0013, P0016, P0017, P0335, P0336, P0340, P0341, P0365, or P0366 is not set.
- The engine is running.
- The ignition voltage is greater than 11 V.
- The CMP actuator is enabled and commanded greater than 0°.
- The rate of change in the camshaft position is less than 3° for 4 s.

Conditions for Setting the DTC

The ECM detects a difference of greater than 8° between the camshaft position angle position and the desired camshaft position for greater than 30 s.

Action Taken When the DTC Sets

- DTCs P0011 and P0014 are Type B DTCs.
- The CMP actuator solenoid valve - inlet and CMP actuator solenoid valve - exhaust are commanded to the park position.

Conditions for Clearing the DTC

DTCs P0011 and P0014 are Type B DTCs.

Diagnostic Aids

- The engine oil condition has a major impact on the camshaft actuator system.
- A low oil level condition may set this DTC. The engine may require an oil change. Inquire with the customer when the last oil change was performed. You may also monitor the scan tool Engine Oil Life Remaining parameter. Advise the customer an oil change may be required.
- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft actuator, or timing belt can cause this DTC to set.
- A resistance on either circuit greater than 8 Ω on the inlet or exhaust CMP actuator solenoid valve control circuit may set this DTC. If you suspect high resistance, ground the control circuit while the engine is idling. The scan tool Inlet or Exhaust CMP Actuator Solenoid Valve Control Circuit Low Voltage Test Status parameter should display Malfunction. If the parameter displays OK, test the control circuit for high resistance.

Circuit/System Verification

Note:

- The engine oil level and the oil pressure are critical to the correct operation of the camshaft position (CMP) actuator system. Verify that the engine has the correct oil level and the correct oil pressure before continuing with this diagnostic.
- The engine oil condition has a major impact on the camshaft actuator system. Debris in the oil can interfere with the camshaft position actuator solenoid and the mechanical camshaft actuator operation. Inspect for dirty or degraded crankcase oil. The engine may require an oil change. Inquire with the customer when the last oil change was performed. You may also monitor the scan tool Engine Oil Life Remaining parameter. Advise the customer an oil change may be required.

1. Verify the engine oil pressure. Refer to [Oil Pressure Diagnosis and Testing](#)
2. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify DTC P0010, P0013, P0016, P0017, P0335, P0336, P0340, P0341, P0365, or P0366 is not set.

If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

3. Engine running at operating temperature, command the appropriate Inlet or Exhaust CMP Actuator to 20° with a scan tool. The Desired Inlet or Exhaust Camshaft Position parameter value should match the Inlet or Exhaust Camshaft Position angle parameter value.
4. Observe the Inlet or Exhaust Camshaft Position Variance value on the scan tool. The Inlet or Exhaust Camshaft Position Variance value will increment for several seconds until the Inlet or Exhaust Camshaft Position angle value matches the Desired Inlet or Exhaust Camshaft Position value. The Inlet or Exhaust Camshaft Position Variance value should then return to 0°.

5. Operate the vehicle within the conditions for running the DTC, to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate Q6 camshaft position actuator solenoid valve.
2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 2 Ω between the low reference circuit terminal 1 and ground.

If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.

Note: A test lamp must be used for this test. The control circuit is pulled-up to a low current voltage. The current is too low to illuminate a test lamp. A voltage on the control circuit is normal.

3. Vehicle in Service Mode, verify that a test lamp does not illuminate between the control circuit terminal 2 and ground.
If the test lamp illuminates, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Connect the DMM negative lead to the control circuit terminal 2. Connect the DMM positive lead to B+. Set the DMM on the diode setting. Command the CMP Actuator Solenoid ON and OFF with a scan tool. The DMM should transition from OL when commanded OFF to less than 1 V when commanded ON.
If the circuit voltage does not correspond to the specified values, test the control circuit for an open/high resistance or a short to ground. If the circuit tests normal, replace the ECM.
5. Vehicle OFF, swap the appropriate Q6 camshaft position actuator solenoid valve with a Q6 camshaft position actuator solenoid valve that is operating correctly.

Note: This step tests the mechanical camshaft position actuator which is part of the inlet and exhaust sprocket assembly.

6. Engine idling, command the appropriate Camshaft Position Actuator from 0° to 20° and back to zero while observing the appropriate scan tool Inlet/Exhaust Camshaft Position Variance parameters. The Inlet/Exhaust Camshaft Position Variance should be less than 2° in each of the commanded states.
If greater than the specified value, replace the mechanical camshaft position actuator.
7. If all circuits and components test normal, replace the Q6 camshaft position actuator solenoid valve.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the appropriate Q6 camshaft position actuator solenoid valve.
2. Test for 5.0-9.0 Ω between the solenoid control terminal 2 and the low reference terminal 1 at the camshaft position actuator solenoid valve.
If not within the specified range, replace the Q6 camshaft position actuator solenoid valve.
3. Test for infinite resistance between each terminal of the solenoid and the solenoid housing.
If not the specified value, replace the Q6 camshaft position actuator solenoid valve.

Dynamic Test

1. Remove the appropriate Q6 camshaft position actuator solenoid valve.
2. Install a 10 A fused jumper wire between the control circuit terminal 2 and 12 V. Momentarily install a jumper wire between the low reference terminal 1 and ground. The pintle should extend.

Note:

- The camshaft position actuator solenoid pintle should be facing downward for this test.
- Do not allow electrical current to flow through the camshaft position actuator solenoid for greater than 1-2 s.

If the function does not perform as specified, replace the Q6 camshaft position actuator solenoid valve.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0016: Crankshaft Position - Inlet Camshaft Position Not Plausible

DTC P0017: Crankshaft Position - Exhaust Camshaft Position Not Plausible

Circuit/System Description

The engine control module (ECM) uses the crankshaft position sensor and the CMP actuator solenoid valves sensor information to monitor the correlation between the crankshaft and the camshaft positions.

Conditions for Running the DTC

- DTCP0335, P0336, P0340, P0341, P0365, P0366, P0641 or P0651 is not set.
- The engine is cranking or running.
- The camshaft position actuator solenoid valves are in the parked position.
- The crankshaft and camshaft position signals are synchronised.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects the CMP actuator solenoid valve - inlet or CMP actuator solenoid valve - exhaust is greater than 10° before or after the nominal position for 4 out of 5 camshaft revolutions in relation to the crankshaft angle while the engine is spinning.

Action Taken When the DTC Sets

DTCs P0016 and P0017 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0016 and P0017 are Type B DTCs.

Diagnostic Aids

The following conditions can also set the DTC:

- A short to ground in a CMP actuator solenoid valve control circuit.
- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft actuator, CMP sensor, crankshaft position sensor, or timing chain.
- Excessive crankshaft end play.
- An actuator that is in the full advance or retard position.
- A crankshaft reluctor wheel that has moved in relationship to top dead centre (TDC).
- Observing the desired and actual camshaft angle parameters, with a scan tool before a DTC sets, may help to isolate whether a condition is specific to one camshaft, or caused by a condition with the crankshaft timing.

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. DTC P0010, P0011, P0013, P0014, P0335, P0336, P0340, P0341, P0365 or P0366 should not be set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Engine idling at the normal operating temperature. DTCs P0016 or P0017 should not set.
If a DTC sets, inspect for the following:
 - The correct installation of the Q6F CMP actuator solenoid valve - inlet or Q6E CMP actuator solenoid valve - exhaust
 - The correct installation of the B26 Crankshaft Position Sensor
 - A timing chain tensioner condition
 - An incorrectly installed timing chain
 - Excessive play in the timing chain
 - A timing chain that jumped teeth
 - A crankshaft reluctor wheel that has moved in relationship to top dead center (TDC) on the crankshaft
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that are captured in the freeze frame/failure records data.

[Typical Scan Tool Data](#)

[HO2S 1 or 2 Heater](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: 0.3-2.5 A			
Ignition Voltage	0 A	0 A	0.3-2.5 A
HO2S Heater Low Control	0 A	0 A	0 A

[Circuit/System Description](#)

The heated oxygen sensors (HO2S) are used for fuel control and post-catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. Each HO2S must reach operating temperature to provide an accurate voltage signal. A heating element inside each of the HO2S minimises the time required for the sensor to reach operating temperature. Voltage is provided to the heater by an ignition voltage circuit through a fuse. With the engine running, ground is provided to the heater by the HO2S heater low control circuit, through a low side driver within the engine control module (ECM). The ECM uses pulse-width modulation (PWM) to control the HO2S heater operation to maintain a specific HO2S operating temperature range.

[Conditions for Running the DTC](#)

P0030 and P0036

- The ignition voltage is greater than 11 V.
- Engine speed is greater than 400 RPM.
- DTC P0030 and P0036 run continuously when the above conditions are met.

P0053 and P0054

- DTCs P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, or P2610 are not set.

- The vehicle is OFF for greater than 8 h.
- The engine coolant temperature (ECT) and the inlet air temperature (IAT) are within 8°C (14°F).
- The ECT is between -30 to +45°C (-22 to +113°F).
- The ignition voltage is less than 32 V.
- The engine run time is less than 275 ms.
- DTC P0053 and P0054 run once per cold start-up when the above conditions are met.

P0135 and P0141

- DTCs P0116, P0117, P0118, P0119, or P0128 are not set.
- The ignition voltage is between 10-32 V.
- The HO2S heaters are at operating temperature.
- The scan tool HO2S Heater device control is not active.
- The commanded HO2S heater duty cycle is greater than 0 percent.
- DTC P0135 and P0141 run twice per ignition cycle when the above conditions are met for 120 s.

Conditions for Setting the DTC

P0030 and P0036

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 7 s.

P0053 and P0054

The ECM detects the HO2S heater is not within a specified resistance range at engine start-up.

P0135 and P0141

The ECM detects the HO2S heater current is less than 0.30 A or greater than 2.5 A for more than 10 s.

Action Taken When the DTC Sets

DTC P0030, P0036, P0053, P0054, P0135, and P0141 are Type B DTCs.

Conditions for Clearing the DTC

DTC P0030, P0036, P0053, P0054, P0135, and P0141 are Type B DTCs.

Diagnostic Aids

- If the condition is intermittent, move the related harnesses and connectors, with the engine running, while monitoring the scan tool circuit status parameters for the component. The circuit status parameters change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.
- An open fuse in the HO2S heater circuit may be caused by the heater element in one of the sensors. The condition may not be present until the sensor operates for a period of time. If no fault is present in the heater circuit, monitor the amperage of each heater with a scan tool to determine if one of the heater elements is the cause of the open fuse. Inspect the sensor pigtail or the harness for contacting the exhaust system.

Circuit/System Verification

1. Engine running at operating temperature, command the appropriate HO2S heater ON and OFF with a scan tool while observing the circuit test status parameters listed below.
 - HO2S 1 or 2 Heater Control Circuit Low Voltage Test Status
 - HO2S 1 or 2 Heater Control Circuit Open Test Status
 - HO2S 1 or 2 Heater Control Circuit High Voltage Test StatusEach parameter should display OK or Not Run.
2. Observe the scan tool HO2S 1 or 2 Heater parameters. The amperage should be within 0.2-1.5 A.
3. Move the related wiring and connectors while observing the HO2S 1 or 2 Heater parameters with a scan tool. The parameters should not change with movement. If movement affects the parameter, repair the appropriate harness or connector.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate B52 heated oxygen sensor.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition voltage circuit terminal listed below and ground.
 - B52 HO2S 1 terminal 1
 - B52 HO2S 2 terminal DIf the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test all components connected to the ignition voltage circuit and replace as necessary.
3. Observe the scan tool HO2S 1 or 2 Heater Control Open Circuit Test Status parameter. The parameter should display Malfunction. If not the specified value, test the heater control circuit terminal listed below for a short to ground, or for a short to voltage. If the circuit tests normal, replace the K20 ECM.
 - B52 HO2S 1 terminal 2
 - B52 HO2S 2 terminal E
4. Connect a 3 A fused jumper wire between the appropriate heater control circuit terminal listed below and ground. Observe the scan tool HO2S 1 or 2 Heater Control Circuit Low Voltage Test Status parameter. The parameter should transition from OK to Malfunction. If not the specified value, test the heater control circuit terminal listed below for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
 - B52 HO2S 1 terminal 2
 - B52 HO2S 2 terminal E
5. Vehicle OFF, connect a 10 A fused jumper wire between the appropriate heater control circuit terminal and ignition voltage circuit terminal listed below:
 - B52 HO2S 1 ignition voltage circuit terminal 1 to control circuit terminal 2
 - B52 HO2S 2 ignition voltage circuit terminal D to control circuit terminal E
6. Engine running, observe the HO2S 1 or 2 Control Circuit High Voltage Test Status parameter. The parameter should transition from Not Run to Malfunction. If not the specified value, test the control circuit and the ignition voltage circuit for high resistance. If the circuits test normal, replace the K20 ECM.
7. If all circuits test normal, test or replace the B52 heated oxygen sensor.

MAF Control	P0101, P121B	P0101, P0102	P0101, P0102	P0101, P0102, P121C	-

[Typical Scan Tool Data](#)

[MAF Sensor](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Vehicle ON, normal operating temperature and engine speed between 1,375 and 1,425 RPM Parameter Normal Range: 1,800-2,400 Hz			
Ignition Voltage	0 Hz	0 Hz	-
MAF Sensor Signal	0 Hz	0 Hz	0 Hz
MAF Control	-	0 Hz	-

[Circuit/System Description](#)

The mass air flow (MAF) sensor is integrated with the inlet air temperature (IAT) sensor. The MAF sensor is an air flow meter that measures the amount of air entering the engine. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. The air flow and engine speed are very dependent on the battery pack state of charge. A small quantity of air entering the engine indicates a low load condition. A large quantity of air entering the engine indicates a high load condition.

The ECM applies 5 volts to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a frequency based on the inlet air flow through the sensor bore.

The MAF sensor is supplied power through the powertrain relay and a fuse. The ECM enables the MAF sensor only during engine run mode by grounding the MAF control circuit via a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM monitors the status of the driver. If the ECM detects an incorrect voltage for the commanded state of the driver, a MAF sensor supply voltage low side driver control circuit DTC is set.

Conditions for Running the DTC

- DTCs P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0335, and P0336 are not set.
- The engine speed is between 500 and 8,000 RPM.
- The IAT Sensor is between -20 and +125°C (-4 and +257°F).
- The ECT Sensor is between -7 and +125°C (+19 and +257°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the MAF sensor signal is not within a predetermined range of the calculated MAF value.

Action Taken When the DTC Sets

DTC P0101 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0101 is a Type B DTC.

Diagnostic Aids

- Inspect the harness of the MAF sensor to verify that it is not routed too close to the following components:
 - The ignition coil module
 - Any solenoids
 - Any relays
 - Any motors

- Any type of contamination on the MAF sensor heating elements will degrade the proper operation of the sensor. Certain types of contaminants act as a heat insulator, which will impair the response of the sensor to airflow changes. Water or snow can create the opposite effect, and cause the signal to increase rapidly. Inspect for any contamination, water intrusion, or debris on the sensing elements of the MAF sensor. If debris is present, clean the sensor. If the sensor cannot be cleaned, replace the sensor.
- A high resistance may cause a driveability concern before this DTC sets.
- Certain aftermarket air filters may cause this DTC to set.
- Certain aftermarket air induction systems may cause this DTC to set.
- Modifications to the air induction system may cause this DTC to set.

Special Tools

J 38522 Variable Signal Generator.

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

Circuit/System Verification

Note: To ensure a proper engine load, this diagnostic should be performed when the Hybrid/EV Battery Pack Charge Remaining parameter is at least 40%.

1. Observe the DTC information with a scan tool. Verify that DTC P121B and P121C are not set.
If any of the DTCs are set, refer to [DTC P121B or P121C](#) .
2. Vehicle ON, engine speed between 1,375 and 1,425 RPM, normal operating temperature. Verify the scan tool MAF Sensor parameter is between 1,800 and 2,400 Hz.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Verify the following conditions do not exist:
 - A dirty, restricted, or deteriorating air filter element
 - A leaking, loose, or cracked PCV pipe or seal
 - A restricted or collapsed air inlet duct
 - A misaligned, leaking, or damaged air inlet duct
 - Any objects blocking the air inlet probe of the B75B mass air flow/inlet air temperature sensor
 - Any contamination or debris on the sensing elements in the probe of the B75B mass air flow/inlet air temperature sensor
 - A cracked, damaged, or leaking B75B mass air flow/inlet air temperature sensor housing
 - Any water intrusion in the induction system
 - Any snow or ice build-up at the air cleaner or B75B mass air flow/inlet air temperature sensor in cold climates
 - Any vacuum leak
 - A B74 MAP sensor seal that is leaking, missing, or damaged
 - Q38 Throttle body for dirt, debris, and coking. Refer to [Throttle Body Inspection and Cleaning](#) .
 - A damaged Q38 throttle body blade or shaft
 - Missing, restricted, or leaking exhaust components. Refer to [Symptoms - Engine Exhaust](#) .

If you find any of the above conditions, repair as necessary.

2. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the signal circuit terminal 5 and ground.

If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

- If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
4. Verify that a test lamp illuminates between the ignition voltage circuit terminal 4 and ground.
If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test or replace the components on the ignition voltage circuit.
 5. Connect the test lamp between the MAF control circuit terminal 2 and the ignition voltage circuit terminal 4.
 6. Vehicle in Service Mode, command the MAF Sensor Supply Voltage Low Side Driver ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.
If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
 7. Vehicle OFF, connect the red lead of the J 38522 to the signal circuit terminal 5 at the harness connector. Connect the battery voltage supply to B+, and the black lead to ground.
 8. Set the J 38522 to the following specifications.
 - Signal switch to 5 V
 - Frequency switch to 5 KHz
 - Duty Cycle switch to Normal
- Note:** The engine may run rough and stall.
9. Vehicle ON, engine running, observe the scan tool MAF Sensor Hz parameter. The parameter should be between 4,950 and 5,025 Hz.
If not within the specified range, replace the K20 ECM.
 10. If all circuits test normal, test or replace the B75B mass air flow/intake air temperature sensor.

Circuit/System Description

The mass air flow (MAF) sensor is integrated with the inlet air temperature (IAT) sensor. The MAF sensor is an air flow meter that measures the amount of air entering the engine. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. The air flow and engine speed are very dependent on the battery pack state of charge. A small quantity of air entering the engine indicates a low load condition. A large quantity of air entering the engine indicates a high load condition.

The ECM applies 5 volts to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a frequency based on the inlet air flow through the sensor bore.

The MAF sensor is supplied power through the powertrain relay and a fuse. The ECM enables the MAF sensor only during engine run mode by grounding the MAF control circuit via a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM monitors the status of the driver. If the ECM detects an incorrect voltage for the commanded state of the driver, a MAF sensor supply voltage low side driver control circuit DTC is set.

Conditions for Running the DTC

- The engine is running for greater than 1 s.
- The engine speed is greater than 300 RPM.
- The ignition voltage is greater than 10 V.
- The above conditions are met for greater than 1 s.
- These DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0102

The ECM detects that the MAF sensor signal is less than 1,800 Hz or 0 g/s for greater than 30 s.

P0103

The ECM detects that the MAF Sensor is greater than 14,500 Hz or 108 g/s for greater than 30 s.

Action Taken When the DTC Sets

DTCs P0102 and P0103 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0102 and P0103 are Type B DTCs.

Diagnostic Aids

- Verify the integrity of the air induction system by inspecting for the following conditions:
 - Any water intrusion in the induction system
 - Any contamination or debris on the sensing elements of the MAF sensor
 - Damaged components
- Verify that any electrical aftermarket devices are properly connected and grounded. Refer to [Checking Aftermarket Accessories](#) .

Circuit/System Verification

Note: To ensure a proper engine load, this diagnostic should be performed when the Hybrid/EV Battery Pack Charge Remaining parameter is at least 40%.

1. Observe the DTC information with a scan tool. Verify that DTC P121B and P121C are not set.
If any of the DTCs are set, refer to [DTC P121B or P121C](#) .
2. Vehicle ON, engine speed between 1,375 and 1,425 RPM, normal operating temperature. Verify the scan tool MAF Sensor parameter is between 1,800 and 2,400 Hz.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.
2. Vehicle in Service Mode, test for 4.8-5.2 V between the signal circuit terminal 5 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
3. Verify that a test lamp illuminates between the ignition voltage circuit terminal 4 and ground.
If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test or replace the components on the ignition voltage circuit.
4. Connect the test lamp between the MAF control circuit terminal 2 and the ignition voltage circuit terminal 4.
5. Vehicle in Service Mode, command the MAF Sensor Supply Voltage Low Side Driver ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.
If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
6. Vehicle OFF, connect the red lead of the J 38522 to the signal circuit terminal 5 at the harness connector. Connect the battery voltage supply to B+, and the black lead to ground.
7. Set the J 38522 to the following specifications.
 - Signal switch to 5 V
 - Frequency switch to 5 KHz
 - Duty Cycle switch to Normal

Note: The engine may run rough and stall.

8. Engine running, observe the scan tool MAF Sensor Hz parameter. The parameter should be between 4,950 and 5,025 Hz.
If not within the specified range, replace the K20 ECM.

9. If all circuits test normal, test or replace the B75B mass air flow/intake air temperature sensor.

MAP Sensor Signal	0 psi	0 psi	18+psi
Low Reference	-	18+psi	-

Circuit Description

The manifold absolute pressure (MAP) sensor measures the pressure inside the intake manifold. Pressure in the inlet manifold is affected by engine speed, throttle opening, air temperature, and barometric pressure (BARO). A diaphragm within the MAP sensor is displaced by the pressure changes that occur from the varying load and operating conditions of the engine. The sensor translates this action into electrical resistance. The MAP sensor wiring includes 3 circuits. The engine control module (ECM) supplies a regulated 5 V to the sensor on a 5 V reference circuit. The ECM supplies a ground on a low reference circuit. The MAP sensor provides a signal voltage to the ECM, relative to the pressure changes, on the MAP sensor signal circuit. The ECM converts the signal voltage input to a pressure value.

Under normal operation the highest pressure that can exist in the inlet manifold is equal to BARO. This occurs when the engine is operated at wide-open throttle (WOT) or when the vehicle is ON while the engine is OFF. Under these conditions, the ECM uses the MAP sensor to determine the current BARO. The lowest manifold pressures occur when the vehicle is idling or decelerating. MAP can range from 1.5 psi, when pressures are low, to as much as 15 psi when pressures are high, depending on the BARO. The ECM monitors the MAP sensor signal for pressure outside of the normal range.

Conditions for Running the DTC

Condition 1

- DTCP0102, P0103, P0107, P0108, P010C, P010D, P0111-P0114, P0116-P0119, P0128, P0401, P0405, P0406, P042E, P0335, or P0336 is not set.
- The IAT and ECT Sensor parameters are between -20 and +125°C (-4 and 257°F).
- Engine speed is between 500 and 8000 RPM.

Condition 2

- DTC P0107, P0108, P2227-P2230, or P2610 is not set.
- Engine not rotating.

This DTC runs continuously when either of the above conditions are met.

Conditions for Setting the DTC

The engine control module (ECM) detects that the MAP sensor pressure is not within range of the calculated pressure that is derived from the system of models for more than 0.5 s.

Action Taken When the DTC Sets

DTC P0106 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0106 is a Type B DTC.

[Diagnostic Aids](#)

- A skewed or stuck engine coolant temperature (ECT) or IAT sensor will cause the calculated models to be inaccurate and may cause this DTC to run when it should not. Refer to [Temperature Versus Resistance](#) .
- The BARO that is used by the ECM to calculate the air flow models is initially based on the MAP sensor at Vehicle ON. When the engine is running, the ECM will continually update the BARO value near wide open throttle using the MAP sensor and a calculation. A skewed MAP sensor will cause the BARO value to be inaccurate. Use the scan tool and compare the BARO parameter at Vehicle ON to the Altitude vs. Barometric Pressure Table. Refer to [Altitude Versus Barometric Pressure](#) .
- A skewed MAP sensor will also cause the first and second intake manifold models to disagree with the actual MAP sensor measurements. Use the scan tool and compare the MAP Sensor parameter to a known good vehicle, under various operating conditions.

Circuit/System Verification

1. Vehicle in Service Mode, verify DTC P0697 is not set.
If DTC P0697 is set, refer to [DTC P0641, P0651, P0697, or P06A3](#) : [ECM](#) .
2. Determine the current vehicle testing altitude. Vehicle in Service Mode, observe the scan tool BARO Sensor parameter. Compare the parameter to the [Altitude Versus Barometric Pressure](#) table. The BARO sensor pressure parameter should be within the specified range indicated in the table.
3. Observe the scan tool MAP sensor parameter. Engine running, the MAP Sensor parameter should change.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Verify the integrity of the air induction system by inspecting for the following conditions:
 - Any damaged components
 - Loose or improper installation
 - Improperly routed vacuum hoses
 - Any vacuum leak
 - Any type of restriction
 - MAP sensor seal that is missing or damaged
2. Verify that restrictions do not exist in the exhaust system. Refer to [Restricted Exhaust](#) .
3. Vehicle OFF, disconnect the harness connector at the B74 MAP sensor.
4. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
5. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
6. Verify the scan tool MAP Sensor parameter is less than 0.5 V.
If greater than the specified range, test the signal circuit terminal 3 for a short to voltage. If the circuit tests normal, replace the K20 ECM.
7. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 1. Verify the scan tool MAP Sensor parameter is greater than 4.7 V.

- If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
- If all circuits test normal, test or replace the MAP sensor.

Component Testing

Note: You must perform the Circuit/System Testing in order to verify the integrity of the MAP sensor circuits before proceeding with the Component Testing.

Skewed Sensor Test

- Vehicle in Service Mode, observe the MAP sensor scan tool parameter.
- Use the observed MAP Sensor scan tool parameter that is closest to a value that is indicated in the first column of the table.
- Connect the *J-23738-A* to the port of the B74 MAP sensor.
- Apply 5 in Hg of vacuum to the B74 MAP sensor, with the *J-23738-A*. The MAP sensor parameter in the first column of the table should decrease by 2.5 psi. The acceptable range is indicated in the second column of the table.
- Apply 10 in Hg of vacuum to the B74 MAP sensor using the *J-23738-A*. The MAP sensor parameter in the first column of the table should decrease by 5 psi. The acceptable range is indicated in the third column of the table.

Vehicle in Service Mode, MAP Sensor Parameter	MAP Sensor Parameter With 5 Inches of Vacuum Applied	MAP Sensor Parameter With 10 Inches of Vacuum Applied
15 psi	11.5-12.5 psi	9.0-10.0 psi
14 psi	10.5-12.0 psi	8.0-9.5 psi
13 psi	10.0-11.0 psi	7.5-9.0 psi
12 psi	8.5-10.0 psi	6.0-7.5 psi
10 psi	7.0-8.5 psi	4.5-6.0 psi
9 psi	5.5-7.0 psi	3.0-4.5 psi

Erratic Signal Test

- Vehicle OFF, remove the B74 MAP sensor.
- Install a 3 A fused jumper wire between the 5 V reference circuit terminal 1 and the corresponding terminal of the B74 MAP sensor.
- Install a jumper wire between the low reference terminal 2 of the B74 MAP sensor and ground.
- Install a jumper wire at terminal 3 of the B74 MAP sensor.
- Connect a DMM between the jumper wire from the terminal 3 of the B74 MAP sensor and ground.
- Vehicle in Service Mode, with the *J-23738-A*, slowly apply vacuum to the sensor while observing the voltage on the DMM. The voltage should vary between 4.9-0.2 V without any spikes or dropouts.

If the voltage is erratic, replace the B74 MAP sensor.

[Circuit Description](#)

The manifold absolute pressure (MAP) sensor measures the pressure inside the intake manifold. Pressure in the inlet manifold is affected by engine speed, throttle opening, air temperature, and barometric pressure (BARO). A diaphragm within the MAP sensor is displaced by the pressure changes that occur from the varying load and operating conditions of the engine. The sensor translates this action into electrical resistance. The MAP sensor wiring includes 3 circuits. The engine control module (ECM) supplies a regulated 5 V to the sensor on a 5 V reference circuit. The ECM supplies a ground on a low reference circuit. The MAP sensor provides a signal voltage to the ECM, relative to the pressure changes, on the MAP sensor signal circuit. The ECM converts the signal voltage input to a pressure value.

Under normal operation the highest pressure that can exist in the inlet manifold is equal to BARO. This occurs when the engine is operated at wide-open throttle (WOT) or when the vehicle is ON while the engine is OFF. Under these conditions, the ECM uses the MAP sensor to determine the current BARO. The lowest manifold pressures occur when the vehicle is idling or decelerating. MAP can range from 1.5 psi, when pressures are low, to as much as 15 psi when pressures are high, depending on the BARO. The ECM monitors the MAP sensor signal for pressure outside of the normal range.

*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

Circuit/System Description

The intake air temperature (IAT) sensor is integrated with the mass air flow (MAF) sensor. It is a variable resistor that measures the temperature of the air entering the engine. The IAT sensor has a signal circuit and a low reference circuit. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit.

IAT	IAT Resistance	IAT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

- DTCs P0112, P0113, P0117, P0118 are not set.
- The vehicle has been OFF at least 8 hours.
- Vehicle in Service Mode.
- The ECT start-up signal is colder than 60°C (140°F).
- This DTC runs once per ignition cycle when the enabling conditions are met.

Conditions for Setting the DTC

The ECM determines the absolute difference between IAT start-up temperature and the ECT start-up temperature is greater than 40°C (72°F).

Action Taken When the DTC Sets

DTC P0111 is a Type B DTC.

[Conditions for Clearing the DTC](#)

DTC P0111 is a Type B DTC.

[Diagnostic Aids](#)

- An IAT sensor that is skewed, due to more resistance than is normal, can widen the spread between the 2 sensors and cause this DTC to set. Measure and record the resistance of the IAT sensor at various ambient temperatures, and then compare those measurements to the Temperature vs. Resistance Table. Refer to [Temperature Versus Resistance](#) .
- A slight to moderate resistance in the IAT sensor signal circuit or low reference circuit will increase the range between these two sensors. This condition results in a greater voltage on the IAT sensor signal circuit, which is interpreted by the ECM as a colder IAT.
- Inspect the mass air flow/inlet air temperature sensor terminals for corrosion.

Circuit/System Verification

Note: Perform Step 1 of this verification procedure only if the vehicle has been OFF for 8 hours or more.

1. Vehicle in Service Mode, observe the following scan tool parameters. The readings should be within 40°C (72°F) of each other.
 - Start-Up IAT
 - Start-Up ECT
2. Engine running, observe the scan tool IAT sensor parameter. The reading should be between -38 and +149°C (-36 and +300°F), depending on the current ambient temperature and the vehicle operating conditions.
3. Operate the vehicle within the conditions for running the DTC to verify that the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.
2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
3. Vehicle in Service Mode, verify the scan tool IAT Sensor parameter is colder than -39°C (-38°F).

If warmer than the specified range, test the signal circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the ECM or the sensor may be damaged.

4. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground. Verify the scan tool IAT Sensor parameter is warmer than 149°C (300°F).

If colder than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
5. If all circuits test normal, test or replace the B75B mass air flow/intake air temperature sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the IAT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) . The resistance values should be in range of the table values.

If not within the specified range, replace the B75B mass air flow/inlet air temperature sensor.

[IAT Sensor](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
IAT Sensor Signal	P0112, P0114	P0111, P0113, P0114	P0113*, P0114	P0111
Low Reference	-	P0111, P0113, P0114	P0113*, P0114	P0111

*Internal ECM or sensor damage may occur if the circuit is shorted to B+.

[Typical Scan Tool Data](#)

[IAT Sensor](#)

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running			

Parameter Normal Range: Varies with ambient temperature

IAT Sensor Signal	150°C (302°F)	-40°C (-40°F)	-40°C (-40°F)*
Low Reference	-	-40°C (-40°F)	-40°C (-40°F)*

*Internal ECM or sensor damage may occur if the circuit is shorted to B+

Circuit/System Description

The intake air temperature (IAT) sensor is integrated with the mass air flow (MAF) sensor. It is a variable resistor that measures the temperature of the air entering the engine. The IAT sensor has a signal circuit and a low reference circuit. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit.

IAT	IAT Resistance	IAT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTCs

P0112 or P0113

- The engine is running.
- These DTCs run continuously when the above condition is met.

P0114

- Service Mode is active.
OR
- The engine is running.
- This DTC runs continuously when the above condition is met.

Conditions for Setting the DTCs

P0112

The ECM detects that the IAT sensor signal is warmer than 149°C (300°F) for greater than 5 s.

P0113

Note: The scan tool display range is between -40 and + 150°C (-40 and +302°F).

The ECM detects that the IAT sensor signal is colder than -59°C (-72°F) for greater than 5 s.

P0114

The ECM detects that the IAT sensor signal is intermittent or has abruptly changed greater than 125°C (257°F) warmer or colder for greater than 5 s.

Action Taken When the DTCs Set

DTCs P0112, P0113 and P0114 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0112, P0113 and P0114 are Type B DTCs.

Diagnostic Aids

- An IAT sensor signal circuit or low reference circuit that is shorted to the MAF sensor signal circuit can cause a DTC P0113 to set. This condition causes a rapid fluctuation in the IAT Sensor parameter.
- An IAT sensor signal circuit that is shorted to the MAF sensor ignition circuit can cause a DTC P0113 and/or a DTC P0114 to set.

Circuit/System Verification

1. Engine running, observe the scan tool IAT sensor parameter. The reading should be between -38 and +149°C (-36 and +300°F).
2. Operate the vehicle within the conditions for running the DTC to verify that the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.
2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
3. Vehicle in Service Mode, verify the scan tool IAT Sensor parameter is colder than -39°C (-38°F).
If warmer than the specified range, test the signal circuit terminal 3 for a short to ground. If the circuit tests normal, replace the K20 ECM.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the ECM or the sensor may be damaged.

4. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground. Verify the scan tool IAT Sensor parameter is warmer than 149°C (300°F).
If colder than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
5. If all circuits test normal, test or replace the B75B mass air flow/intake air temperature sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the IAT sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) . The

resistance values should be in range of the table values.

If not within the specified range, B75B mass air flow/inlet air temperature sensor.

[DTC Descriptor](#)

DTC P0116: Engine Coolant Temperature (ECT) Sensor Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal Circuit	P0117, P0119	P0118	P0118*	P0116, P0119, P0128
Low Reference	-	P0118, P0119	-	P0119, P0128

*ECM or sensor damage may occur if the circuit is shorted to B+.

[Typical Scan Tool Data](#)

[ECT Sensor](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running in closed loop			
Parameter Normal Range: Varies with coolant temperature			
Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	-	-40°C (-40°F)	-40°C (-40°F)

[Circuit/System Description](#)

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 V to the ECT sensor signal circuit and a ground for the low reference circuit.

The purpose of this diagnostic is to determine if the input from the ECT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the engine is OFF. If the required engine OFF time is met at start-up, the ECM will compare the temperature difference between the actual measured ECT and IAT sensors.

Conditions for Running the DTC

- DTCs P0111, P0112, P0113, P0114, P0117, P0118, and P2610 are not set.
- The vehicle and the propulsion system has been off for greater than 8 hours before the engine is started.
- The engine is running.
- The inlet air temperature (IAT) is warmer than -7°C (19°F).
- This DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM detects the difference of the temperature of the ECT and IAT sensors is greater than 20°C (68F).

Action Taken When the DTC Sets

DTC P0116 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0116 is a Type B DTC.

Diagnostic Aids

- Inspect the ECT sensor terminals for corrosion.
- An intake air temperature (IAT) sensor that is biased colder at various ambient temperatures due to greater resistance than is normal will increase the range between these 2 sensors. Measure and record the resistance of the IAT sensor at various ambient temperatures, then compare those measurements to the Temperature vs. Resistance table. Refer to [Temperature Versus Resistance](#) .
- A slight to moderate resistance in the IAT sensor signal circuit or low reference circuit will increase the range between these two sensors. This condition results in a greater voltage on the IAT sensor signal circuit, which is interpreted by the ECM as a colder IAT.
- If the condition is intermittent, allow the vehicle to sit for greater than 8 hours with the Vehicle OFF and the propulsion system inactive, may help isolate the condition. Compare the scan tool Radiator Coolant Temperature Sensor and ECT Sensor temperature sensor values at vehicle ON. The Radiator Coolant Temperature Sensor and the ECT Sensor parameters should display within 3°C (5°F).

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify that DTC P0111, P0112, P0113, P0114, P0117, or P0118 are not set.
If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle OFF, inspect the cooling system surge tank for the proper coolant level. Refer to [Loss of Coolant](#) and [Cooling System Draining and Filling](#) .
3. Engine ticking over for 15 minutes with the A/C OFF.

Note: Depending on ambient temperature, it may take up to 4 minutes for the temperatures to equalise.

4. Command the engine coolant thermostat heater to 100 percent with a scan tool. Increase the engine speed to wide open throttle. Observe the scan tool RCT and the ECT sensor parameters. The RCT and the ECT sensor parameters should be within 20°C (68°F).

5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B34 engine coolant temperature sensor.
2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 engine control module.
3. Vehicle in Service Mode, verify the scan tool ECT sensor parameter is colder than -39°C (-38°F).
If warmer than the specified range, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the K20 engine control module.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

4. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify the scan tool ECT Sensor parameter is warmer than 140°C (284°F).
If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.
5. If all circuits test normal, test or replace the B34 engine coolant temperature sensor.

Component Testing

Static Test

1. Vehicle OFF, remove the B34 engine coolant temperature sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the B34 engine coolant temperature sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) table and verify that the resistance is within 5% of the specification.
If not within the specified range, replace the B34 engine coolant temperature sensor.

ECT Sensor Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	-	-40°C (-40°F)	-40°C (-40°F)

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 V to the ECT sensor signal circuit and a ground for the low reference circuit. This diagnostic checks for an open, short to ground or an intermittent circuit condition between the ECM and ECT sensor.

Conditions for Running the DTC

P0117

- Vehicle ON, or the engine is running.
- This DTC runs continuously when the above conditions are met.

P0118

- The engine run time is greater than 10 s.
- The inlet air temperature (IAT) sensor is greater than 0°C (32°F).
- This DTC runs continuously when the above conditions are met.

P0119

- DTC P0117 or P0118 are not set.
- Vehicle ON, or the engine is running.
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0117

The ECM detects that the ECT sensor signal is warmer than 149°C (300°F) for greater than 5 s.

P0118

Note: The scan tool display range is between -40°C to +150°C (-40°F to +302°F).

The ECM detects that the ECT sensor signal is colder than -59°C (-74°F) for greater than 5 s.

P0119

The ECM detects that the ECT sensor signal has abruptly changed by a minimum of 5°C (9°F), warmer or colder for greater than 3 s.

[Action Taken When the DTC Sets](#)

- DTCs P0117, P0118 and P0119 are Type B DTCs
- The cooling fans will be commanded ON.
- The engine is forced ON and Autostop is disabled.

[Conditions for Clearing the DTC](#)

DTCs P0117, P0118 and P0119 are Type B DTCs

Circuit/System Verification

1. Engine running, observe the scan tool ECT Sensor parameter. The reading should be between -39 to +139°C (-38 to +282°F).
2. Engine running, observe the scan tool ECT Sensor parameter while moving the related wiring harness and harness connectors. The reading should not change abruptly. If the reading changes abruptly, repair the wiring harness or the harness connectors.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B34 engine coolant temperature sensor.
2. Vehicle OFF, all systems OFF. This may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 engine control module.
3. Vehicle in Service Mode, verify the scan tool ECT Sensor is colder than -39°C (-38.2°F).
If warmer than the specified range, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K20 engine control module.
4. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 2. Verify the scan tool ECT Sensor is warmer than 140°C (284°F).
If colder than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.
5. If all circuits test normal, test or replace the B34 engine coolant temperature sensor.

Component Testing

Static Test

1. Vehicle OFF, remove the B34 engine coolant temperature sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the B34 engine coolant temperature sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) table and verify that the resistance is within 5% of the specification.

If not within the specified range, replace the B34 engine coolant temperature sensor.

TP Sensor 2 Signal	0.00 V	5.00 V	5.00 V
Low Reference	-	4-5 V	-

Circuit/System Description

The throttle body assembly contains 2 throttle position (TP) sensors. The TP sensors are mounted to the throttle body assembly and are not serviceable. The TP sensors provide a signal voltage that changes relative to throttle blade angle. The engine control module (ECM) supplies the TP sensors with a common 5 V reference circuit, a common low reference circuit, and 2 independent signal circuits.

The TP sensors have opposite functionality. TP sensor 1 signal voltage decreases and TP sensor 2 signal voltage increases.

Conditions for Running the DTC

P0121

- DTCs P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0335, or P0336 is not set.
- The engine speed is between 500-8,000 RPM.
- The engine coolant temperature (ECT) is between -7 to +125°C (19-257°F).
- The inlet air temperature (IAT) is between -20 to +125°C (-4 to +257°F).
- The DTC runs continuously when the above conditions are met.

P0122, P0123, P0222, P0223

- DTC P06A3 is not set.
- The run/crank voltage is greater than 6.4 V.
- The ignition is ON.
- The DTCs runs continuously when the above conditions are met.

P2135

- DTCs P0122, P0123, P0222, P0223, and P06A3 is not set.
- The run/crank voltage is greater than 6.4 V.
- The ignition is ON.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0121

The ECM detects that the TP sensor 1 voltage is stuck in range for greater than 1 s.

P0122

The ECM detects that the TP sensor 1 voltage is less than 0.32 V for greater than 1 s.

P0123

The ECM detects that the TP sensor 1 voltage is greater than 4.7 V for greater than 1 s.

P0222

The ECM detects that the TP sensor 2 voltage is less than 0.25 V for greater than 1 s.

P0223

The ECM detects that the TP sensor 2 voltage is greater than 4.6 V for greater than 1 s.

P2135

The ECM detects that TP sensor 1 and TP sensor 2 disagree greater than 7-10 percent for greater than 1 s.

Action Taken When the DTC Sets

P0121

- DTC P0121 is a Type B DTC.
- A message centre displays Propulsion Power is Reduced.
- Under certain conditions, the ECM commands the engine OFF.

P0122, P0123, P0222, P0223, or P2135

- DTC P0122, P0123, P0222, P0223, and P2135 are Type A DTCs.
- A message centre displays Propulsion Power is Reduced.
- Under certain conditions, the ECM commands the engine OFF.

Conditions for Clearing the DTC

- DTC P0121 is a Type B DTC.
- DTC P0122, P0123, P0222, P0223, and P2135 are Type A DTCs.

Diagnostic Aids

A high resistance condition on the throttle position and throttle actuator control circuits could cause a DTC to set.

Test or replace the Q38 throttle body assembly.
If Agree
6. Verify DTC P0121, P0122, P0123, P0222, P0223, and P2135 is not set.
If any of the DTCs are set

Refer to Circuit/System Testing

If none of the DTCs are set

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
8. Verify a DTC does not set.

If any DTC sets

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

If no DTCs set

9. All OK

Circuit/System Testing

Note: Disconnecting the throttle body harness connector causes additional DTCs to set.

1. Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at Q38 throttle body assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal C and ground.

If 5 Ω or greater

- 2.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 2.2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

If less than 5 Ω

3. Vehicle in Service Mode.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal E and ground.

If less than 4.8 V

- 4.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 4.2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 4.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

If greater than 5.2 V

- 4.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
- 4.2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

If between 4.8-5.2 V

5. Vehicle in Service Mode.
6. Test for less than 1 V between the throttle position sensor 1 signal circuit terminal D and ground.

If 1 V or greater

- 6.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
- 6.2. Test for less than 1 V between the signal circuit terminal D and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

If less than 1 V

7. Install a 3 A fused jumper wire between throttle position sensor 1 signal circuit terminal D and the 5 V reference circuit terminal E.
8. Verify the scan tool Throttle Position Sensor 1 voltage parameter is greater than 4.8 V.

If less than 4.8 V

- 8.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 8.2. Test for infinite resistance between the signal circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 8.3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

If greater than 4.8 V

9. Test for 4.8-5.2 V between the throttle position sensor 2 signal circuit terminal F and ground.

If less than 4.8 V

- 9.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 9.2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 9.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

If greater than 5.2 V

- 9.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
- 9.2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

If between 4.8-5.2 V

10. Test or replace the Q38 throttle body assembly.

Repair Instructions

- [Throttle Body Assembly Replacement](#)
- [Control Module References](#) for ECM replacement, programming and setup

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Vehicle in Service Mode.
6. Verify the Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.

If Disagree

Test or replace the Q38 throttle body assembly.

If Agree

7. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset.

If any DTC sets

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

If no DTC sets

8. All OK

DTC P0128

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0128: Engine Coolant Temperature (ECT) Below Thermostat Regulating Temperature

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
ECT Sensor Signal	P0117, P0119	P0118	P0118*	P0116, P0119, P0128
Low Reference	-	P0118, P0119	-	P0119, P0128

*ECM or sensor damage may occur if the circuit is shorted to B+

[Typical Scan Tool Data](#)

[ECT Sensor](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running in closed loop			
Parameter Normal Range: Varies with coolant temperature			
ECT Sensor Signal	150°C (302°F)	-40°C (-40°F)	-40°C (-40°F)
Low Reference	-	-40°C (-40°F)	-40°C (-40°F)

[Circuit/System Description](#)

The engine control module (ECM) monitors the temperature of the engine coolant for engine control and as enabling criteria for some diagnostics. The ECM monitors the amount of time to reach a predetermined temperature based on the Start up ECT sensor. The ECM uses this temperature to determine if the engine has warmed up to the thermostat regulating temperature. If the engine coolant temperature does not increase normally or does not reach the thermostat regulating temperature, diagnostics that use the ECT as enabling criteria, may not run when expected. If the engine coolant temperature fails to reach the thermostat regulating temperature, before a predetermined amount of time, the DTC sets.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P00B3, P00B4, P00B6 or P010C are not set.
- The start-up ECT sensor is between -10 to +59°C (14 to +138°F).
- The calculated airflow into the engine is greater than 1 g/s.
- The engine OFF time is greater than 30 min.
- The thermostat commanded duty cycle is less than 50%.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the amount of time it takes for the ECT sensor to reach target temperature has exceeded a calibrated time.

Action Taken When the DTC Sets

- DTC P0128 is a Type B DTC.
- The engine is forced ON and Autostop is disabled.

Conditions for Clearing the DTC

DTC P0128 is a Type B DTC.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle OFF, inspect the cooling system surge tank for the proper coolant level. Refer to [Loss of Coolant](#) and [Cooling System Draining and Filling](#) .
2. Vehicle in Service Mode, observe the DTC information with a scan tool. DTC P00B7, P0597, P0598, P0599, or P2181 should not be set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
3. Engine running for 15 min with the A/C OFF.

Note: Depending on ambient temperature, it may take up to 4 min for the temperatures to equalise.

4. Command the engine coolant thermostat heater to 0% with a scan tool. Increase the engine speed to wide open throttle. Observe the scan tool ECT Sensor parameter. The temperature should increase to greater than 75°C (167°F).
If less than the specified value, replace the E41 engine coolant thermostat heater.
5. Command the engine coolant thermostat heater to 100% with a scan tool. Increase the engine speed to wide open throttle. Observe the scan tool radiator coolant temperature sensor and the ECT Sensor parameters. The radiator coolant temperature sensor and the ECT Sensor parameters should be within 20°C (68°F).
6. Engine idling, observe the DTC information with a scan tool. DTC P0128 should not set.
7. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the B34 engine coolant temperature sensor.

2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 engine control module.

3. Vehicle in Service Mode, verify the scan tool ECT Sensor parameter is colder than -39°C (-38°F).

If warmer than the specified range, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K20 engine control module.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

4. Install a 3A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1. Verify the scan tool ECT Sensor parameter is greater than 130°C (266°F).

If less than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.

5. If all circuits test normal, test or replace the B34 engine coolant temperature sensor.

Component Testing

Static Test

1. Vehicle OFF, remove the engine coolant temperature sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the B34 engine coolant temperature sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) table and verify that the resistance is within 5% of the specification.

If not within the specified range, replace the B34 engine coolant temperature sensor.

[Typical Scan Tool Data](#)

[HO2S 1 or 2](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: 200-800 mV			
HO2S 1 or 2 High Signal	0 mV	1,850-1,950 mV	1,850-1,950 mV
HO2S 1 or 2 Low Signal	0 mV	1,850-1,950 mV	1,850-1,950 mV

[Circuit/System Description](#)

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the engine control module (ECM) operates in an open loop mode, ignoring the HO2S signal voltage while calculating the air to fuel ratio. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,900 mV. Once sufficient HO2S voltage fluctuation is observed by the control module, closed loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter closed loop earlier and the control module to calculate the air to fuel ratio sooner.

This ECM uses a high bias voltage on the high and low signal circuits of the HO2S. The voltage measured between the low signal terminal and ground varies based on the temperature of the sensor and will typically be between 0-1,000 mV under normal operating conditions. The value of the high signal terminal measured to ground is equal to the value of the low signal measured to ground plus the 1,900 mV bias between the low signal and the high signal. In closed loop, the sensor functions in the same voltage range as systems with the low bias voltage. In open loop or open circuit conditions, the high bias voltage is present and takes the voltage outside of the normal operating range for easier fault detection.

[Conditions for Running the DTC](#)

P0131 or P0137

- DTCs P0106, P0107, P0108, P0122, P0123, P0201, P0202, P0203, P0204, P0222, P0223, P0442, P0443, P0449, P0452, P0453, P0455, P16F3, P2101, or P2135 are not set.
- The engine is running.
- The ignition voltage is between 10-32 V.
- The fuel system is in Closed Loop.
- The fuel control system is not in decel fuel cut off.
- The ECM is not performing any intrusive diagnostic tests.
- A scan tool output device control is not active.
- The fuel level is greater than 10 percent.
- Fuel has less than or equal to 87 percent ethanol.
- The DTCs run continuously when the above conditions are met for 5 s.

P0132 or P0138

- DTCs P0106, P0107, P0108, P0122, P0123, P0201, P0202, P0203, P0204, P0222, P0223, P0411, P0442, P0443, P0449, P0452, P0453, P0455, P16F3, P2101, P2135, P2440, P2444 are not set.
- The ignition voltage is between 10-32 V.
- Fuel has less than or equal to 87 percent ethanol.
- The engine is running for greater than 195 s.
- The fuel level is greater than 10 percent.
- The fuel control is not in power enrichment.
- The DTCs run continuously when the above conditions are met for 5 s.

P0134 or P0140

- DTCs P0101, P0102, P0103, P0122, P0123, P0222, P0223, P16F3, P2101, P2103, P2135 are not set.
- The HO2S heaters are at operating temperature.
- The ignition voltage is between 10-32 V.
- The engine run time is greater than 150 s.
- DTC P0134 runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0131 or P0137

The ECM detects that the HO2S voltage is less than 50 mV for greater than 48 s for DTC P0131 or 54 s for DTC P0137.

P0132 or P0138

The ECM detects that the HO2S voltage is greater than 1,050 mV for greater than 13 s.

P0134 or P0140

The ECM detects that the HO2S voltage is greater than 1,700 mV for greater than 25 s.

Action Taken When the DTC Sets

DTCs P0131, P0132, P0137, and P0138 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0131, P0132, P0137, and P0138 are Type B DTCs.

[Circuit/System Verification](#)

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify no HO2S heater DTCs are set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Engine running, observe the appropriate scan tool HO2S 1 or 2 voltage parameter. The reading should vary between 50-1,050 mV.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the appropriate B52 HO2S.
2. Vehicle in Service Mode, observe the scan tool HO2S 1 or 2 voltage parameter. The parameter should display between 1,850-1,950 mV.
If less than the specified range, test the high and low signal circuits for a short to ground. If both signal circuits test normal, replace the K20 ECM.
3. Test for 1,850-3,000 mV between the high signal circuit terminal listed below and ground.
 - B52 HO2S 1 high signal terminal 4
 - B52 HO2S 2 high signal terminal BIf less than the specified range, test the high signal circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the high signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
4. Connect a 3 A fused jumper wire between the high signal circuit and low signal circuit terminals listed below:
 - B52 HO2S 1 high signal circuit terminal 4 to low signal circuit terminal 3
 - B52 HO2S 2 high signal circuit terminal B to low signal circuit terminal A

Note: The low signal circuit is tied to a pull-up circuit within the ECM. A voltage of 0-1,100 mV on the low signal circuit is normal.

5. Verify the scan tool HO2S 1 or 2 voltage parameter displays 0.0 mV.
If greater than the specified range, test the low signal circuit for an open/high resistance or for a short to voltage. If the circuit tests normal, replace the K20 ECM.
6. Verify none of the following conditions exist:
 - Lean or rich fuel injectors--Refer to [Fuel Injector Solenoid Coil Test](#)
 - Water intrusion in the B52 HO2S harness connector
 - Low or high fuel system pressure--Refer to [Fuel System Diagnosis](#)
 - Fuel that is contaminated--Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#)
Fuel saturation of the evaporative emission (EVAP) canister

-
- Exhaust leaks
- Engine vacuum leaks
- Engine oil consumption--Refer to [Oil Consumption Diagnosis](#)
- Engine coolant consumption--Refer to [Loss of Coolant](#)

If you find any of the above conditions, repair as necessary.

7. If all circuits test normal, test or replace the appropriate B52 HO2S.

Typical Scan Tool Data

HO2S 1 or 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: 200-800 mV			
HO2S 1 or 2 High Signal	0 mV	1,850-1,950 mV	1,850-1,950 mV
HO2S 1 or 2 Low Signal	0 mV	1,850-1,950 mV	1,850-1,950 mV

Circuit/System Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the engine control module (ECM) operates in an open loop mode, ignoring the HO2S signal voltage while calculating the air to fuel ratio. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,900 mV. Once sufficient HO2S voltage fluctuation is observed by the ECM, closed loop is entered. The ECM uses the HO2S voltage to determine the air to fuel ratio. An HO2S voltage that increases toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter closed loop earlier and the ECM to calculate the air to fuel ratio sooner.

This ECM uses a high bias voltage on the high and low signal circuits of the HO2S. The voltage measured between the low signal terminal and ground varies based on the temperature of the sensor and will typically be between 0-1,000 mV under normal operating conditions. The value of the high signal terminal measured to ground is equal to the value of the low signal measured to ground plus the 1,900 mV bias between the low signal and the high signal. In closed loop, the sensor functions in the same voltage range as systems with the low bias voltage. In open loop or open circuit conditions, the high bias voltage is present and takes the voltage outside of the normal operating

range for easier fault detection.

Conditions for Running the DTC

P0133 or P1133

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0131, P0132, P0134, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0442, P0443, P0449, P0452, P0453, P0455, P16F3, P2101, P2135 are not set.
- The engine coolant temperature (ECT) is greater than 50°C (122°F).
- The ignition voltage is between 10-32 V.
- The fuel level is greater than 10 percent.
- The engine run time is greater than 90 s.
- The inlet air temperature (IAT) is greater than -40°C (-40°F).
- The HO2S heater is ON for greater than 40 s.
- The fuel alcohol content is less than 87 percent ethanol.
- The engine speed is between 1,000-3,500 RPM.
- Barometric (BARO) pressure is greater than 70 kPa (10 psi).
- The mass air flow (MAF) is between 17-40 g/s.
- The fuel system is in Closed Loop.
- A scan tool output device control is not active.
- The fuel control system is not in decel fuel cut-off (DFCO)
- The fuel control state is not in Power Enrichment.
- The DTCs run once per drive cycle when the above conditions are met for greater than 1 s.

P013A or P013E

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P16F3, P2101, or P2135 are not set.
- The ignition voltage is between 10-32 V.
- The fuel level is greater than 10 percent.
- DTC P2270 has run and passed.
- DTC P013E has run and passed for P013A.
Then
- The fuel control system is in decel fuel cut-off (DFCO)
- The DTCs run once per drive cycle when the above conditions are met.

P013B or P013F

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P16F3, P2101, or P2135 are not set.
- DTCs P013A, P013E, P013F, P2270, and P2271 have run and passed.
- DTCs P013F has run and passed for P013B.
- The ignition voltage is between 10-32 V.
- The fuel level is more than 10 percent.
- Then
- The fuel control system is in fuel enrichment mode.
- The DTCs run once per drive cycle when the above conditions are met.

P2270 or P2271

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P16F3, P2101, P2135 are not set.
- The ignition voltage is between 10-32 V.
- The fuel level is greater than 10 percent.
- The engine speed is between 1,800-3,500 RPM.
- The airflow is between 18-28 g/s.
- The vehicle speed is between 40-145 km/h (25-90 MPH).
- The fuel control system is in decel fuel cut-off (DFCO)
- The engine is operating in Closed Loop.
- The evaporative emission (EVAP) diagnostics are not in control of purge.
- The HO2S heater is ON for greater than 60 s.
- The catalyst temperature is between 0-1,000°C (32-1,832°F).
- DTCs P013A, P013E, and P2270 have run and passed. --P2271 only
- DTC P2270 runs once per trip when all of the above conditions have been met for 3 s.
- DTC P2271 runs once per trip.

P2A00

- DTCs P0106, P0107, P0108, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0131, P0132, P0201, P0202, P0203, P0204, P0222, P0223, P16F3, P2101, P2135 are not set.
- The ignition voltage is between 10-32 V.
- The engine run time is greater than 100 s.
- The engine speed is between 1,000-3,400 RPM.
- The ignition voltage is between 10-32 V.
- The engine air flow is between 4-30 g/s.
- The engine coolant temperature is warmer than 70°C (158°F).

- The fuel control system is not in decel fuel cut-off (DFCO)
- The fuel control system is in fuel enrichment mode.
- DTC P2A00 runs continuously when the above conditions are met for 5 s.

Conditions for Setting the DTC

P0133

- The ECM detects that the heated oxygen sensor (HO2S) 1 rich to lean or lean to rich average response time is greater than a calibrated threshold value.
- DTC P0133 sets within 60 s when the above condition is met.

P013A

The accumulated mass air flow monitored during rich to lean transitions between 450-150 mV is greater than a calibrated value.

P013B

The accumulated mass air flow monitored during rich to lean transitions between 350-600 mV is greater than a calibrated value.

P013E

- The ECM detects that the heated oxygen sensor (HO2S) 2 cannot achieve voltage below 450 mV.
and
- The accumulated mass air flow monitored during the Delayed Response Test under DFCO is greater than a calibrated value.

P013F

- The ECM detects that the heated oxygen sensor (HO2S) 2 cannot achieve voltage above 350 mV.
and
- The accumulated mass air flow monitored during the Delayed Response Test is greater than a calibrated value.

P1133

- The ECM detects that the heated oxygen sensor (HO2S) 1 rich-to-lean counts, or the lean-to-rich counts are less than a calibrated value.
- DTC P1133 sets within 60 s when the above condition is met.

P2270

- The heated oxygen sensor (HO2S) 2 sensor cannot achieve voltage greater than 850 mV.
and
- The accumulated mass air flow monitored during the Stuck Lean Voltage Test is greater than a calibrated value.

P2271

- The ECM detects that the heated oxygen sensor (HO2S) 2 sensor cannot achieve voltage less than 100 mV.
and
- The accumulated mass air flow monitored during the stuck rich voltage test is greater than a calibrated value.

P2A00

- The HO2S 1 is greater than 1,100 mV for greater than 5 s and the engine is not in closed loop.
- DTC P2A00 sets within 25 s when the above condition is met.

Action Taken When the DTC Sets

- DTCs P0133, P013E, P013F, P1133, P2270, P2271, P2A00 are Type B DTCs.
- DTCs P013A and P013B are Type A DTCs.

Conditions for Clearing the DTC

- DTCs P0133, P013E, P013F, P1133, P2270, P2271, P2A00 are Type B DTCs.
- DTCs P013A and P013B are Type A DTCs.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle ON, observe the DTC information with a scan tool. Verify no other HO2S DTCs are set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Verify none of the following conditions exist:
 - Lean or rich fuel injectors--Refer to [Fuel Injector Solenoid Coil Test](#)
 - Water intrusion in the B52 HO2S harness connector
 - Low or high fuel system pressure--Refer to [Fuel System Diagnosis](#)
 - Fuel that is contaminated--Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#)
 - Fuel saturation of the evaporative emission (EVAP) canister
 - Exhaust leaks
 - Engine vacuum leaks
 - Engine oil consumption--Refer to [Oil Consumption Diagnosis](#)
 - Engine coolant consumption--Refer to [Loss of Coolant](#)If you find any of the above conditions, repair as necessary.
2. Vehicle OFF, disconnect the harness connector at the appropriate B52 heated oxygen sensor.

3. Vehicle in Service Mode, observe the scan tool HO2S 1 or 2 voltage parameter. The parameter should display between 1,850-1,950 mV.
If less than the specified range, test the high and low signal circuits for a short to ground. If both signal circuits test normal, replace the K20 ECM.
4. Test for 1,850-3,000 mV between the high signal circuit terminal listed below and ground.
 - B52 HO2S 1 high signal terminal 4
 - B52 HO2S 2 high signal terminal BIf less than the specified range, test the high signal circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the high signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
5. Vehicle OFF, connect a 3 A fused jumper wire between the high signal circuit and the low signal circuit terminals listed below.
 - B52 HO2S 1 high signal circuit terminal 4 to low signal circuit terminal 3
 - B52 HO2S 2 high signal circuit terminal B to low signal circuit terminal A

Note: The low signal circuit is tied to a pull-up circuit within the ECM. A voltage of 0-1,100 mV on the low signal circuit is normal.

6. Vehicle in Service Mode, verify the scan tool HO2S 1 or 2 voltage parameter displays 0.0 mV.
If greater than the specified range, test the low signal circuit for an open/high resistance or for a short to voltage. If the circuit tests normal, replace the K20 ECM.
7. If all circuits test normal, test or replace the B52 HO2S.

DTC Descriptors

DTC P0171: Fuel Trim System Lean

DTC P0172: Fuel Trim System Rich

Circuit/System Description

The engine control module (ECM) controls the air/fuel metering system in order to provide the best possible combination of driveability, fuel economy, and emission control. The ECM monitors the heated oxygen sensor (HO2S) signal voltage and adjusts the fuel delivery based on the signal voltage while in Closed Loop. A change made to the fuel delivery changes the long and short term fuel trim (FT) values. The short term FT values change rapidly in response to the HO2S voltage signals. These changes fine tune the engine fuelling. The long term FT makes coarse adjustments in order to maintain an optimum air/fuel ratio. The ideal FT values are around zero percent. A positive FT value indicates that the ECM is adding fuel in order to compensate for a lean condition. A negative FT value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition.

Conditions for Running the DTC

- DTCs P0030, P0053, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0114, P0121, P0122, P0123, P0131, P0132, P0133, P0134, P0135, P0201, P0202, P0203, P0204, P0300, P0301, P0302, P0303, P0304, P0442, P0455, P0458, and P2A00 are not set.
- The engine is in Closed Loop.
- The catalyst monitor intrusive test, post HO2S intrusive test, device controls and EVAP leak test are not active.
- The engine coolant temperature (ECT) is between -38 to +130°C (-36.4 to +266°F).
- The inlet air temperature (IAT) is between -20 to +150°C (-4 to +302°F).
- The manifold absolute pressure (MAP) is between 15-255 kPa (2-37 PSI).

- The engine speed is between 400-6,100 RPM.
- The engine airflow is between 1-512 g/s.
- The fuel level is greater than 10%.
- The barometric pressure (BARO) is more than 70 kPa.
- These DTCs run continuously when the above conditions have been met.

Conditions for Setting the DTC

- The long term FT weighted average value is more or less than a calibrated value.
- The above condition is present for approximately 3 min after the conditions for running the DTC have been met.

Action Taken When the DTC Sets

DTCs P0171 and P0172 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0171 and P0172 are type B DTCs.

Diagnostic Aids

- The system will become lean if a fuel injector is not supplying enough fuel -- P0171.
- A lean condition may be present during high fuel demand due to a fuel pump that does not deliver enough fuel, a plugged fuel filter, or a restricted fuel pipe -- P0172.
- The system will become rich if a fuel injector is supplying too much fuel -- P0172.
- An exhaust system leak that may not be audible but can cause a DTC to set.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode, verify that other DTCs are not set.
If any DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Observe the MAP Sensor parameter. The MAP Sensor pressure should be within the range specified for your altitude. Refer to [Altitude Versus Barometric Pressure](#) .
If not within the specified range, refer to [DTC P0106](#) .
3. Vehicle ON, engine speed between 1,375--1,425 RPM, normal operating temperature. Verify the scan tool MAF Sensor parameter is between 1,800-2,400 Hz.
If not within the specified range, refer to [DTC P0101](#) .
4. Observe the Long Term Fuel Trim parameter with a scan tool. The reading should be between -19 to +24%.
If not within the specified range, verify none of the following conditions exist:

P0171

- Vacuum hoses for splits, kinks, and improper connections.
- Insufficient fuel in the tank.
- Low fuel pressure, refer to [Fuel System Diagnosis](#) .
- Ethanol concentration greater than 15%, refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .
- Fuel contamination, refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .

- Malfunctioning fuel injectors, refer to [Fuel Injector Solenoid Coil Test](#) .
- Missing, loose, or leaking exhaust components from the Heated Oxygen Sensor 1 forward, refer to [Symptoms - Engine Exhaust](#) .
- Vacuum leaks at the inlet manifold, the throttle body, and the fuel injector O-rings.
- The air induction system and the air inlet ducts for leaks or for a missing air filter element.
- A cracked EVAP canister.
- Evaporative pipes obstructed or leaking.
- The crankcase ventilation system for leaks.

P0172

- Vacuum hoses for splits, kinks, and improper connections
 - The air inlet duct for being collapsed or restricted
 - The air filter for being dirty or restricted
 - Objects blocking the throttle body
 - Excessive fuel in the crankcase due to leaking fuel injectors
 - The EVAP control system for improper operation, refer to [Evaporative Emission Control System Diagnosis](#) .
 - Excessive fuel pressure, refer to [Fuel System Diagnosis](#) .
 - Malfunctioning fuel injectors, refer to [Fuel Injector Solenoid Coil Test](#) .
 - Fuel contamination, refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .
5. If all conditions test normal, test the engine for a mechanical condition. Refer to [Symptoms - Engine Mechanical](#)
 6. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P018B-P018D

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P018B: Fuel Pressure Sensor Performance

DTC P018C: Fuel Pressure Sensor Circuit Low Voltage

DTC P018D: Fuel Pressure Sensor Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P018C, P0641	P018C	P018D, P0641	P06A6
Signal	P018C	P018C	P018D	P018B
Low Reference	-	P018D	-	P06A6

[Circuit/System Description](#)

The fuel pressure sensor is located on the fuel line. The fuel pressure sensor monitors the fuel pressure in the fuel line. The fuel pump control module monitors the voltage signal from the fuel pressure sensor.

[Conditions for Running the DTC](#)

- The engine is running.
- DTC P018C, P018D, P0231, P0232, P023F, P064A, P1255 or P06A6 are not active.

- DTC P0641 has not failed this ignition cycle.
- Fuel pump control is enabled and the fuel pump control state is normal.
- The engine has been running for at least 5 seconds.

Conditions for Setting the DTC

The fuel pump control module does not detect a change in the fuel pressure of at least 30 kPa (4.4 psi) when the fuel pump is operating. The fuel pressure sensor performance diagnostic provides a means to detect fuel pressure sensor output that is stuck within the normal operating range of the sensor.

Action Taken When the DTC Sets

DTC P018B, P018C and P018D are Type A DTCs.

Conditions for Clearing the DTC

DTC P018B, P018C and P018D are Type A DTCs.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Circuit/System Testing

Note: Verify that the fuel tank is not empty. Only perform this diagnostic if there is at least 2 gallons of fuel in the fuel tank. Clear the DTC, and start and run the engine. Verify that the DTC P018B resets before proceeding with the circuit system testing. If the DTC does not reset, refer to diagnostic aids.

1. Vehicle OFF, disconnect the harness connector at the B47 fuel pressure sensor.
2. Vehicle OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K27 fuel pump flow control module.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the B47 fuel pressure sensor 5 V reference circuit terminal 3 and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump flow control module.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K27 fuel pump flow control module.
4. Verify the scan tool fuel pressure sensor voltage is less than 1 V.
If greater than the specified range, test the signal circuit terminal 1 for a short to voltage. If the circuit tests normal, replace the K27 fuel pump flow control module.
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3. Verify the scan tool fuel pressure sensor voltage is greater than 4.8 V.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump flow control module.
6. If all circuits test normal, replace the B47 fuel pressure sensor.

Fuel Injector 4 Control	P0204, P0300	P0204, P0300	P0204, P0300

[Circuit/System Description](#)

The engine control module (ECM) enables the appropriate fuel injector pulse for each cylinder. Ignition voltage is supplied to the fuel injectors. The ECM controls each fuel injector by grounding the control circuit via a solid state device called a driver. The ECM monitors the status of each driver. If the ECM detects an incorrect voltage for the commanded state of the driver, a fuel injector control circuit DTC sets.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is greater than 11 V for greater than 5 s.
- These DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

- The ECM detects an incorrect voltage on the fuel injector control circuit.
- The above condition is met for greater than 6 s.

Action Taken When the DTC Sets

DTCs P0201, P0202, P0203, and P0204 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0201, P0202, P0203, and P0204 are Type B DTCs.

Diagnostic Aids

- High resistance in the circuits of the injectors may set a misfire DTC without setting an injector DTC. Test the injector circuits of the affected cylinders for a high resistance if you suspect a condition.
- Performing the Fuel Injector Solenoid Coil Test may help isolate an intermittent condition.

Special Tools

J 34730-2C Test Lamp

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

Circuit/System Verification

1. Engine running, observe the following control circuit status parameters:
 - Cylinder 1-4 Injector Control Circuit Low Voltage Test Status
 - Cylinder 1-4 Injector Control Circuit Open Test Status
 - Cylinder 1-4 Injector Control Circuit High Voltage Test Status

Each parameter should toggle between OK and Not Run or Not Run and OK.

2. Observe the DTC information with a scan tool. DTCs P0201, P0202, P0203, or P0204 should not set.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate Q17 fuel injector.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.

If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all components connected to the ignition circuit and replace as necessary.

3. Test for 2.5-3.5 V between the control circuit terminal 2 and ground.

If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.

4. Vehicle OFF, connect a *J 34730-2C* Test Lamp to the Q17 fuel injector harness connector.

5. Engine running, the test lamp should flash.

If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.

If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

6. If all circuits test normal, test or replace the Q17 fuel injector.

DTC P0231, P0232, or P023F

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0231: Fuel Pump Control Circuit Low Voltage

DTC P0232: Fuel Pump Control Circuit High Voltage

DTC P023F: Fuel Pump Control Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0231	P023F	P0232	P023F, P2635
Low Reference	-	P023F	-	P023F, P2635

[Circuit/System Description](#)

The engine control module (ECM) supplies voltage to the fuel pump control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the fuel pump control module supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel rail pressure.

[Conditions for Running the DTC](#)

P0231, P023F

The ignition voltage is between 9-18 V.

P0232

The control enable voltage signal supplied for the ECM to fuel pump control module is inactive for 4 seconds after engine has been shut off.

[Conditions for Setting the DTC](#)

The fuel pump control module detects a fault on the fuel pump voltage circuit that is less than 11 V or greater than 18 V.

[Action Taken When the DTC Sets](#)

DTCs P0231, P0232, and P023F are Type A DTCs.

[Conditions for Clearing the DTC](#)

DTCs P0231, P0232, and P023F are Type A DTCs.

[Diagnostic Aids](#)

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

On vehicles equipped with a high pressure mechanical pump on Direct Fuel Injection engines, the vehicle may continue to run even though the pump in the fuel tank is not operating.

Circuit/System Verification

Vehicle in Service Mode, command the fuel pump ON and OFF using the scan tool ECM fuel pump output control. The fuel pump should turn ON and OFF.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G12 fuel pump.
2. Connect a test lamp between the control circuit terminal 1 and ground.
3. Vehicle in Service Mode, command the G12 fuel pump ON and OFF with a scan tool. The test lamp should turn ON and OFF, as commanded.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K27 fuel pump control module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
4. Vehicle OFF, connect a test lamp between the control circuit terminal 1 and the low reference circuit terminal 2.
5. Vehicle in Service Mode, command the G12 fuel pump ON with a scan tool. The test lamp should illuminate.
If the test lamp does not illuminate, test the low reference circuit terminal 2 for a short-circuit to voltage or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
6. If all circuits test normal, replace the G12 fuel pump.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Fuel Tank Fuel Pump Module Replacement](#)

DTC P025A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P025A: Fuel Pump Control Module Enable Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open or High Resistance	Short to Voltage	Signal Performance
FPCM Control	P025A	P025A	-	P025A

[Circuit/System Description](#)

The engine control module (ECM) supplies voltage to the fuel pump control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the fuel pump control module supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel rail pressure.

[Conditions for Running the DTC](#)

The engine is running.

[Conditions for Setting the DTC](#)

The serial data message from the ECM to the fuel pump control module does not agree with the state of the control enable voltage signal supplied from the ECM to the fuel pump control module for more than 2 seconds.

Action Taken When the DTC Sets

DTC P025A is a Type A DTC.

Conditions for Clearing the DTC

DTC P025A is a Type A DTC.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the K27 fuel pump control module.
2. Vehicle OFF, connect a test lamp between the control circuit terminal 20 and ground.
3. Vehicle in Service Mode, command the ECM fuel pump enable command ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
4. If all circuits test normal, replace the K27 fuel pump control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for ECM or fuel pump control module replacement, programming and setup

DTC P0300-P0304

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0300: Engine Misfire Detected

DTC P0301: Cylinder 1 Misfire Detected

DTC P0302: Cylinder 2 Misfire Detected

DTC P0303: Cylinder 3 Misfire Detected

DTC P0304: Cylinder 4 Misfire Detected

[Circuit/System Description](#)

The engine control module (ECM) uses information from the crankshaft position sensor in order to determine when an engine misfire is occurring and uses information from the camshaft position sensors in order to determine which cylinder is misfiring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM is able to detect individual misfire events. If the ECM detects a misfire rate sufficient to cause emission levels to exceed mandated standards, DTC P0300 sets. Under certain driving conditions, a misfire rate can be high enough to cause the 3-way catalyst to overheat, possibly damaging the converter. The malfunction indicator lamp (MIL) will flash ON and OFF when converter overheating, damaging conditions are present and DTC P0300 is set. DTCs P0301-P0304 correspond to cylinders 1-4. If the ECM is able to determine that a specific cylinder is misfiring, the DTC for that cylinder will also set.

[Conditions for Running the DTC](#)

- DTCs P0016, P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0117, P0118, P0119, P0122, P0123, P0222, P0223, P0335, P0336, P0606, P0651, P0697, P06A3, P16F3, P2101, P2122, P2123, P2127, P2135, and P2138 are not set.

- When DTC P0315 is set, the engine speed must be greater than 1,000 RPM.
- Engine run time is greater than 2 crankshaft revolutions.
- The engine speed is between 1,250 and 4,750 RPM.
- The ignition voltage is between 9 and 32 V.
- The engine coolant temperature (ECT) is between -7 and +125°C (+19 and +257°F).
- When the startup ECT is colder than -7°C (+19°F), this diagnostic will be delayed until the ECT is warmer than +21°C (+69°F).
- The fuel level is greater than 10 percent.
- The ECM is not in fuel shut-off, or decel fuel cut-off mode.
- DTCs P0300-P0304 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM is detecting a crankshaft rotation speed variation indicating a misfire sufficient to cause emission or catalyst damaging levels to exceed mandated standards.

Action Taken When the DTC Sets

- DTCs P0300-P0304 are Type B DTCs.
- When the MIL is flashing the fuel injector may be disabled for the misfiring cylinder to protect the catalytic converter.
- Depending on the conditions that set the DTC, the engine may go into Open Loop.

Conditions for Clearing the DTC

DTCs P0300-P0304 are Type B DTCs.

Diagnostic Aids

- The Crankshaft Position System Variation Learn procedure may need to be performed. Refer to [Crankshaft Position System Variation Learn](#) .
- A high resistance condition on any fuel injector control circuit can cause an engine misfire P0300-P0304 DTC to set without setting a fuel injector circuit P0201-P0204 DTC.
- A high resistance condition on any ignition control (IC) circuit can cause an engine misfire P0300-P0304 DTC to set without setting an IC circuit P0351-P0354 DTC.
- Inspect the following for possible sources of vibration:
 - Water pump and belt
 - A damaged reluctor wheel

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Special Tools

- J 26792 HEI Spark Tester.
- J 36012-A Ignition System Diagnosis Harness.

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Circuit/System Verification](#)

1. Engine running at normal operating temperature, verify there is no abnormal engine noise.
If there is an abnormal engine noise, refer to [Symptoms - Engine Mechanical](#) .
2. Observe the DTC information with a scan tool. Verify that DTC P0201-P0204, P0315, P0335, P0336, P0351-P0354 are not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

Note: A misfire may only occur when the engine is under a load. An engine load may be necessary to verify the condition.

3. Observe the scan tool Misfire Current Counter parameters. The Misfire Current Counters should not be incrementing.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

Note: You must perform the Circuit/System Verification first.

1. Verify that the following conditions do not exist:
 - Vacuum hose splits, kinks, and incorrect connections
 - Engine vacuum leaks
 - Crankcase ventilation system vacuum leaks
 - Fuel pressure that is too low or too high--Refer to [Fuel System Diagnosis](#) .
 - Contaminated fuel--Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .
 - Restricted exhaust system--Refer to [Restricted Exhaust](#) .

If you find any of the above conditions, repair as necessary.

2. Vehicle OFF, remove the K35 ignition coil module harness connector and remove the K35 ignition coil module.
3. Inspect the K35 ignition coil module spark plug boots for the following conditions:
 - Damage
 - Carbon tracking
 - Oil contamination
 - Water intrusion

If you find any of the above conditions, repair as necessary.

4. Connect the harness connector to the K35 ignition coil module.

Note: It may be necessary to secure the J 36012-A to the spark plug boots with electrical tape.

5. Install the J 36012-A to the spark plug boots.
6. Install the J 26792 between the spark plug boot of the misfiring cylinder and ground.
7. Connect the remaining wires to the appropriate cylinders.

Note: An erratic or weak spark is considered a no spark condition.

8. Attempt to start the engine and observe the J 26792 . The spark tester should spark.

If there is no spark, refer to [Electronic Ignition System Diagnosis](#) .

9. Vehicle OFF, remove the spark plug from the misfiring cylinder. Verify the following conditions do not exist with the spark plug:

- Gas, coolant, or oil fouled--Refer to [Spark Plug Inspection](#) .
- Cracked, worn, incorrectly gapped--Refer to [Ignition System Specifications](#) .

If there is a condition with the spark plug, replace the spark plug.

10. Exchange the suspected spark plug with another cylinder that is operating correctly.

11. Engine running, observe the scan tool Misfire Current Counters. The misfire should not follow the spark plug exchange.

If the misfire follows the spark plug, replace the spark plug.

12. If all conditions test normal, test or inspect for the following:

- A lean or rich fuel injector--Refer to [Fuel Injector Solenoid Coil Test](#) .
- An engine mechanical condition--Refer to [Symptoms - Engine Mechanical](#) .

Repair Instructions

- [Ignition Coil Replacement](#)
- [Spark Plug Replacement](#)

Repair Verification

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Vehicle OFF for 60 s.
5. Engine running, observe the Misfire Current Counters with a scan tool. The Misfire Current Counters should not be incrementing.
If the Misfire Current Counters are incrementing, a misfire still exists.
6. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the freeze frame/failure records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) and perform the appropriate diagnostic procedure.
7. To verify that the performance of the catalytic converter has not been affected by the condition that set this DTC, perform the Repair Verification for DTC P0420. Refer to [DTC P0420](#) .

DTC P0315

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0315: Crankshaft Position System Variation Not Learned

[Circuit/System Description](#)

The crankshaft position system variation learn feature is used to calculate reference period errors caused by slight build tolerance variations in the crankshaft position sensor, crankshaft, and crankshaft position sensor position. The calculated error allows the engine control module (ECM) to accurately compensate for reference period variations. This enhances the ability of the ECM to detect misfire events over a wide range of engine speeds and load conditions. The ECM stores the crankshaft position system variation learn values after a learn procedure has been performed. If the actual crankshaft position system variation learn values are not stored within the crankshaft position compensating value look up table, then DTC P0300 may set. If the crankshaft position variation system learn values are not stored in the ECM memory, or a proper ECM power down does not occur after completing the Crankshaft Position System Variation Learn procedure, then DTC P0315 sets.

[Conditions for Running the DTC](#)

The diagnostic runs continuously when the vehicle is ON.

[Conditions for Setting the DTC](#)

The ECM detects that the crankshaft position system variation learn values are not stored in memory.

[Action Taken When the DTC Sets](#)

DTC P0315 is a Type A code.

[Conditions for Clearing the MIL/DTC](#)

DTC P0315 is a Type A code.

[Diagnostic Aids](#)

- To ensure the battery pack has sufficient state of charge to get crankshaft position variation learn values with the lowest engine noise present, this procedure should be performed when the Hybrid/EV Battery Pack Charge Remaining parameter is at least 40%.
- DTC P0315 may set after the programming of other vehicle modules has been performed.

Circuit/System Verification

Note: The Crankshaft Position System Variation Learn procedure may have to be repeated up to 5 times before the procedure is successful.

1. Perform the Crankshaft Position System Variation Learn procedure. Refer to [Crankshaft Position System Variation Learn](#) .
2. If the Crankshaft Position System Variation Learn procedure cannot be performed successfully, inspect for the following conditions:
 - The Service Mode is active, until the battery is discharged
 - Interference in the signal circuit of the B26 crankshaft position sensor
 - An ECM power disconnect, with Vehicle in Service Mode, that may have erased the crankshaft position system variation values and set DTC P0315
 - Any debris between the crankshaft position sensor and the reluctor wheel
 - A damaged or misaligned reluctor wheel
 - Any worn crankshaft main bearings
 - Excessive crankshaft runout
 - A damaged crankshaft

If the ECM is still unable to complete the learn procedure, replace the K20 ECM.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P0324, P0326, or P06B6

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0324: Knock Sensor System Performance

DTC P0326: Knock Sensor Performance

DTC P06B6: Control Module Knock Sensor Processor Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Knock Sensor Signal	P0327	P0325	P0328	P0326
Knock Sensor Low Reference	P0327	P0325, P06B6	P0328	P0326

[Circuit/System Description](#)

The knock sensor enables the engine control module (ECM) to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation. The knock sensor produces an alternating current (AC) voltage signal that varies depending on the vibration level during engine operation. The ECM adjusts the spark timing based on the amplitude and the frequency of the knock sensor signal. The ECM receives the knock sensor signal through 2 isolated circuits. The ECM learns a minimum knock sensor noise level for all of the engine speed ranges. The ECM monitors for a normal knock sensor signal. The ECM monitors the internal knock sensor processor by verifying a 20 KHz signal generated on the signal circuit is detected on the sensor low reference circuit.

[Conditions for Running the DTC](#)

P0324 and P0326-Condition 1

- Engine speed is between 600 and 8,500 RPM.
- Engine is running for greater than 2 s.
- The engine coolant temperature (ECT) is warmer than -40°C (-40°F).
- The inlet air temperature (IAT) is warmer than -40°C (-40°F).
- The DTCs run continuously when the above conditions are met.

P0326-Condition 2

- Engine speed is greater than 2,000 RPM.
- Engine is running for greater than 1 s.
- The ECT is warmer than -40°C (-40°F).
- The IAT is warmer than -40°C (-40°F).
- The DTC runs continuously when the above conditions are met.

P06B6

- Engine speed is between 600 and 5,000 RPM.
- Engine is running greater than 5 s.
- The DTC runs continuously when the above conditions are met.

[Conditions for Setting the DTC](#)

P0324

The ECM detects that the knock sensor signal indicates an excessive engine knock or noise is present in at least a single cylinder.

P0326

- The ECM detects that the knock sensor signal indicates the sensor harness is connected, but the sensor is not properly bolted to the engine.
OR
- The ECM detects that the knock sensor signal indicates an excessive engine knock is present.

P06B6

The ECM has detected an internal knock sensor processor fault.

Action Taken When the DTC Sets

- DTCs P0324, P0326, and P06B6 are Type B DTCs.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTC

DTCs P0324, P0326, and P06B6 are Type B DTCs.

Circuit/System Verification

1. Engine running, observe the DTC information with a scan tool. Verify DTC P0325, P0327, P0328, and P06B6 is not set.
If DTC P0325, P0327, or P0328 is set with P06B6, refer to [DTC P0325, P0327, or P0328](#) for further diagnosis.
If DTC P06B6 is set, and no external knock sensor circuit issues exist, replace the K20 ECM.
2. Vehicle OFF, inspect for the following:
 - The B68 knock sensor for physical damage. A sensor that is dropped or damaged may cause a DTC to set
 - The sensor for proper installation. A sensor that is loose or not at the correct torque may cause a DTC to set. Refer to [Fastener Tightening Specifications](#) .
 - The sensor mounting surface for burrs, casting flash, and foreign material
 - The sensor must be clear of hoses, brackets, and engine electrical wiring
 - Loose brackets
 - Water pump and belt
 - An engine mechanical condition--Refer to [Symptoms - Engine Mechanical](#)
If a condition is found, repair as necessary.
3. If there is no mechanical condition, test or replace the B68 knock sensor.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure Records data.

Knock Sensor Low Reference	P0327	P0325, P06B6	P0328	P0326

[Circuit/System Description](#)

The knock sensor enables the engine control module (ECM) to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation. The knock sensor produces an alternating current (AC) voltage signal that varies depending on the vibration level during engine operation. The ECM adjusts the spark timing based on the amplitude and the frequency of the knock sensor signal. The ECM receives the knock sensor signal through 2 isolated circuits. The ECM learns a minimum knock sensor noise level for all of the engine speed ranges. The ECM monitors for a normal knock sensor signal. The ECM monitors the internal knock sensor processor by verifying a 20 KHz signal generated on the signal circuit is detected on the sensor low reference circuit.

[Conditions for Running the DTC](#)

P0325

- Engine speed is between 600 and 8,500 RPM.
- Engine is running at least 5 s.
- The ECT is warmer than -40°C (-40°F).
- The IAT is warmer than -40°C (-40°F).
- The DTC runs continuously when the above conditions are met.

P0327 and P0328

- Engine speed is less than 8,500 RPM.
- The DTCs run continuously when the above condition is met.

Conditions for Setting the DTC

P0325

The ECM detects that a knock sensor signal circuit is open.

P0327

The ECM detects that a knock sensor signal circuit is shorted to ground.

P0328

The ECM detects that a knock sensor signal circuit is shorted to voltage.

Action Taken When the DTC Sets

- DTCs P0325, P0327, and P0328 are Type B DTCs.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTC

DTCs P0325, P0327, and P0328 are Type B DTCs.

Diagnostic Aids

- Inspect the knock sensor for physical damage. A sensor that is dropped or damaged may cause a DTC to set.
- The sensor mounting surface must be free of burrs, casting flash, and foreign material.
- The sensor must be clear of hoses, brackets, and engine electrical wiring.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Engine running, observe the DTC information with a scan tool. DTC P0325, P0327, or P0328 should not set.
2. Move the related harnesses and connectors for the knock sensor circuits while observing the scan tool parameters listed below. The parameters should display NO.
 - Cylinder 1 Knock Detected

- Cylinder 2 Knock Detected
- Cylinder 3 Knock Detected
- Cylinder 4 Knock Detected

If the parameters change, repair the wiring or the harness connectors.

3. Observe the DTC information with a scan tool. DTC P0325, P0327, or P0328 should not set.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Verify the B68 knock sensor is properly tightened, refer to [Fastener Tightening Specifications](#) .
If not the specified value, correct the condition as appropriate.
2. Vehicle OFF, disconnect the harness connector at the B68 knock sensor.
3. Vehicle in Service Mode, measure for 1-4 V between each of the following circuits and ground on the K20 ECM side of the harness connector:
 - The signal circuit, terminal 1
 - The low reference circuit, terminal 2

If less than the specified range, test the circuits for a short to ground or an open/high resistance. If the circuits test normal, replace the K20 ECM.

If greater than the specified range, test the circuits for a short to voltage. If the circuits test normal, replace the K20 ECM.

4. If all circuits test normal, replace the B68 knock sensor.

Repair Instructions

- [Control Module References](#) for ECM replacement, programming and setup.

DTC P0335 or P0336

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0335: Crankshaft Position Sensor Circuit

DTC P0336: Crankshaft Position Sensor Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Crankshaft Position Sensor 5 V Reference	P0172, P0335, P0606 , P0651	P0335	P0172, P0335, P0606, P0651	P0145A, P0336
Crankshaft Position Sensor Signal	P0172, P0335	P0172, P0335, P0606	P0172, P0335	P0336
Low Reference	-	P0172, P0335, P0606	-	P0336

[Circuit/System Description](#)

The crankshaft position sensor detects crankshaft speed and position. The crankshaft position sensor produces an alternating current (AC) voltage of different amplitude and frequency. The frequency depends on the velocity of the crankshaft, and the AC voltage output depends on the crankshaft position and battery voltage. The crankshaft position sensor works in conjunction with a 58 tooth reluctor wheel attached to the crankshaft. The engine control module (ECM) can synchronise the ignition timing, fuel injector timing, and spark knock control based on the crankshaft position sensor and the camshaft position sensor inputs. The crankshaft position sensor is also used to detect misfire.

[Conditions for Running the DTC](#)

P0335 Condition 1

- DTCs P0101, P0102 and P0103 are not set.
- The engine is attempting to start and the camshaft position sensor pulses are being received.
- Calculated Air Flow is greater than 3.0 g/s.

Condition 2

- DTC P0651 is not active.
- The engine is running.

Condition 3

- DTCs P0365, P0366, P0641, and P0651, are not set.
- The engine is running or the engine is attempting to start.

P0336 Condition 1

- DTCs P0335 or P0651 are not set.
- Calculated Air Flow is greater than 3.0 g/s.
- Engine speed is greater than 450 RPM.

Condition 2

- DTC P0651 is not set.
- The engine is running.

Condition 3

- DTCs P0101, P0102, and P0103 are not set.
- Engine is attempting to start and the camshaft position sensor pulses are being received.
- Calculated Air Flow is greater than 3.0 g/s.

Condition 4

- DTCs P0365, P0366, P0641, and P0651 are not set.
- The engine is running or the engine is attempting to start.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0335

DTC P0335 sets if one of the conditions listed below occur:

- The ECM detects that the engine has been attempting to start for greater than 4 s without a crankshaft position sensor pulse.
- Engine running and the ECM does not detect a crankshaft position sensor pulse for 0.7 s.

P0336

DTC P0336 sets if one of the conditions listed below occur:

- The ECM detects that the engine has been attempting to start for greater than 1.5 s without detecting the synchronisation gap on the reluctor wheel.
- The ECM detects that the engine is running, but greater than 10 crankshaft resynchronisation have occurred within 10 s.
- The ECM detects that the engine is running for greater than 0.4 s without detecting the synchronisation gap on the reluctor wheel.
- The ECM detects that the engine is running, but receives less than 51 or greater than 65 crankshaft position sensor pulses, during one engine revolution.

Action Taken When the DTC Sets

- DTCs P0335 and P0336 are Type B DTCs.
- The Driver Information Centre displays Engine not available, Service Soon and Propulsion power is reduced.

Conditions for Clearing the DTC

DTCs P0335 and P0336 are Type B DTCs.

Diagnostic Aids

The following conditions may also set the DTCs:

- Physical damage to the crankshaft position sensor or the reluctor wheel
- Excessive play or looseness of the crankshaft position sensor or the reluctor wheel
- Improper installation of the crankshaft position sensor or the reluctor wheel
- Foreign material passing between the crankshaft position sensor and the reluctor wheel
- Excessive air gap between the crankshaft position sensor and the reluctor wheel
- The ECM uses the camshaft position sensors to determine engine speed and position when there is a crankshaft position sensor condition.

[Circuit/System Verification](#)

Note: If you were sent here from [Engine Cranks But Does Not Run](#), proceed to [Circuit/System Testing](#).

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify DTCs P0651, P2618, or P2619 are not set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Attempt to start the engine. Observe the scan tool Engine Speed parameter. The scan tool should indicate an engine speed greater than 0 RPM.
3. Attempt to start the engine. Observe the scan tool HPCM Engine Speed parameter. The scan tool should indicate an engine speed greater than 0 RPM.
If the above condition exists, refer to DTCs P2618 or P2619 for further diagnosis.

4. Move the related harnesses/connectors of the B26 crankshaft position sensor and verify the engine does not stumble, stall, or change engine speed.
If the above condition exists, repair the harness/connectors as necessary.
5. Attempt to start the engine. Observe the DTC information with a scan tool. DTC P0335 and P0336 should not set.
6. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF. Disconnect the harness connector at the B26 crankshaft position sensor.
2. Vehicle OFF, all systems OFF. It may take 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
4. Test for 4.8-5.2 V between the signal circuit terminal 3 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
5. Vehicle OFF, connect a 3 A fused jumper wire to the signal circuit terminal 3.
6. Vehicle ON, momentarily touch the end of the fused jumper wire to ground while monitoring the scan tool Crankshaft Position Sensor Active Counter. The parameter should increment.
If the parameter does not increment, replace the K20 ECM.
7. If all circuits test normal, replace the B26 Crankshaft Position Sensor.

[Circuit/System Description](#)

Each camshaft is equipped with a camshaft position sensor that the engine control module (ECM) monitors. The camshaft position sensor is a hall effect switch that works in conjunction with a 4X reluctor wheel. The reluctor wheels are mounted to the camshaft position actuators that are mounted to the end of the camshafts. The ECM uses the camshaft position sensor signals in order to determine the position of the camshafts. The ECM supplies 5 V to the camshaft position sensors on the 5 V reference circuits and supplies a ground on the low reference circuits. The camshaft position sensors provide a signal to the ECM on the signal circuits.

Conditions for Running the DTC

P0340 Condition 1

- DTCs P0101, P0102, and P0103 are not set.
- The engine is attempting to start.
- Calculated Air Flow is greater than 3.0 g/s.

Condition 2

- Engine is running.
- DTC P0641 is not set.

Condition 3

- Engine is attempting to start.
- DTCs P0335, P0336, P0641 or P0651, are not set.

Condition 4

- Receiving crankshaft pulses.
- DTCs P0335, P0336, P0641 or P0651, are not set.

P0365 Condition 1

- Engine is attempting to start.
- DTCs P0101, P0102, or P0103 are not set.
- Calculated Air Flow is greater than 3.0 g/s.

Condition 2

- Engine is running.
- DTC P0641 is not set.

Condition 3

- Engine is attempting to start.
- DTCs P0335, P0336, P0641 or P0651, are not set.

Condition 4

- Crankshaft is synchronised to camshaft.
- DTCs P0335, P0336, P0641 or P0651, are not set.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

Condition 1

- The time since the last camshaft position pulse is greater than 5.5 s.
- The ECM detects that the engine is attempting to start for greater than 4 s, without a camshaft position sensor pulse.

Condition 2

Fewer than 4 camshaft pulses have been received in greater than 3 s.

Condition 3

No camshaft sensor pulses have been received during the first engine cycle.

Condition 4

The number of camshaft pulses received during 100 engine cycles equals 0.

Action Taken When the DTC Sets

- DTCs P0340, and P0365 are Type B DTCs.
- The camshaft position actuator is commanded to the park position.

Conditions for Clearing the DTC

DTCs P0340, and P0365 are Type B DTCs.

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. DTC P0641 should not be set.
If DTC P0641 is set, refer to [DTC P0641, P0651, P0697, or P06A3 : ECM](#) .
2. Engine running, observe the scan tool Inlet or Exhaust Camshaft Position Active Counter parameters. The parameters should be incrementing.
3. Observe the DTC information with a scan tool. DTC P0340 or P0365 should not set.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF. Disconnect the harness connector at the appropriate B23 camshaft position sensor.
2. Vehicle OFF, all systems OFF. It may take 2 minutes for all Vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 2 and

ground.

If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.

3. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.

If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.

4. Test for 4.8-5.2 V between the signal circuit terminal 3 and ground.

If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

If greater than the specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

5. If all circuits test normal, test or replace the B23 Camshaft Position Sensor.

Circuit/System Description

Each camshaft is equipped with a camshaft position sensor that the engine control module (ECM) monitors. The camshaft position sensor is a hall effect switch that works in conjunction with a 4X reluctor wheel. The reluctor wheels are mounted to the camshaft position actuators that are mounted to the end of the camshafts. The ECM uses the camshaft position sensor signals in order to determine the position of the camshafts. The ECM supplies 5 V to the camshaft position sensors on the 5 V reference circuits and supplies a ground on the low reference circuits. The camshaft position sensors provide a signal to the ECM on the signal circuits.

[Conditions for Running the DTC](#)

Condition 1

- DTCs P0335, P0336, P0641, or P0651, are not set.
- Engine is attempting to start.

Condition 2

- DTCs P0335, P0336, P0641, or P0651, are not set.
- Crankshaft is synchronised to the camshaft.

[Conditions for Setting the DTC](#)

Condition 1

The ECM detects a signal from the camshaft position sensor, but the number of pulses are less than 4 or greater than 6 of what is expected for one crankshaft revolution.

Condition 2

The number of camshaft pulses received during 100 engine cycles is less than 398 or greater than 402.

[Action Taken When the DTC Sets](#)

DTCs P0341 and P0366 are Type B DTCs.

[Conditions for Clearing the DTC](#)

DTCs P0341 and P0366 are Type B DTCs.

[Diagnostic Aids](#)

A high resistance condition on the camshaft position sensor circuits may cause a DTC to set.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. DTC P0641 should not be set.
If DTC P0641 is set, refer to [DTC P0641, P0651, P0697, or P06A3 : ECM](#) .
2. Engine running, observe the scan tool Inlet or Exhaust Camshaft Position Active Counter parameter. The parameters should be incrementing.
3. Observe the DTC information with a scan tool. DTC P0341 or P0366 should not set.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, inspect the appropriate B23 camshaft position sensor for the correct installation.
If the B23 camshaft position sensor is loose, inspect the sensor and the O-ring for damage, and replace as necessary.
2. Disconnect the harness connector at the appropriate B23 camshaft position sensor.

3. Vehicle OFF, all systems OFF. It may take 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
4. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground, or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
5. Test for 4.8-5.2 V between the signal circuit terminal 3 and ground.
If less than the specified range, test the signal circuit for a short to ground, or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
6. Vehicle OFF, connect a 3 A fused jumper wire to the signal circuit terminal 3.
7. Vehicle in Service Mode, momentarily touch the end of the fused jumper wire to ground while monitoring the scan tool parameters listed below. The parameters should increment.
 - Inlet Camshaft Position Active Counter
 - Exhaust Camshaft Position Active Counter
 - If the parameters do not increment, replace the K20 ECM.
8. Inspect the engine for the following conditions:
 - Physical damage to the B23 camshaft position sensor or the reluctor wheel
 - Excessive play or looseness of the B23 camshaft position sensor or the reluctor wheel
 - Excessive camshaft end play
 - Improper installation of the B23 camshaft position sensor or the reluctor wheel
 - Foreign material passing between the B23 camshaft position sensor and the reluctor wheel
 - The timing chain and tensioner for wear or damageIf any of the above conditions exists, repair as necessary.
9. If all circuits test normal, replace the B23 camshaft position sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

*The engine cranks but does not run and opens the fuse that supplies voltage to the ignition coil.

**The engine cranks but does not run.

Circuit/System Description

Ignition voltage is supplied to the ignition coil. The engine control module (ECM) provides an ground for the ignition coil control circuits. When the ECM removes the ground path of the ignition primary coil, the magnetic field produced by the coil collapses. The collapsing magnetic field produces a voltage in the secondary coil which ignites the spark plugs. The sequencing and timing are controlled by the ECM.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is greater than 5 V.
- The DTC runs continuously once the above condition is met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P0351, P0352, P0353 and P0354 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0351, P0352, P0353 and P0354 are Type B DTCs.

Diagnostic Aids

If the condition is intermittent, moving the related harnesses and connectors, with the engine running, while monitoring the appropriate scan tool Misfire Current Cylinder parameter and the appropriate Ignition Coil Control Circuit Status parameter this may help isolate the condition.

- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Start the engine.
2. Observe the scan tool Cylinder 1-4 Current Misfire Counter parameters. The counters should not be incrementing.
3. Observe the appropriate Ignition Coil Control Circuit Status parameter should read OK.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the K35 ignition coil module.
2. Vehicle in Service Mode, verify that a test lamp does not illuminate between the appropriate control circuit listed below and ground.
 - Ignition coil 1 control terminal D
 - Ignition coil 2 control terminal E
 - Ignition coil 3 control terminal F
 - Ignition coil 4 control terminal G

If the test lamp illuminates, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
3. Verify that a test lamp does not illuminate between the appropriate control circuit listed below and B+.

- Ignition coil 1 control terminal D
- Ignition coil 2 control terminal E
- Ignition coil 3 control terminal F
- Ignition coil 4 control terminal G

If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.

4. Vehicle OFF, all systems OFF. This may take up to 2 minutes for all vehicle systems to power down.
5. Connect a 3 A fused jumper wire to the appropriate control circuit listed below and ground.
 - Ignition coil 1 control terminal D
 - Ignition coil 2 control terminal E
 - Ignition coil 3 control terminal F
 - Ignition coil 4 control terminal G

Note: This procedure needs to be performed quickly because once DTC P0AB9 or P16E0 sets, the engine will not turn over. If this occurs, turn the Vehicle OFF, all systems OFF. This may take up to 2 minutes for all vehicle systems to power down and then retest.

6. Attempt to start the engine, observe the appropriate Ignition Coil 1-4 Control Circuit Low Voltage Test Status parameter with a scan tool. The parameter should display Malfunction.
If not the specified value, test the control circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
7. If all circuits test normal, test or replace the K35 ignition coil module.

DTC P0420

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) Provides An overview of each diagnostic category.

DTC Descriptor

DTC P0420: Catalyst System Low Efficiency

Circuit/System Description

A 3-way catalyst controls emissions of hydrocarbons, CO and NOX. The catalyst within the converter promotes a chemical reaction, which oxidises the hydrocarbon(s) and the CO that are present in the exhaust gas. This process converts the hydrocarbon(s) and the CO into water vapor and CO₂, and reduces the NOX, converting the NOX into nitrogen. The catalyst also stores oxygen. The ECM monitors this process by using heated oxygen sensors (HO₂S) that are in the exhaust stream before and after the 3- way catalyst. The HO₂S produces an output signal that the ECM uses to calculate the oxygen storage capacity of the catalyst. This indicates the ability of the catalyst to convert the exhaust emissions efficiently. The ECM monitors the efficiency of the catalyst by monitoring the HO₂S during an off-idle, ECM commanded Decel Fuel Cut Off (DFCO) event. When the catalyst is functioning properly, the post catalyst HO₂S response to the fuel conditions during the DFCO event is slow compared to the response of the pre catalyst HO₂S. When the post HO₂S response is near that of the pre HO₂S, the oxygen storage capability and efficiency of the catalyst may be degraded below an acceptable threshold.

Conditions for Running the DTC

- DTC P0030, P0036, P0053, P0054, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P0131, P0132, P0133, P0134, P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P0171, P0172, P0178, P0179, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P1133, P16F3, P2101, P2135, P2269, P2270, P2271, or P2A00 is not set.
- The engine speed is between 1,800-3,500 RPM to enable the catalyst diagnostic. Once the engine speed is in range, the engine speed must be between 1,700-3,650 RPM to keep the test enabled.
- The accelerator pedal position is less than 100 %.
- The evaporative emission (EVAP) purge is not commanded ON.

- The HO2S heaters are ON for greater than 60 s.
- The air flow into the engine is between 18-28 g/s.
- The system voltage is between 10-32 V.
- The vehicle speed is between 40-145 km/h (25-90 MPH) to enable the catalyst diagnostic. To keep the test enabled the vehicle speed cannot change greater than 5 km/h (3 MPH).
- The catalyst calculated temperature is less than 1,000°C (1,832°F).
- The engine is operating in closed loop.
- The engine is operating in Decel Fuel Cut Off (DFCO).

This diagnostic attempts one test during each valid OFF-idle period once the above conditions have been met. This diagnostic attempts up to 6 tests during each drive cycle.

Conditions for Setting the DTC

The ECM determines that the efficiency of the catalyst has degraded below a calibrated threshold.

Action Taken When the DTC Sets

DTC P0420 is a Type A DTC.

Conditions for Clearing the DTC

DTC P0420 is a Type A DTC.

Diagnostic Aids

Inspect for the following conditions, which may cause a catalyst to degrade:

- An engine misfire
- High engine oil or high coolant consumption
- Retarded spark timing
- A weak or poor spark
- A lean fuel mixture
- A rich fuel mixture
- A damaged oxygen sensor or wiring harness

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify there are no other DTCs set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Engine running, operate the vehicle within the Conditions for Running the DTC. Observe the scan tool Catalyst Monitor Not At Idle Test Conditions Met parameter. The parameter will change to Yes when the Conditions have been met.
If not the specified value, operate the vehicle within the Conditions for Running the DTC.
3. Monitor the scan tool Catalyst Monitor Test State parameter. When the parameter indicates Active, the Catalyst Monitor Test is running.
4. Continue to monitor the parameter. When the parameter indicates Inactive, the Catalyst Monitor Test has completed.
5. When the test has completed, the Catalyst Monitor Test Counter parameter will increment by one and the Catalyst Monitor Test Result parameter will indicate Pass, Fail, or No Decision.
If no decision has been made, repeat steps 2-4 until the Test Result parameter indicates Pass or Fail.

Circuit/System Testing

1. Verify the following conditions do not exist with the catalytic converter:

- Dents
- A severe discolouration caused by excessive temperatures
- Road damage
- An internal rattle caused by damaged catalyst substrate
- Restrictions

If a condition is found, replace the catalytic converter.

2. Verify the following conditions do not exist with the exhaust system:

- Leaks
- Physical damage
- Loose or missing hardware

If a condition is found, repair the exhaust system.

3. Verify the following conditions do not exist with the B52B Heated Oxygen Sensor 2.

- The HO2S is not at the correct torque
- Damage

If a condition is found, repair or replace the B52B Heated Oxygen Sensor 2 as necessary.

4. If all physical conditions test normal, test or replace the catalytic converter.

[Repair Instructions](#)

[Repair Verification](#)

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Vehicle OFF for 60 s.
5. Engine running, operate the vehicle within the Conditions for Running the DTC. Observe the scan tool Catalyst Monitor Not At Idle Test Conditions Met parameter. The parameter will change to Yes when the Conditions have been met.
If not the specified value, operate the vehicle within the Conditions for Running the DTC.
6. Monitor the scan tool Catalyst Monitor Test State parameter. When the parameter indicates Active, the Catalyst Monitor Test is running.

7. Continue to monitor the parameter. When the parameter indicates Inactive, the Catalyst Monitor Test has completed
8. When the test has completed, the Catalyst Monitor Test Counter parameter will increment by one and the Catalyst Monitor Test Result parameter will indicate Pass, Fail, or No Decision.
If no decision has been made, repeat steps 5-7 until the Test Result parameter indicates Pass or Fail.
9. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) and perform the appropriate diagnostic procedure.

DTC P043E, P043F, or P145F

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P043E: Evaporative Emission (EVAP) System Reference Orifice Flow Insufficient

DTC P043F: Evaporative Emission (EVAP) System Reference Orifice Flow Excessive

DTC P145F: Evaporative Emission (EVAP) System Reference Orifice Performance

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The engine control module (ECM) monitors the pressure across the reference orifice with the EVAP leak detection pump pressure sensor. When all conditions are met, the ECM commands the vacuum pump ON and monitors the EVAP leak detection pump pressure sensor. If the ECM detects the pressure is too low, too high, or not stabilised, a DTC sets.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1458, P1459, P145A, P145C,

P145D, P145E, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, or U182D is not set.

- The vehicle is OFF.
- The propulsion system is not active.
- The refueling request button is not pressed
- A service bay test is not active
- The purge valve is closed
- The vent solenoid valve is closed
- The EVAP Leak Detection Pump switching valve is in the vent position
- The EVAP Leak Detection Pump vacuum pump is ON
- The odometer is greater than 16 km (10 mi)
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI)
- The fuel level is between 10-90%
- The engine coolant temperature is less than 40°C (104°F)
- The inlet air temperature is between 4-45°C (39-113°F)
- The system voltage is greater than 10 V
- The vehicle speed less than 1.6 km/h (1 MPH)
- There are three possible time windows for this test to run. Up to that point, and through this time period, the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Conditions for Setting the DTC

P043E

- The ECM detects the EVAP leak detection pump pressure is greater than 4 kPa (0.58 PSI) after 6 minutes.
OR
- The ECM detects the EVAP leak detection pump pressure is greater than 4.5 kPa (0.65 PSI) after 10 s.

P043F

- The ECM detects the EVAP leak detection pump pressure is less than 1.18 kPa (0.17 PSI) after 6 minutes.
OR
- The ECM detects the EVAP leak detection pump pressure is less than 1.18 kPa (0.17 PSI) after 30 s.

P145F

The ECM detects the difference between the first EVAP leak detection pump pressure measurement is greater than 0.51 kPa (0.073 PSI) then the second measurement after 30 s.

Action Taken When the DTC Sets

DTCs P043E, P043F and P145F are Type B DTCs.

Conditions for Clearing the DTC

DTCs P043E, P043F and P145F are Type B DTCs.

Diagnostic Aids

- Inspect the tube and clamps from the EVAP leak detection pump to the vent solenoid for damage. A damage/open tube may allow debris to enter the pump and plug the reference orifice.
- Remove the EVAP leak detection pump and look inside the pump opening for any debris that could restrict or plug the reference orifice. The reference orifice is a small opening at the 2 o'clock position in the pump vacuum opening. Inspect for missing or damage O-rings.
- With the fresh air tube removed from the EVAP leak detection pump assembly, blow controlled air, 5-10 PSI, into this tube. There should be air escaping from behind the fuel fill pocket indicating this tube and filter are not restricted.
- A switching valve stuck in the pump position can cause insufficient flow.
- This part is not serviceable. It is very important that no debris be found in the pump fresh air inlet or vacuum openings, the tube between the vent solenoid valve and EVAP leak detection pump assembly as this could cause a P043E to set.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Vehicle in Service Mode, verify the scan tool BARO pressure is within the range specified in the [Altitude Versus Barometric Pressure](#) table.
2. Record the EVAP leak detection pump pressure sensor reading. The reading should be 1.18-4 kPa (0.17-0.58 PSI) less than BARO.
3. Command the EVAP Leak Detection Pump Command ON with the scan tool and monitor the EVAP leak detection pump pressure. Observe this for a steady or increasing PSI.
 - If the PSI is increasing, then there is a restriction in the orifice.
 - If the PSI is steady, then the orifice is good.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

[Circuit/System Testing](#)

Note: The reference orifice is a small opening at the 2 o'clock position in the pump vacuum opening.

1. Vehicle OFF, remove the Q63 EVAP leak detection pump. Inspect the reference orifice within the pump for a restriction/blockage. The reference orifice should not be restricted.
 - If the reference orifice is restricted, inspect and repair any of the conditions listed below:
 - The EVAP leak detection pump to the vent solenoid tube and clamps for damage
 - A missing or damage EVAP leak detection pump O-rings
 - The fresh air tube near the fuel fill pocket for a restriction
 - The fresh air tube for a restriction
2. If all components test normal, replace the Q63 EVAP system leak detection pump assembly.

[DTC Descriptors](#)

DTC P0442: Evaporative Emission (EVAP) System Small Leak Detected

DTC P0455: Evaporative Emission (EVAP) System Large Leak Detected

[Circuit/System Description](#)

This DTC tests the evaporative emission (EVAP) system for a small and large leak when the Vehicle is turned OFF and the correct conditions are met. The propulsion system needs to be OFF for several hours before the small and large leak tests run. The EVAP leak detection pump creates a vacuum across a 0.51 mm (0.020 in) reference orifice. This reference vacuum is then compared to the vacuum level created in the fuel tank to determine if a leak exists

The following table illustrates the relationship between the ON and OFF states, and the OPEN or CLOSED states of the EVAP components:

Engine Control Module Command	EVAP Canister Purge Solenoid Valve	EVAP Canister Vent Solenoid Valve	Vacuum Pump	Switch Valve
ON	Open	Open/Venting	Pump Runs	Pump Position/Not Venting
OFF	Closed	Closed/Not Venting	Pump OFF	Vent Position

[Conditions for Running the DTC](#)

- DTCs P043E, P043F, P06E4, P0111, P0112, P0113, P0114, P0117, P0118, P0116, P0119, P0128, P0449, P0498, P0499, P1458, P145A, P145C, P145D, P145E, P145F, P0451, P0452, P0453, P0461, P0462, P0463, P0502, P0503, P0722, P0723, P1459, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0140, U182D, U0073, U0074, is not set
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI).

- The fuel level is between 10-90 %.
- The ECT is less than 40°C (104°F).
- The IAT is between 4-45°C (39-113°F).
- The system voltage is greater than 10 V.
- Vehicle speed less than 1.6 km/h (1 MPH).
- A refuelling event needs to be detected prior to running this test --P0455 only.
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Conditions for Setting the DTC

P0442

DTC P0442 sets when the EVAP leak detection pump pressure sensor (gauge) vacuum reading is less than the 0.51 mm (0.020 in) reference orifice vacuum measurement plus a calibrated value for greater than 6 min.

P0455

DTC P0455 sets after a refueling event has been detected and the small/large leak diagnostics have not passed. If the EVAP leak detection pump pressure sensor (gauge) vacuum reading is less than the 0.51 mm (0.020 in) reference orifice vacuum measurement and times a calibrated value for greater than 6 min.

Action Taken When the DTC Sets

DTCs P0442 and P0455 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0442 and P0455 are Type B DTCs.

Diagnostic Aids

- The EVAP system can be filled with smoke more quickly and completely by injecting smoke at the purge tube and commanding the vent solenoid valve open. For example, when injecting smoke at the purge tube, remove the filler cap or temporarily leave the vent solenoid valve open until smoke is observed. Close the system and continue testing. If using a fuel cap adapter at the filler neck, disconnect the purge tube at the EVAP canister purge solenoid valve until smoke is observed.
- To help locate intermittent leaks, use the *EN 41413-200* Evaporative Emissions System Tester to introduce smoke into the EVAP system. Move all EVAP components while observing smoke with a high intensity white light.
- To improve the visibility of the smoke exiting the EVAP system, observe the suspected leak area from different angles with a high intensity white light.
- If a small leak is difficult to find, it may be necessary to remove the EVAP components and test them one at a time using the adapters in the GE-41413-300 .

Special Tools

- CH-48096 EVAP Service Access Port Tool
- GE-41413-300 EVAP Cap And Plug Kit
- J 41413-200 Evaporative Emissions System Tester
- GE-41413-SPT High Intensity White Light
- J 41415-30 Fuel Tank Cap Adapter

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Circuit/System Verification](#)

1. Verify the following conditions do not exist in the EVAP system:
 - Loose, incorrect, missing, or damaged fuel fill cap
 - A damaged EVAP purge solenoid
 - Disconnected, incorrectly routed, kinked, or damaged EVAP pipes and hoses
 - A damaged EVAP vent valve or EVAP canister

If you find any of the above conditions, repair as necessary.

Note: Refer to the J 41413-200 operation manual for detailed instructions in [Evaporative Emission Control System Diagnosis](#)

2. Disconnect the purge tube at the quick connector on the evaporative emission canister side of the Q12 evaporative emission canister purge solenoid valve and install the CH-48096
3. Connect the J 41413-200 to the CH-48096
4. Use the flow meter on the J 41413-200 calibrated to 0.51 mm (0.020 in) to determine if there is a leak in the evaporative emission system.

Note:

- Larger volume fuel tanks and/or those with lower fuel levels may require several minutes for the floating indicator to stabilise.
- Ensure that the vehicle underbody temperature is similar to the ambient temperature and allow the surrounding air to stabilise before starting the diagnostic procedure. The system flow will be less with higher temperatures.

5. Use the remote switch to activate the J 41413-200 and compare the flow meter's stable floating indicator position to the red flag. The floating indicator should be below the red flag.
6. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

[Circuit/System Testing](#)

1. Vehicle OFF, turn the nitrogen/smoke valve on the control panel to SMOKE.
2. Vehicle in Service Mode, command the EVAP vent solenoid ON with a scan tool.

Note:

- The fuel sender may need to be accessed to inspect some of the EVAP system components.
- Larger volume fuel tanks and/or those with lower fuel levels may require several minutes for the floating indicator to stabilise.
- Introduce smoke at 15 second intervals while testing the system.

3. Use the remote switch to introduce smoke into the EVAP system.
4. Verify that smoke is not exiting the entire EVAP system with the GE-41413-SPT

If smoke is observed, repair the condition as necessary.

Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs
4. Vehicle OFF, all systems OFF, this may take up to 2 minutes.
5. Vehicle in Service Mode, seal the EVAP system and use the flow meter on the J 41413-200 , calibrated to 0.51 mm (0.020 in) to determine that there is no leak in the EVAP system. Use the remote switch to activate the J 41413-200 and compare the flow meter's stable floating indicator position to the red flag. The floating indicator should be below the red flag.
If floating indicator is above the red flag, a leak still exists.
6. If the repair was related to a DTC, duplicate the conditions for running the DTC and use the freeze frame/failure records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

Evaporative Emission Purge Solenoid Valve Control	P0458	P0443	P0459

[Circuit/System Description](#)

The evaporative emission (EVAP) purge solenoid valve is used to purge fuel vapor from the EVAP canister to the inlet manifold. The EVAP purge solenoid valve is pulse width modulated (PWM). Ignition voltage is supplied directly to the EVAP purge solenoid valve. The engine control module (ECM) controls the solenoid by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

- The vehicle is ON.
- The powertrain relay voltage is greater than 11 V.
- DTCs P0443, P0458 and P0459 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 5 s.

Action Taken When the DTC Sets

DTCs P0443, P0458 and P0459 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0443, P0458 and P0459 are Type B DTCs.

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, command the EVAP purge solenoid valve to 50 percent with a scan tool. You should hear the solenoid clicking.
2. Engine running, command the EVAP purge solenoid valve from 0 to 50 percent and back to 0 percent with a scan tool while observing the control circuit status parameters listed below:
 - EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status
 - EVAP Purge Solenoid Valve Control Circuit Open Test Status
 - EVAP Purge Solenoid Valve Control Circuit Low Voltage Test StatusEach parameter should display OK or Not Run.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q12 evaporative emission purge solenoid valve.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition voltage circuit terminal 1 and ground.
If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test all components connected to the ignition voltage circuit and replace as necessary.
3. Test for 2.5-3.5 V between the control circuit terminal 2 and ground
If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the K20 engine control module.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 engine control module.
4. Command the EVAP purge solenoid valve from 0 to 100 percent with a scan tool. The DMM should transition from 2.5-3.5 V at 0 percent, to less than 0.2 V when commanded to 100 percent.
If the circuit voltage does not correspond to the specified values, replace the K20 engine control module
5. If all circuits test normal, test or replace the Q12 evaporative emission purge solenoid valve

Component Testing

1. Vehicle OFF, disconnect the harness connector at the Q12 evaporative emission purge solenoid valve

2. Test for 25.0-30.0 Ω between the control terminal 2 and the ignition voltage terminal 1.

If not within the specified range, replace the Q12 evaporative emission purge solenoid valve

B+	P0498	P0449, P0498	-
Evaporative Emission Vent Solenoid Valve Control	P0498	P0449	P0499

[Circuit/System Description](#)

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. Battery voltage is supplied to the normally closed evaporative emission (EVAP) vent solenoid valve. The ECM grounds the EVAP vent solenoid valve control circuit through an internal switch called a driver. The ECM monitors the status of the driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

[Conditions for Running the DTC](#)

DTCs P0449, P0498 and P0499 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P0449, P0498 and P0499 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0449, P0498 and P0499 are Type B DTCs.

Diagnostic Aids

Where multiple DTCs set look for a common root cause like battery feeds, grounds, splices, etc.

3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q13 evaporative emission vent solenoid valve.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the battery voltage circuit terminal 2 and ground.
If the test lamp does not illuminate, test the battery voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the battery voltage circuit fuse is open, test all components connected to the battery voltage circuit and replace as necessary.
3. Test for 2.5-3.5 V between the control circuit terminal 1 and ground.
If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the K20 engine control module.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 engine control module.
4. Command the EVAP vent solenoid valve On and Off with a scan tool. The DMM should transition from 2.5-3.5 V when commanded Off, to less than 0.2 V when commanded On..
If the circuit voltage does not correspond to the specified values, replace the K20 engine control module.
5. If all circuits test normal, test or replace the Q13 evaporative emission vent solenoid valve.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the Q13 evaporative emission vent solenoid valve.
2. Test for 25.0-30.0 Ω between the control terminal 1 and the battery voltage terminal 2.

If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.

3. Test for no air flow through the Q13 evaporative emission vent solenoid valve by applying vacuum to the pump side of the valve. It should hold 1-2 in. Hg (3-7 kPa) for 30 s.

If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.

4. Reconnect the harness connector at the Q13 evaporative emission vent solenoid valve.
5. Command the Q13 evaporative emission vent solenoid valve On with a scan tool and apply vacuum to the pump side of the valve. It should not hold vacuum.

If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.

FTP Sensor 5 V Reference	0 V	0-1.5 V	5 V
FTP Sensor Signal	0 V	0 V	3-5 V
FTP Sensor Low Reference	-	4-5 V	-

Circuit/System Description

The fuel tank pressure (FTP) sensor measures the pressure or vacuum in the evaporative emission (EVAP) system. The engine control module (ECM) supplies a 5 V reference and a low reference circuit to the FTP sensor. The FTP sensor signal voltage varies depending on EVAP system pressure or vacuum.

The following tables illustrate relationship examples between the FTP sensor and the ON and OFF states, and the OPEN or CLOSED states of the EVAP components:

FTP Relationship

Fuel Tank Pressure	FTP in. H2O/PSI	FTP Signal Voltage
Pressure	Positive Value, 14.9 in. H2O / 0.54 PSI	High, 4.73 V
No Pressure	Near Zero, 0 in. H2O / 0.001 PSI	2.6 V
Vacuum	Negative Value, -2.37 in. H2O / -0.08 PSI	Low, 2.3 V

FTP to EVAP Leak Detection Pump Assembly Relationship

Fuel Tank Pressure	FTP Sensor	EVAP Leak Detection Pump Switch Valve	Vent Valve	EVAP Leak Detection Pump Pressure
Pressure or Vacuum	Positive or Negative Value	Vent	Closed	100 kPa (14.50 PSI) *
Vacuum	Negative Value - 1 kPa (0.15 PSI)	Pump/Not Venting	Open	99 kPa (14.36 PSI) **
Pressure	Positive Value - 3 kPa (0.44 PSI)	Pump/Not Venting	Open	103 kPa (14.94 PSI) **

* Equivalent to barometric pressure reading.

** The values are examples only. Your readings may vary from this depending on the pressure or vacuum in the system and barometric pressure.

Conditions for Running the DTC

P0451

Condition 1:

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P06E4, P0722, P0723, P1221, P1459, P145A, P2066, P2067,

P2068, P2400, P2401, P2402, P2418, P2419, P2420, U0140, U182D, U0073, U0074, P2537 or P2610 is not set.

- DTC P1458 or P145D are not present when the test failed this ignition cycle.
- The barometric pressure (BARO) is between 70-110 kPa (10 -16 PSI).
- The fuel level is between 10-90 %.
- The engine coolant temperature (ECT) is less than 40°C (104°F).
- The inlet air temperature (IAT) is between 4°-45°C (39°-113°F).
- The propulsion system is not active.
- The vehicle is OFF.
- The service bay test is not active.
- The refuelling request button is not pressed.
- The battery voltage is greater than 10 V.
- The vehicle speed is less than 1.6 km/h (1 MPH).
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.
- The DTC runs once per drive cycle and immediately after a code clear when the above conditions are met.

Condition 2:

- DTCs P0068, P0071, P0072, P0073, P010C, P010D, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P012B, P012C, P012D, P0121, P0122, P0123, P0222, P0223, P0442, P0443, P0449, P0452, P0453, P0455, P0458, P0459, P0498, P0499, P0502, P0503, P0722, P0723, P0606, P1104, P1221, P145A, P145D, P145E, P1458, P1459, P16F3, P2100, P2101, P2102, P2103, P2400, P2401, P2402, P2418, P2419, P2420, P2422 or P2450 is not set.
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI).
- The outside air temperature (OAT) is between 4°-35°C (39-102°F).
- The engine is running.
- The run/crank voltage is greater than 11 V.
- The EVAP Purge solenoid valve is not enabled.
- The refueling request button is not pressed
- The DTC runs once per drive cycle when the above conditions are met.

P0452 and P0453

- Vehicle ON or the engine is running.
- DTCs P0452 and P0453 run continually when the above conditions are met.

[Conditions for Setting the DTC](#)

P0451

The ECM detects the difference between the FTP sensor and the EVAP leak detection pump (ELDP) pressure is greater than 0.747 kPa (0.11 PSI) for greater than 5 s

P0452

The ECM detects the FTP sensor voltage is less than 0.15 V for greater than 8 s.

P0453

The ECM detects the FTP sensor voltage is greater than 4.85 V for greater than 8 s.

Action Taken When the DTC Sets

DTCs P0451, P0452 and P0453 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0451, P0452 and P0453 are Type B DTCs.

Diagnostic Aids

- A restriction in the EVAP canister or vent lines that keeps the FTP and EVAP leak detection pump sensor from comparing each others value.
- Since this is a sealed system there could be a pressure or vacuum existing in the system.
- A vent valve stuck closed will affect performance.
- A switching valve stuck in the vent position will affect performance.
- Ensure that the reference port on the FTP sensor is unobstructed.
- Scan tool output controls, snapshot, and the plot function can help detect erratic sensor operation.

Special Tools

J 41413-200 Evaporative Emissions System Tester

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Circuit/System Verification](#)

Note: The order of these steps is important. If not followed properly you will be bleeding off any pressure or vacuum in the system and not see any change in the EVAP leak detection pump sensor.

P0451

1. Vehicle in Service Mode, observe and note the EVAP Leak Detection Pump Pressure with a scan tool.
2. Observe and note the FTP sensor pressure.
 - If the FTP is 0 in. H₂O (0 PSI), 0.15-0.29 PSI pressure or vacuum will need to added to the EVAP system.
 - If the FTP is 15 in. H₂O (0.54 PSI), you will need to reduce the pressure or vacuum by 0.15-0.29 PSI before proceeding as this is outside the readable range of the FTP sensor.

Note: Ambient and vehicle component temperature must be above 0°C (32°F) to command the switching valve. This prevents erroneous results and damage to the EVAP leak detection pump assembly.

3. Command the EVAP Leak Detection Pump Switching Valve Command to Not Venting and command the EVAP Vent Solenoid Valve Command ON.
4. Observe and note the EVAP Leak Detection Pump Pressure, and Fuel Tank Pressure Sensor with a scan tool.
5. Subtract the second EVAP Leak Detection Pump Pressure reading from the first reading. This value equals what the Fuel Tank Pressure Sensor should be (ELDP reading 2 - ELDP reading 1 = FTP reading 2). The Fuel Tank Pressure Sensor should be within 0.747 kPa (0.11 PSI).

P0452 and P0453

1. Request a refuelling event. This opens the vent valve to bleed off any pressure or vacuum.
2. Remove the fuel cap.
3. Vehicle in Service Mode.
4. Observe the scan tool FTP sensor parameter.
5. The FTP sensor parameter should be 2.63 V at 0 kPa (0 PSI).

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector B150 fuel tank pressure sensor.

Note: Testing for steps 2-6 is performed on the ECM side of the harness connector.

2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the B150 fuel tank pressure sensor low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 engine control module.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the B150 fuel tank pressure sensor 5 V reference circuit terminal 3 and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 engine control module.
4. Verify the scan tool FTP sensor parameter is less than 0.2 V.
If greater than the specified range, test the B150 fuel tank pressure sensor circuit terminal 1 for a short to voltage. If the circuit tests normal, replace the K20 engine control module.
5. Install a 3 A fused jumper wire between the B150 fuel tank pressure sensor signal circuit terminal 1 and the 5 V reference circuit terminal 3. Verify the scan tool FTP sensor parameter is greater than 4.7 V.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.

Note: Testing for this step is performed on the EVAP assembly side of the harness connector.

6. Remove the EVAP assembly and test, inspect, and repair the items listed below. If all items test normal, replace the B150 fuel tank pressure sensor
 - Poor connection at the X350 harness connector
 - Open or shorted 5 V reference circuit

- Open or shorted sensor signal circuit
- Open low reference circuit

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC Descriptor

DTC P0497: Evaporative Emission (EVAP) System No Flow During Purge

Circuit/System Description

This DTC tests for proper inlet manifold vacuum flow to the evaporative emission (EVAP) system. The engine control module (ECM) opens the EVAP canister purge solenoid valve and the EVAP canister vent solenoid valve. The ECM then monitors the fuel tank pressure (FTP) sensor and EVAP leak detection pump pressure sensor to determine if a vacuum is being drawn on the EVAP system. If vacuum in the EVAP system is less than a predetermined value within a predetermined time, this DTC sets.

Conditions for Running the DTC

- DTCs P0068, P0071, P0072, P0073, P0106, P0107, P0108, P0122, P0123, P0222, P0223, P0443, P0449, P0451, P0452, P0453, P0455, P0458, P0459, P0498, P0499, P0502, P0503, P0606, P0722, P0723, P16F3, P1104, P1458, P1459, P145A, P145D, P145E, P2100, P2101, P2102, P2103, P2400, P2401, P2402, P2418, P2419, P2420, P2422, P2450 is not set.
- The EVAP purge solenoid is open.
- The EVAP vent solenoid is open.
- The EVAP leak detection pump switching valve transitions from vent to not vent, pumping, to vent.
- The EVAP leak detection pump is OFF.
- The ignition voltage is greater than 11 volts.
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI).
- The outside air temperature is between 4-35°C (39-95°F).
- The engine RPM to enable is between 1500-3400
- The engine RPM to re-enable is between 1600-3300

- The engine vacuum to enable is between 10-37 kPa (1.5-5.4 PSI)
- The engine vacuum to re-enable is between 11-35 kPa (1.6-5.1 PSI)
- The engine airflow to enable is between 9-34 gps
- The engine airflow to re-enable is between 10-32 gps
- The purge flow to enable is greater than 0.14 gps
- The purge flow to re-enable is greater than 0.13 gps
- The purge duty cycle to enable is greater than 15 %
- The purge duty cycle to re-enable is greater than 16 %
- The requested purge flow to enable is greater than 1.45 %
- The delivered purge flow to re-enable is greater than 1.40 %
- The delivered purge flow to enable is greater than 1.10 %
- The engine is running
- The purge is enabled
- The refuelling request button is not pressed
- The device control is less than 0.5 seconds
- The fuel tank protection is not active.

DTC P0497 will run once per trip with propulsion system active and engine ON.

Conditions for Setting the DTC

After an initial time delay of 3 s when the FTP sensor reading is greater than 0.39 kPa (0.056 PSI)

Or

After an initial time delay of 3 s when the FTP sensor reading is less than 0.39 kPa (0.056 PSI), plus an EVAP leak detection pump switching valve delay time of 0.2 s.

If the EVAP leak detection pump pressure sensor, gauge, indicates a vacuum change less than 2 kPa (0.29 PSI) for 20 s, then a low purge flow failure has been detected.

Action Taken When the DTC Sets

DTC P0497 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0497 is a Type B DTC.

Diagnostic Aids

- A temporary blockage in the EVAP canister purge solenoid valve, purge pipe or EVAP canister could cause an intermittent condition. Inspect and repair any restriction in the EVAP system.
- A EVAP vent solenoid valve stuck closed can cause this DTC to set.
- A EVAP leak detection pump switching valve stuck in the vent or pump position can cause this DTC to set.
- A fuel tank fuel pump module assembly not fully seated in the fuel tank can cause this DTC to set.
- A loose fuel cap can cause this DTC to set.

Special Tools

- J 41413-200 Evaporative Emissions System Tester (EEST)
- GE-41413-300 EVAP Cap And Plug Kit
- GE-41413-SPT High Intensity White Light
- CH-48096 EVAP Service Access Port Tool

For equivalent regional tools, refer to Special Tools : [Diagnostic Tools](#) .

Circuit/System Verification

1. Verify the following conditions do not exist in the EVAP system:
 - A loose, missing, or damaged fuel fill cap.
 - A stuck closed, blocked, or restricted EVAP canister purge solenoid valve.
 - A blockage or restriction in the EVAP canister purge solenoid valve vacuum supply hose, purge pipe, EVAP canister or vapor pipe.

If you find any of the above conditions, repair as necessary.

Note: Refer to *EN 41413-200 Evaporative Emissions System Tester* operation manual for detailed instructions in [Evaporative Emission Control System Diagnosis](#)

2. Connect the CH-48096 to the EVAP purge solenoid valve. Connect the J 41413-200 to CH-48096 .
3. Be sure the EVAP leak detection pump switching valve is in the vent position and the vent solenoid is open.
4. Use the flow meter on the J 41413-200 calibrated to 0.51 mm (0.020 in) to determine there is no leak in the EVAP system.
If a leak is detected, use the J 41413-200 to apply smoke to the EVAP system until the leak is located following the [Evaporative Emission Control System Diagnosis](#) .
5. To improve the visibility of the smoke exiting the EVAP system, observe the suspected leak area from different angles with the GE-41413-SPT .
6. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

Note: Perform the Circuit/System Verification before proceeding with the Circuit/System Testing.

1. Remove the J 41413-200 installed during verification then install a vacuum gauge to the CH-48096
2. Engine running observe the vacuum gauge. Vacuum should not be present.
If there is vacuum present test or replace the Q12 EVAP purge solenoid valve.
3. Observe the vacuum gauge while commanding the Q12 EVAP purge solenoid valve on with the scan tool. Vacuum should be present from 10-100 %
If no vacuum is present test or replace the Q12 EVAP purge solenoid valve.
4. Command the EVAP Test and observe the FTP sensor voltage with a scan tool. The FTP sensor parameter should be less than 0.60 volts within 60 seconds.
If the FTP sensor parameter is less than the specified range, repair the blocked purge path.

DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, or P2610 - ECM

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0601: Control Module Read Only Memory Performance

DTC P0602: Control Module Not Programmed

DTC P0603: Control Module Long Term Memory Reset

DTC P0604: Control Module Random Access Memory Performance

DTC P0606: Control Module Processor Performance

DTC P062F: Control Module Long Term Memory Performance

DTC P0630: VIN Not Programmed or Mismatched - Engine Control Module (ECM)

DTC P16F3: Control Module Redundant Memory Performance

DTC P2610: Control Module Ignition off Timer Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). This diagnostic also addresses if the ECM is not programmed.

The ECM monitors its ability to read and write to the memory. It also monitors a timing function.

Conditions for Running the DTC

P0601, P0602, P0630, P16F3

- The vehicle is ON.
- These DTCs run continuously when the above condition is met.

P0603, P062F

- The vehicle is ON.
- These DTCs run once per ignition cycle.

P0604

- The vehicle is ON for greater than 30 s.
- DTC P0604 runs continuously when the above condition is met.

P0606

- The system voltage is greater than 11 V.
- DTC P0606 runs continuously when the above condition is met.

P2610

- Vehicle OFF.
- The ECM is not powered down.
- DTC P2610 runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects an internal failure or incomplete programming for more than 10 s.

Action Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, P0606, P062F, P0630, and P16F3 are Type A DTCs.
- DTC P2610 is a Type B DTC.

Conditions for Clearing the DTC

- DTCs P0601, P0602, P0603, P0604, P0606, P062F, P0630, and P16F3 are Type A DTCs.
- DTC P2610 is a Type B DTC.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the ECM may cause a DTC to set. Verify the following:

- The battery cables are clean and tight, and the battery is fully charged. Refer to [Battery Inspection/Test](#)
- The ECM ground circuits do not have an open circuit or high resistance.
- The ECM power circuits do not have an open circuit, short to ground, or high resistance.

DTC P0601-P0604, P0606, or P062F - Fuel Pump Control Module

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0601: Control Module Read Only Memory (ROM)

DTC P0602: Control Module Not Programmed

DTC P0603: Control Module Long Term Memory Reset

DTC P0604: Control Module Random Access Memory (RAM)

DTC P0606: Control Module Internal Performance

DTC P062F: Control Module Long Term Memory Performance

Circuit/System Description

The internal fault detection is handled inside the fuel pump control module. No external circuits are involved.

Conditions for Running the DTC

The fuel pump control module runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The fuel pump control module has detected an internal malfunction.

[Action Taken When the DTC Sets](#)

DTC P0601, P0602, P0603, P0604, P0606 and P062F are type A DTCs.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0628: Fuel Pump Enable Circuit Low Voltage

DTC P0629: Fuel Pump Enable Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Fuel Pump Enable	P0628, P069E, P0AC4	P0629, P069E, P0AC4	P0629, P069E

Circuit/System Description

The engine control module (ECM) provides ignition voltage to the fuel pump flow control module whenever the engine is cranking or running. The ECM enables the fuel pump flow control module as long as the engine is cranking or running, and ignition system reference pulses are received. While this enable voltage is being received, the fuel pump flow control module supplies a varying voltage to the fuel tank fuel pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

- The engine speed is greater than 0 RPM.
- The ignition voltage is greater than 11 V.
- The DTCs run continuously when the conditions above are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 2.5 s.

[Action Taken When the DTC Sets](#)

DTCs P0628 and P0629 are Type B DTCs.

[Conditions for Clearing the DTC](#)

DTCs P0628 and P0629 are Type B DTCs.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Attempt to start the engine. Observe the DTC information with a scan tool. DTC P0628 or P0629 should not set.
2. Vehicle in Service Mode, command the Fuel Pump Enable ON and OFF with a scan tool while observing the control circuit status parameters listed below:
 - Fuel Pump Enable Circuit Low Voltage Test Status
 - Fuel Pump Enable Circuit Open Test Status
 - Fuel Pump Enable Circuit High Voltage Test StatusEach parameter should toggle between OK and Not Run or Not Run and OK.
3. Engine running, command the Fuel Pump Enable ON and OFF with a scan tool while observing the control circuit status parameters listed below:
 - Fuel Pump Enable Circuit Low Voltage Test Status
 - Fuel Pump Enable Circuit Open Test Status
 - Fuel Pump Enable Circuit High Voltage Test StatusEach parameter should toggle between OK and Not Run or Not Run and OK.
4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the K27 fuel pump control module harness connector.
2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 0 V on the enable circuit terminal 20.
If greater than the specified value, test for a short to voltage on the enable circuit. If the circuit/connections test normal, replace the K20 ECM.
3. Vehicle in Service Mode, command the Fuel Pump Enable ON with a scan tool.
4. Test for B+ on the enable circuit terminal 20.
If less than the specified range, test for a short to ground or an open/high resistance on the enable circuit. If the circuit/connections test normal, replace the K20 ECM.
5. If all circuits/connections test normal, replace the K27 fuel pump control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P0641 or P06A6 - Fuel Pump Control Module

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0641: 5 V Reference Circuit

DTC P06A6: 5 V Reference Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P018C, P0641, P06A6	P018C	P018D, P0641, P06A6	P06A6
Signal	P018C	P018B, P018C	P018D	P018B
Low Reference	-	P0641, P06A6	-	P06A6

[Circuit/System Description](#)

The fuel pressure sensor is located on the fuel line. The fuel pressure sensor monitors the fuel pressure in the fuel line. The fuel pump control module monitors the voltage signal from the fuel pressure sensor.

[Conditions for Running the DTC](#)

The engine is running.

[Conditions for Setting the DTC](#)

The fuel pump control module detects that the fuel pressure 5 V reference is above or below a predetermined voltage threshold.

[Action Taken When the DTC Sets](#)

DTCs P0641 and P06A6 are Type A DTCs.

[Conditions for Clearing the DTC](#)

DTCs P0641 and P06A6 are Type A DTCs.

[Diagnostic Aids](#)

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Circuit/System Testing

1. Vehicle OFF, disconnect harness connector of the B47 fuel pressure sensor.
2. Vehicle OFF, test for less than 1.0 Ω between the low reference circuit terminal 2 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K27 fuel pump control module.
4. If all circuits test normal, replace the B47 fuel pressure sensor.

DTC P0641, P0651, P0697, or P06A3 - ECM

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0641: 5V Reference 1 Circuit

DTC P0651: 5V Reference 2 Circuit

DTC P0697: 5V Reference 3 Circuit

DTC P06A3: 5V Reference 4 Circuit

Circuit/System Description

The engine control module (ECM) has four internal 5 V reference circuits. Each internal reference circuit provides external 5 V reference circuits for more than one sensor. A short to ground or short to voltage on one external 5 V reference circuit can affect all components connected to the same internal 5 V reference circuit.

Conditions for Running the DTC

DTCs P0641, P0651, P0697, and P06A3 run continuously when the ignition voltage is greater than 6.4 V.

Conditions for Setting the DTC

The ECM detects a voltage out of tolerance condition on the 5 V reference 1, 2, 3, or 4 circuit for less than 1 s.

Action Taken When the DTC Sets

DTCs P0641, P0651, P0697, and P06A3 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0641, P0651, P0697, and P06A3 are Type A DTCs.

Diagnostic Aids

P0641

The 5 V reference 1 circuit provides 5 V to the following sensors:

- The exhaust camshaft position sensor
- The intake camshaft position sensor
- The A/C refrigerant pressure sensor
- The fuel tank pressure sensor

P0651

The 5 V reference 2 circuit provides 5 V to the following sensors:

- The crankshaft position sensor
- The evaporative emission system leak detection pump assembly

P0697

The 5 V reference 3 circuit provides 5 V to the following sensors:

- The accelerator pedal position (APP) sensor 2
- The manifold absolute pressure (MAP) sensor

P06A3

The 5 V reference 4 circuit provides 5 V to the following sensors:

- The accelerator pedal position (APP) sensor 1
- The throttle body throttle position sensors 1 and 2

It may be possible to locate the fault by disconnecting one component at a time from the appropriate 5 V reference circuit while viewing the corresponding 5-volt Reference 1-4 Circuit Status parameter on the scan tool. The scan tool parameter will change from Malfunction to OK when the source of the fault is disconnected. If all 5 V reference

components have been disconnected and a fault is still indicated, the fault may exist in the wiring harness.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. DTCs P0641, P0651, P0697, and P06A3 should not set.
2. Observe the circuit status parameters listed below:
 - 5 V Reference 1 Circuit Status
 - 5 V Reference 2 Circuit Status
 - 5 V Reference 3 Circuit Status

- 5 V Reference 4 Circuit Status

Each parameter should display OK.

3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

Note: Additional DTCs will set when disconnecting components

1. Vehicle OFF, disconnect the harness connector at all appropriate sensors for the applicable DTC. Refer to Diagnostic Aids.
2. Vehicle in Service Mode, test for 4.8-5.2 V between one of the 5 V reference circuits and ground.
If less than the specified range, test for a short to ground on the 5 V reference circuit for each of the affected components. If all circuits test normal, replace the K20 ECM.
If greater than the specified range, test for a short to voltage on the 5 V reference circuit for each of the affected components. If all circuits test normal, replace the K20 ECM.

Note: A short to voltage on the signal circuit of certain components may cause this DTC to set.

3. Connect each component associated with the 5 V reference circuit one at a time while monitoring the appropriate scan tool 5 V Reference 1, 2, 3, or 4 parameter. The voltage should display 4.8-5.2 V.
If not within the specified range when a component is connected, test the signal circuit of the component for a short to voltage. If the circuit tests normal, replace the component.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P0650

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0650: Malfunction Indicator Lamp (MIL) Control Circuit

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0650	P0650	-	-
MIL Control	P0650/MIL ON	P0650	P0650	-

[Circuit/System Description](#)

The malfunction indicator lamp (MIL) illuminates to inform the driver that an emission system fault has occurred and the engine control system requires service. Ignition voltage is supplied directly to the MIL and, when the emission system fault occurs, the engine control module (ECM) turns the MIL ON by grounding the MIL control circuit. Under normal operating conditions, the MIL should be ON only when the vehicle is ON and the engine is OFF.

[Conditions for Running the DTC](#)

- The vehicle is ON or the engine is running.
- Ignition voltage is greater than 11 V.
- The DTC runs continuously when the above conditions are met.

[Conditions for Setting the DTC](#)

The ECM detects that the commanded state of the MIL driver and the actual state of the control circuit do not match for greater than 5 s.

[Action Taken When the DTC Sets](#)

DTC P0650 is a Type B DTC, with no MIL request.

[Conditions for Clearing the DTC](#)

DTC P0650 is a Type B DTC, with no MIL request.

[Diagnostic Aids](#)

If the condition is intermittent, move the related harnesses and connectors with the Vehicle in Service Mode, and with the engine running while monitoring the scan tool MIL control circuit status parameters. The MIL control circuit status parameters will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Engine running, command the MIL ON and OFF with a scan tool. The MIL should turn ON and OFF as commanded.
2. Command the MIL ON and OFF with a scan tool while observing the control circuit status parameters listed below:
 - MIL Control Circuit Low Voltage Test Status
 - MIL Control Circuit Open Test Status
 - MIL Control Circuit High Voltage Test StatusEach parameter should display OK or Not Run.
3. Vehicle in Service Mode, command the MIL ON and OFF with a scan tool while observing the control circuit status parameters listed below:
 - MIL Control Circuit Low Voltage Test Status
 - MIL Control Circuit Open Test Status
 - MIL Control Circuit High Voltage Test StatusEach parameter should display OK or Not Run.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions you observed from the Freeze Frame/Failure Records data.

[Circuit/System Testing](#)

1. Vehicle in Service Mode, verify that the P16 instrument cluster warning indicators are illuminated.
If the P16 instrument cluster indicators are not illuminated, test the ignition circuit terminal 31 for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the P16 instrument cluster.
2. Vehicle OFF, disconnect the harness connector X1 at the K20 engine control module.
3. Vehicle in Service Mode, observe the MIL. The MIL should not illuminate.
If the MIL is illuminated, test the control circuit terminal 52 X1 for a short to ground. If the circuit tests normal, replace the P16 instrument cluster.
4. Connect a 3 A fused jumper wire between the control circuit terminal 52 X1 and ground. The MIL should illuminate.
If the MIL does not illuminate, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.

<ul style="list-style-type: none"> • Component OFF - OK for Open/Low Voltage Test Status and Not Run for High Voltage Test Status • Component ON - Not Run for Open/Low Voltage Test Status and OK for High Voltage Test Status 			
Battery Voltage	-	Not Run	-
Engine Controls Ignition Relay Control Circuit	Not Run	Not Run	Malfunction

Circuit/System Description

There are 2 ignition voltage circuits supplied to the engine control module (ECM). One is supplied by the powertrain relay, or EC ignition relay, and the other is supplied by the

Run/Crank relay. The ECM monitors and compares the ignition voltage supplied by the 2 relays.

Conditions for Running the DTC

P0685

- The vehicle is ON.
- The ignition voltage is greater than 11 V.
- The DTC runs continuously when the above conditions are met.

P0689

- DTC P0685 is not set.
- The powertrain relay is commanded on.
- The ignition voltage is greater than 11 V.
- The DTC runs continuously when the above conditions are met.

P0690

- DTC P0685 is not set.
- The powertrain relay is commanded on.
- The DTC runs continuously when the above conditions are met.

P1682

- The powertrain relay is commanded on.
- The ignition voltage is greater than 5.5 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0685

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 2 s.

P0689

The ECM detects the engine controls ignition relay feedback circuit is less than 5 V when the powertrain relay is commanded ON.

P0690

- The ECM detects the engine controls ignition relay feedback circuit is greater than 2 V when the powertrain relay is commanded OFF.
- The condition is present for greater than 4 s.

P1682

The ECM detects that the voltage level difference is greater than 3 V between the 2 ignition voltage circuits for less than 1 s.

Action Taken When the DTC Sets

P0685, P0690

- DTCs P0685 and P0690 are Type B DTCs.
- A message centre displays Propulsion Power is Reduced.
- Under certain conditions, the ECM commands the engine OFF.

P0689

- DTC P0689 is a Type C DTC.
- A message centre displays Propulsion Power is Reduced.
- Under certain conditions, the ECM commands the engine OFF.

P1682

- DTC P1682 is a Type A DTC.
- A message centre displays Propulsion Power is Reduced.
- Under certain conditions, the ECM commands the engine OFF.

Conditions for Clearing the DTC

- DTCs P0685 and P0690 are Type B DTCs.
- DTC P0689 is a Type C DTC.
- DTC P1682 is a Type A DTC.

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Note:

- A short to voltage on a power feed circuit for another component may cause DTC P0690 to set. If any other DTC is set, diagnose that DTC first.
- If you were sent here from Engine Cranks But Does Not Run, proceed to Circuit/System Testing.

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify no other DTCs are set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Command the Engine Controls Ignition Relay ON and OFF with a scan tool while observing the following parameters:

- Engine Controls Ignition Relay Control Circuit Low Voltage Test Status
- Engine Controls Ignition Relay Control Circuit Open Test Status
- Engine Controls Ignition Relay Control Circuit High Voltage Test Status

Each parameter should display OK or Not Run in each commanded state.

3. Observe the scan tool DTC information. DTC P0685, P0689, P0690, or P1682 should not set.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

Note: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing unless sent here from Engine Cranks But Does Not Run.

1. Vehicle OFF, disconnect the KR75 powertrain relay.
2. Verify a test lamp illuminates between ground and the relay circuit terminals listed below:
 - Terminal 86
 - Terminal 30

If the test lamp does not illuminate, test the relay battery voltage circuit for an open/high resistance.

Note: High resistance in the circuit/underhood fuse block for either the powertrain relay or the run/crank relay can cause DTC P1682 to set.

3. Vehicle in Service Mode, verify that a test lamp does not illuminate between the ignition voltage circuit terminal 87 and ground.

If the test lamp illuminates, test the ignition voltage circuit for a short to voltage.
4. Connect a 20 A fused jumper wire between the relay switch B+ circuit terminal 30 and the relay switch ignition voltage circuit terminal 87.
5. Observe the scan tool Engine Controls Ignition Relay Feedback Signal parameter. The ECM should communicate, and the parameter should display B+.

If not the specified value, or the ECM does not communicate, test the ignition voltage circuit between the powertrain relay and the ECM for a short to ground or for an open circuit/high resistance. If the circuit/connections test normal, replace the K20 ECM.
6. Vehicle OFF, connect a DMM set to the diode setting between control circuit terminal 85 and ground. Verify the DMM displays OL.

If not the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.
7. Vehicle in Service Mode, verify the DMM displays less than 1 V.

If not within the specified range, test the control circuit terminal 85 for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
8. If all circuits test normal, replace the KR75 powertrain relay.

Component Testing

1. Vehicle OFF, disconnect the KR75 powertrain relay.
2. Test for 70-110 Ω between terminals 85 and 86 of the KR75 powertrain relay.

If not within the specified range, replace the KR75 powertrain relay.
3. Test for infinite resistance between the following terminals of the KR75 powertrain relay:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87

If not the specified value, replace the KR75 powertrain relay.

4. Install a 20 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.

If greater than the specified range, replace the KR75 powertrain relay.

DTC Descriptor

DTC P069E: Fuel Pump Control Module Requested MIL Illumination

Circuit/System Description

The fuel pump control module uses the serial data network to signal the engine control module (ECM) that the fuel pump control module is requesting malfunction indicator lamp (MIL) illumination. A DTC is set in the fuel pump control module, and the request for MIL illumination is sent when the fuel pump control module determines that a failure that affects emissions has occurred in the fuel pump control system. When the ECM receives the message from the fuel pump control module, DTC P069E will set in the ECM.

Conditions for Running the DTC

- Vehicle ON for greater than 3 s.
- DTC P069E runs continuously when the above condition is met.

Conditions for Setting the DTC

The fuel pump control module requests the ECM to illuminate the MIL.

Action Taken When the DTC Sets

DTC P069E is a Type A DTC.

Conditions for Clearing the DTC

DTC P069E is a Type A DTC.

[DTC Descriptor](#)

DTC P0700: Transmission Control Module Requested MIL Illumination

[Circuit/System Description](#)

This DTC indicates that an emission related transmission DTC has set in the transmission control module (TCM). The engine control module (ECM) receives the TCM information over the serial data circuit. The ECM illuminates the malfunction indicator lamp (MIL) when the TCM sends a message over the serial data circuit requesting MIL illumination. The DTC information for the ECM will only display DTC P0700, but the freeze frame/failure records data may display the transmission DTC that set.

[Conditions for Running the DTC](#)

- Vehicle ON for greater than 3 s.
- DTC P0700 runs continuously when the above condition is met.

[Conditions for Setting the DTC](#)

The TCM has set an emissions related DTC.

[MAF Sensor](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Vehicle ON, normal operating temperature and engine speed between 1,375 and 1,425 RPM Parameter Normal Range: 1,800-2,400 Hz			
Ignition Voltage	0 Hz	0 Hz	-
MAF Sensor Signal	0 Hz	0 Hz	0 Hz
MAF Control	-	0 Hz	-

[Circuit/System Description](#)

The mass air flow (MAF) sensor is integrated with the inlet air temperature (IAT) sensor. The MAF sensor is an air flow meter that measures the amount of air entering the engine. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. The air flow and engine speed are very dependent on the battery pack state of charge. A small quantity of air entering the engine indicates a low load condition. A large quantity of air entering the engine indicates a high load condition.

The ECM applies 5 volts to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a frequency based on the inlet air flow through the sensor bore.

The MAF sensor is supplied power through the powertrain relay and a fuse. The ECM enables the MAF sensor only during engine run mode by grounding the MAF control circuit via a solid state device called a driver. The ECM monitors the status of the driver. If the ECM detects an incorrect voltage for the commanded state of the driver, a MAF sensor supply voltage control circuit DTC is set.

Conditions for Running the DTC

- DTCs P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0335, and P0336 are not set.
- The engine speed is between 500 and 8,000 RPM.
- The IAT Sensor is between -20 and +125°C (-4 and +257°F).
- The ECT Sensor is between -7 and +125°C (+19 and +257°F).
- This DTC runs continuously within the enabling conditions.

Action Taken When the DTC Sets

DTC P1101 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P1101 is a Type B DTC.

Diagnostic Aids

- A steady or intermittent high resistance of 15 Ω or greater on the ignition voltage circuit will cause the MAF sensor signal to be increased by as much as 60 g/s. To pinpoint this condition perform a voltage drop test on the circuit.
- Any type of contamination on the MAF sensor heating elements will degrade the proper operation of the sensor. Certain types of contaminants act as a heat insulator, which will impair the response of the sensor to airflow changes. Water or snow can create the opposite effect, and cause the signal to increase rapidly.
- Depending on the current ambient temperature, and the vehicle operating conditions, a MAF sensor signal circuit that is shorted to the IAT signal circuit will increase or decrease the MAF sensor signal that is interpreted by the ECM. Additionally it may cause a rapid fluctuation in the IAT Sensor parameter.
- Certain aftermarket air filters may cause this DTC to set.
- Certain aftermarket air induction systems may cause this DTC to set.
- Modifications to the air induction system may cause this DTC to set.

Special Tools

J 38522 Variable Signal Generator.

For equivalent regional tools, refer to Special Tools : [Diagnostic Tools](#) .

[Circuit/System Verification](#)

Note: To ensure a proper engine load, this diagnostic should be performed when the Hybrid/EV Battery Pack Charge Remaining parameter is at least 40%.

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify that DTC P0697 is not set.
If DTC P0697 is set, refer to [DTC P0641, P0651, P0697, or P06A3 : ECM](#) , for further diagnosis.
2. Observe the scan tool MAP Sensor pressure parameter and compare to the [Altitude Versus Barometric Pressure](#) table. The MAP sensor reading should be within the specified range.
If not within the specified range, refer to [DTC P0106](#) , for further diagnosis.
3. Vehicle ON, engine speed between 1,375 and 1,425 RPM, normal operating temperature. Verify the scan tool MAF Sensor parameter is between 1,800 and 2,400 Hz.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

[Circuit/System Testing](#)

1. Verify the following conditions do not exist:
 - A dirty, restricted, or deteriorating air filter element
 - A leaking, loose, or cracked PCV pipe or seal
 - A restricted or collapsed air inlet duct
 - A misaligned, leaking, or damaged air inlet duct
 - Any objects blocking the air inlet probe of the B75B mass air flow/inlet air temperature sensor
 - Any contamination or debris on the sensing elements in the probe of the B75B mass air flow/inlet air temperature sensor
 - A cracked, damaged, or leaking B75B mass air flow/inlet air temperature sensor housing
 - Any water intrusion in the induction system
 - Any snow or ice build-up at the air cleaner or B75B mass air flow/inlet air temperature sensor in cold climates
 - Any vacuum leak
 - A B74 MAP sensor seal that is leaking, missing, or damaged
 - Q38 Throttle body for dirt, debris, and coking. Refer to [Throttle Body Inspection and Cleaning](#) .
 - A damaged Q38 throttle body blade or shaft
 - Missing, restricted, or leaking exhaust components. Refer to [Symptoms - Engine Exhaust](#) .

If you find any of the above conditions, repair as necessary.
2. Vehicle OFF, disconnect the harness connector at the B75B mass air flow/inlet air temperature sensor.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the signal circuit terminal 5 and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
4. Verify that a test lamp illuminates between the ignition voltage circuit terminal 4 and ground.
If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test or replace the components on the ignition voltage circuit.
5. Connect the test lamp between the MAF control circuit terminal 2 and the ignition voltage circuit terminal 4.
6. Vehicle in Service Mode, command the MAF Sensor Supply Voltage Low Side Driver ON and OFF with a scan tool. The test lamp should turn ON and OFF when

changing between the commanded states.

If the test lamp is always ON, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 ECM.

If the test lamp is always OFF, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

7. Vehicle OFF, connect the red lead of the J 38522 to the signal circuit terminal 5 at the harness connector. Connect the battery voltage supply to B+, and the black lead to ground.
8. Set the J 38522 to the following specifications.
 - Signal switch to 5 V
 - Frequency switch to 5 KHz
 - Duty Cycle switch to Normal

Note: The engine may run rough and stall.

9. Engine running, observe the scan tool MAF Sensor Hz parameter. The parameter should be between 4,950 and 5,025 Hz.
If not within the specified range, replace the K20 ECM.
10. If all circuits test normal, test or replace the B75B mass air flow/inlet air temperature sensor.

[Circuit/System Description](#)

The mass air flow (MAF) sensor is integrated with the inlet air temperature (IAT) sensor. The MAF sensor is an air flow meter that measures the amount of air entering the engine. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. The air flow and engine speed are very dependent on the battery pack state of charge. A small quantity of air entering the engine indicates a low load condition. A large quantity of air entering the engine indicates a high load condition.

The ECM applies 5 volts to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a frequency based on the inlet air flow through the sensor bore.

The MAF sensor is supplied power through the powertrain relay and a fuse. The ECM enables the MAF sensor only during engine run mode by grounding the MAF control

circuit via a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM monitors the status of the driver. If the ECM detects an incorrect voltage for the commanded state of the driver, a MAF sensor supply voltage low side driver control circuit DTC is set.

Conditions for Running the DTC

P121B

- Vehicle ON and the engine is not running.
- The DTC runs continuously when the above conditions are met for greater than 1 s.

P121C

- The engine is running.
- The DTC runs continuously when the above conditions are met for greater than 1 s.

Conditions for Setting the DTC

P121B

The ECM detects the commanded and actual states of the MAF control circuit do not match for greater than 4 s.

P121C

The ECM detects the commanded and actual states of the MAF control circuit do not match for greater than 4 s.

Action Taken When the DTC Sets

DTCs P121B and P121C are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P121B and P121C are Type B DTCs.

DTC P1255 or P064A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P064A: Fuel Pump Control Module Performance

DTC P1255: Fuel Pump Control Module Driver Over-temperature

[Circuit/System Description](#)

The engine control module (ECM) supplies voltage to the fuel pump control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the fuel pump control module supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel rail pressure.

[Conditions for Running the DTC](#)

The engine is running.

[Conditions for Setting the DTC](#)

The fuel pump control module detects an over-temperature fault.

[Action Taken When the DTC Sets](#)

DTCs P064A and P1255 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P064A and P1255 are Type A DTCs.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

DTC Descriptor

DTC P1400: Cold Start Emission Reduction Control System

Circuit/System Description

The catalyst must be warmed to efficiently reduce the emissions. The cold start strategy is to reduce the amount of time it takes to warm the catalyst. During a cold start, the engine spark timing is altered to allow the catalyst to warm quickly. This diagnostic monitors the following to build an exhaust energy model:

- Spark advance
- Engine airflow
- Engine coolant temperature
- Engine run time

The actual model is then compared to the expected exhaust energy model.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0114, P0116, P0117, P0118, P0121, P0122, P0123, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0335, P0336, P0351, P0352, P0353, P0354, P0641, P0651, P0697, P06A3, P2122, P2123, P2127, P2128, P2135, and P2138 are not set.
- The engine coolant temperature (ECT) sensor is greater than -10°C (14°F).
- The calculated 3-way catalyst temperature is less than 350°C (662°F).
- The engine control module (ECM) will exit the diagnostic if the calculated 3-way catalyst temperature is greater than 550°C (1022°F) when the engine run time is greater

than 30 s.

- The ECM will exit the diagnostic if the engine run time is greater than a calibrated value.
- This DTC runs within the first 15 s of start-up. This diagnostic runs once per trip when a cold start has been determined.

Conditions for Setting the DTC

The actual exhaust energy model does not match the expected exhaust energy model.

Action Taken When the DTC Sets

DTC P1400 is a Type A DTC.

Conditions for Clearing the DTC

DTC P1400 is a Type A DTC.

Reference Information

Description and Operation

[Hybrid Modes of Operation Description](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle OFF, allow the engine to cool to be within the temperatures listed in the Conditions for Running the DTC.
2. Engine running for at least 30 s, observe the scan tool DTC information. DTC P1400 should run and pass.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Verify that none of the conditions listed below exists with the air inlet system:
 - Damage, restriction, or modification
 - Dirty or deteriorating air filter element
 - Crankcase ventilation system for correct operation.
 - Water intrusion
 - Vacuum leak and other unmetered air downstream of the mass air flow (MAF) sensor
 - Intake manifold leak

If a condition is found, repair as necessary.

2. Verify that none of the conditions listed below exists with the exhaust system:
 - Water intrusion
 - Exhaust leak
 - Damaged, restricted, or modified exhaust system - Refer to [Symptoms - Engine Exhaust](#) .

If a condition is found, repair as necessary.

3. If all of the above conditions test normal, inspect for an engine mechanical condition that could alter the air flow into the combustion chamber. Refer to [Symptoms - Engine Mechanical](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P1458-P145A

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1458: Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor Performance

DTC P1459: Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor Circuit Low Voltage

DTC P145A: Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor Circuit High Voltage

[Circuit/System Description](#)

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of three main components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The EVAP leak detection pump pressure sensor performs a correlation to barometric pressure (BARO). After a short delay period, the EVAP leak detection pump pressure sensor, absolute, reading is compared to the BARO. Large deviations will increment the fail counter threshold and sets a P1458.

There are two different threshold calibrations used in the comparison to the BARO. A smaller threshold is used when there has been a recent BARO update and then a larger threshold value is used when there has not been a recent BARO update.

[Conditions for Running the DTC](#)

P1458

Condition 1:

- DTCs P043E, P043F, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P145A, P145C, P145D, P145E, P145F, P012B, P012C, P012D, P0222, P0223, P0443, P0449, P0451, P0452, P0453, P0458, P0459, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1458, P1459, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, U182D is not set.
- The barometric pressure (BARO) is between than 70-110 kPa (10-16 PSI).
- The fuel level is between 10-90%.
- The propulsion system is not active.
- The engine coolant temperature (ECT) is less than 40°C (104°F).
- The inlet air temperature (IAT) is between 4-45°C (39-113°F).
- The battery voltage is greater than 10 V.
- Vehicle speed is less than 1.6 km/h (1 MPH).
- No ignition key up during this test.
- No refuelling request button is pressed.
- A service bay test is not active.
- The device control exceeds 0.5 seconds
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Condition 2:

- DTCs P0068, P0071, P0072, P0073, P0101, P0102, P0103, P0106, P0107, P0108, P010C, P010D, P0111, P0112, P0113, P0114, P0121, P0122, P0123, P012B, P012C, P012D, P0222, P0223, P0442, P0443, P0449, P0452, P0453, P0455, P0458, P0459, P0498, P0499, P0502, P0503, P0606, P0722, P0723, P16F3, P1104, P1221, P1458, P1459, P145A, P145D, P145E, P2100, P2101, P2102, P2103, P2400, P2401, P2402, P2418, P2419, P2420, P2422, P2450 is not set.
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI).
- The outside air temperature (OAT) is between 4-35°C (39-102°F).
- The propulsion system is active and the engine is running.
- The system voltage is greater than 11 V.
- The purge is not enabled.
- A refueling request button is not pressed.
- The device control exceeds 0.5 seconds.
- The FTP sensor performance diagnostic P0451 is running.
- The EVAP system no purge flow diagnostic P0497 is running.

P1459 and P145A

Runs any time the ECM is awake and the propulsion system is active or not active.

Conditions for Setting the DTC

P1458

- When the propulsion system is not active - If the difference between the EVAP system leak detection pump pressure sensor, absolute, reading and the BARO value is 3 kPa (0.44 PSI) for 14 s.
- When the propulsion system is active, and after a stabilisation time of 10 s - When a recent BARO update has occurred within the last 0.1 km (0.06 mi), if the difference between the EVAP system leak detection pump pressure sensor, absolute, reading and the BARO value from the MAP sensor is 15 kPa (2.17 PSI).
- When a recent BARO update has not occurred within the last 0.1 km (0.06 mi) - If the difference between the EVAP system leak detection pump pressure sensor, absolute, reading and the BARO value from the MAP sensor is 20 kPa (2.9 PSI).

P1459

The ECM detects that the EVAP system leak detection pump pressure sensor signal is less than 0.7 V for greater than 8 s.

P145A

The ECM detects that the EVAP system leak detection pump pressure sensor signal is greater than 4.85 V for greater than 8 s.

Action Taken When the DTC Sets

DTCs P1458, P1459 and P145A are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1458, P1459 and P145A are Type B DTCs.

Diagnostic Aids

- A normal BARO reading of the vehicle's geographic location will help to determine if a BARO sensor is significantly off its reading.
- The diagnostic does not run when purge is enabled because it can influence the EVAP leak detection pump pressure sensor reading if there is any restriction in the fresh air plumbing.
- Test for a plugged 5 micron in-line vent filter between the EVAP system leak detection pump and the fuel fill neck.
- This diagnostic is disabled when P0451 or P0497 is currently running.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, compare the BARO reading against the EVAP leak detection pump sensor reading with a scan tool. Compare this to the Altitude vs. Barometric Pressure Table referenced here [Altitude Versus Barometric Pressure](#) .
A variance of more than 3 kPa (0.44 PSI) indicates a skewed BARO or EVAP leak detection pump sensor.
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q63 EVAP system leak detection pump assembly.

Note: Testing for steps 2-5 is performed on the ECM side of the harness connector.

2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the Q63 EVAP system leak detection pump pressure sensor low reference circuit terminal 8 and ground.

If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.

3. Vehicle in Service Mode, test for 4.8-5.2 V between the Q63 EVAP system leak detection pump 5 V reference circuit terminal 6 and ground.

If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.

4. Verify the scan tool EVAP leak detection pump pressure sensor parameter is less than 0.2 V.

If greater than the specified range, test the Q63 EVAP system leak detection pump signal circuit terminal 7 for a short to voltage. If the circuit tests normal, replace the K20 ECM.

5. Install a 3 A fused jumper wire between the Q63 EVAP system leak detection pump signal circuit terminal 7 and the 5 V reference circuit terminal 6. Verify the scan tool EVAP leak detection pump pressure sensor parameter is greater than 4.7 V.

If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.

Note: Note: Testing for this step is performed on the EVAP leak detection pump assembly side of the harness connector.

6. Remove the EVAP assembly and test, inspect, and repair the items listed below. If the items test normal, replace the Q63 EVAP system leak detection pump assembly.

- Poor connection at the X351 harness connector
- Open or shorted 5 V reference circuit
- Open or shorted sensor signal circuit
- Open low reference circuit

[DTC Descriptors](#)

DTC P145C: Evaporative Emission (EVAP) System Leak Detection Pump Stuck Off

DTC P145D: Evaporative Emission (EVAP) System Leak Detection Pump Stuck On

[Circuit/System Description](#)

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The EVAP leak detection vacuum pump stuck off test is performed by comparing an initial stabilised EVAP leak detection pump pressure sensor, absolute, reading to a second stabilised reading for a short period of time.

The EVAP leak detection vacuum pump stuck on test is performed after the switching valve transitions from vent to not venting, pump, position. If after the second EVAP leak detection pump pressure sensor reading, a difference between the two pressure readings indicates the EVAP leak detection vacuum pump is stuck on.

[Conditions for Running the DTC](#)

P145C and P145D

- DTCs P043E, P043F, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1458, P1459, P145A, P145C, P145D, P145E, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, U182D is not set.
- The propulsion system is not active
- The EVAP purge valve is closed
- The EVAP vent solenoid valve is closed
- The EVAP Leak Detection Pump switching valve is in the vent position
- The EVAP Leak Detection Pump vacuum pump is ON
- The odometer greater than 16 km (10 mi)
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI)
- The fuel level is between 10-90%
- The engine coolant temperature is less than 40°C (104°F)
- The inlet air temperature is between 4-45°C (39-113°F)
- The system voltage is greater than 10 V
- The vehicle speed is less than 1.6 km/h (1 MPH)
- No ignition key up during test
- The refuelling request button is not pressed
- A service bay test is not active
- The device control is not active
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours

Conditions for Setting the DTC

P145C

The EVAP leak detection pump is commanded ON during the first reference orifice vacuum measurement and the stabilized EVAP leak detection pump pressure sensor vacuum reading is less than 0.1 kPa (0.01 PSI) for greater than 6 min.

Or

The EVAP leak detection pump is commanded ON during the second reference orifice vacuum measurement and the stabilized EVAP leak detection pump pressure sensor vacuum reading is less than 0.1 kPa (0.01 PSI) for greater than 30 s.

P145D

The EVAP leak detection pump is commanded OFF for the first time and the EVAP leak detection pump switching valve has transitioned from vent to not venting, pump position. The difference between an initial EVAP leak detection pump pressure sensor reading and a second EVAP leak detection pump pressure sensor reading is greater

than 1 kPa (0.14 PSI) for greater than 8 s.

Or

The EVAP leak detection pump is commanded OFF for the second time and the EVAP leak detection pump pressure sensor vacuum reading is greater than 1.18 kPa (0.17 PSI) for greater than 14 s.

Action Taken When the DTC Sets

DTCs P145C and P145D are Type B DTCs.

Conditions for Clearing the DTC

DTCs P145C and P145D are Type B DTCs.

DTC Descriptors

DTC P145E: Evaporative Emission (EVAP) System Leak Detection Pump to Vent Solenoid Valve Leak Detected

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

This DTC sets when the ECM detects with a leak 0.51 mm (0.020 in) between the EVAP leak detection pump and the EVAP vent solenoid valve.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1459, P145A, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2537, P2610, U0073, U0074, U0140, U182D, P043E, P043F, P0451, P1458, P145C, P145D and P2450 are not set
- The EVAP purge valve is closed
- The EVAP vent solenoid valve transitions to closed
- The EVAP leak detection pump switching valve in not venting, pump position
- The EVAP leak detection pump vacuum pump is ON

- The odometer greater than 16 km (10 mi)
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI)
- The fuel level is between 10-90%
- The engine coolant temperature is less than 40°C (104°F)
- The inlet air temperature is between 4-45°C (39-113°F)
- The system voltage is greater than 10 V
- The vehicle speed is less than 1.6 km/h (1 MPH)
- No ignition key up during this test
- The refuelling request button is not pressed
- A service bay test is not active
- The device control is not active
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Conditions for Setting the DTC

The ECM detects, the vacuum reading is less than the reference vacuum for greater than 30 s.

Action Taken When the DTC Sets

DTC P145E is a Type B DTC.

Conditions for Clearing the DTC

DTC P145E is a Type B DTC.

Diagnostic Aids

- The EVAP system can be filled with smoke at the fresh air side of the vacuum pump using the adapters in the GE-41413-300 .
- Smoke seen coming out of the fresh air side of the EVAP leak detection pump assembly is not consider a failed part. This includes the electrical connection port as diagnostics will not detect a leak on the fresh air side of the system.
- To help locate intermittent leaks, use the J 41413-200 to introduce smoke into the EVAP system. Move all the EVAP components while observing for smoke with a high intensity white light.
- To improve the visibility of the smoke exiting the EVAP system, observe the suspected leak area from different angles with the GE-41413-SPT .
- If a small leak is difficult to find, it may be necessary to remove the EVAP components and test them one at a time using the adapters in the GE-41413-300 .
- Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Special Tools

- GE-41413-300 EVAP Cap And Plug Kit
- GE-41413-SPT High Intensity White Light
- J 41413-200 Evaporative Emissions System Tester (EEST)

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

Circuit/System Verification

1. Verify the following conditions do not exist in the EVAP system:
 - Disconnected, incorrectly routed, kinked, or damaged EVAP pipes, O rings and hoses.
 - A damaged EVAP vent solenoid valve.

If you find any of the above conditions, repair as necessary.

Note: Refer to the J 41413-200 operation manual for detailed instructions in [Evaporative Emission Control System Diagnosis](#)

2. Disconnect the fresh air tube at the quick connector on the Q63 evaporative emission system leak detection pump and using adapters in the GE-41413-300 , specifically GE 41413-323, connect the J 41413-200

Note: Ensure that the vehicle underbody temperature is similar to the ambient temperature and allow the surrounding air to stabilise before starting the diagnostic procedure. The system flow will be less with higher temperatures.

3. Use the flow meter on the J 41413-200 calibrated to 0.51 mm (0.020 in) determine if there is a leak in the evaporative emission system. Compare the flow meter's stable floating indicator position to the red flag. The floating indicator should be below the red flag.
If a leak is detected, use the J 41413-200 to apply smoke to the EVAP system until the leak is located following the [Evaporative Emission Control System Diagnosis](#)
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data

Circuit/System Testing

Note: Refer to the J 41413-200 operation manual for detailed instructions.

1. Disconnect the Q13 evaporative emission vent solenoid valve from the hose going to the EVAP leak detection pump and install *GE 41413-324* female EEST to fuel tank adapter and *GE 41413-310* green cap to plug the hose.
2. Using J 41413-200 connected to the fresh air side of the Q63 evaporative emission system leak detection pump test the hose between the Q13 evaporative emission vent solenoid valve and the Q63 evaporative emission system leak detection pump for a leak.
If a leak is detected repair the affected component.
3. If no leak is found test the Q13 evaporative emission vent solenoid valve for a leak.
4. Test for no air flow through the Q13 evaporative emission vent solenoid valve by applying vacuum to the pump side of the valve. It should hold 1-2 in. Hg (3-7 kPa) for 30 s.
If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.

- [Evaporative Emission Canister Vent Solenoid Valve Replacement](#)

DTC P1461

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P1461: Evaporative Emission (EVAP) System Pressure Incorrect During Fuel Fill Door Open Request

[Circuit/System Description](#)

The Hybrid Powertrain Control Module 2 (HPCM2) monitors the fuel tank pressure (FTP) during a fuel fill door open request. If the FTP pressure does not fall within a predetermined range within 30 seconds this DTC sets.

[Conditions for Running the DTC](#)

- The HPCM2 is active.
- The fuel fill door open switch is pressed.

[Conditions for Setting the DTC](#)

The Hybrid Powertrain Control Module 2 detects the FTP sensor reading does not fall within a predetermined value for greater than 30 s.

[Action Taken When the DTC Sets](#)

The DTC P1461 is a type A DTC.

[Conditions for Clearing the DTC](#)

The DTC P1461 is a type A DTC.

[Diagnostic Aids](#)

- A restriction in the EVAP canister or vent lines that might hold FTP pressure could affect this.
- This DTC will not prevent the fuel fill door from opening.
- A vent valve stuck closed could affect this.
- Ensure that the reference port on the FTP sensor is unobstructed.
- Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

DTC P1516, P2101, P2119, or P2176

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1516: Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance

DTC P2101: Throttle Actuator Position Performance

DTC P2119: Throttle Closed Position Performance

DTC P2176: Minimum Throttle Position Not Learned

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Motor Control 1	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176
Motor Control 2	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176	P1516, P2101, P2176

[Circuit/System Description](#)

The engine control module (ECM) controls the throttle valve by applying a varying voltage to the control circuits of the throttle actuator control (TAC) motor. The ECM monitors the duty cycle that is required to actuate the throttle valve. The ECM monitors the throttle position (TP) sensors 1 and 2 to determine the actual throttle valve position.

[Conditions for Running the DTC](#)

P1516

- The ignition is ON or the engine is operating.
- The run/crank voltage is greater than 6.4 V.
- The DTC runs continuously when the above conditions are met.

P2101

- DTC P1682 is not set.
- The run/crank voltage is greater than 6.4 V.
- The engine is running or the following conditions are met:
 - The engine is not running.
 - The ignition voltage is greater than 11 V.
 - The TAC system is not in the Battery Saver mode.
 - The ECM is commanding the throttle.
 - The ECM has learned the minimum throttle position.
- The DTC runs continuously when the above conditions are met.

P2119

- DTC P06A3 is not set.
- The powertrain relay voltage is greater than 5.5 V.
- The TP sensor 1 voltage is greater than 1.76 V.
- The TP sensor 2 voltage is greater than 1.7 V.
- The ECM is not commanding the throttle blade.
- The DTC runs when the ignition is turned to the OFF position, when the above conditions are met.

P2176

- The ignition is ON.
- The run/crank voltage is greater than 6.4 V.
- The ECM enable the minimum throttle learn procedure.
- DTC P2176 run continuously when the above conditions are met.

[Conditions for Setting the DTC](#)

P1516

The actual throttle position does not match the predicted throttle position for greater than 1 s.

P2101

The actual throttle position does not match the predicted throttle position for greater than 1 s.

P2119

The ECM detects that the throttle blade did not return to the default position when the TAC motor is de-energised for greater than 1 s.

P2176

The ECM detects that both throttle position (TP) sensors were greater than a predetermined voltage during the minimum throttle learn procedure for greater than 2 s.

Action Taken When the DTC Sets

- DTCs P1516, P2101, and P2176 are Type A DTCs.
- DTC P2119 is a Type C DTC.
- A message centre displays Propulsion Power is Reduced.
- Under certain conditions, the ECM commands the engine OFF.

Conditions for Clearing the DTC

- DTCs P1516, P2101, and P2176 are Type A DTCs.
- DTC P2119 is a Type C DTC.

Diagnostic Aids

- Inspect for a condition in which the throttle valve may have been held open. For example, ice may have formed in the throttle bore causing the throttle valve not to close.
- A high resistance condition on the throttle position and throttle actuator control circuits could cause a DTC to set.
- A low battery condition may cause a DTC to set.

[Circuit/System Verification](#)

Note: A low 12 V battery voltage or charging system condition may cause a DTC to set.

1. Vehicle in Service Mode.
2. Verify DTC P0121, P0122, P0123, P0222, P0223, P0562, P0563, or P2135 is not set.
If any of the DTCs are set
Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
If none of the DTCs are set
3. Verify the scan tool Throttle Body Idle Air Flow Compensation parameter is less than 90 %.
90 % or greater
Refer to [Throttle Body Inspection and Cleaning](#)
If less than 90 %
4. Clear the DTCs with a scan tool.
5. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.

6. Vehicle in Service Mode.
7. Verify the scan tool TAC Motor parameter displays Enabled.

If Disabled

Refer to Circuit/System Testing

If Enabled

8. Verify DTC P1516, P2101, P2119, or P2176 is not set.

If any of the DTCs are set

Refer to Circuit/System Testing

If none of the DTCs are set

Note: If there is a condition with the throttle body, the TAC Motor Command parameter will go to 99 % for a predetermined amount of time and then a DTC sets. Once a DTC is set, the TAC Motor Command parameter will go to 0 % and the TAC Motor parameter will display Disabled.

9. Verify the scan tool TAC Motor parameter displays Enabled while performing the Throttle Sweep Test with a scan tool.

If Disabled

Note: Before replacing the throttle body assembly, make sure the TAC motor control circuits are not shorted to B+.

Test or replace the Q38 throttle body assembly.

If Enabled

10. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

11. Verify a DTC does not set.

If any DTC sets

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

If no DTCs set

12. All OK

Circuit/System Testing

1. Vehicle OFF.

Warning: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

2. Verify the conditions listed below do not exist with the Q38 throttle body assembly:

- A throttle blade that is not in the rest position
- A throttle blade that is binding open or closed
- A throttle blade that is free to move open or closed without spring pressure

If a condition is found

Test or replace the Q38 throttle body assembly.

If a condition is not found

3. Vehicle OFF.

Note: Disconnecting the throttle body harness connector may cause additional DTCs to set.

4. Disconnect the harness connector at the Q38 throttle body assembly, vehicle in Service Mode.
5. Verify that a test lamp does not illuminate between each motor control circuit listed below and ground.
 - TAC Motor Control Closed circuit terminal A
 - TAC Motor Control Open circuit terminal B

If the test lamp illuminates

- 5.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
- 5.2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

If the test lamp is always OFF

6. Verify that a test lamp does not illuminate between each motor control circuit listed below and B+.
 - TAC Motor Control Closed circuit terminal A
 - TAC Motor Control Open circuit terminal B

If the test lamp illuminates

- 6.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 6.2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 engine control module.

If the test lamp is always OFF

7. Vehicle OFF, set the DMM to the 40 V scale, select the Min/Max Recording Mode, and set the Peak Min/Max response time to 1 ms.

Note:

- The DMM Min/Max Recording Mode and the response time of 1 ms must be reset after testing each circuit.
- The vehicle must be OFF and the ECM completely powered down before testing each circuit.

8. Verify the Max voltage is within 1 V of B+ while using DMM Min/Max Recording Mode function on each control circuit listed below with the vehicle in Service Mode.
 - TAC Motor Control Closed circuit terminal A
 - TAC Motor Control Open circuit terminal B

If not within 1 V of B+

- 8.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 8.2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K20 engine control module.

If within 1 V of B+

9. Test or replace the Q38 throttle body assembly.

Repair Instructions

- [Throttle Body Assembly Replacement](#)
- [Control Module References](#) for ECM replacement, programming and setup

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Vehicle in Service Mode.
6. Verify the scan tool TAC Motor parameter displays Enabled while performing the Throttle Sweep Test with a scan tool.

If Disabled

Test or replace the Q38 throttle body assembly.

If Enabled

7. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset.

If any DTC sets

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

If no DTC sets

8. All OK

DTC P15F9

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for a overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P15F9: Hybrid System Engine Speed Control Intervention Request Type Signal Message Counter Incorrect

[Circuit/System Description](#)

The hybrid powertrain control module is constantly sending serial data messages to the ECM regarding the operating state of the powertrain propulsion system. These messages are sent in a continuously repeating series of rolling counts with associated password protect samples and each count/sample is assigned a value. The ECM uses the values, during a propulsion system mode shift, to determine when and at what RPM to idle the internal combustion engine. When the ECM determines that too many of the counts/samples contain an error value, the ECM sets DTC P15F9.

[Conditions for Running the DTC](#)

- DTC U1817 is not set.
- The engine run time is greater than 0.5 s.
- No other CAN errors are present.
- DTC P15F9 runs continuously when the above conditions are met.

[Conditions for Setting the DTC](#)

The ECM detects that 10 of 16 counts/samples contain an error value.

[Action Taken When the DTC Sets](#)

DTC P15F9 is a Type B DTC

[Conditions for Clearing the DTC](#)

DTC P15F9 is a Type B DTC.

[Diagnostic Aids](#)

An intermittent fault in the CAN circuits will cause the ECM to set DTC P15F9.

DTC Descriptor

DTC P15FB: Brake Pedal Position Sensor Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module (EBCM) monitors the brake pedal position sensor in order to provide emission related brake pedal position information to the engine control module (ECM). The EBCM sends the information, via the serial data circuit, to the ECM in a continuously repeating series of 16 rolling counts, with each count assigned a value. When the ECM determines that too many of the counts have an incorrect value, the ECM sets DTC P15FB.

Conditions for Running the DTC

- The vehicle is ON.
- DTC P15FB runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM detects that too many of the rolling counts have an incorrect value.

Action Taken When the DTC Sets

- DTC P15FB is a Type B DTC.
- Brake pedal position is defaulted to 0 for as long as the fault is active.

Conditions for Clearing the DTC

DTC P15FB is a Type B DTC.

DTC P162D

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P162D: Evaporative Emission (EVAP) System Alarm Clock Signal Not Received

Circuit/System Description

The wake up signal circuit is energised by the hybrid powertrain control module 2 to immediately activate other control modules connected to this circuit when the body control module (BCM) signals the powertrain control module 2 that serial data is required.

Depending on the option content, control modules that may receive the wake up signal are as follows:

- 14 V Power Module
- Battery Charger
- Battery Energy Control Module (BECM)
- Electronic Brake Control Module (EBCM)
- A/C Compressor
- Transmission Control Module (TCM)
- Engine Control Module (ECM)
- Power Inverter Module

Conditions for Running the DTC

- DTC's P0502, P0503, P0722, P0723, P2610, U182D, U0073, U0074 or P2537 is not set.
- The vehicle power mode master requires serial data communication to occur.

- The hybrid powertrain control module 2 attempts to wake up the control modules connected to its control module output wake up circuit.
- A service bay test is not active

Conditions for Setting the DTC

At Propulsion System Active, if the ECM did not receive feedback from the hybrid powertrain control module 2 that the alarm clock was set, and any one of the three wake-up timer events did not occur, then the DTC fails.

Action Taken When the DTC Sets

- DTC P162D is a type B DTC.
- The control modules are never signaled; therefore the specific subsystems will not function.
- The vehicle will not start while the circuit is shorted to ground.
- The MIL will illuminate after the 2nd ignition cycle, along with several DIC messages.

Conditions for Clearing the DTC

DTC P162D is a type B DTC.

Diagnostic Aids

Short to ground will also set multiple no communication codes for high speed GMLAN control modules.

[Circuit/System Testing](#)

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Note: Use the schematic to identify the following:

- The control modules that share the K114B hybrid powertrain control module 2 terminal 69 X2 accessory wake-up serial data 2 circuit
- The control module B+, ignition, ground, communication enable and serial data circuit terminals

1. Vehicle OFF, disconnect the X2 harness connectors at the K114B hybrid powertrain control module 2.
2. Vehicle OFF, all systems OFF, all keys at least 3 metres away from vehicle, all access doors closed. It may take up to 2 minutes for all vehicle systems to power down. Test for greater than 100 Ω , but less than infinite resistance, between the accessory wake-up serial data 2 circuit terminal 69 X2 and ground.
If less than the specified range, refer below to Testing the Accessory Wake-Up Serial Data 2 Circuits for a Short to Ground.
If infinite resistance, test the accessory wake-up serial data 2 circuit for an open/high resistance.
3. Verify that a test lamp illuminates between each B+ circuit terminal and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the K114B hybrid powertrain control module 2.
4. Verify that a test lamp illuminates between each ignition circuit terminal and ground.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the K114B hybrid powertrain control module 2.
5. If the circuits test normal, replace the K114B hybrid powertrain control module 2.

Testing the Accessory Wake-Up Serial Data 2 Circuits for a Short to Ground

1. Perform the High Voltage Disabling procedure before proceeding with this diagnostic. Refer to [High Voltage Disabling](#).
2. Reconnect the 12 V battery.
3. Vehicle OFF, disconnect the harness connector at an easily accessible control module that shares the K114B hybrid powertrain control module 2 terminal 69 X2 accessory wake-up serial data 2 circuit.
4. Test for less than 100 Ω between the K114B hybrid powertrain control module 2 accessory wake-up serial data 2 circuit terminal 69 X2 and ground.
If greater than the specified range, replace the control module that was just disconnected.
5. Repeat step 1 until all control modules on the K114B hybrid powertrain control module 2 accessory wake-up serial data 2 circuit terminal 69 X2 have been disconnected.
6. Repair the short to ground on the accessory wake-up serial data 2 circuit.

DTC P1E00: Hybrid Powertrain Control Module 2 Requested MIL Illumination

[Circuit/System Description](#)

This diagnostic trouble code (DTC) indicates that an emission related DTC has set in the hybrid powertrain control module 2. The hybrid powertrain control module 2 sends a message, via the serial data circuit, to the engine control module (ECM) requesting illumination of the malfunction indicator lamp (MIL). When the ECM receives the message, DTC P1E00 will set in the ECM.

[Conditions for Running the DTC](#)

- The vehicle is ON for greater than 3 s.
- DTC P1E00 runs continuously when the above condition is met.

[Conditions for Setting the DTC](#)

The hybrid powertrain control module 2 has set an emission related DTC.

[Action Taken When the DTC Sets](#)

DTC P1E00 is a Type A DTC.

[Conditions for Clearing the DTC](#)

APP Sensor 1 Signal	0.00 V	0.00 V	4-5 V
APP Sensor 1 Low Reference	-	4-5 V	-

APP Sensor 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating.			
Parameter Normal Range: APP Sensor 2 0.39-0.59 V			
APP Sensor 2 5 V Reference	0.00 V	0.00 V	1-3 V
APP Sensor 2 Signal	0.00 V	0.00 V	2-5 V
APP Sensor 2 Low Reference	-	4-5 V	-

Circuit/System Description

The accelerator pedal assembly contains 2 accelerator pedal position (APP) sensors. The APP sensors are mounted to the accelerator pedal assembly and are not serviceable. The APP sensors provide a signal voltage that changes relative to pedal position. The engine control module (ECM) supplies each APP sensor with a 5 V reference circuit, a low reference circuit, and a signal circuit. Both the APP sensors 1 and 2 signal percentages increase as the pedal is depressed, from approximately 0% at rest to above 95% when fully depressed.

The ECM provides the accelerator pedal position or driver torque request to the hybrid powertrain control module. The hybrid powertrain control module determines how the torque output will be distributed between the two electric motors and the engine.

Conditions for Running the DTC

P2122, P2123, P2127, P2128

- DTC P0697 is not set - P2127 or P2128.
- DTC P06A3 is not set - P2122 or P2123.
- The ignition is ON or the engine is running
- The run/crank voltage is greater than 6.4 V.

- The DTCs run continuously when the above conditions are met.

P2138

- DTCs P06A3, P0697, P2122, P2123, P2127, or P2128 are not set.
- The ignition is ON or the engine is running
- The run/crank voltage is greater than 6.4 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2122

The ECM detects that the APP sensor 1 voltage is less than 0.46 V for greater than 1 s.

P2123

The ECM detects that the APP sensor 1 voltage is greater than 4.7 V for greater than 1 s.

P2127

The ECM detects that the APP sensor 2 voltage is less than 0.32 V for greater than 1 s.

P2128

The ECM detects that APP sensor 2 voltage is greater than 2.6 V for greater than 0.5 s.

P2138

The voltage difference between APP sensor 1 and APP sensor 2 exceeds a predetermined value for greater than 1 s.

Action Taken When the DTC Sets

- DTCs P2122, P2123, P2127, and P2128, and P2138 are Type A DTCs.
- A message centre displays Propulsion Power is Reduced.

Conditions for Clearing the DTC

DTCs P2122, P2123, P2127, and P2128, and P2138 are Type A DTCs.

Diagnostic Aids

- A high resistance condition on the accelerator pedal sensor circuits could cause a DTC to set.
- Ensure that the in-line harness connector seals are installed correctly. Improper installation could result in water intrusion into the connector and cause a DTC to set.

2. Verify DTC P0697 or P06A3 is not set.
If any of the DTCs are set
Refer to for DTC P0641, P0651, P0697, or P06A3 : [ECM](#) further diagnosis.
If none of the DTCs are set
3. Verify the APP Sensor 1 Circuit Status and APP Sensor 2 Circuit Status displays OK.
If Malfunction is displayed
Refer to Circuit/System Testing
If OK is displayed
4. Verify the scan tool APP Sensor 1 and 2 Agree/Disagree parameter displays Agree while performing the tests listed below:
 - Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release pedal. Repeat the procedure several times.
 - Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times.**If Disagree**
Refer to Circuit/System Testing
If Agree
5. Verify that DTC P2122, P2123, P2127, P2128, or P2138 is not set.
If any of the DTCs are set
Refer to Circuit/System Testing
If none of the DTCs set
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify DTC P2122, P2123, P2127, P2128, or P2138 is not set.
If any DTC sets
Refer to Circuit/System Testing
If no DTCs set
8. All OK

[Circuit/System Testing](#)

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B107 accelerator pedal assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between each low reference circuit terminal listed below and ground.
 - Low reference circuit terminal 4 or A
 - Low reference circuit terminal 5 or D**If 5 Ω or greater**
 - 2.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
 - 2.2. Test for less than 2 Ω in the low reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K20 engine control module.

If less than 5 Ω

3. Vehicle in Service Mode.
4. Test for 4.8-5.2 V between each 5 V reference circuit terminal listed below and ground.
 - 5 V reference circuit terminal 1 or C
 - 5 V reference circuit terminal 2 or F

If less than 4.8 V

- 4.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
- 4.2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 4.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

If greater than 5.2 V

- 4.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
- 4.2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

If between 4.8-5.2 V

5. Verify each APP sensor voltage parameter is less than 0.2 V.
 - If 0.2 V or greater**
 - 5.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
 - 5.2. Test for less than 1 V between the signal circuit terminal listed below and ground.
 - APP sensor 1 signal circuit terminal 3 or E
 - APP sensor 2 signal circuit terminal 6 or B
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

If less than 0.2 V

6. Install a 3 A fused jumper wire between each signal circuit terminal listed below and the 5 V reference circuit terminal 1.
 - APP sensor 1 signal circuit terminal 3 or E
 - APP sensor 2 signal circuit terminal 6 or B
7. Verify the scan tool APP sensor voltage parameter is greater than 4.8 V.
 - If 4.8 V or less**
 - 7.1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.

- 7.2. Test for infinite resistance between the signal circuit terminal and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 7.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K20 engine control module.

If greater than 4.8 V

8. Test or replace the B107 accelerator pedal assembly.

Repair Instructions

DTC P219A

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P219A: Fuel Trim Cylinder Balance Bank 1

Circuit/System Description

The Fuel Trim Cylinder Balance diagnostic detects a rich or lean cylinder to cylinder air/fuel ratio imbalance. The diagnostic monitors the heated oxygen sensor (HO2S) signal frequency and amplitude characteristics by calculating an accumulated voltage over a predetermined sample period. An imbalance is indicated when multiple samples of the accumulated voltage are consistently higher than the desired value.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0201 - P0204, P0222, P0223, P0300, P0301 - P0304, P0442, P0443, P0455, P0458, P0461, P0462, P0463, P16F3, P2101, P2135 are not set.
- A scan tool device control is not active.
- The intrusive diagnostics are not active.
- The engine overspeed protection is not active.
- The fuel control is in air-fuel Closed Loop status for greater than 1 s.
- The system voltage is greater than 10.9 V.
- The engine coolant temperature is greater than -20°C (-4°F).
- The engine speed is between 1,350-4,800 RPM.
- The fuel level is greater than 10%.

Conditions for Setting the DTC

Multiple samples of the pre-catalyst HO2S accumulated voltage are consistently greater than the desired value.

[Action Taken When the DTC Sets](#)

DTC P219A is a Type A DTC.

[Conditions for Clearing the DTC](#)

DTC P219A is a Type A DTC.

[Diagnostic Aids](#)

- The air fuel imbalance diagnostic is very sensitive to heated oxygen sensor (HO2S) design. An aftermarket sensor or an incorrect part number may cause a DTC to set.
- Monitoring the misfire current counters, or misfire graph, may help to isolate the cylinder that is causing the condition.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Testing

1. Vehicle in Service Mode, observe the scan tool DTC information. Verify there are no other DTCs set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Engine running, observe the MAP sensor parameter. The reading should be between 14-110 kPa (2-16 PSI).
If not within the specified range, refer to [DTC P0106](#) .
3. Vehicle OFF, verify that none of the conditions listed below exists:
 - Inspect the air induction system for modified, damaged, leaking, or restricted components.
 - Inspect the crankcase ventilation system for improper operation.
 - Inspect the vacuum hoses for splits, kinks, and improper connections.
 - Inspect for vacuum leaks at the inlet manifold, the throttle body, and the fuel injector O-rings.
 - Test for a restricted, damaged, leaking, or modified exhaust system from the catalytic converter forward. Refer to [Symptoms - Engine Exhaust](#) .
 - Test the fuel injectors for improper operation. Refer to [Fuel Injector Solenoid Coil Test](#) .
 - Test for fuel contamination. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .
 - Test for excessive fuel in the crankcase due to leaking injectors.
 - Test the ignition system for improper operation. Refer to [Electronic Ignition System Diagnosis](#) .
4. If all the above conditions test normal, test the engine for any mechanical conditions which could alter the flow into the combustion chamber. Refer to [Symptoms - Engine Mechanical](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P2400-P2402

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P2400: Evaporative Emission (EVAP) System Leak Detection Pump Control Circuit

DTC P2401: Evaporative Emission (EVAP) System Leak Detection Pump Control Circuit Low Voltage

DTC P2402: Evaporative Emission (EVAP) System Leak Detection Pump Control Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
B+	P2400, P2419	P2400, P2418	-
Evaporative Emission System Leak Detection Pump Control	P2401	P2400	P2402

[Circuit/System Description](#)

The evaporative emission (EVAP) system uses an EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The ECM commands the EVAP leak detection pump control circuit through an internal switch called a driver. The ECM monitors the commanded and actual status of the

driver. If the ECM detects they do not match a DTC sets.

[Conditions for Running the DTC](#)

- The vehicle is ON.
- P2400, P2401 and P2402 run continuously when the above conditions are met.

[Conditions for Setting the DTC](#)

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 5 s.

[Action Taken When the DTC Sets](#)

DTCs P2400, P2401 and P2402 are Type B DTCs.

[Conditions for Clearing the DTC](#)

DTCs P2400, P2401 and P2402 are Type B DTCs.

[Diagnostic Aids](#)

- The EVAP leak detection pump is very quiet. You might feel it running rather than hear it.
- The devices have to be in their commanded state.
- Where multiple DTCs set look for a common root cause like battery feeds, grounds, splices, etc.

Circuit/System Verification

Note: This EVAP leak detection pump is very quiet. You might feel it running rather than hear it.

1. Vehicle in Service Mode, observe the EVAP leak detection pump output control parameters with a scan tool.
 - EVAP Leak Detection Pump Output Circuit High Voltage Test Status
 - EVAP Leak Detection Pump Output Circuit Open Test Status
 - EVAP Leak Detection Pump Output Circuit Low Voltage Test StatusEach parameter should display OK or Not Run.
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q63 evaporative emission system leak detection pump.
2. Vehicle in Service Mode, verify that a test lamp illuminates between the battery circuit terminal 3 and ground.
If the test lamp does not illuminate, test the battery circuit for a short to ground or an open/high resistance. If the circuit tests normal and the battery circuit fuse is open, test all components connected to the battery circuit and replace as necessary.
3. Test for 2.5-3.5 V between the control circuit terminal 4 and ground.
If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the K20 ECM.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.

4. Command the EVAP leak detection pump ON and OFF with a scan tool. The DMM should transition from 2.5-3.5 V when commanded OFF, to less than 0.2 V when commanded ON.

If not the specified values, replace the K20 ECM.

5. If all circuits test normal, test or replace the Q63 evaporative emission system leak detection pump.

[DTC Descriptors](#)

DTC P2418: Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit

DTC P2419: Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit Low Voltage

DTC P2420: Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
B+	P2400, P2419	P2400, P2418	-
EVAP Leak Detection Pump Switching Valve Control	P2419	P2418	P2420

[Circuit/System Description](#)

The evaporative emission (EVAP) system uses an EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump pressure sensor
- EVAP leak detection pump switching valve

The engine control module (ECM) commands the EVAP leak detection pump switching valve to vent or not venting, pumping, position by a switch called a driver. The ECM

monitors the commanded state of the driver and the actual state of the control circuit. If they do not match it sets a DTC. The switching valve is located inside the EVAP leak detection pump and is non-serviceable.

[Conditions for Running the DTC](#)

P2418, P2419 and P2420 run continuously when the above conditions are met.

[Conditions for Setting the DTC](#)

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 5 s.

[Action Taken When the DTC Sets](#)

DTCs P2418, P2419 and P2420 are Type B DTCs.

[Conditions for Clearing the DTC](#)

DTCs P2418, P2419 and P2420 are Type B DTCs.

[Diagnostic Aids](#)

- Where multiple DTCs set look for a common root cause like battery feeds, grounds, splices, etc.
- Indeterminate state will display if the device is not in a commanded state. This is not to be considered a failure. Use the scan tool to exercise the device.

DTC Descriptors

DTC P2422: Evaporative Emission (EVAP) Vent Solenoid Valve Stuck Closed

Circuit/System Description

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. Battery voltage is supplied to the normally closed evaporative emission (EVAP) vent solenoid valve. The ECM commands the solenoid valve open (venting) or closed (not venting) by grounding the EVAP vent solenoid valve output circuit through an internal switch called a driver. The ECM monitors the EVAP leak detection pump pressure sensor, gauge, to determine if a EVAP system pressure (vacuum) is near or above the reference pressure (vacuum) after a calibrated period of time. The ECM uses this reference to determine if the valve is stuck and sets the DTC when the vacuum exceeds a calibrated threshold.

Conditions for Running the DTC

- DTCs P043E, P043, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P145C, P145D, P145E, P0222, P0223, P0449, P0451 P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1458, P1459, P145A, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, U182D is not set.
- The EVAP purge valve is closed
- The EVAP vent solenoid transitions from closed to open to closed
- The EVAP leak detection pump switching valve in not venting, pump position
- The EVAP leak detection pump is ON
- The odometer greater than 15.9 km (9.9 mi)
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI)

- The fuel level is between 10-90%
- The engine coolant temperature less than 40°C (104°F)
- The inlet air temperature is between -4 -45°C (25 -113°F)
- The system voltage greater than 10 V
- The vehicle speed less than 1.6 km/h (1 MPH)
- There is no key up during test
- The refuelling request button is not pressed
- The service bay test is not active
- The device control exceeds 0.5 s
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Conditions for Setting the DTC

Sufficient pressure or vacuum exist in the fuel tank system.

- The fuel tank pressure (FTP) sensor indicates a pressure greater than 0.697 kPa (0.1 PSI) or a vacuum less than -0.697 kPa (-0.1 PSI) and the vent solenoid is commanded OPEN.
- The change in the FTP sensor reading is less than 1 kPa (0.15 PSI) after 10 s.

Or

No pressure or vacuum exists in the fuel tank system

- The FTP sensor indicates a pressure less than 0.697 kPa (0.1 PSI) or a vacuum greater than -0.697 kPa (-0.1 PSI) and the vent solenoid is commanded OPEN
- The EVAP leak detection pump is commanded ON
- The 0.020" reference orifice vacuum measurement minus the EVAP leak detection pump sensor, gauge, vacuum reading is less than 0.3 kPa (0.04 PSI) after 5 s.

Action Taken When the DTC Sets

DTC P2422 is a Type B DTCs.

Conditions for Clearing the DTC

DTC P2422 is a Type B DTCs.

Diagnostic Aids

- A P0451 or P0497 can set with the Vehicle ON, the engine running and a stuck valve.

- A P0451 or P2422 can set with the Vehicle in Service Mode and a stuck valve.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Engine running, observe the DTC information with a scan tool. DTC P0449, P0498, or P0499 should not set.
2. Vehicle in Service Mode, command the EVAP vent solenoid valve ON and OFF with the scan tool. An audible click should be heard when the valve operates.
3. Vehicle in Service Mode, observe the EVAP vent solenoid valve output circuit parameters with a scan tool.
 - EVAP Vent Solenoid Valve Output Circuit High Voltage Test Status

- EVAP Vent Solenoid Valve Output Circuit Open Test Status
- EVAP Vent Solenoid Valve Output Circuit Low Voltage Test Status

Each parameter should display OK or Not Run.

4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the Q13 evaporative emission vent solenoid valve.
2. Test for 25.0-30.0 Ω between the control terminal 1 and the battery voltage terminal 2.
If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.
3. Test for no air flow through the Q13 evaporative emission vent solenoid valve by applying vacuum to the pump side of the valve. It should hold 1-2 in. Hg (3-7 kPa) for 30 s.
If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.
4. Reconnect the harness connector at the Q13 evaporative emission vent solenoid valve.
5. Energise the Q13 evaporative emission vent solenoid valve with a scan tool and apply vacuum to the pump side of the valve. It should not hold vacuum.
If not within the specified range, replace the Q13 evaporative emission vent solenoid valve.

DTC P2450

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P2450: Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Performance

[Circuit/System Description](#)

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

When the EVAP leak detection vacuum pump is ON, and the EVAP leak detection pump switching valve transitions from vent to not venting, pump, position, there should be an initial vacuum drop followed by a vacuum increase on a good system. The diagnostic looks for a difference relative to the reference vacuum, either an increase or decrease. No vacuum change indicates a problem with the EVAP leak detection pump switching valve and a P2450 is set. The switching valve is integral to the EVAP leak detection pump assembly and is non serviceable.

[Conditions for Running the DTC](#)

- DTCs P043E, P043F, P0451, P1458, P145C, P145D, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1459, P145A, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2537, P2610, U0073, U0074, U0140, U182D and P2422 are not set.
- The purge solenoid valve is closed
- The vent solenoid valve is closed

- The vehicle is OFF
- The refuelling request button pressed
- A service bay test is not active
- The EVAP leak detection pump switching valve transitions from vent to not venting, pump position
- The EVAP leak detection vacuum pump is ON
- The odometer greater than 16 km (10 mi)
- The barometric pressure (BARO) is between 70-110 kPa (10-16 PSI)
- The fuel level is between 10-90%
- The engine coolant temperature is less than 40°C (104°F)
- The inlet air temperature is between 4-45°C (39-113°F)
- The system voltage is greater than 10 V
- The vehicle speed less than 1.6 km/h (1 MPH)
- There are three possible time windows for this test to run. Up to that point, and through this time period, the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

[Conditions for Setting the DTC](#)

The EVAP leak detection pump is commanded ON, and the EVAP leak detection pump switching valve transitions from vent to not venting, pump, position. If all conditions are not met after 5 s, then the EVAP leak detection pump switching value is stuck and the P2450 sets.

[Action Taken When the DTC Sets](#)

DTC P2450 is a Type B DTC.

[Conditions for Clearing the DTC](#)

DTC P2450 is a Type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode, observe the EVAP leak detection pump switching valve command parameter with a scan tool.
The parameter should display Venting or Not Venting
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Component Testing

Note: Ensure that the vehicle underbody temperature is similar to the ambient temperature and allow the surrounding air to stabilise before starting the diagnostic procedure.

1. Vehicle in Service Mode, command the EVAP Test with the scan tool and observe the following parameters.
 - The switching valve command status should change from Venting to Not Venting.
 - The EVAP leak detection pump command should show On
 - The EVAP vent solenoid valve command should show On
2. Observe and note the EVAP leak detection pump pressure and Fuel Tank Pressure.
Both pressures should drop.
3. If status changes, but no pressure drop, remove the vent pipe and the fresh air pipe from the EVAP leak detection pump assembly.
Look into the pump openings, inspect and repair any of the conditions listed below:

- The EVAP leak detection pump to the vent solenoid tube and clamps for damage or restriction
 - Missing or damaged EVAP leak detection pump O-rings
 - The fresh air tube near the fuel fill pocket for a restriction
 - The fresh air tube for a restriction
4. If all components test normal, replace the Q63 EVAP leak detection pump assembly.

[DTC Descriptor](#)

DTC P2537: Accessory Wakeup Serial Data 2

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wakeup Serial Data 2	C0561, P0335, P0700, P0AC4, P1E00, P2537, U0100, U1818, U1861	C0561, P0335, P0700, P0AC4, P1E00, P2537, U0100, U1818, U1861	P0AC4, P1E00	-

[Circuit/System Description](#)

The hybrid powertrain control module 2 supplies 12 V to the Accessory Wakeup Serial Data 2 circuit as a wakeup signal to the control modules listed below. This occurs when the body control module (BCM) signals the engine control module (ECM) that serial data is required.

- G1 A/C Compressor
- K1 14 V Power Module
- K16 Battery Energy Control Module (BECM)
- K17 Electronic Brake Control Module (EBCM)
- K20 Engine Control Module
- T6 Power Inverter Module
- T12 Transmission Control Module (TCM)
- T18 Battery Charger Control Module

[Conditions for Running the DTC](#)

- The propulsion system is active for greater than 0.5 s.
- The DTC runs once per ignition cycle when the above condition is met.

[Conditions for Setting the DTC](#)

The ECM detects that the state of the accessory line is low when it should be high.

[Action Taken When the DTC Sets](#)

DTC P2537 is a type B DTC.

[Conditions for Clearing the DTC](#)

DTC P2537 is a type B DTC.

[Diagnostic Aids](#)

A short to ground or an open/high resistance on the Accessory Wakeup Serial Data 2 circuit may set multiple no communication codes for high speed GMLAN control modules.

DTC P2618 or P2619

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P2618: Crankshaft Position Signal Output Circuit Low Voltage

DTC P2619: Crankshaft Position Signal Output Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Crankshaft Position Sensor Output Circuit	P2618	P0AC4, P0335	C0242, C0561, P0335, P0606, P0700, P0AB9, P0AC4, P0AF8, P148A, P148C, P1E00, P2619, U0100, U0121, U1839, U186A, U1876, U1879	-

[Circuit/System Description](#)

The engine control module (ECM) outputs a signal through an output driver that replicates the crankshaft position signal. This output signal is used for the power inverter module. The ECM monitors the electrical integrity of the crankshaft position output signal to check for the signal being shorted to ground or shorted to power.

[Conditions for Running the DTC](#)

P2618

- The ignition voltage is greater than 11.0 V.
- The engine is not cranking.

- The crankshaft position output is commanded high.
- The DTC runs continuously when the above conditions are met.

P2619

- The ignition voltage is greater than 11.0 V.
- The engine is not cranking.
- The crankshaft position output is commanded low.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P2618 and P2619 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P2618 and P2619 are Type B DTCs.

[Circuit/System Testing](#)

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .

2. Connect the 12 V battery.
3. Vehicle OFF, disconnect the X2 harness connector at the T6 power inverter module.
4. Vehicle in Service Mode, test for 0.04 V between the signal circuit terminal X2-5 and ground.
 - If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
 - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for ECM or hybrid powertrain control module setup, and programming

DTC P2635 - Fuel Pump Control Module

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P2635: Fuel Pump Flow Performance

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0231	P023F	P0232	P023F, P2635
Low Reference	-	P023F	-	P023F, P2635

[Circuit/System Description](#)

The engine control module (ECM) supplies voltage to the fuel pump control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the fuel pump control module closes the ground switch of the fuel pump and also supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel rail pressure.

[Conditions for Running the DTC](#)

- DTC P018B, P018C, P018D, P0231, P0232, P023F, P064A, P1255 or P06A6 are not active.
- DTC P0641 has not failed this ignition cycle.
- Fuel pump control is enabled and the fuel pump control state is normal.
- The system voltage is greater than 11 V.
- The engine has been running for more than 30 seconds.

- Low fuel level warning not present.

[Conditions for Setting the DTC](#)

This DTC sets when the fuel pump control module detects a predetermined fuel pressure performance degradation between the desired fuel rail pressure and the current fuel rail pressure.

[Action Taken When the DTC Sets](#)

DTC P2635 is a Type B DTC.

[Conditions for Clearing the DTC](#)

DTC P2635 is a Type B DTC.

[Diagnostic Aids](#)

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

On vehicles equipped with a high pressure mechanical pump on Direct Fuel Injection engines, the vehicle may continue to run even though the pump in the fuel tank is not operating.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Testing

Note: Do not replace the fuel pump control module based on a history DTC P2635. The DTC P2635 may be stored but that does not indicate a failure of the fuel pump control module. Refer to [Strategy Based Diagnosis](#) for further history DTC diagnostics.

1. Verify that DTCs P018C, P018D, P0231, P0232, or P023F are not set.
If the DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle OFF, disconnect the harness connector at the G12 fuel pump.
3. Vehicle OFF, test for less than 5.0 Ω between the G12 fuel pump low reference circuit terminal 2 and ground.
If greater than the specified range, test the G12 fuel pump low reference circuit for a high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
4. Vehicle OFF, install a test lamp between the control circuit terminal 1 and the low reference circuit terminal 2.
5. Vehicle in Service Mode, command the fuel pump ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.
If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K27 fuel pump control module.
If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
6. Perform the [Fuel System Diagnosis](#) to verify proper fuel pressure.
If the fuel pressure is not normal, replace the G12 fuel pump
7. If all circuits test normal, replace the K27 fuel pump control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Fuel Tank Fuel Pump Module Replacement](#)

- [Control Module References](#) for fuel pump control module replacement, programming and setup

Symptoms - Engine Controls

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Symptoms Description](#)

Symptoms cover conditions that are not covered by DTCs. Certain conditions can cause multiple symptoms. These conditions are listed together under Symptoms Testing. Conditions that may only cause specific symptoms are listed separately under additional symptoms testing.

However, symptoms which affect the internal combustion engine (ICE) of a typical gas powered vehicle may not be noticeable on the Volt ICE. For the Volt ICE, symptoms such as, hesitation, sag, stumble, sluggishness, surging, and even engine stalling, are buffered by the Voltec propulsion system, which is designed to smooth out ICE irregularities. Even when the battery pack is depleted and the ICE is forced to run in order to sustain the charge, the battery pack should still have enough retained power to perform this buffering function. Refer to [Hybrid Modes of Operation Description](#) for more information.

Perform the symptoms testing before using the additional symptoms testing.

[Symptoms Definition](#)

Backfire: Fuel ignites in the inlet manifold or in the exhaust system, making a loud popping noise.

Cuts Out, Misfires: A steady pulsation or jerking that follows engine speed. The exhaust has a steady spitting sound.

Detonation/Spark Knock: A mild to severe ping which usually gets worse while under load. The engine makes sharp metallic knocks that change with throttle opening.

Dieseling, Run-On: The engine continues to run after the vehicle is turned OFF.

Engine Control Module (ECM) Commanded Reduced Engine Power: The ECM illuminates the Reduced Engine Power lamp and will limit engine power under potential engine damaging or emissions related conditions. A DTC may be not be set.

Fuel Odor: A noticeable smell of unburned fuel.

Hard Start: Engine does not start for a long time. The engine does eventually run, or may start but immediately stall.

Poor Fuel Economy: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, the fuel economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.

Poor Fuel Fill Quality: Difficulty when refuelling the vehicle.

Rough, Unstable Idle and/or Stalling: The engine runs unevenly. If severe, the engine or the vehicle may shake and the engine may stall.

Symptoms Verification

Before using the Symptom tables, perform the following inspections

- Verify the engine control module (ECM) and the malfunction indicator lamp (MIL) are operating correctly.
- Verify there are no DTCs stored.
- Verify the scan tool data is within the normal operating range.
- Verify there are no Bulletins available for the current symptom.
- Verify the vehicle tires are correctly inflated and meet original equipment specifications.
- Verify the Hybrid/EV Battery Pack state of charge. A low state of charge will force the engine to idle at a higher rpm. Refer to [Plug-In Charging System Description and Operation](#) .
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important, and can lead to correcting a condition without additional testing. It may also help to reveal the cause of an intermittent condition.

Identifying Intermittent Conditions

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movements of a component. Refer to the following for a list of issues that may cause an intermittent condition:

- Moisture and water intrusion in connectors, terminals, and components
- Incomplete connector mating
- Poor terminal contact
- High circuit or component resistance-High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Harness that is too short or tight
- Wire insulation that is chaffed or cut
- High or low ambient temperature
- High or low engine coolant temperature
- High underhood temperature

- Excessive heat in a component or in a circuit due to circuit resistance, poor terminal contact, or high electrical load
- High or low system voltage
- High vehicle load conditions
- Rough road surfaces
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge
- Incorrect installation of aftermarket, add on accessories

Visual/Physical Check

- Verify that the control module grounds are clean, tight, and correctly located.
- Verify that the vacuum hoses are not split or kinked, and are properly routed and connected.
- Verify that the air filter is clean and free from restrictions.
- Verify that there is no water intrusion in connectors, terminals, and components.
- Inspect the air inlet ducts for the following conditions:
 - Collapsed
 - Damaged areas
 - Looseness
 - Incorrect installation
 - Leaking
- Inspect for air leaks at the throttle body mounting area, the mass air flow (MAF) sensor and inlet manifold sealing surfaces.
- Inspect the wiring harness for the following conditions:
 - Poor connections
 - Pinches
 - Cuts
- Inspect for loose, damaged, unseated, or missing sensors/components.
- Inspect the terminals for corrosion and correct contact.

Symptoms Testing

Backfire, Cuts-Out, Misses, Detonation/Spark Knock, Dieseling/Run-On, ECM Commanded Reduced Engine Power, Fuel Odor, Hard Start, Poor Fuel Economy, Poor Fuel Fill Quality, or Rough, Unstable Idle and/or Stalling.

- Test or inspect the fuel system for the following conditions:
 - Incorrect operation, volume and pressure. Refer to [Fuel System Diagnosis](#) .
 - Leaking or improperly operating fuel injectors. Refer to [Fuel Injector Solenoid Coil Test](#) .
 - Improper fuel quality. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .

- Test or inspect the ignition system for the following conditions:

Note: Observe the scan tool Cylinder 1-4 Current Misfire Counters and the Ignition Coil Control Circuit Status parameters to help isolate an ignition system condition.

- Spark plugs for incorrect heat range, coolant or oil fouling, or an abnormal condition. Refer to [Spark Plug Inspection](#) and [Spark Plug Replacement](#) .
 - Secondary ignition system component susceptible to moisture. Wet down the secondary ignition system with water from a spray bottle. This may help locate damaged or deteriorated ignition system components. Look/listen for arcing or misfiring as the water is applied.
 - Weak spark. Use the J 26792 for testing and refer to [Electronic Ignition System Diagnosis](#) . For equivalent regional tools, refer to [Special Tools : Diagnostic Tools](#) .
- Test or inspect for the following conditions:
 - Items that can cause an engine to run lean or rich. Refer to [DTC P0171 or P0172](#) for additional information.
 - An intermittent crankshaft position sensor condition. Observe the scan tool Crankshaft Position Resync Counter parameter. The Resync Counter parameter should remain at 0 during all operating conditions, and when moving the related harnesses and connectors between the crankshaft position sensor and the ECM.
 - Knock sensor system excessive spark retard activity. Observe the scan tool Knock Retard parameter for activity greater than 0° and refer to [DTC P0324, P0326, or P06B6](#) and [DTC P0325, P0327, or P0328](#) for further diagnosis.
 - Electromagnetic interference on the reference circuit, which can cause a misfire condition. You can usually detect electromagnetic interference with a scan tool by monitoring the engine speed parameter. A sudden increase in the engine speed parameter with little change in actual engine speed may be an indication that electromagnetic interference is present. Inspect the high voltage components near the ignition control circuit if a condition exists.
 - Inspect the heated oxygen sensors (HO2S) for contamination from fuel, silicon, or the incorrect use of RTV sealant. The sensors may have a white powdery coating resulting in a high, but false, signal voltage, which gives a rich exhaust indication.
 - A leaking or restricted positive crankcase ventilation system.
 - Inspect the exhaust system components for the following:
 - Physical damage or possible internal malfunction.
 - Restricted 3-way catalyts.
For more information, refer to [Symptoms - Engine Exhaust](#)
 - Inspect the engine cooling system for the following conditions:
 - A thermostat with incorrect heat range. Refer to [Thermostat Diagnosis](#) .
 - Improperly operating engine cooling fans. Refer to [DTC P1485-P1487](#) .
 - Improperly operating engine coolant thermostat heater. Refer to [DTC P0597-P0599](#) .
 - Low engine coolant level. Refer to [Cooling System Draining and Filling](#) .
 - Inspect the engine for the following mechanical failures:
 - Excessive oil in the combustion chamber or leaking valve seals
 - Incorrect cylinder compression
 - Sticking or leaking valves

- Worn camshaft lobes
 - Incorrect valve timing
 - Broken valve springs
 - Excessive carbon buildup in the combustion chambers. Clean the chambers with top engine cleaner, if necessary. Follow the instructions on the can.
 - Incorrect engine parts
- If the above conditions do not address the symptom, refer to the additional symptoms tests.

Additional Symptoms Tests

Detonation/Spark Knock

- Test the engine for an overheating condition. Refer to [Engine Overheating](#) .
- Inspect for excessive carbon buildup in the combustion chambers. Clean the chambers with Top Engine Cleaner, if necessary. Follow the instructions on the can.

Engine Control Module (ECM) Commanded Reduced Engine Power

Review the scan tool Reduced Engine Power History parameter to determine the reason for the last reduced engine power event.

Fuel Odour

- Inspect for a Saturated EVAP canister. Refer to [Evaporative Emission Control System Description](#) .
- Inspect for a condition with the internal components of the fuel tank assembly. Refer to [Fuel System Description](#) .

Hard Start

- Test the engine coolant temperature (ECT) sensor. Compare the ECT sensor value to the inlet air temperature (IAT) sensor value on a cold engine. The ECT and IAT sensor values should be within approximately 3°C (5°F). If the ECT sensor is out of range with the IAT sensor, test the resistance of the ECT sensor. Refer to [Temperature Versus Resistance](#) for resistance specifications. Replace the ECT sensor if the resistance is not within specification. If the sensor is within the specification, test the ECT circuits for a high resistance.
- Test the fuel pump operation. The fuel pump should turn ON for 2 s when attempting to start the engine. Refer to [Fuel Pump Electrical Circuit Diagnosis](#) .
- Observe the Throttle Body Idle Airflow Compensation parameter with a scan tool. A value greater than 80 % may indicate an excessive accumulation of deposits in the throttle bore. Inspect the throttle body and bore and clean, if necessary. Refer to [Throttle Body Inspection and Cleaning](#) .

Poor Fuel Economy

- Inspect for heavy loads being carried or towed.
- Observe the Throttle Body Idle Airflow Compensation parameter with a scan tool. A value greater than 80 % may indicate an excessive accumulation of deposits in the

throttle bore. Inspect the throttle body and bore and clean, if necessary. Refer to [Throttle Body Inspection and Cleaning](#) .

Poor Fuel Fill Quality

- Inspect for restricted vent lines
- Inspect for high fuel temperature
- Inspect for a condition with the internal components of the fuel tank assembly

For more information, refer to the following:

- [Engine Controls Schematics](#)
- [Fuel System Description](#)
- [Evaporative Emission Control System Description](#)

Rough, Unstable Idle and/or Stalling

- Inspect the engine mounts. Refer to [Engine Mount Inspection](#) .
- Observe the Throttle Body Idle Airflow Compensation parameter with a scan tool. A value greater than 80 % may indicate an excessive accumulation of deposits in the throttle bore. Inspect the throttle body and bore and clean, if necessary. Refer to [Throttle Body Inspection and Cleaning](#) .

Poor Fuel Fill Quality

Condition	Causes
DEFINITION: During the fuelling process a continual, occasional or no fuel nozzle shut-off condition has occurred.	
Difficult to fill	<ul style="list-style-type: none"> • Fuel fill limiter vent valve stuck closed • Evaporative emission (EVAP) canister restricted • High fuel temperature • Fuel filler hose is kinked • Faulty dispensing nozzle
Over fill	<ul style="list-style-type: none"> • Fill limiter vent valve stuck open or leaking • Fuel inlet check valve stuck open
Pre-mature shut-off of the fuel dispensing nozzle occurs immediately after engaging dispensing nozzle, tank empty	<ul style="list-style-type: none"> • Restricted vapour lines or fuel fill pipe • High fuel temperature • Inlet check valve at tank stuck closed, fill pipe full of fuel • Fuel tank full, gauge not accurate
Pre-mature shut-off of the fuel dispensing nozzle, more than 1/8 of tank capacity dispensed	<ul style="list-style-type: none"> • Kinked, pinched or plugged lines in fuel tank vent system • EVAP canister restricted • Fuel limiting vent valve stuck closed or obstruction at top of fuel tank
Fuel Spitback	<ul style="list-style-type: none"> • Restricted EVAP canister • High fuel temperature

Malfunction Indicator Lamp (MIL) Diagnosis

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The malfunction indicator lamp (MIL) illuminates to inform the driver that an emission system fault has occurred and the engine control system requires service. Ignition voltage is supplied directly to the MIL and, when the emission system fault occurs, the engine control module (ECM) turns the MIL ON by grounding the MIL control circuit. Under normal operating conditions, the MIL should be ON only when the vehicle is ON and the engine is OFF.

[Diagnostic Aids](#)

If the condition is intermittent, move the related harnesses and connectors with the vehicle ON and the engine OFF, and with the engine running while monitoring the scan tool MIL control circuit status parameters. The MIL control circuit status parameters will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

Note: Any MIL requesting DTCs that may be set should be diagnosed first.

1. Engine running, command the MIL ON and OFF with a scan tool. The MIL should turn ON and OFF as commanded.
2. Command the MIL ON and OFF with a scan tool while observing the control circuit status parameters listed below:
 - MIL Control Circuit Low Voltage Test Status
 - MIL Control Circuit Open Test Status
 - MIL Control Circuit High Voltage Test StatusEach parameter should display OK or Not Run.
3. Vehicle in Service Mode, command the MIL ON and OFF with a scan tool while observing the control circuit status parameters listed below:
 - MIL Control Circuit Low Voltage Test Status
 - MIL Control Circuit Open Test Status
 - MIL Control Circuit High Voltage Test StatusEach parameter should display OK or Not Run.

[Circuit/System Testing](#)

1. Vehicle in Service Mode, verify that the P16 instrument cluster warning indicators are illuminated.
If the P16 instrument cluster indicators are not illuminated, test the ignition circuit terminal 31 for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, replace the P16 instrument cluster.
2. Vehicle OFF, disconnect the harness connector X1 at the K20 engine control module.
3. Vehicle in Service Mode, observe the MIL. The MIL should not illuminate.
If the MIL is illuminated, test the control circuit terminal 52 X1 for a short to ground. If the circuit tests normal, replace the P16 instrument cluster.

4. Connect a 3 A fused jumper wire between the control circuit terminal 52 X1 and ground. The MIL should illuminate.
If the MIL does not illuminate, test the control circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 engine control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Instrument Cluster Replacement](#)
- [Control Module References](#) for ECM replacement, setup, and programming

Engine Cranks But Does Not Run

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

The engine cranks but does not run is an organised approach to identify a condition which prevents the engine from starting. This diagnostic directs the technician to the appropriate system diagnosis.

Diagnostic Aids

- When the engine is started, it is cranked by the 300 V drive motor/generator, which can rotate the engine to operating speed (800 RPM) within just a few hundred milliseconds. However, it may be difficult to determine the running state of the engine. Observe the scan tool ICE Status parameter to determine the running state of the engine. The parameter will display one of the following values:
 - Engine Stalled
 - Invalid
 - OFF
 - Running
 - Silent Start
 - Stop
 - Start
- Some failure conditions can make the engine appear to start, run briefly, then stall, which results in the following two DIC messages being displayed:
 - Engine Not Available, Service Vehicle Soon
 - Propulsion Power Reduced
- Inspect the engine for good secure electrical grounds.
- Insufficient fuel can prevent the engine from starting. Thoroughly inspect the fuel delivery system for sufficient fuel volume to the fuel injectors. Inspect the fuel supply components for partial blockage or restrictions.

- Fuel injectors with partially blocked and restricted nozzles, or a malfunctioning solenoid, can prevent the engine from starting. Refer to [Fuel Injector Solenoid Coil Test](#) .
- There may be fuel spray at the fuel injectors and the indicated fuel pressure may be correct, yet there may not be enough fuel for combustion to take place. If the fuel injectors and the injector circuit are OK, and fuel spray is detected, the fuel injector ON time may be inadequate. If the engine control module (ECM) receives incorrect inputs from the various information sensors, the fuel delivered by the fuel injectors may be inadequate for the engine to start. Check all the engine data parameters with a scan tool and compare the values indicated with the expected values or the values from a known vehicle in good condition.
- Inspect the engine for good secure electrical grounds.
- Water or foreign material in the fuel can prevent the engine from starting. During freezing weather, the water can freeze inside the fuel system. After 30 min in a heated repair shop, the water may melt and allow the engine to start. The malfunction may not recur until parked overnight in freezing temperatures.
- Under extreme weather conditions, or over a period of time, the ignition system may become susceptible to moisture. This condition may become serious enough to prevent the engine from starting. Bring the vehicle into a dry, heated garage and allow it to dry out for several hours. If the engine then starts, inspect for an ignition system that is susceptible to moisture.

- J 34730-2C Injector Tester.

For equivalent regional tools, refer to Special Tools : [Diagnostic Tools](#) .

Circuit/System Verification

Note: This diagnostic assumes the following:

- The battery is completely charged. See [Battery Inspection/Test](#) .
- There is adequate fuel in the fuel tank.

1. Attempt to start the engine while observing the DTC information with a scan tool. Verify that DTC P0117, P0118, P018B, P018C, P018D, P0119, P0121, P0122, P0123, P0222, P0223, P0231, P0232, P023F, P025A, P0335, P0336, P0513, P0562, P0563, P0601, P0602, P0603, P0604, P0606, P062F, P0628, P0629, P0633, P0641, P064A, P0685, P0689, P0690, P06A6, P1255, P1516, P1631, P1682, P16F3, P2101, P2119, P2135, P2176, P2610 or P2635 are not set.

If any of the DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

2. Attempt to start the engine while observing the scan tool Engine Speed parameter with a scan tool. The scan tool should indicate an engine speed greater than 0 RPM.

If the engine speed is 0 RPM, refer to [DTC P0335 or P0336](#) .

3. Vehicle in Service Mode, command the fuel pump enable ON with a scan tool while observing the circuit status parameters listed below:

- Fuel Pump Enable Circuit High Voltage Test Status
- Fuel Pump Enable Circuit Open Test Status
- Fuel Pump Enable Circuit Low Voltage Test Status

Each parameter should display OK or Not Run.

If not the specified value, refer to [Fuel Pump Electrical Circuit Diagnosis](#) .

4. Vehicle OFF, install the CH-48027 . Refer to [Fuel Pressure Gauge Installation and Removal](#) .

Note:

- The fuel pump may need to be commanded ON a few times, in order to obtain the highest possible fuel pressure.
- Do NOT start the engine for this test.

5. Vehicle in Service Mode, command the fuel pump enable ON with a scan tool. The fuel pressure should be between 365-414 kPa (53-60 PSI).

If not within the specified range, refer to [Fuel System Diagnosis](#) .

6. Vehicle OFF, disconnect the harness connector at a Q17 Fuel Injector.

7. Connect the J 34730-2C to the fuel injector harness connector.

8. Vehicle ON, attempt to start the engine while observing the injector tester. The injector tester should flash or illuminate.

If the injector tester does not flash or illuminate, refer to [DTC P0201, P0202, P0203, or P0204](#) for further diagnosis.

Note: It may be necessary to secure the J 36012-A to the spark plug boots with electrical tape.

9. Install the J 36012-A to the spark plug boots.
10. Connect the J 26792 between the boot of a spark plug wire and ground.
11. Connect the remaining wires to the appropriate cylinders.

Note: An erratic or weak spark is considered a no spark condition.

12. Attempt to start the engine while observing the spark tester. The spark tester should spark.

If there is no spark, refer to [Electronic Ignition System Diagnosis](#) .

13. Verify the following conditions do not exist:

- Air inlet duct to the throttle body collapsed
- Air filter and air inlet system restricted/obstructed
- Spark plugs gas or coolant fouled
- Skewed manifold absolute pressure (MAP) sensor
- Skewed engine coolant temperature (ECT) sensor
- Restricted exhaust system. Refer to [Restricted Exhaust](#) .
- Fuel contamination. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .
- Engine mechanical condition, for example, worn timing chain or low compression. Refer to [Symptoms - Engine Mechanical](#) .

If you find any of the above conditions, repair as necessary.

Repair Verification

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Ignition Coil Replacement](#)
- [Spark Plug Replacement](#)

Fuel System Diagnosis

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The engine control module (ECM) supplies voltage to the fuel pump control module when power up is commanded. The voltage from the ECM to the fuel pump control module remains active for two seconds, unless the engine is in Crank or Run. While this voltage is being received, the fuel pump control module closes the ground switch of the fuel pump and also supplies a varying voltage to the fuel tank fuel pump module in order to maintain the desired fuel line pressure.

The fuel system is an electronic returnless on-demand design. A returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

The fuel tank stores the fuel supply. An electric turbine style fuel pump attaches to the fuel tank fuel pump module inside the fuel tank. The fuel pump supplies high pressure fuel through the fuel feed pipe to the fuel injection system. The fuel pump also supplies fuel to a venturi pump located on the bottom of the fuel tank fuel pump module. The function of the venturi pump is to fill the fuel tank fuel pump module reservoir. The fuel tank fuel pump module contains a reverse flow check valve. The check valve maintains fuel pressure in the fuel feed pipe and the fuel rail in order to prevent long cranking times.

- *CH 48027* Digital Pressure Gauge
- *EN 37287* Fuel Line Shut-Off Adapters

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Circuit/System Verification](#)

Note:

- Inspect the fuel system for damage or external leaks before proceeding.
- Verify that adequate fuel is in the fuel tank before proceeding.
- The scan tool Fuel Pump Enable may need to be commanded ON a few times in order to obtain the highest possible fuel pressure.
- Before proceeding with this test review the User Manual CH 48027-5 for Safety Information and Instructions.

1. Vehicle in Service Mode, observe the DTC information with a scan tool. DTC P018B, P018C, P018D, P0231, P0232, P023F, P025A, P0562, P0563, P0601-P0604, P0606, P062F, P0641, P064A, P06A6, P1255, P2534, P2635, U0073, U0100 or U0140 should not be set.

If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

2. Vehicle OFF, all accessories OFF, install a *CH 48027* Gauge . Refer to [Fuel Pressure Gauge Installation and Removal](#)

Note: DO NOT perform the Fuel System Diagnosis if the engine coolant temperature is above 60°C (150°F). High fuel pressure readings may result due to hot soak fuel boiling. With the engine OFF, the fuel pressure may increase beyond the pressure relief regulator valve's setting point of 690 kPa (100 psi) ± 5 percent.

3. Vehicle in Service Mode, command the Fuel Pump Enable ON with a scan tool.

4. Verify the fuel pressure is between 379-427 kPa (55-62 psi) with the fuel pump operating.

5. Engine running at normal operating temperature, the Fuel Pump Control Module Fuel Pressure Sensor parameter should read between 296-310 kPa (43-45 psi).

[Circuit/System Testing](#)

Note:

- The scan tool Fuel Pump Enable may need to be commanded ON a few times in order to obtain the highest possible fuel pressure.
- DO NOT start the engine.

1. Vehicle in Service Mode, command the Fuel Pump Enable ON with a scan tool.
2. Observe the fuel pressure gauge while the fuel pump is operating. Verify the fuel pressure is between 379-427 kPa (55-62 psi).
 - If the fuel pressure is greater than the specified range, replace the fuel tank fuel pump module.
 - If the fuel pressure is less than the specified range, test, inspect, and repair the items listed below. If all items test normal, replace the fuel tank fuel pump module.
 - Restricted fuel feed pipe
 - Inspect the harness connectors and the ground circuits of the fuel pump for poor connections.
3. Verify that the fuel pressure does not decrease more than 34 kPa (5 psi) in 1 minute.
 - If the fuel pressure decreases more than the specified value, perform the following procedure:
 - 3.1. Vehicle OFF, relieve the fuel pressure.
 - 3.2. Install the *EN 37287* Adapter between the fuel feed pipe and the fuel rail.
 - 3.3. Open the valve on the *EN 37287* Adapter .
 - 3.4. Vehicle in Service Mode, command the Fuel Pump Enable ON with a scan tool and bleed the air from the *CH 48027* Gauge .
 - 3.5. Command the Fuel Pump Enable ON and then OFF with a scan tool.
 - 3.6. Close the valve on the *EN 37287* Adapter .
 - 3.7. Monitor the fuel pressure for 1 minute.
 - If the fuel pressure decreases more than 34 kPa (5 psi) within the specified time, locate and replace the leaking fuel injector(s).
 - If the fuel pressure does not decrease more than 34 kPa (5 psi) within the specified time, replace the fuel tank fuel pump module.
4. Relieve the fuel pressure to 69 kPa (10 psi).
5. Verify that the fuel pressure does not decrease more than 14 kPa (2 psi) in 5 minutes.
 - If the fuel pressure decreases more than the specified value, replace the fuel tank fuel pump module.
6. Operate the vehicle within the conditions of the customer's concern while monitoring the fuel pressure with the *CH 48027* Gauge . The fuel pressure should not drop off during acceleration, cruise or hard cornering.
 - If the fuel pressure drops off, test, inspect, and repair the items listed below. If all items test normal, replace the fuel tank fuel pump module.
 - Restricted fuel feed pipe
 - Inspect the harness connectors and the ground circuits of the fuel pump for poor connections
7. If the fuel system tests normal, refer to [Symptoms - Engine Controls](#) , [Fuel Injector Solenoid Coil Test](#) , and [Fuel Injector Balance Test](#) .

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Pump High Signal	P0231	P023F	P0232	P023F, P2635
Fuel Pump Low Signal	-	P023F	-	P023F, P2635

[Circuit/System Description](#)

The engine control module (ECM) supplies voltage to the fuel pump control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump control module remains active for two seconds, unless the engine is in crank or run. While this voltage is being received, the fuel pump control module closes the ground switch of the fuel pump and also supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel rail pressure.

Circuit/System Verification

Vehicle in Service Mode, command the fuel pump ON and OFF using the scan tool ECM output control. The fuel pump should turn on and off.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G12 fuel pump.
2. Connect a test lamp between the control circuit terminal 1 and ground.
3. Vehicle in Service Mode, command the G12 fuel pump ON and OFF using a scan tool ECM fuel pump output control. The test lamp should turn ON and OFF, as commanded.
 - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the K27 fuel pump control module.
 - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
4. Vehicle OFF, connect a test lamp between the control circuit terminal 1 and the low reference circuit terminal 2.
5. Vehicle in Service Mode, command the G12 fuel pump ON using a scan tool. The test lamp should illuminate.
 - If the test lamp does not illuminate, test the low reference circuit terminal 1 for a short-circuit to voltage or an open/high resistance. If the circuit tests normal, replace the K27 fuel pump control module.
6. If all circuits test normal, replace the G12 fuel pump.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The engine control module (ECM) enables the appropriate fuel injector pulse for each cylinder. The ignition voltage is supplied directly to the fuel injectors. The ECM controls each fuel injector by grounding the control circuit via a solid state device called a driver. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. A fuel injector control circuit DTC may not set, but a misfire may be apparent. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

[Component Testing](#)

Verify the resistance of each Q17 fuel injector with one of the following methods:

- If the engine coolant temperature (ECT) sensor is between 10-32°C (50-90°F), the resistance of each fuel injector should be 11-14 Ω. If the injectors measure OK, perform the Fuel Injector Balance Test. Refer to [Fuel Injector Balance Test](#) .
If not within the specified range, replace the Q17 fuel injector.
- If the ECT sensor is not between 10-32°C (50-90°F), measure and record the resistance of each fuel injector. Subtract the lowest resistance value from the highest resistance value. The difference between the lowest value and the highest value should be equal to or less than 3 Ω. If the injectors measure OK, perform the Fuel Injector Balance Test. Refer to [Fuel Injector Balance Test](#) .
If not within the specified range, add all of the fuel injector resistance values to obtain a total resistance value. Divide the total resistance value by the number of fuel injectors to obtain an average resistance value. Subtract the lowest individual fuel injector resistance value from the average resistance value. Compute the difference between the highest individual fuel injector resistance value and the average resistance value. Replace the Q17 fuel injector that displays the greatest difference above or below the average.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Fuel Injector Replacement](#)

Fuel Injector Balance Test

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provide an overview of each diagnostic category.

[Circuit/System Description](#)

When performing the fuel injector balance test, the scan tool is first used to energise the fuel pump. The scan tool is then used to pulse each injector for a precise amount of time, allowing a measured amount of fuel to be injected. This causes a drop in the system fuel pressure that can be recorded and used to compare each injector.

[Diagnostic Aids](#)

- Monitoring the Cylinder 1-4 Current Misfire Counters may help to isolate the fuel injector that is causing the condition.
- Operating the vehicle over a wide temperature range may help isolate the fuel injector that is causing the condition.

Special Tools

CH 48027 Digital Pressure Gauge

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

Note:

- DO NOT perform this test if the engine coolant temperature (ECT) is above 94°C (201°F). Irregular fuel pressure readings may result due to hot soak fuel boiling.
- Verify that adequate fuel is in the fuel tank before proceeding with this diagnostic.
- Before proceeding with this test review the User Manual CH 48027-5 for Safety Information and Instructions.

Fuel Injector Balance Test with Scan Tool

1. Verify the correct fuel system pressure. Refer to [Fuel System Diagnosis](#) .
2. Vehicle in Service Mode, command the Fuel Pump Enable ON and then OFF three times with a scan tool. On the last command, as the fuel pressure begins to slowly degrade and stabilise, select a fuel pressure within 34 kPa (5 psi) of the maximum pump pressure. Record this fuel pressure. This is the starting pressure at which you will pulse each injector.
3. With a scan tool, select the Fuel Injector Balance function within the Control Functions menu.
4. Select an injector to be tested.
5. Energise the fuel injector by depressing the Pulse Injector button on the scan tool at the previously selected pressure.
6. After the injector stops pulsing, select Min from the Display Mode on the CH 48027 Gauge and record the Min pressure.

Note: New test results will not be recorded if the Min/Max results are not cleared after each injector is tested.

7. Clear the Min/Max results on the CH 48027 Gauge.
8. Select Normal from the Display Mode on the CH 48027 Gauge.
9. Press Continue on the scan tool to select the next injector.
10. Repeat steps 4 through 9 for each fuel injector.
11. Subtract the minimum pressure from the starting pressure for one fuel injector. The result is the pressure drop value.
12. Obtain a pressure drop value for each fuel injector.

13. Add all of the individual pressure drop values except for the injector suspected of being faulty. This is the total pressure drop.
14. Divide the total pressure drop by the number of fuel injectors that were added together. This is the average pressure drop. The difference between any individual pressure drop and the average pressure drop should not be more than 20 kPa (3 psi).
If the difference between any individual pressure drop and the average pressure drop is more than 20 kPa (3 psi), replace the fuel injector.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Fuel Injector Replacement](#)

Alcohol/Contaminants-in-Fuel Diagnosis

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#)
- Review [Strategy Based Diagnosis](#)
- [Diagnostic Procedure Instructions](#)

[Test Description](#)

Water contamination in the fuel system may cause an engine to stall, not to start, or misfire in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel injection system, and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust or deterioration.

Ethanol concentrations of greater than 10 percent can cause engine operating conditions and fuel system deterioration. Fuel with more than 10 percent ethanol may result in engine operating conditions such as a no start. Excessive concentrations of ethanol used in an engine not designed for it may cause fuel system corrosion, deterioration of rubber components, and fuel filter restriction.

[Reference Information](#)

Special Tools

CH 44175-A Fuel Composition Tester

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[System Verification](#)

The fuel sample should be drawn from the bottom of the tank so that any water present in the tank will be detected. The sample should be bright and clear.

If the sample appears cloudy, or contaminated with water, as indicated by a water layer at the bottom of the sample, perform the Particulate Contaminants in Fuel Testing Procedure.

If alcohol contamination is suspected, perform the Alcohol in Fuel Testing procedure.

[Alcohol in Fuel Testing with Special Tool](#)

1. Test the fuel composition using *CH 44175-A* Fuel Composition Tester and Instruction Manual.
2. If water appears in the fuel sample, clean the fuel system.
3. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample.
4. If the fuel sample contains more than 15 percent ethanol, add fresh, regular gasoline to the vehicle's fuel tank.
5. Test the fuel composition.
6. If testing shows the ethanol percentage is still more than 15 percent, replace the fuel in the vehicle.

[Alcohol in Fuel Testing without Special Tool](#)

1. Using a 100 ml (3.38 oz) specified cylinder with 1 ml (0.034 oz) graduation marks, fill the cylinder with fuel to the 90 ml (3.04 oz) mark.
2. Add 10 ml (0.34 oz) of water in order to bring the total fluid volume to 100 ml (3.38 oz) and install a stopper.
3. Shake the cylinder vigorously for 10-15 seconds.
4. Carefully loosen the stopper in order to release the pressure.
5. Re-install the stopper and shake the cylinder vigorously again for 10-15 seconds.
6. Put the cylinder on a level surface for approximately 5 minutes in order to allow adequate liquid separation. If alcohol is present in the fuel, the volume of the lower layer, which would now contain both alcohol and water, will be more than 10 ml (0.34 oz). For example, if the volume of the lower layer is increased to 15 ml (0.51 oz), this indicates at least 5 percent alcohol in the fuel. The actual amount of alcohol may be somewhat more because this procedure does not extract all of the alcohol from the fuel.

[Particulate Contaminants in Fuel Testing Procedure](#)

1. Using an approved fuel container, draw approximately 0.5 liter (0.53 qt) of fuel.
2. Place the container on a level surface for approximately 5 minutes in order to allow settling of the particulate contamination. Particulate contamination will show up in various shapes and colours. Sand will typically be identified by white or light brown crystals. Rubber will appear as black and irregular particles.
3. Observe the fuel sample. If any physical contaminants or water are present, clean the fuel system.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Fuel Tank Draining](#)

Evaporative Emission Control System Diagnosis

[Reference Information](#)

Special Tools

EN 41413-VLV EVAP Service Port Vent Fitting

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Operating Instructions for the Evaporative Emission System Tester](#)

Vehicle Setup

Note: A large difference between the vehicle temperature and shop temperature will seriously affect the accuracy of the tests. Always allow enough time, at least 15 m, for the vehicle temperature to adjust to the shop temperature.

Note: If the refuelling request button is pushed then the vent solenoid valve will remain open for 30 mins. The scan tool will be required to manually close the vent solenoid valve prior to testing and before the 30 min time expires. After 30 min the vent solenoid returns to it's natural closed state.

Note: If fuel level is 90% or greater it will take longer to fill the system with smoke because the fuel fill tube check valve will be closed and force any smoke to pass through the ORVR pipe and orifice.

1. Vehicle in Service Mode, open the bonnet. Position a large fan to blow air under the vehicle onto the fuel tank area.
2. Connect the red battery clip from the tester to the positive battery terminal at the underhood auxiliary fuse block X50B.

Note: The vehicle 12 V battery must be fully charged for optimal tester performance and because every module will be awake in this powered mode.

3. Connect the black battery clip of the tester to chassis ground.

[Flow Meter Test - Leak Detection](#)

1. Open the nitrogen tank valve and turn the nitrogen/smoke valve on the front control panel to nitrogen.
2. Connect the hose to the correct test orifice on the bottom front of the tester. For orifice size, refer to the vehicle specific information found in the service procedures for DTCs that relate to evaporative emission (EVAP) system leaks.

3. Press and release the remote switch to activate the tester.
4. Position the sliding red flag on the flow meter to align with the floating indicator. When the red flag is set, press and release the remote switch to deactivate the tester.
5. Remove the hose from the test orifice and install the hose onto the vehicle. For proper connection location, and the special tool numbers for any adapters that may be required, refer to the service manual for the vehicle being tested. The vehicle specific information can be found in service procedures for DTCs that relate to EVAP system leaks.
6. Seal the EVAP system per instructions in the service manual. Most systems can be sealed using a scan tool output control for the evaporative emission (EVAP) canister vent solenoid valve. Other systems require that the system be plugged. Refer to the service manual for the vehicle being tested for specific instructions.

Note:

- Larger volume fuel tanks, and/or those with lower fuel levels, may require several minutes to fill with nitrogen.
- Static buildup may cause the float indicator to stick. It may be necessary to tap on the flow meter to free the float.

7. Press and release the remote switch to activate the nitrogen flow and fill the system.
8. Compare the stable floating indicator position to the red flag. The floating indicator should be below the red flag. If above the red flag, go to the smoke procedure.
9. Press and release the remote switch to deactivate the tester.

Smoke Procedure - Locate the Leak

Note: It is not recommended to use the tester in an outside repair bay area because wind and sunlight may affect temperature and your ability to see the smoke.

1. Turn OFF any fans that may cause air movement around or near the vehicle.

Note: Completely unwind the nitrogen/smoke hose from the bracket for optimal tester performance.

2. Connect the nitrogen/smoke hose to the vehicle as directed in the service manual. Some vehicles require that the nitrogen/smoke hose be connected at the front of the EVAP system at the EVAP service port. An adapter may be necessary. Other vehicles require the connection be made at the rear of the system using an adapter at the fuel fill cap. Consult the service manual for vehicle specific instructions regarding connection location and adapters.
3. Open the nitrogen tank valve and turn the nitrogen/smoke valve on the control panel to smoke.

Note: The remote switch operates in a push ON, push OFF fashion.

4. Press and release the remote switch to activate the tester and inject smoke into the EVAP system.
5. Verify smoke has filled the EVAP system by opening the system opposite the end where smoke is injected. When injecting smoke at the service port, remove the fuel fill cap and temporarily leave the evaporative emission (EVAP) canister vent solenoid valve open, and EVAP leak detection pump switching valve in the vent position, until smoke is observed. Then close the system and continue testing. If using a special tool fuel fill cap adapter at the filler neck, use the *EN 41413-VLV* EVAP Service Port Vent Fitting tool at the service port until smoke is observed, then remove the *EN 41413-VLV* EVAP Service Port Vent Fitting tool and continue with the test.

Note: Inject smoke in less than 2 min cycles for optimal tester performance.

6. Press and release the remote switch to deactivate the tester.

Note: For optimal visual smoke performance, deactivate the smoke flow and allow the system pressure to drop. Allowing the smoke to exit through small holes at a low

flow rate greatly enhances visibility.

7. Introduce smoke into the system for an additional 60 s. Continue introducing smoke at 15 s intervals, as necessary.
8. Using a high-intensity white light, inspect the entire EVAP system path, and look for the source of the leak indicated by the exiting smoke. Introduce smoke at 15 s intervals, as needed, until the source of the leak is identified.

Temperature Variation Instructions

The Concern

Ideal circumstances for conducting the EVAP flow meter test require equal temperatures between the nitrogen gas and the vehicle EVAP system. Significant differences in temperature between them can result in a flow or pressure change during testing, causing misleading results. Typically, the evaporative emissions system tester is stored indoors, approximately 21°C (70°F). Vehicles brought in for diagnosis may have an EVAP system at significantly different temperatures -40 to +43°C (-40 to +110°F).

For Example

Note: With no temperature difference between the nitrogen gas and EVAP system, the resulting vehicle EVAP system pressure will remain stable at 3.2 kPa (22.3 PSI) once pressurised, providing no leaks are present.

When the EVAP flow meter tests are performed with significant differences in temperature between the nitrogen gas and the vehicle EVAP system, the following results can occur:

- An increase in flow during the flow meter test can be caused by a vehicle warm EVAP system cooling down.
- A decrease in flow during the flow meter test can be caused by a vehicle cool EVAP system warming up.

The Solution

When working on a vehicle with significant differences in temperature between the vehicle EVAP system and the nitrogen gas, allow the vehicle EVAP system temperature to stabilise as close as possible to the temperature of the nitrogen gas before conducting the Flow Meter Test.

Electronic Ignition System Diagnosis

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

Ignition voltage is supplied to the ignition coil. The engine control module (ECM) provides an ground for the ignition coil control circuits. When the ECM removes the ground path of the ignition primary coil, the magnetic field produced by the coil collapses. The collapsing magnetic field produces a voltage in the secondary coil which ignites the spark plugs. The sequencing and timing are controlled by the ECM.

[Diagnostic Aids](#)

If the condition is intermittent, moving the related harnesses and connectors, with the engine running, while monitoring the appropriate scan tool Misfire Current Cylinder parameter and the appropriate Ignition Coil Control Circuit Status parameter this may help to isolate the condition.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the K35 ignition coil module.
2. Test for less than 5 Ω between the ground circuit terminal B and ground.
If greater than the specified range, repair the ground circuit for an open/high resistance.
3. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all the systems to power down. Test for less than 5 Ω between the low reference circuit terminal C and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
4. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition voltage circuit terminal A and ground.
If the test lamp does not illuminate, test the ignition voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition voltage circuit fuse is open, test all components connected to the ignition voltage circuit and replace as necessary.
5. If all circuits test normal, test or replace the K35 ignition coil module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Ignition Coil Replacement](#)
- [Control Module References](#) for replacement, setup, and programming

Inspection/Maintenance System Check

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Description

Several states require that a vehicle pass on-board diagnostic (OBD) system tests and the inspection/maintenance (I/M) emission inspection in order to renew number plates. This is accomplished by viewing the I/M System Status display on a scan tool. Using a scan tool, the technician can observe the I/M System Status in order to verify that the vehicle meets the criteria that complies with the local area requirements. While testing in the I/M System Status mode, some diagnostic trouble codes (DTCs) may occur that are called I/M Test DTCs. An I/M Test DTC is defined as a DTC that is currently commanding the MIL ON, and is stored in non-volatile memory. The intended use of this data is to prevent vehicles from passing I/M inspection without proper repair to the vehicle. These DTCs are not erasable from any scan tool command or erasable by disconnecting power to the controller. The I/M Test DTCs will be supported by all emissions related control modules. For example, Engine Control Modules (ECMs), Transmission Control Modules (TCMs), and Fuel Pump Control Modules (FPCMs). An I/M Test DTC will not be stored or erased from the control module except at the end of trip processing which occurs 5 s after vehicle OFF.

Conditions for Updating the I/M System Status

Each system requires at least one, and sometimes several, diagnostic tests. The results of these tests are reported by a DTC. A system monitor is complete when either all of the DTCs comprising the monitor have Run and Passed, or any one of the DTCs comprising the monitor have illuminated the malfunction indicator lamp (MIL). Once all of the tests are completed, the I/M System Status display will indicate YES in the Completed column.

For example, when the HO2S Heater Status indicates YES, either all of the oxygen sensor heater tests have passed or one of the tests has illuminated the MIL. If the vehicle has four heated oxygen sensors, either all four heater circuit tests have passed or one of the heater circuit tests has illuminated the MIL. The I/M System Status will indicate NO under the Completed column when any of the required tests for that system have not run. The following is a list of conditions that would set the I/M System Status indicator to NO:

- The vehicle is new from the factory and has not yet been driven through the necessary drive conditions to complete the tests.
- The 12 V battery has been disconnected or discharged below operating voltage.
- The control module power or ground has been interrupted.
- The control module has been reprogrammed.

- The control module DTCs have been cleared as part of a service procedure.

Conditions for Clearing I/M Test DTCs

1. Only the OBD II System can erase the I/M Test DTC. The OBD II system must determine that the malfunction that caused the I/M Test DTC to be stored is no longer present and is not commanding the MIL. Each of the following represents ways to clear an I/M Test DTC:
 - If the MIL goes out due to 3 passing drive cycles and the scan tool code clear is not used, the I/M Test DTC is erased at power down of the last drive cycle.
 - If a scan tool code clear is used to turn OFF the MIL, the I/M Test DTC is not erased, the DTC must PASS and not FAIL. The I/M Test DTC is erased at power down of the drive cycle.
 - If the controller is reflashed/reprogrammed, all I/M Test DTCs are erased.
2. For the OBD II System to run a single drive cycle for clearing an I/M Test DTC, all of the following conditions must occur:
 - Vehicle ON, engine run time is greater than 600 s.
 - Cumulative vehicle speed is greater than 41 km/h (25 mph) for greater than 300 s.
 - Continuous engine running, and vehicle speed is 0 km/h (0 mph) for greater than 30 s.
 - Vehicle OFF for 5 s.

Monitored Emission Control Systems

The OBD II system monitors all emission control systems that are on-board. Not all vehicles need every possible emission control system. For example, a vehicle may not be equipped with secondary air injection (AIR) or exhaust gas recirculation (EGR). The OBD II regulations require monitoring of the following; if equipped:

- The air conditioning system
- The catalytic converter efficiency
- Comprehensive component monitoring--Emission related inputs and outputs
- The evaporative emission (EVAP) system
- The fuel delivery system
- Heated catalyst monitoring
- Misfire monitoring
- The oxygen sensor system (O2S or HO2S)
- The oxygen sensor heater system (HO2S heater)

For the specific DTCs required for each system, refer to [Inspection/Maintenance \(I/M\) Test DTC Table](#) . Systems such as misfire and comprehensive components may not be listed in a system status list. These tests run continuously and do not require an I/M System Status indicator.

Diagnostic Aids

The I/M System Status display provides an indication of when the control module has completed the required tests. This does not necessarily mean that the test has passed, only that a decision was made. If the diagnostic fails, a DTC will indicate the failure. If a failure indication is present for a DTC associated with one of the I/M regulated

systems, it may prevent other required tests from running. For example, a DTC for the control circuit of the EVAP purge solenoid may not be listed in the Inspection/Maintenance System DTC Table because it is a continuous test. If this DTC is set, the Active Tests for the EVAP system may not run.

The I/M System Status information may be useful for a technician to determine if diagnostics have run when verifying repairs.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool I/M System Status indicators, and the I/M Test DTCs. All I/M System Status indicators should display YES, and no I/M Test DTCs should be present.

Circuit/System Testing

Note: Many DTC related repairs will instruct the technician to clear the DTC information. Clearing the DTC will reset the I/M System Status indicators to NO. Performing the I/M Complete System Set Procedure will set each of the I/M System Status indicators to YES.

1. Observe the ECM DTC information with a scan tool. Verify no DTCs are present.
If a DTC is set that would prevent the I/M System Status tests from completing, diagnose that DTC before continuing. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Review applicable service bulletins for software updates that would prevent the I/M System Status tests from completing.
If a control module re-program or other repair is required, perform the [Inspection/Maintenance Complete System Set Procedure](#) .
3. Observe the scan tool I/M System Status indicators. The I/M System Status indicators should display Yes.
If any I/M System Status indicators display NO, perform the [Inspection/Maintenance Complete System Set Procedure](#) .
4. Observe the I/M Test DTC and I/M System Status information with a scan tool. There should be no I/M Test DTCs, and there should be no I/M System Status indicators displaying NO.
If an I/M Test DTC is set and all of the I/M System Status indicators are Yes, there is no need to perform the Complete System Set Procedure. Diagnose the DTC using the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) and refer to Conditions for Clearing the I/M Test DTCs.
If an I/M Test DTC is set and the I/M System Status indicators are NO, diagnosis the DTC and perform the [Inspection/Maintenance Complete System Set Procedure](#) .

Inspection/Maintenance Complete System Set Procedure

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Description

The purpose of the Inspection/Maintenance (I/M) complete system set procedure is to satisfy the enable criteria necessary to execute all of the I/M readiness diagnostics and complete the trips for those particular diagnostics. When all I/M monitored diagnostic tests are completed, the I/M System Monitor Indicators are set to YES. Perform the Inspection/Maintenance (I/M) Complete System Set Procedure if any I/M System Monitor indicators are set to NO.

Conditions for Meeting a Cold Start

- Ignition voltage between 10-32 V.
- Barometric pressure (BARO) between 10-16 psi.
- Engine coolant temperature (ECT) less than 40°C (104°F).
- Inlet air temperature (IAT) between 4-45°C (39-113°F).
- Fuel level between 10 and 90 %.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool Inspection/Maintenance (I/M) System Monitor and the I/M test DTCs. All I/M System Monitors should display YES, and there should be no I/M Test DTCs.

Inspection/Maintenance (I/M) System Set Procedure

Warning: Refer to [Road Test Warning](#) in the Preface section.

1. Vehicle ON, accelerate to a speed greater than 40 km/h (25 MPH) with engine speed greater than 1800 RPM.
2. Maintain the vehicle speed and engine speed until the engine reaches normal operating temperatures.

3. Park vehicle and ensure that the vehicle meets the conditions for a cold start listed above.
4. Allow vehicle to sit undisturbed for a minimum of 8 hours.
5. Vehicle in Service Mode, observe the Inspection/Maintenance (I/M) Monitors with a scan tool. All of the I/M System Monitors should display YES.
If any of the I/M System Monitors display NO, refer to the [Inspection/Maintenance \(I/M\) Test DTC Table](#) for the monitor which did not display YES. The I/M System DTC Table identifies the DTCs associated with each I/M System Monitor.

Note: An I/M Test DTC will not be stored or erased from the ECU except at the end of trip processing, which occurs 5 s after Vehicle OFF.

6. Observe the I/M Test DTC information with a scan tool. Verify there are no I/M Test DTCs present.
If an I/M Test DTC is set, diagnose the DTC using the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) and refer to [Inspection/Maintenance System Check](#).
7. Observe the ECM DTC information with a scan tool. Verify no DTCs are present.
If a DTC is set, diagnose using the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#). After repairs, perform the [Inspection/Maintenance Complete System Set Procedure](#) to verify no further DTCs are set.

Inspection/Maintenance (I/M) Test DTC Table

System	DTCs Required to Set System Status to YES
<p>If an I/M System Status indicator did NOT update to YES during the Inspection/Maintenance Complete System Set Procedure , review each indicator and reference this table to determine each DTC associated with the I/M System Status Indicator. Each DTC listed below has specific conditions that must be met for the diagnostic to run. Included within the conditions are additional DTCs which, if set, may inhibit the DTCs listed below from running. Reviewing and operating the vehicle within the Conditions for Running for each DTC listed below will allow the I/M System Status Indicators to transition to YES.</p>	
Catalyst	DTC P0420
EVAP	<ul style="list-style-type: none"> • DTC P043E, P043F, or P145F • DTC P0442 or P0455 • DTC P0451-P0453
Fuel	DTC P219A
Oxygen Sensor	<ul style="list-style-type: none"> • DTC P0131, P0132, P0134, P0137, P0138, or P0140 • DTC P0133, P013A, P013B, P013E, P013F, P1133, P2270, P2271, or P2A00
Oxygen Sensor Heater	DTC P0030, P0036, P0053, P0054, P0135, or P0141
Camshaft Position	DTC P0011 or P0014

Engine Control Module Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera .	
Engine Control Module	

Caution:

- Turn the ignition OFF when installing or removing the control module connectors and disconnecting or reconnecting the power to the control module (battery cable, powertrain control module (PCM)/engine control module (ECM)/transaxle control module (TCM) pigtail, control module fuse, jump leads, etc.) in order to prevent internal control module damage.
- Control module damage may result when the metal case contacts battery voltage. DO NOT contact the control module metal case with battery voltage when servicing a control module, using battery booster cables, or when charging the vehicle battery.
- In order to prevent any possible electrostatic discharge damage to the control module, do not touch the connector pins or the soldered components on the circuit board.
- Remove any debris from around the control module connector surfaces before servicing the control module. Inspect the control module connector gaskets when diagnosing or replacing the control module. Ensure that the gaskets are installed correctly. The gaskets prevent contaminant intrusion into the control module.
- The replacement control module must be programmed.

1

Procedure

1. Record the current Engine Oil Life percentage, and use a scan tool to update the NEW ECM, if replacing.
2. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
3. Disconnect the electrical connectors.
4. If replacing ECM, reprogram the ECM. Refer to [Control Module References](#)

Engine Control Module Bracket Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the electronic control module. Refer to Engine Control Module Replacement .
	Engine Control Module Bracket Fastener (Qty: 3)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Engine Control Module Bracket

Crankshaft Position System Variation Learn

Note: The Crankshaft Position System Variation Learn procedure is required when the following service procedures have been performed, regardless of whether DTC P0315 is set:

- A crankshaft position sensor replacement
- An engine control module (ECM) replacement
- An engine replacement
- A crankshaft balancer replacement
- A crankshaft replacement
- Any engine repairs which disturb the crankshaft to crankshaft position sensor relationship.

Note: The ECM monitors certain component signals to determine if all the conditions are met to continue with the Crankshaft System Position Variation Learn procedure.

1. Vehicle in Service Mode, observe the DTC information with a scan tool. Verify no other DTCs are set, except DTCs P0300-P0304, or P0315. If DTCs are set, except DTCs P0300-P0304, or P0315, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

Note: To ensure the battery pack has sufficient state of charge to get Crankshaft Position Variation Learn values with the lowest engine noise present, this procedure should be performed when the Hybrid/EV Battery Pack Charge Remaining parameter is at least 40%.

2. Select the Crankshaft Position Variation Learn procedure with a scan tool and perform the following:
 - 2.1. Block drive wheels.
 - 2.2. Set parking brake.
 - 2.3. DO NOT apply brake pedal.
 - 2.4. Turn the air conditioning (A/C) OFF.
 - 2.5. When directed, apply and hold brake pedal for the duration of the procedure.
 - 2.6. Vehicle ON, engine running at operating temperature.
 - 2.7. The vehicle must remain in Park or Neutral.

Note: The ECM controls the engine speed during the Crankshaft Position System Variation Learn procedure.

- 2.8. Tap and release the accelerator pedal to start the Crankshaft Position Variation Learn procedure.
3. The scan tool displays Learn In Progress.
4. The scan tool displays Learn Successful.

5. Verify DTC P0315 ran and passed This Ignition Cycle.

If DTC P0315 failed or did not run This Ignition Cycle, or another DTC is present, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

6. Once the Crankshaft Position System Variation Learn procedure has successfully completed, and in order to store the crankshaft position system variation values in the ECM, turn OFF the vehicle and verify all vehicle systems are OFF. This may take up to 2 minutes.

Throttle/Idle Learn

[Description](#)

The engine control module (ECM) learns the airflow through the throttle body to ensure the correct engine speed. The learnt airflow values are stored within the ECM. These values are learned to adjust for production variation and will continuously learn during the life of the vehicle to compensate for reduced airflow due to throttle body coking. Anytime the throttle body airflow rate changes, for example due to cleaning or replacement, the values must be re-learned.

An engine that had a heavily coked throttle body that has been cleaned or replaced may take several drive cycles to learn out the coking. To accelerate the process, the scan tool has the ability to reset all learnt values back to zero. A new ECM will also have values set to zero.

The engine speed may be unstable or a DTC may set if the learned values do not match the actual airflow.

[Conditions for Running the Throttle Learn Procedure](#)

Reset Procedure

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0121, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0351, P0352, P0353, P0354, P0601, P0604, P0606, P060D, P0641, P0651, P0697, P06A3, P1101, P1516, P2101, P2119, P2122, P2123, P2127, P2128, P2135, P2138, or P2176 are not set.
- Vehicle in Service Mode.
- The vehicle speed sensor (VSS) is 0 km/h (0 MPH).

Learn Procedure

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0121, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0351, P0352, P0353, P0354, P0601, P0604, P0606, P060D, P0641, P0651, P0697, P06A3, P1101, P1516, P2101, P2119, P2122, P2123, P2127, P2128, P2135, P2138, or P2176 are not set.
- The engine speed is between 1,400-4,000 RPM.
- The manifold absolute pressure (MAP) is greater than 5 kPa.
- The mass air flow (MAF) is greater than 2 g/s.
- The ignition voltage is greater than 10 V.

Throttle Learn

Reset Procedure - Performed after the throttle body is cleaned or replaced

1. Vehicle in Service Mode, perform the Idle Learn Reset with a scan tool.
2. Engine running, monitor the TB Idle Airflow Compensation parameter with a scan tool. The TB Idle Airflow Compensation value should equal 0 %.
3. Clear the DTCs and return to the diagnostic that referred you here.

Learn Procedure - Performed after the ECM is programmed or replaced

Note: Do NOT perform this procedure if DTCs are set. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

1. Engine running for 3 minutes.
2. Monitor the Engine Speed with a scan tool.
3. The ECM will start to learn the new idle cells and the Engine Speed should start to decrease.
4. Vehicle OFF for 60 s.
5. Engine running for 3 minutes.
6. After the 3 minute run time the engine speed should be normal.
7. Once the engine speed has returned to normal, clear DTCs and return to the diagnostic that referred you here.

Engine Coolant Temperature Sensor Replacement - Thermostat

The engine coolant temperature sensor is integrated in the engine coolant thermostat housing. Refer to [Water Inlet Replacement](#) .

Engine Coolant Temperature Sensor Replacement - Water Outlet

Callout	Component Name
<p>Preliminary Procedure</p> <p>Partially drain the cooling system. Refer to Cooling System Draining and Filling .</p>	
	<p>Engine Coolant Temperature Sensor</p>

1

Procedure

1. Remove the retaining clip.
2. Disconnect the electrical connector.

Mass Airflow Sensor with Inlet Air Temperature Sensor Replacement

Callout	Component Name
1	Mass Airflow Sensor Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section.
	Mass Airflow Sensor with Intake Air Temperature Sensor

2

Procedure

Disconnect the electrical connector.

Manifold Absolute Pressure Sensor Replacement

Callout	Component Name
Preliminary Procedure	
Remove the fuel injection fuel rail. Refer to Fuel Injection Fuel Rail Assembly Replacement .	
	Manifold Absolute Pressure Sensor Fastener

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 5 N·m(44 lb in)
2	Manifold Absolute Pressure Sensor Procedure Disconnect the electrical connector.

Heated Oxygen Sensor Replacement - Sensor 1

Callout

Component Name

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedure

Disable the high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .

1	<p>Heated Oxygen Sensor</p> <p>Caution: Refer to Heated Oxygen and Oxygen Sensor Caution in the Preface section.</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. If reinstalling the old sensor, coat the threads with anti-seize compound. Refer to Adhesives, Fluids, Lubricants, and Sealers . <p>Tighten 42 N·m (31 lb ft)</p> <p>Special Tools</p> <p>EN-6129 Remover Installer</p> <p>For equivalent regional tools, refer to Special Tools : Diagnostic Tools .</p>
---	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Heated Oxygen Sensor Replacement - Sensor 2

Callout

Component Name

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Preliminary Procedure

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

Heated Oxygen Sensor

Caution: Refer to [Heated Oxygen and Oxygen Sensor Caution](#) in the Preface section.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Procedure

1. Disconnect the electrical connector.
2. If reinstalling the old sensor, coat the threads with anti-seize compound. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .

Tighten

42 N·m (31 lb ft)

Special Tools

EN-6197 Remover Installer

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

Accelerator Pedal Position Sensor Replacement

Callout	Component Name
1	Accelerator Pedal Fastener Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)

2	Accelerator Pedal Position Sensor Procedure Disconnect the electrical connector.
---	-----------------------------------------------------------------------------------------------

Throttle Body Assembly Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement .	
	Throttle Body Assembly Fastener (Qty: 4)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 8 N·m (71 lb in)</p>
2	<p>Throttle Body Assembly</p> <p>Procedure</p> <ol style="list-style-type: none">1. Use a NEW seal.2. Disconnect the electrical connector.3. Perform the throttle learn procedure. Refer to Control Module References .

Throttle Body Inspection and Cleaning

Note: Over extended time and mileage, deposits may accumulate on the back of the throttle valve plate. The source of the deposit is exhaust gas. Typically these deposits pose no problem. Occasionally the deposit may accumulate to a point where perceived pedal effort or throttle valve movement is effected. This procedure should not be performed on vehicles with mileage under 80,450 km (50,000 mi).

1. Remove the air cleaner outlet duct. Refer to [Air Cleaner Outlet Duct Replacement](#) .

Warning: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

Caution: Do not insert any tools into the throttle body bore in order to avoid damage to the throttle valve plate.

2. Inspect the throttle body bore and the throttle valve plate for deposits. You will need to open the throttle valve in order to inspect all surfaces.

Caution: Do not use any solvent that contains Methyl Ethyl Ketone (MEK). This solvent may damage fuel system components.

3. Clean the throttle body bore and the throttle valve plate using a clean shop towel with an appropriate cleaner.
4. Install the air cleaner outlet duct. Refer to [Air Cleaner Outlet Duct Replacement](#) .

Fuel Pressure Gauge Installation and Removal

Special Tools

EN-34730-91 Pressure Tester

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

Warning: Petrol or petrol vapours are highly flammable. A fire could occur if an ignition source is present. Never drain or store petrol or diesel fuel in an open container,

due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.

Warning: Remove the fuel tank cap and relieve the fuel system pressure before servicing the fuel system in order to reduce the risk of personal injury. After you relieve the fuel system pressure, a small amount of fuel may be released when servicing the fuel lines, the fuel injection pump, or the connections. In order to reduce the risk of personal injury, cover the fuel system components with a shop towel before disconnection. This will catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

1. Remove the resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
2. Remove the protective cap from the test connection.
3. Attach the *EN-34730-91* tester (1) to the test connection.
4. Install the resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
5. Start the engine.
 - Bleed the pressure tester at idling speed.
 - Collect the exiting fuel in a suitable container.
 - Read the fuel pressure from the pressure gauge.

Caution: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

6. Remove the resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
7. Detach the pressure gauge *EN-34730-91* tester from the test connection.
8. Install the resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .

Fuel Tank Draining

Special Tools

CH 45004 Fuel Tank Drain Hose

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#)

Warning: Refer to [Petrol/Petrol Vapours Warning](#) in the Preface section.

1. Remove the fuel fill cap.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

2. Raise and suitably support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
3. Loosen the fuel fill pipe hose clamp (1) at the fuel tank.
4. Separate the fuel fill pipe hose from the fuel tank (2).
5. Using the *CH 45004* hose drain as much fuel from the tank as possible.

Fuel Tank Replacement

Special Tools

- *CH-807* Closure Plug
- *EN-6015* Closure Plug

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Removal Procedure](#)

Danger: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.

Warning: Refer to [Petrol/Petrol Vapours Warning](#) in the Preface section.

Warning: Refer to [Safety Glasses Warning](#) in the Preface section.

1. Drain the fuel tank. Refer to [Fuel Tank Draining](#) .
2. Remove the rear axle. Refer to [Rear Axle Replacement](#) .

3. Disconnect the evaporative emission and fuel pipe connectors (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
4. Close the fuel tank vent pipe and the evaporative emission hose with the *CH-807* plugs .
5. Close the fuel feed pipe and the fuel pump feed hose with the *EN-6015* plugs .
6. Loosen the hose clamps (2) and slide the filler tube away from the fuel tank.
7. Disconnect the fuel tank harness electrical connector (3).

Warning: To help avoid personal injury, always use jack stands when you are working on or under any vehicle that is supported only by a jack.

Caution: When you are jacking or lifting a vehicle at the frame side rails or other prescribed lift points, be certain that the lift pads do not contact the catalytic converter, the brake pipes or the fuel lines. If such contact occurs, vehicle damage or unsatisfactory vehicle performance may result.

8. Support the fuel tank with a suitable adjustable jack (4) as shown in the graphic.
9. Remove the 2 fuel tank strap bolts (2) and the 2 fuel tank strap washers (3).
10. Remove the 2 fuel tank straps (5) from the 2 fuel tank strap rear brackets (1).

Note: A second technician is required.

11. Move the fuel tank (2) rearwards and lower the fuel tank slowly using the suitable adjustable jack (1).

[Disassemble Procedure](#)

1. Unclip the 2 wiring harness clips (2) from the fuel tank.
2. Unclip the 2 fuel tank upper shield clips (3) and (4) and remove the fuel tank upper shield (1) from the fuel tank.
3. Remove the fuel tank fuel pump module. Refer to [Fuel Tank Fuel Pump Module Replacement](#) .

Assemble Procedure

1. Install the fuel tank fuel pump module. Refer to [Fuel Tank Fuel Pump Module Replacement](#) .

2. Install the fuel tank upper shield (1) to the fuel tank and attach the 2 fuel tank upper shield clips (3, 4).
3. Clip the 2 wiring harness clips (2) to the fuel tank.

[Installation Procedure](#)

Note: A second technician is required.

1. Raise the fuel tank slowly using a suitable adjustable jack (1) and move the fuel tank (2) forwards.

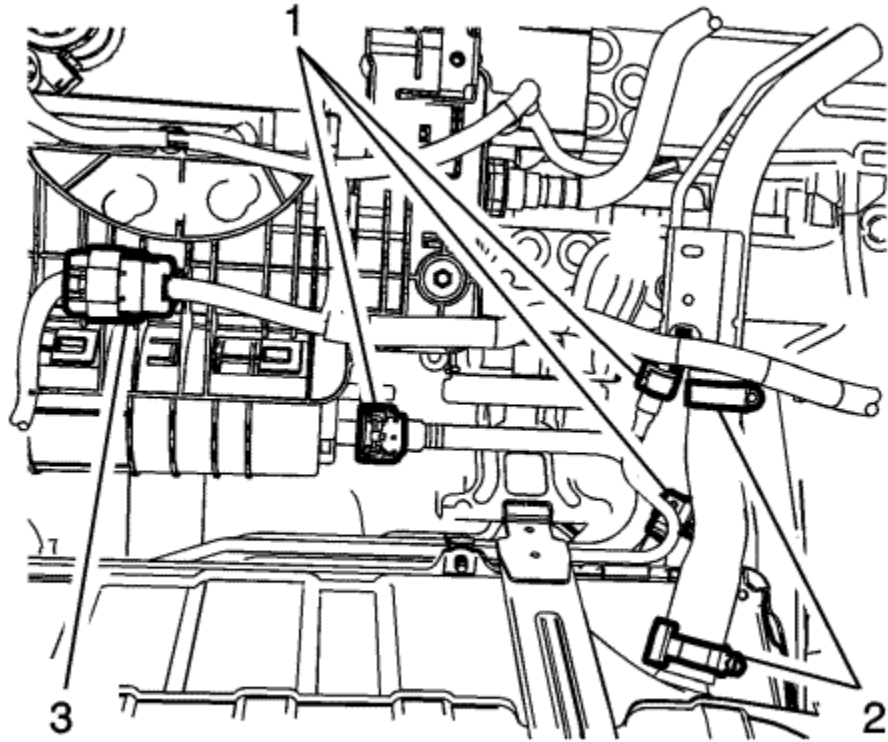

2. Install the 2 fuel tank straps (5) to the 2 fuel tank strap rear brackets (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 2 fuel tank strap bolts (2) with the 2 fuel tank strap washers (1) and tighten to **20 N·m (15 lb ft)**.

4. Remove the suitable adjustable jack (4) from the fuel tank.

5. Connect the fuel tank harness electrical connector (3).
6. Remove the *CH-807* plugs from the fuel tank vent pipe and the evaporative emission hose.
7. Remove the *EN-6015* plugs from the fuel feed pipe and the fuel pump feed hose.
8. Slide the filler hose onto the tank and tighten the hose clamps (2) to **4 N·m (35 lb in)**.
9. Connect the evaporative emission and fuel pipe connectors (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
10. Install the rear axle. Refer to [Rear Axle Replacement](#) .
11. Refill the fuel tank.

Fuel Pressure Sensor Replacement - Fuel Feed Pipe

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the drive motor battery. Refer to Drive Motor Battery Replacement and Shipping Preparation .2. Relieve the fuel system pressure.3. Disconnect the fuel pressure sensor electrical connector.	

4. Place a drain pan underneath the vehicle.

1	Fuel Pressure Sensor Caution: Refer to Fastener Caution in the Preface section. Tighten 19 N·m(14 lb ft)
---	-------------------------------------------------------------------------------------------------------------------------------------------------

Fuel Tank Filler Pipe Replacement

Callout	Component Name
	<p>Warning: Petrol or petrol vapours are highly flammable. A fire could occur if an ignition source is present. Never drain or store petrol or diesel fuel in an open container, due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.</p> <p>Preliminary Procedure</p>

1. Remove the filler cap.
2. Remove the right rear wheelhouse liner. Refer to [Rear Wheelhouse Panel Liner Replacement](#) .
3. Disconnect the evaporative emission canister quick connect pipes. Refer to [Plastic Collar Quick Connect Fitting Service](#)

1	Fuel Tank Filler Pipe Fastener (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Fuel Tank Filler Pipe Hose Clamp Tighten 4 N·m(35 lb in)
3	Fuel Tank Filler Pipe

Fuel Feed Pipe Replacement — Chassis

[Removal Procedure](#)

1. Remove the engine compartment fuel feed pipe. Refer to [Fuel Feed Pipe Replacement : Chassis](#) → [Engine Compartment](#) .
2. Remove the drivetrain and front suspension frame. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .
3. Remove the fuel tank. Refer to [Fuel Tank Replacement](#) .

4. Remove the fuel feed pipe (1) from the plastic clips (2).

5. Remove the fuel feed pipe (1) from the plastic clips (2).

6. Remove the fuel feed pipe (1) from the plastic clips (2).
7. Disconnect the fuel pressure sensor electrical connector (3).
8. Disconnect the fuel feed pipe quick connect (4). Refer to [Plastic Collar Quick Connect Fitting Service](#) .

[Installation Procedure](#)

1. Connect the fuel feed pipe quick connect (4). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
2. Install the fuel feed pipe (1) to the plastic clips (2).
3. Connect the fuel pressure sensor electrical connector (3).

4. Install the fuel feed pipe (1) to the plastic clips (2).

5. Install the fuel feed pipe (1) from the plastic clips (2).
6. Install the fuel tank. Refer to [Fuel Tank Replacement](#) .
7. Install the drivetrain and front suspension frame. Refer to [Drivetrain and Front Suspension Frame Replacement](#) .
8. Install the engine compartment fuel feed pipe. Refer to [Fuel Feed Pipe Replacement : Chassis](#) → [Engine Compartment](#) .

Fuel Feed Pipe Replacement — Engine Compartment

Callout	Component Name
Preliminary Procedure	
1.	Remove the air cleaner resonator. Refer to Air Cleaner Resonator Outlet Duct Replacement .
2.	Disconnect the fuel feed pipe connector. Refer to Plastic Collar Quick Connect Fitting Service .

Fuel Tank Fuel Pump Module Replacement

Special Tools

CH 45722 Fuel Sender Lock Ring Wrench

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Removal](#)

1. Remove the fuel tank. Refer to [Fuel Tank Replacement](#) .
2. Disconnect the evaporative emission and fuel lines (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
3. Disconnect the electrical connector (2).

4. Using the *CH 45722* wrench, remove the lock ring (1) by turning counter-clockwise.

5. Partially raise the fuel pump module and disconnect the vent valve connector (1). Refer to [Plastic Collar Quick Connect Fitting Service](#)

6. Remove the fuel pump module (1) and O-ring (2).

[Installation Procedure](#)

1. Install a NEW O-ring (2) and the fuel pump module (1).

2. Connect the vent valve connector (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .

3. Using the *CH 45722* wrench, install the lock ring (1) by turning clockwise.

4. Connect the electrical connector (2).
5. Connect the evaporative emission and fuel lines (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
6. Install the fuel tank. Refer to [Fuel Tank Replacement](#) .

Fuel Pump Flow Control Module Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the quarter trim panel. Refer to Quarter Inner Trim Finish Panel Replacement .</p>	
	<p>Fuel Pump Flow Control Module Fastener</p>

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 10 N·m(89 lb in)
2	Fuel Pump Flow Control Module Procedure If replacing, reprogram the control module. Refer to Control Module References

Fuel Tank Pressure Sensor Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the carbon canister. Refer to Evaporative Emission Canister Replacement .</p>	
	<p>Fuel Tank Fuel Pressure Sensor</p>

1

Procedure

Disconnect the electrical connector.

Fuel Level Sensor Replacement

Callout	Component Name
Preliminary Procedure	
Remove the fuel pump module. Refer to Fuel Tank Fuel Pump Module Replacement .	
	Fuel Level Sensor

1

Procedure

1. Release the retaining tabs.
2. Disconnect the electrical connector.

Plastic Collar Quick Connect Fitting Service

[Removal Procedure](#)

Warning: Refer to [Petrol/Petrol Vapours Warning](#) in the Preface section.

Note: There are several types of Plastic Collar Fuel and Evaporative Emission Quick Connect Fittings used on this vehicle.

- Bartholomew (1)
- Q Release (2)

- Squeeze to Release (3)
- Sliding Retainer (4)
- Global Connect (5)
- TI Loc (6)
- Safe Lock (7)

The following instructions apply to all of these types of Plastic Collar Quick Connect Fittings except where indicated.

Warning: Refer to [Safety Glasses and Compressed Air Warning](#) in the Preface section.

1. Using compressed air, blow any dirt out of the quick-connect fitting.

2. This step applies to Bartholomew style connectors ONLY. Squeeze the plastic quick-connect fitting release tabs.

3. This step applies to Q Release style connectors ONLY. Release the fitting by Pushing the tab toward the other side of the slot in the fitting.

4. This step applies to Squeeze to Release style connectors ONLY. Squeeze where indicated by arrows on both sides of the plastic ring surrounding the quick-connect fitting.

5. This step applies to Squeeze to Release style connectors ONLY. Push in the male side slightly in order to slide the retainer away from the retainers, squeeze where indicated by arrows on both sides of the plastic ring surrounding the quick-connect fitting.

6. This step applies to Sliding Retainer style connectors ONLY. Release the fitting by pressing on one side of the release tab causing it to push in slightly. If the tab doesn't move try pressing the tab in from the opposite side. The tab will only move in one direction.

7. This step applies to the Global Connector style only. Push the connector toward the tube in order to release the pressure. Press and hold down the release mechanism, and pull the connector straight out.

8. This step applies to the TI Loc style only. Push the connector toward the tube in order to release the pressure. Release the redundant latch (1) with two fingers or a flat bladed tool. Then press and hold down the bottom release mechanism (2) and pull the connector straight out.

Warning: Refer to [Relieving Fuel Pressure Warning](#) in the Preface section.

9. This step applies to the Safe Lock style only. Push the connector toward the tube in order to release the pressure. Release the second latch (1) with two fingers. Then press and hold down the bottom release mechanism (2) and pull the connector straight out.
10. Using a clean shop towel, wipe off the male pipe end.
11. Inspect both ends of the fitting for dirt and burrs.
12. Clean or replace components as necessary.

[Installation Procedure](#)

Warning: Refer to [Fuel Pipe Fitting Warning](#) in the Preface section.

1. Apply a few drops of clean engine oil to the male pipe end.

2. Push both sides of the quick-connect fitting together in order to cause the retaining feature to snap into place.

3. Pull on both sides of the quick-connect fitting to make sure the connection is secure.

4. Insert the tube in the connector until the retainer snaps in place.
5. Push down on the redundant latch (1) until it is fully engaged and snapped into position.

6. Insert the tube in the connector until the retainer snaps in place.
7. Push down on the second latch (1) in order to secure the connection.
8. Inspect for leaks using the following procedure:
 - 8.1. Turn the ignition ON, with the engine OFF for 2 seconds.
 - 8.2. Turn the ignition OFF, for 10 seconds.
 - 8.3. Turn the ignition ON, with the engine OFF for 2 seconds.
 - 8.4. Turn the ignition OFF.
 - 8.5. Inspect for leaks.

Fuel Injection Fuel Rail Assembly Replacement

[Removal Procedure](#)

1. Disconnect the battery negative cable. Refer [Battery Negative Cable Disconnection and Connection](#) .
2. Remove the resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
3. Disconnect the fuel feed pipe from the fuel rail. Refer to [Plastic Collar Quick Connect Fitting Service](#) .

4. Remove the fuel injection ground fastener (1) and reposition the ground cable (2).
5. Disconnect the electrical connectors.

6. Remove the fuel injection fuel rail fasteners (1) and fuel injection fuel rail (2).
7. Remove the fuel injectors. Refer to [Fuel Injector Replacement](#) .

[Installation Procedure](#)

1. Install the injectors. Refer to [Fuel Injector Replacement](#) .
2. Use new O-rings and lubricate with clean engine oil. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the fuel injection fuel rail assembly (2) and tighten the fasteners to **8 N·m (71 lb in)**.

4. Reposition the ground cable (2), install the fuel injection ground fastener (1) and tighten to **4 N·m (35 lb in)**.
5. Connect the electrical connectors.
6. Connect the fuel feed pipe from the fuel rail. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
7. Install the resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
8. Connect the battery negative cable. Refer [Battery Negative Cable Disconnection and Connection](#) .

Fuel Injector Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1458 1669 1495">1. Disconnect the battery negative cable. Evaporative Emission Canister Vent Solenoid Valve Replacement

Callout	Component Name
<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p>	
<p>Preliminary Procedure</p>	

1. Remove the rear underbody air deflector. Refer to [Underbody Rear Air Deflector Replacement](#) .
2. Lower the canister bracket to gain access to the vent solenoid valve.

1	<p>Evaporative Emission Vent Solenoid Valve Fastener (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 7 N·m(62 lb in)</p>
2	<p>Evaporative Emission Vent Solenoid Valve</p> <p>Procedure</p> <ol style="list-style-type: none">1. Disconnect the evaporative emission connectors. Refer to Plastic Collar Quick Connect Fitting Service .2. Disconnect the electrical connector.

Evaporative Emission Canister Replacement

Callout

Component Name

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Preliminary Procedure

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

Evaporative Emission Canister

Procedure

1

1. Disconnect the evaporative emission connectors. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
2. Release the retaining tab using a flat bladed tool while simultaneously sliding the canister to the left.
3. Disconnect the fuel pressure sensor electrical connector.
4. Transfer parts as necessary.

Evaporative Emission Canister Purge Solenoid Valve Replacement

Callout	Component Name
Preliminary Procedure	
1.	Remove the air cleaner resonator outlet duct. Refer to Air Cleaner Resonator Outlet Duct Replacement .
2.	Disconnect the plastic connector. Refer to Plastic Collar Quick Connect Fitting Service

1	Evaporative Emission Canister Purge Solenoid Valve Fastener Caution: Refer to Fastener Caution in the Preface section. Tighten 10 N·m (89 lb in)
2	Evaporative Emission Canister Purge Solenoid Valve Procedure Disconnect the electrical connector.

Evaporative Emission System Vacuum Leak Detection Pump Replacement

Callout	Component Name
<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <p>Preliminary Procedure</p>

Evaporative Emission System Cleaning

Special Tools

GE 41413 Evaporative Pressure and Purge Station

For equivalent regional tools, refer to [Special Tools](#) : [Diagnostic Tools](#) .

[Inspection Procedure](#)

Caution: Use the EVAP Pressure/Purge Diagnostic Station CH 41413 in order to provide a clean, dry, low pressure gas source. Do not substitute any other pressurised gas source. Damage may result to the EVAP system.

Note: Proceed with the following procedure only if referenced by an evaporative emission diagnostic or repair procedure.

1. Turn OFF the ignition.
2. Remove the evaporative canister purge valve. Refer to [Evaporative Emission Canister Purge Solenoid Valve Replacement](#) .
3. Lightly tap the evaporative canister purge valve on a hard surface.
4. Inspect for carbon particles exiting either of the vacuum ports.
 - If no carbon particles were detected, but a blockage was detected during a diagnostic procedure, install the original evaporative canister purge valve. Continue with the cleaning procedure.
 - If carbon particles are found during the inspection procedure, continue with the cleaning procedure.
 - If a diagnostic procedure directed you to replace the evaporative canister purge valve and no carbon particles were detected, replace the evaporative canister purge valve. Return to the published service procedure.

[Cleaning Procedure](#)

1. Remove the evaporative canister. Refer to [Evaporative Emission Canister Replacement](#) .
2. Turn OFF the main valve on the GE 41413 purge station .
3. Disconnect the hose from the diagnostic station pressure regulator.
4. Using a section of vacuum hose, connect one end onto the evaporative pressure/purge diagnostic station pressure regulator.
5. Connect the other end of the vacuum hose to the canister side of the purge pipe.
6. Turn ON the main nitrogen cylinder valve and continue to discharge nitrogen for 15 seconds.
7. If the nitrogen does not clear the blockage, replace the purge pipe.

8. Return the evaporative pressure/purge diagnostic station to the stations original condition.
9. Install a new evaporative canister. Refer to [Evaporative Emission Canister Replacement](#) .
10. Install a new evaporative canister purge valve. Refer to [Evaporative Emission Canister Purge Solenoid Valve Replacement](#) .
11. Return to the diagnostic table that sent you here.

Ignition Coil Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner resonator. Refer to Air Cleaner Resonator Outlet Duct Replacement .	
	Ignition Coil Fastener (Qty: 2)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 8 N·m(71 lb in)</p> <p>Special Tools</p> <p><i>EN 6009</i> Remover and Installer Ignition Module</p> <p>For equivalent regional tools, Refer to Special Tools : Diagnostic Tools</p>
2	<p>Ignition Coil</p> <p>Procedure</p> <p>Disconnect the electrical connector.</p>

Spark Plug Inspection

Spark Plug Usage

1. Ensure that the correct spark plug is installed. An incorrect spark plug causes driveability conditions. Refer to the Electronic Parts Catalogue.
2. Ensure that the spark plug has the correct heat range. An incorrect heat range causes the following conditions:
 - Spark plug fouling--Colder plug
 - Pre-ignition causing spark plug and/or engine damage--Hotter plug

Spark Plug Inspection

1. Inspect the terminal post (1) for damage.
 - Inspect for a bent or broken terminal post (1).

- Test for a loose terminal post (1) by twisting and pulling the post. The terminal post (1) should NOT move.

2. Inspect the insulator (2) for flash-over or carbon tracking, soot. This is caused by the electrical charge travelling across the insulator (2) between the terminal post (1) and ground. Inspect for the following conditions:
 - Inspect the spark plug boot for damage.
 - Inspect the spark plug recess area of the cylinder head for moisture, such as oil, coolant, or water. A spark plug boot that is saturated causes arcing to ground.

3. Inspect the insulator (2) for cracks. All or part of the electrical charge may arc through the crack instead of the electrodes (3, 4).

4. Inspect for evidence of improper arcing.
 - Measure the gap between the centre electrode (4) and the side electrode (3) terminals. Refer to [Ignition System Specifications](#) . An excessively wide electrode gap can prevent correct spark plug operation.
 - Inspect for the correct spark plug torque. Refer to [Ignition System Specifications](#) . Insufficient torque can prevent correct spark plug operation. An over torqued spark plug, causes the insulator (2) to crack.
 - Inspect for signs of tracking that occurred near the insulator tip instead of the centre electrode (4).
 - Inspect for a broken or worn side electrode (3).
 - Inspect for a broken, worn, or loose centre electrode (4) by shaking the spark plug.
5. A rattling sound indicates internal damage.
6. A loose centre electrode (4) reduces the spark intensity.
 - Inspect for bridged electrodes (3, 4). Deposits on the electrodes (3, 4) reduce or eliminates the gap.
 - Inspect for worn or missing platinum pads on the electrodes (3, 4) If equipped.
 - Inspect for excessive fouling.
 - Inspect the spark plug recess area of the cylinder head for swarf. Dirty or damaged threads can cause the spark plug not to seat correctly during installation.

[Spark Plug Visual Inspection](#)

1. Normal operation--Brown to greyish-tan with small amounts of white powdery deposits are normal combustion by-products from fuels with additives.

2. Carbon Fouled--Dry, fluffy black carbon, or soot caused by the following conditions:

- Rich fuel mixtures
- Leaking fuel injectors
- Excessive fuel pressure
- Restricted air filter element
- Incorrect combustion
- Reduced ignition system voltage output
- Weak coils
- Worn ignition wires
- Incorrect spark plug gap
- Excessive idling or slow speeds under light loads can keep spark plug temperatures so low that normal combustion deposits may not burn off.
- Deposit Fouling--Oil, coolant, or additives that include substances such as silicone, very white coating, reduces the spark intensity. Most powdery deposits will not effect spark intensity unless they form into a glazing over the electrode.

Spark Plug Replacement

Callout	Component Name
Preliminary Procedure	
Remove the ignition coil. Refer to Ignition Coil Replacement .	
	Spark Plug (Qty: 4)

Caution: Refer to [Fastener Caution](#) in the Preface section.

1

Tighten

25 N·m (18 lb ft)

Camshaft Position Actuator Solenoid Valve Replacement - Intake

Callout	Component Name
Preliminary Procedure Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .	
	Camshaft Position Actuator Solenoid Valve Fastener (Qty: 2)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 8 N·m (71 lb in)
2	Camshaft Position Actuator Solenoid Valve Procedure Disconnect the electrical connector.

Crankshaft Position Sensor Replacement

Callout

Component Name

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Preliminary Procedure

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

1	<p>Crankshaft Position Sensor Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 8 N·m (71 lb in)</p>
2	<p>Crankshaft Position Sensor</p> <p>Procedure</p> <ol style="list-style-type: none">1. Perform the crank variation learn procedure. Refer to Crankshaft Position System Variation Learn .2. Disconnect the electrical connector.

Camshaft Position Sensor Replacement - Exhaust

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .	
	Camshaft Position Sensor Fastener

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 8 N·m (71 lb in)
2	Camshaft Position Sensor Procedure Disconnect the electrical connector.

Camshaft Position Sensor Replacement - Intake

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner resonator duct. Refer to Air Cleaner Resonator Outlet Duct Replacement .	
	Camshaft Position Sensor Fastener

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 8 N·m (71 lb in)
2	Camshaft Position Sensor Procedure Disconnect the electrical connector.

Knock Sensor Replacement

Callout	Component Name
Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Preliminary Procedure	

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

1	<p>Knock Sensor Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 20 N·m (15 lb ft)</p>
2	<p>Knock Sensor</p> <p>Procedure</p> <p>Disconnect the electrical connector.</p>

Air Cleaner Outlet Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner resonator. Refer to Air Cleaner Resonator Outlet Duct Replacement .	
1	Air Cleaner Outlet Duct Clamp

Caution: Refer to [Fastener Caution](#) in the Preface section.

2

Air Cleaner Outlet Duct

Air Cleaner Resonator Outlet Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the oil level indicator.	
	Air Cleaner Resonator Outlet Duct Fastener (Qty: 2)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Air Cleaner Resonator Outlet Duct Clamp (Qty: 2)
3	Air Cleaner Resonator Outlet Duct

Air Cleaner Element Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Disconnect the air cleaner resonator duct from the air cleaner. Refer to Air Cleaner Resonator Outlet Duct Replacement .</p>	
	<p>Air Cleaner Element</p>

1

Procedure

1. Disconnect the mass airflow electrical connector.
2. Release the retaining tabs.

Air Cleaner Assembly Replacement

Callout	Component Name
Preliminary Procedure	
Disconnect the air cleaner resonator duct from the air cleaner assembly. Refer to Air Cleaner Resonator Outlet Duct Replacement .	
Air Cleaner Assembly	

Note: Ensure lower flap of Air Inlet Tube is positioned between Wiring Harness and CRFM, the Flap should not overlap harness. Squeezing the air inlet tube (squeezing the lower flap upward) during install, the flap will clear the harness and fall into the correct location when the upper retainer is secured.

1

Procedure

1. Disconnect the electrical connectors.
2. Transfer parts as necessary.

Camshaft Actuator System Description

Camshaft Position (CMP) Actuator System

The camshaft position (CMP) actuator system is an electro-hydraulic operated device used for a variety of engine performance and operational enhancements. These enhancements include lower emission output through exhaust gas dilution of the intake charge in the combustion chamber, a broader engine torque range, and improved fuel economy. The CMP actuator system accomplishes this by changing the angle or timing of the camshaft relative to the crankshaft position. The CMP actuator simply allows earlier or later intake and exhaust valve opening during the four stroke engine cycle. The CMP actuator cannot vary the duration of valve opening, or the valve lift.

During engine OFF, engine idling conditions, and engine shutdown, the camshaft actuator is held in the Park position. Internal to the CMP actuator assembly is a return spring and a locking pin. During non-phasing modes of the camshaft, the return spring rotates the camshaft back to the Park position, and the locking pin retains the CMP actuator sprocket to the camshaft.

CMP Actuator System Operation

The camshaft position (CMP) actuator system is controlled by the engine control module (ECM). The ECM sends a signal to a CMP actuator solenoid in order to control the amount of engine oil flow to a Cam Actuator passage. The pressurised engine oil is sent to unseat the locking pin, and to the vane and rotor assembly of the CMP actuator. There are 2 different passages for oil to flow through, a passage for cam advance and a passage for cam retard. The Cam Actuator is attached to a camshaft and is hydraulically operated in order to change the angle of the camshaft relative to crankshaft position (CKP). Engine oil pressure (EOP), viscosity, temperature and engine oil level can have an adverse affect on Cam Actuator performance.

Electronic Ignition System Description

[Electronic Ignition System Operation](#)

The electronic ignition system produces and controls the high energy secondary spark. This spark ignites the compressed air/fuel mixture at precisely the correct time, providing optimal performance, fuel economy, and control of exhaust emissions. The engine control module (ECM) collects information from the crankshaft position sensor, and the inlet and exhaust camshaft position sensors to determine the sequence, dwell, and timing of the spark for each cylinder. The ECM transmits a frequency signal to the ignition coil assembly on the appropriate ignition control circuit to fire the spark plugs.

[Crankshaft Position Sensor](#)

The crankshaft position sensor is an externally magnetically biased digital output integrated circuit sensing device. The sensor provides a pulse for each magnetic pole of the encoder wheel on the crankshaft. The sensor produces an ON/OFF DC voltage of varying frequency, with 58 output pulses per crankshaft revolution. The frequency of the sensor output depends on the velocity of the crankshaft. The ECM uses sensor signal pulse to determine crankshaft speed and position to calculate the best timing for ignition and fuel injection. The ECM also uses crankshaft position sensor information to control camshaft phasing, and to detect cylinder misfire.

The crankshaft position sensor is connected to the engine control module by the circuits listed below:

- A 5 V reference circuit
- A low reference circuit
- A signal circuit

[Crankshaft Encoder Wheel](#)

The crankshaft encoder wheel is part of the crankshaft. The encoder wheel consists of 58 tooth and a reference gap. Each tooth on the encoder wheel is spaced 6° apart with a 12° space for the reference gap. The pulse from the reference gap is known as the sync pulse. The sync pulse is used to synchronize the ignition coil module firing sequence with the crankshaft position, while the other tooth provides cylinder location during a revolution.

[Camshaft Position Sensors](#)

The inlet and exhaust camshaft position sensors are each triggered by a notched reluctor wheel built onto the camshaft sprockets. The four signal pulses every camshaft revolution. Each notch is a different size which is used to identify the compression stroke of each cylinder and to enable sequential fuel injection. The camshaft position sensors are connected to the ECM by the circuits listed below:

- A 5 V reference circuit
- A low reference circuit
- A signal circuit

Ignition Coil Assembly

The ignition coil assembly integrates the 4 coils and the ignition control module within a single sealed component.

The ignition coil assembly has the following circuits:

- An ignition voltage circuit
- A ground
- A low reference circuit
- 4 ignition coil control circuits

The ECM controls the individual coils by transmitting timing pulses on the ignition coil circuit of each ignition coil to enable a spark event.

The spark plugs are connected to each coil by a short boot. The boot contains a spring that conducts the spark energy from the coil to the spark plug. The spark plug electrode is coated with platinum for long wear and higher efficiency.

Engine Control Module [ECM]

The ECM controls all ignition system functions, and constantly adjusts the spark timing. The ECM monitors information from various sensor inputs that include the following:

- The crankshaft position sensor
- The accelerator pedal position (APP)
- The manifold absolute pressure (MAP) sensor
- The inlet air temperature (IAT) sensor
- The vehicle speed sensor (VSS)
- The engine knock sensor
- The engine coolant temperature (ECT) sensor
- The mass airflow (MAF) sensor
- The camshaft position sensors

Engine Control Module Description

The Engine Control Module (ECM) interacts with many emission related components and systems, and monitors emission related components and systems for deterioration. OBD II diagnostics monitor the system performance and a diagnostic trouble code (DTC) sets if the system performance degrades. The ECM is part of a network and communicates with various other vehicle control modules.

Malfunction indicator lamp (MIL) operation and DTC storage are dictated by the DTC type. A DTC is ranked as a Type A or Type B if the DTC is emissions related. Type C is a non-emissions related DTC.

The ECM is the control centre of the engine controls system. Review the components and wiring diagrams in order to determine which systems are controlled by the ECM.

The ECM constantly monitors the information from various sensors and other inputs, and controls the systems that affect engine performance and emissions. The ECM also performs diagnostic tests on various parts of the system and can turn on the MIL when it recognises an operational problem that affects emissions. When the ECM detects a malfunction, the ECM stores a DTC. The condition area is identified by the particular DTC that is set. This aids the technician in making repairs.

ECM Function

The ECM can supply 5 V or 12 V to various sensors or switches. This is done through pull-up resistors to regulated power supplies within the ECM. In some cases, even an ordinary shop voltmeter will not give an accurate reading due to low input resistance. Therefore, a digital multimeter (DMM) with at least 10 mega ohms input impedance is required in order to ensure accurate voltage readings.

The ECM controls the output circuits by controlling the ground or the power feed circuit through transistors or a device called an output driver module.

EEPROM

The electronically erasable programmable read only memory (EEPROM) is an integral part of the ECM. The EEPROM contains program and calibration information that the ECM needs in order to control engine operation.

Special equipment, as well as the correct program and calibration for the vehicle, are required in order to reprogram the ECM.

Data Link Connector (DLC)

The data link connector (DLC) provides serial data communication for ECM diagnosis. This connector allows the technician to use a scan tool in order to monitor various serial data parameters and display DTC information. The DLC is located inside the driver's compartment, underneath the dash.

[Malfunction Indicator Lamp \(MIL\)](#)

The malfunction indicator lamp (MIL) is inside the instrument panel cluster (IPC). The MIL is controlled by the ECM and illuminates when the ECM detects a condition that affects vehicle emissions.

[ECM Service Precautions](#)

The ECM, by design, can withstand normal current draws that are associated with vehicle operations. However, care must be used in order to avoid overloading any of these circuits. When testing for opens or shorts, do not ground or apply voltage to any of the ECM circuits unless the diagnostic procedure instructs you to do so. These circuits should only be tested with a DMM unless the diagnostic procedure instructs otherwise.

[Emissions Diagnosis For State I/M Programs](#)

This OBD II equipped vehicle is designed to diagnose any conditions that could lead to excessive levels of the following emissions:

- Hydrocarbons (HC)
- Carbon monoxide (CO)
- Oxides of nitrogen (NOx)
- Evaporative emission (EVAP) system losses

Should this vehicle's on-board diagnostic system (ECM) detect a condition that could result in excessive emissions, the ECM turns ON the MIL and stores a DTC that is associated with the condition.

[Aftermarket \(Add-On\) Electrical And Vacuum Equipment](#)

Caution: Do not attach add-on vacuum operated equipment to this vehicle. The use of add-on vacuum equipment may result in damage to vehicle components or systems.

Caution: Connect any add-on electrically operated equipment to the vehicle's electrical system at the 12 V battery (power and ground) in order to prevent damage to the vehicle.

Aftermarket, add-on, electrical and vacuum equipment is defined as any equipment installed on a vehicle after leaving the factory that connects to the vehicle's electrical or vacuum systems. No allowances have been made in the vehicle design for this type of equipment.

Add-on electrical equipment, even when installed to these strict guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system, such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain condition is to eliminate all of the aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, the problem may be diagnosed in the normal manner.

[Electrostatic Discharge \(ESD\) Damage](#)

Note: In order to prevent possible electrostatic discharge damage to the ECM, DO NOT touch the connector pins on the ECM.

The electronic components that are used in the control systems are often designed to carry very low voltage. These electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 V of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 V for a person to even feel a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

Emissions Control Information Label

The under bonnet Vehicle Emissions Control Information Label contains important emission specifications. This identifies the year, the displacement of the engine in litres, and the class of the vehicle.

This label is located in the engine compartment of every General Motors vehicle. If the label has been removed, it can be ordered from GM service parts operations (GMSPO).

Engine Maintenance and Fuel Monitor Description

[Maintenance Mode Description](#)

The maintenance modes are automated engine run cycles performed to mitigate the potential adverse affects to internal combustion engine (ICE) components due to limited or no engine run time. The engine control module (ECM) monitors ICE run time and fuel age and invokes the engine maintenance mode or the fuel maintenance mode when the threshold criteria is exceeded. Limited engine run time can result in component degradation, combustion by-product (water/fuel) accumulation in engine oil, and stale petrol which can lead to the following conditions:

- Insufficient engine lubrication
- Flat spots in bearings
- Water pump belt damage
- Fuel pump failure
- Blocked/restricted fuel injectors
- Rough engine operation due to stale fuel

The maintenance modes are also necessary to exercise emissions related equipment and to reduce the possibility of ICE no-start conditions. The ICE must start every time to prevent the vehicle occupants from being stranded.

[Operation](#)

Engine Maintenance Mode

The engine maintenance mode will run every 42 days if the ECM determines that the ICE run time has not been sufficient enough to purge the contaminants from the engine oil. The ECM commands the ICE to run for a contaminant burn-off time of at least 30 s after the engine coolant temperature (ECT) reaches 65°C (149°F), unless cold starts have been experienced since the last engine maintenance mode event. Between 15-90 s are added to the required contaminant burn-off time each time all of the following cold start criteria are met:

- ECT and inlet air temperature (IAT) are within 8°C (14°F) at engine start up.
- ECT and IAT are less than 20°C (68°F) at engine start up.
- ECT does not exceed 65°C (149°F) during the run cycle.

If an ECT or IAT sensor fault is present at an initial ignition cycle engine run event, a default time will be added to the required contaminant burn-off time.

The ICE runs continuously while the engine maintenance mode is active.

At power down, ICE run time duration above 65°C (149°F) ECT, is subtracted from the required contaminant burn-off time.

The engine maintenance mode timer (days since engine run) is reset to 0 when the required contaminant burn-off time is complete.

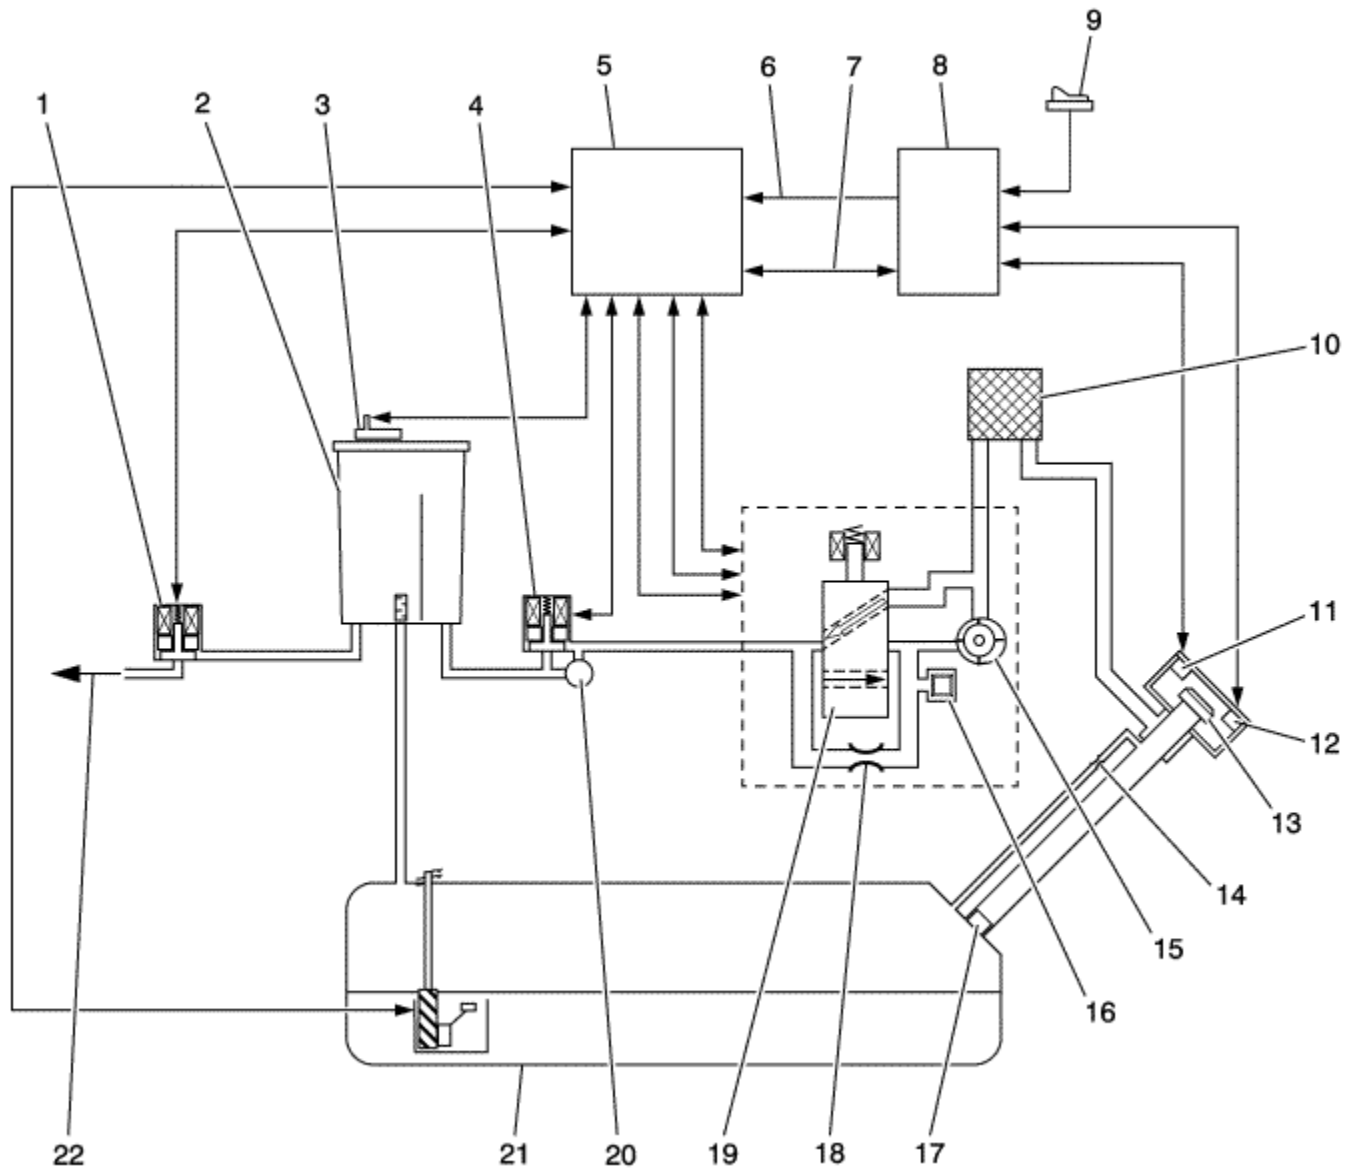

Fuel Maintenance Mode

When the ECM determines that the fuel age is greater than 365 days, the ICE will run until the fuel level is less than 1/3 tank. The ICE will cycle ON and OFF and will run as efficiently as possible while the fuel maintenance mode is active.

EVAP System Operation

The evaporative emission (EVAP) control system limits fuel vapours from escaping into the atmosphere. Fuel tank vapours are allowed to move from the fuel tank, due to pressure in the tank, through the EVAP vapour tube, into the EVAP canister. Carbon in the canister adsorbs and stores the fuel vapors. The EVAP canister stores the fuel vapors until the engine is able to use them.

This vehicle's sealed fuel system features a normally sealed fuel tank and canister to reduce canister loading during daily cycles. Different than the EVAP diagnostic hardware from conventional EVAP systems this vent solenoid valve is normally closed. This keeps the fuel vapor sealed in the fuel tank and canister. The vent solenoid valve is only open for canister purge, refueling, fuel tank pressure (FTP) sensor correlation or leak check with the EVAP leak detection pump. Additionally, excessive pressure is vented through the vent hose and EVAP canister vent solenoid valve to the atmosphere at a predetermined limit. Diagnostics are performed with the propulsion system ON and OFF.

Propulsion System OFF

The engine control module (ECM) wake-up timer, which is located in the Hybrid Powertrain Control Module 2, activates the ECM at three predetermined times so that leak detection can occur. This is where the EVAP leak detection pump hardware is used. The ECM uses several tests to determine if the EVAP system is leaking or restricted. These tests execute with the engine OFF at 5, 7, or 9.5 hours after the vehicle has been shut OFF. These soak times allow the fuel temperature and pressure to stabilize.

Propulsion System ON

EVAP purge flow, FTP sensor and EVAP leak detection pump sensor performance diagnostics are conducted.

Purge Solenoid Valve Leak Test

This vehicle does not have a purge solenoid leak test. A leaking purge solenoid will set DTCs P0442 or P0455.

[Large Leak Test](#)

This vehicle does not have an engine running version of the large leak diagnostic. The large leak diagnostic only runs when the propulsion system is not active. This is accomplished by using the EVAP leak detection pump hardware and a prior refuelling event was detected.

[Small Leak Test](#)

This vehicle does not use the engine OFF natural vacuum diagnostic for small leak detection. Instead it uses the EVAP leak detection pump hardware. This test executes when the propulsion is not active at 5, 7, or 9.5 hours after the vehicle has been shut OFF.

[EVAP System Components](#)

The EVAP system consists of the following components:

EVAP Purge Solenoid Valve

The EVAP purge solenoid valve controls the flow of vapours from the EVAP system to the inlet manifold. The purge solenoid valve opens when commanded ON by the ECM. This normally closed valve is pulse width modulated (PWM) by the ECM to precisely control the flow of fuel vapor to the engine. This valve will also be opened during some portions of the EVAP testing when the engine is running, allowing engine vacuum to enter the EVAP system.

EVAP Canister

The canister is filled with carbon pellets used to adsorb and store fuel vapors. Fuel vapor is stored in the canister until the ECM determines that the vapor can be consumed in the normal combustion process.

Fuel Tank Pressure Sensor

The FTP sensor measures the difference between the pressure or vacuum in the fuel tank and outside air pressure. The ECM provides 5 V reference, ground and signal circuit to the FTP sensor. Depending on the vehicle, the sensor can be located in the vapour space on top of the fuel tank, in the vapour tube between the canister and the tank, or on the EVAP canister. The FTP sensor provides a signal voltage back to the ECM that can vary between 0.15-4.85 V. A high FTP sensor voltage indicates a fuel tank pressure. A low FTP sensor voltage indicates a fuel tank vacuum.

EVAP Vent Solenoid Valve

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. The EVAP vent solenoid valve is normally closed. This keeps vent fuel vapor sealed in the fuel tank and canister. The EVAP vent solenoid valve is similar to a conventional vent valve, but a conventional vent valve is normally open. This vent solenoid valve is only open for canister purge, refuelling, fuel tank pressure sensor correlation or leak check with the EVAP leak detection pump.

Relief Valve

This is a mechanical pressure relieve valve that is part of the vent solenoid valve assembly. It protects the fuel tank by relieving excessive pressure or excessive vacuum that could build up in the sealed fuel tank from environmental changes.

EVAP Leak Detection Pump Assembly

The leak detection pump assembly consists of three main components. These components are integral parts of the EVAP leak detection pump assembly and are not serviceable.

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

This leak detection pump assembly is used for FTP sensor correlation and leak checking the EVAP system for small and large system leaks.

- EVAP leak detection pump pressure sensor's primary purpose is to perform leak detection diagnostics. The sensor itself is diagnosed by a correlation to barometric pressure based off the MAP sensor.
- EVAP leak detection pump 0.51mm (0.020 in) reference orifice, working in conjunction with the EVAP leak detection pump and pressure sensor. This orifice is used to establish a vacuum reference baseline for diagnosing EVAP leaks
- EVAP leak detection pump switching valve switches from a vent position to a pump position depending on the EVAP diagnostics taking place.

Fresh Air Filter

An in-line 5 micron air filter exists between the EVAP leak detection pump fresh air inlet and behind the fuel tank fill door pocket to keep the pump hardware from becoming contaminated.

Vapour Recirculation Tube

A vapor path between the fuel fill pipe and the fuel tank is necessary to fully diagnose the EVAP system. It also accommodates service diagnostic procedures by allowing the entire EVAP system to be diagnosed from the either end of the system.

2.54mm (0.100 in) Orifice in Fuel Fill Vapor Recirculation Pipe

The orifice aids refuelling, onboard refueling vapor recovery (ORVR), to avoid canister overload while still allowing closed system leak detection and compliance with ORVR emissions standards.

Fuel Fill Door Lock Solenoid

Prevents fuel fill door opening prior to pressing the Refuel Request Switch.

Fuel Fill Door Position Switch

Provides input to the Hybrid Powertrain Control Module 2 to determine if the door position is open or closed.

Fuel Fill Cap

The fuel fill cap is equipped with a seal and has no relief valve.

Fuel Fill Pipe Check Valve

The check valve on the fuel fill pipe prevents spit-back during refuelling.

Refuel Request Switch

Note: There is a 30 minute time frame for refuelling to occur. If testing the EVAP system the vent solenoid valve will go back to its normal closed state after 30 min.

Note: If more time is needed a second 1 second press of the switch will be required. Or use the scan tool to command the vent solenoid open, if necessary, for additional testing.

Located in the driver's door panel, this switch when pressed for 1 second, puts the EVAP diagnostics into an abort state, opens the vent solenoid valve for refuelling and releases the fuel fill door. A message will be displayed on the driver information centre. There is a 30 second timer on the door release mechanism allowing sufficient time to press on the fuel door to open it. If 30 seconds lapses before the fuel door is opened a second press of the refuel request switch will be required.

Fuel System Description

[Fuel System Overview](#)

The fuel system is an electronic returnless on-demand design. The returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

An electric turbine style fuel pump attaches to the fuel tank fuel pump module inside the fuel tank. The fuel pump supplies high pressure fuel through the fuel feed pipe to the fuel injection system. The fuel tank fuel pump module contains a reverse flow check valve. The check valve maintains fuel pressure in the fuel feed pipe and the fuel rail in order to enable quick engine starts.

[Electronic Returnless Fuel System](#)

The electronic returnless fuel system is a microprocessor controlled fuel delivery system which transports fuel from the tank to the fuel rail. It functions as an electronic replacement for a traditional, mechanical fuel pressure regulator. The pressure relief regulator valve within the fuel tank provides an added measure of over-pressure protection. Desired fuel pressure is commanded by the engine control module (ECM), and transmitted to the fuel pump control module via a GMLAN serial data message. A fuel pressure sensor located on the fuel feed pipe provides the feedback the fuel pump control module requires for Closed Loop fuel pressure control.

[Fuel Pump Control Module](#)

The fuel pump control module is a serviceable GMLAN module. The fuel pump control module receives the desired fuel pressure message from the ECM and controls the fuel pump located within the fuel tank to achieve the desired fuel pressure. The fuel pump control module sends a 25 kHz PWM signal to the fuel pump, and pump speed is changed by varying the duty cycle of this signal. Maximum current supplied to the fuel pump is 15 A. A fuel pressure sensor located on the fuel feed pipe provides fuel pressure feedback to the fuel pump control module.

[Fuel Pressure Sensor](#)

The fuel pressure sensor is a serviceable 5 V, 3-pin device. It is located on the fuel feed pipe forward of the fuel tank, and receives power and ground from the fuel pump control module through a vehicle wiring harness. The sensor provides a fuel pressure signal to the fuel pump control module, which is used to provide Closed Loop fuel pressure control.

[Fuel Tank](#)

The fuel tank stores the fuel supply. The fuel tank is located in the rear of the vehicle. The fuel tank is held in place by 2 metal straps that are attached to the underbody. The

fuel tank is molded from high-density polyethylene.

Fuel Fill Pipe

The fuel fill pipe has a built-in restrictor in order to prevent refueling with leaded fuel.

Fuel Filler Cap

The fuel fill pipe has a tethered fuel filler cap. A torque-limiting device prevents the cap from being over-tightened. To install the cap, turn the cap clockwise until you hear audible clicks. This indicates that the cap is tightened to the proper torque and fully seated.

Fuel Tank Fuel Pump Module

The fuel tank fuel pump module consists of the following major components:

- The fuel level sensor
- The fuel pump and reservoir assembly
- The fuel filter
- The pressure relief regulator valve

Fuel Level Sensor

The fuel level sensor consists of a float, a wire float arm, and a ceramic resistor card. The position of the float arm indicates the fuel level. The fuel level sensor contains a variable resistor which changes resistance in correspondence with the position of the float arm.

Fuel Pump

The fuel pump is mounted in the fuel tank fuel pump module reservoir. The fuel pump is an electric turbine style pump which pumps fuel to the fuel injection system at a pressure that is based on feedback from the fuel pressure sensor. The fuel pump delivers a constant flow of fuel even during low fuel conditions and aggressive vehicle maneuvers. The fuel pump flex pipe acts to dampen the fuel pulses and noise generated by the fuel pump.

Pressure Relief Regulator Valve

The pressure relief regulator valve replaces the typical fuel pressure regulator used on a mechanical returnless fuel system. The pressure relief regulator valve is closed during normal vehicle operation. The pressure relief regulator valve is used to vent pressure during hot soaks and also functions as a fuel pressure regulator in the event of the fuel pump control module defaulting to 100 percent pulse width modulation (PWM) of the fuel pump. Due to variation in the fuel system pressures, the opening pressure for the pressure relief regulator valve is set higher than the pressure that is used on a mechanical returnless fuel system pressure regulator.

Nylon Fuel Pipes

Nylon pipes are constructed to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature.

Heat resistant rubber hose or corrugated plastic conduit protects the sections of the pipes that are exposed to chafing, high temperature, or vibration.

Nylon fuel pipes are somewhat flexible and can be formed around gradual turns under the vehicle. However, if nylon fuel pipes are forced into sharp bends, the pipes kink and restrict the fuel flow. Also, once exposed to fuel, nylon pipes may become stiffer and are more likely to kink if bent too far. Take special care when working on a vehicle with nylon fuel pipes.

Quick-Connect Fittings

Quick-connect fittings provide a simplified means of installing and connecting fuel system components. The fittings consist of a unique female connector and a compatible male pipe end. O-rings, located inside the female connector, provide the fuel seal. Integral locking tabs inside the female connector hold the fittings together.

Fuel Rail Assembly

The fuel rail assembly is attached to the cylinder head. The fuel rail assembly performs the following functions:

- Positions the injectors in the inlet ports of the cylinder head
- Distributes fuel evenly to the injectors

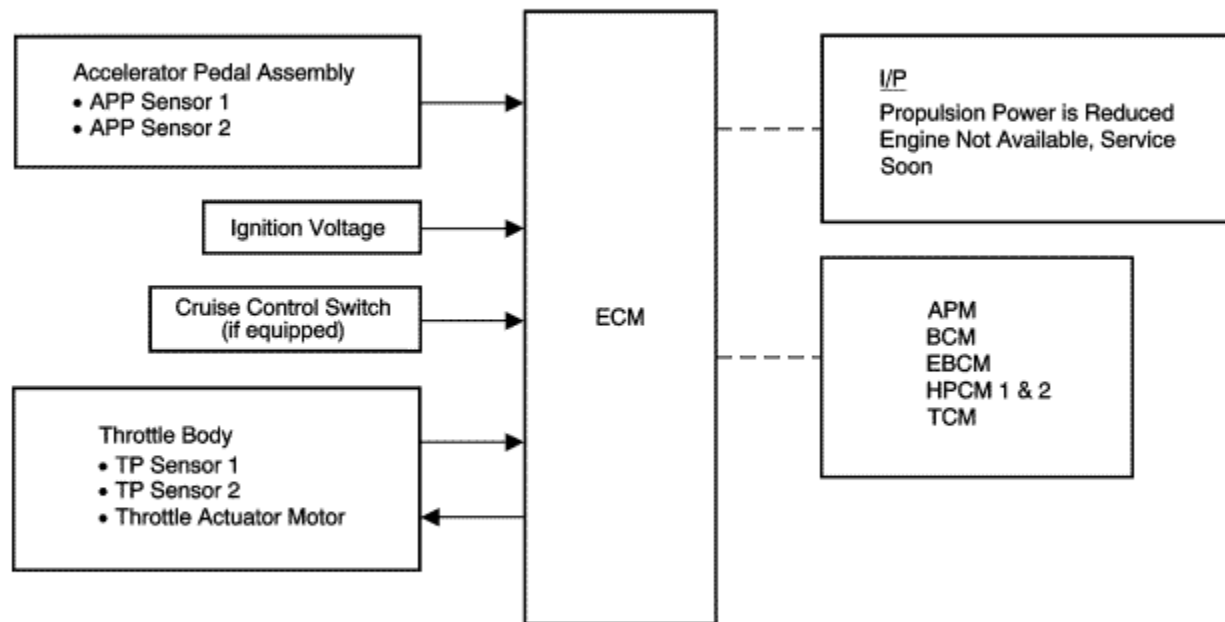

Fuel Injectors

The fuel injector assembly is a solenoid device controlled by the ECM that meters pressurised fuel to a single engine cylinder. The ECM energises the high-impedance, 12 ohms, injector solenoid (4) to open a normally closed ball valve (1). This allows fuel to flow into the top of the injector, past the ball valve, and through a director plate (3) at the injector outlet. The director plate has machined holes that control the fuel flow, generating a spray of finely atomised fuel at the injector tip (2). Fuel from the injector tip is directed at the inlet valve, causing the fuel to become further atomised and vapourised before entering the combustion chamber. This fine atomisation improves fuel economy and emissions.

Throttle Actuator Control (TAC) System Description

Circuit/System Description

The system torque coordination is provided by the hybrid powertrain control module. The engine control module (ECM) provides the accelerator pedal interface in which the driver requests a vehicle torque. These driver requests are coordinated and arbitrated within the ECM and the final driver requested torque is sent to the hybrid powertrain control module. The hybrid powertrain control module then determines how the torque output will be distributed between the two electric motors and the engine. After the torque distribution has been determined, torque reductions are imposed based upon system interrupts that are listed below:

- Vehicle stability
- Torque security
- Component overheating protection

The final arbitrated values are distributed to the system. Torque coordination of the system depends directly upon the high voltage battery pack state of charge.

This system is a distributed control system where the system torque is controlled over a system network. The system network consists of serial data communications between the controllers listed below:

- Engine control module (ECM)
- Hybrid powertrain control module 1 and 2 (HPCM 1 and 2)
- Transmission control module (TCM)
- Electronic brake control module (EBCM)
- Accessory Power Module (APM)

The hybrid powertrain control module determines the engine speed which is based on the high voltage battery pack state of charge. The ECM achieves throttle positioning by providing a pulse width modulated voltage to the throttle actuator motor. The throttle blade is spring loaded in both directions, and the default position is slightly open.

Modes Of Operation

Normal Mode

During the operation of the TAC system, several modes, or functions, are considered normal. The following modes may be entered during normal operations:

- Minimum pedal value--At Vehicle ON, the ECM updates the learned minimum pedal value.
- Minimum throttle position values--At Vehicle ON, the ECM updates the learned minimum throttle position value. In order to learn the minimum throttle position value, the throttle blade is moved to the closed position.
- Ice break mode--If the throttle blade is not able to reach a predetermined minimum throttle position, the ice break mode is entered. During the ice break mode, the ECM commands the maximum pulse width several times to the throttle actuator motor in the closing direction.
- Battery saver mode--After a predetermined time without engine speed, the ECM commands the battery saver mode. During the battery saver mode, the ECM disables the TAC motor control circuits, which removes the current draw used to maintain the engine speed and allows the throttle to return to the spring loaded default position.

Reduced Power Mode

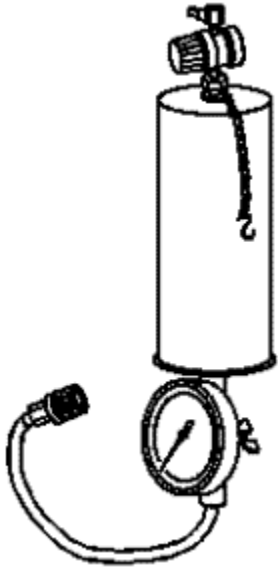

When the ECM detects a condition with the TAC system, the ECM may enter a propulsion power reduced mode. Propulsion power reduced mode may cause one or more of the following conditions:

- Acceleration limiting--The ECM will continue to use the accelerator pedal for propulsion control, however, the vehicle acceleration is limited.
- Limited throttle mode--The ECM will continue to use the accelerator pedal for propulsion control, however, the propulsion power is reduced.
- Throttle default mode--The ECM will turn OFF the throttle actuator motor, and the throttle will return to the spring loaded default position.

- Forced idle mode--The ECM will ignore the accelerator pedal input.
- Engine shutdown mode--The ECM will disable fuel and de-energise the throttle actuator.

Low Reference	-	-40°C (-40°F)	-40°C (-40°F)*

* Internal ECM or sensor damage may occur if the circuit is shorted to B+.

Circuit/System Description

The radiator coolant temperature (RCT) sensor is a variable resistor that measures the temperature of the engine coolant in the radiator. The engine control module (ECM) supplies 5 volts to the RCT signal circuit and supplies a ground to the low reference circuit.

The following table illustrates the difference between temperature, resistance, and voltage:

RCT	RCT Resistance	RCT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

P00B3

- The engine run time is greater than 10 seconds.
- The inlet air temperature (IAT) is colder than 70°C (158°F).
- The DTC runs continuously when the above conditions are met.

P00B4

- The engine run time is greater than 60 seconds.
- The inlet air temperature (IAT) is warmer than -7°C (19°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P00B3

The ECM detects that the RCT sensor is warmer than 149°C (300°F) for greater than 10 seconds.

P00B4

Note: The scan tool only displays to -40°C (-40°F).

The ECM detects that the RCT sensor is colder than -60°C (-76°F) for greater than 10 seconds.

[Action Taken When the DTC Sets](#)

DTC P00B3 and P00B4 are Type B DTCs.

[Conditions for Clearing the MIL/DTC](#)

DTC P00B3 and P00B4 are Type B DTCs.

[Diagnostic Aids](#)

- As the thermostat opens, the RCT sensor temperature should rise steadily, then stabilise once the thermostat opens completely.
- Test the RCT sensor at various temperature levels in order to evaluate the possibility of a skewed sensor.
- If the vehicle has sat for greater than 8 hours, the RCT sensor and the ECT sensor values should display within 3°C (5°F).

Circuit/System Verification

1. Engine running, observe the DTC information with a scan tool. DTCs P00B3 or P00B4 should not set.
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B203 engine coolant temperature sensor.
2. Vehicle OFF, all systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
3. Vehicle in Service Mode, verify the scan tool Radiator Coolant Temperature Sensor parameter is at -40°C (-40°F).
If warmer than the specified range, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K20 ECM.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

4. Install a 1 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1. Verify the Radiator Coolant Temperature Sensor parameter is at 140°C (284°F).
If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
5. If all circuits test normal, test or replace the B203 engine coolant temperature sensor.

Component Testing

1. Vehicle OFF, remove the B203 engine coolant temperature sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the engine coolant temperature sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) table and verify that the resistance is within 5 percent of the specification.
If not within the specified range, replace the B203 engine coolant temperature sensor.

Circuit Description

The engine coolant temperature sensor is a variable resistor that measures the temperature of the engine coolant in the radiator. The engine control module (ECM) supplies 5 volts to the engine coolant temperature signal circuit and supplies a ground to the low reference circuit. The purpose of this diagnostic is to determine if the input from the RCT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the engine is OFF. If the required engine OFF time is met at start-up, the ECM will compare the temperature difference between the actual measured RCT and ECT sensors.

The following table illustrates the difference between temperature, resistance, and voltage:

RCT	RCT Resistance	RCT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

- DTCs P00B3, P00B4, P0112, P0113, P0116, P0117, P0118, P0502, P0503 or P2610 are not set.
- The vehicle has been OFF and the propulsion system inactive for greater than 8 hours before vehicle ON.
- The vehicle is ON, or the engine is running.
- The inlet air temperature (IAT) is warmer than -7°C (19°F).
- The fuel level is greater than 10 percent.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM determines the absolute difference of temperature between the RCT start up temperature and ECT start up temperature is greater than 20°C (68°F).

Action Taken When the DTC Sets

DTC P00B6 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P00B6 is a Type B DTC.

Diagnostic Aids

- As the thermostat opens, the radiator coolant temperature sensor signal should rise steadily, then stabilise once the thermostat opens completely.
- Inspect for the correct operation of the engine cooling system and verify the correct coolant level.

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

[Circuit/System Verification](#)

1. Engine running, observe the DTC information with a scan tool. DTC P00B3, P00B4, P0117, P0118, P0597, P0598, or P0599 should not be set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks. Refer to [Cooling System Draining and Filling](#) and [Loss of Coolant](#).
3. Engine ticking over for 15 minutes with the A/C OFF.

Note: Depending on ambient temperature, it may take up to 4 minutes for the temperatures to equalise.

4. Command the engine coolant thermostat heater to 100 percent with a scan tool. Increase the engine speed to wide open throttle. Observe the scan tool radiator coolant temperature sensor and ECT sensor parameters. The radiator coolant temperature sensor and the ECT sensor parameters should be within 20°C (68°F).
5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B203 engine coolant temperature sensor.
2. Vehicle OFF, all systems OFF. This may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.
3. Vehicle in Service Mode, verify the scan tool Radiator Coolant Temperature Sensor parameter is at -40°C (-40°F).
If warmer than the specified range, test the signal circuit terminal 2 for a short to ground. If the circuit tests normal, replace the K20 ECM.

Note: If the fuse in the jumper wire opens, the signal circuit is shorted to a voltage and the sensor may be damaged.

4. Install a 1 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1. Verify the scan tool Radiator Coolant Temperature Sensor parameter is at 140°C (284°F).
If less than specified range, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
5. If all circuits test normal, test or replace the B203 ECT sensor.

Component Testing

1. Vehicle OFF, remove the B203 ECT sensor.

Note: A thermometer can be used to test the sensor off the vehicle.

2. Test the engine coolant temperature sensor by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance](#) table and verify that the resistance is within 5 percent of the specification.
If not within the specified range, replace the B203 ECT sensor.

[DTC Descriptors](#)

DTC P00B7: Radiator Coolant Temperature (RCT) Insufficient Flow

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Coolant Temperature Sensor Signal	P00B3	P00B4	P00B4*	P00B6
Low Reference	-	P00B4	P00B4*	P00B6

* Internal ECM or sensor damage may occur if the circuit is shorted to B+.

[Typical Scan Tool Data](#)

[Radiator Coolant Temperature Sensor](#)

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running in Closed Loop			
Parameter Normal Range: Varies with ambient temperature			
Radiator Coolant Temperature Sensor Signal	140°C (284°F)	-40°C (-40°F)	-40°C (-40°F)*
Low Reference	-	-40°C (-40°F)	-40°C (-40°F)*

* Internal ECM or sensor damage may occur if the circuit is shorted to B+.

Circuit Description

The engine control module (ECM) monitors the temperature of the engine radiator coolant. The ECM controls the thermostat with a pulse width modulated (PWM) signal. The ECM compares the radiator coolant temperature to the engine coolant temperature in order to determine if there sufficient coolant flow through the thermostat.

Conditions for Running the DTC

- DTCs P00B3, P00B4, P00B6, P0116, P0117, and P0118 are not set.
 - The engine run time is greater than 45 s.
- OR
- The engine coolant temperature is greater than 70°C (158°F).
 - The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

Note: The scan tool display range is between -40 and + 150°C (-40 and +302°F).

The ECM detects the difference between the RCT sensor and the ECT sensor is greater than 45°C (81°F) when the ECT sensor is warmer than 117°C (242°F) for greater than 5 s.

Action Taken When the DTC Sets

DTC P00B7 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P00B7 is a Type B DTC.

Diagnostic Aids

- The thermostat has a mechanical fail-safe in case of an electrical condition with the thermostat heater. The mechanical thermostat will open at approximately 80°C (176°F). The mechanical thermostat will cycle from approximately 85°C (185°F) to approximately 102°C (215°F).
- A resistance condition in the RCT sensor circuits may cause this DTC. This condition results in a greater voltage on the RCT sensor signal circuit, which is interpreted by the ECM as a colder RCT.

Circuit/System Verification

1. Vehicle in Service Mode, observe the DTC information with a scan tool. DTC P00B3, P00B4, P00B6, P0117, P0118, P0597, P0598, and P0599 should not be set. If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks. Refer to [Cooling System Draining and Filling](#) and [Loss of Coolant](#) .
3. Verify the engine cooling fan operates. Refer to [Cooling Fan Malfunction - DTC P148A-P148C](#) .
4. Engine ticking over for 15 minutes with the A/C OFF.

Note: Depending on ambient temperature, it may take up to 4 minutes for the temperature to decrease less than the specified value.

5. Command the Engine Coolant Thermostat Heater to 100 percent with a scan tool. Increase the engine speed to wide open throttle. Observe the scan tool ECT sensor parameter. The temperature should decrease to less than 85°C (185°F).
6. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Vehicle OFF, inspect the cooling system for the conditions below. Refer to [Symptoms - Engine Cooling](#) .

- Weak coolant solution
- Obstructed radiator air flow or bent radiator fins
- Blocked cooling system passages
- Radiator hoses that are restricted, collapsed, or deteriorated
- Damaged water pump and or belt
- Loss of cooling system pressure
 - Leaking surge tank cap
 - Radiator hoses
- Cylinder head or an engine block that is cracked or plugged

If you find any of the above conditions, repair as necessary.

2. If all conditions test normal, replace the E41 engine coolant thermostat heater.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Water Inlet Replacement

*Opens the fuse that supplies voltage to the engine coolant thermostat

[Circuit/System Description](#)

The engine control module (ECM) controls the pulse width modulated (PWM) thermostat. The thermostat controls coolant flow and regulates the engine operating temperature. Ignition voltage is supplied directly to the thermostat. The ECM controls the thermostat by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTCs

- The ignition is ON or the engine is running.
- The DTCs run continuously once the above condition is met

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 15 seconds.

Action Taken When the DTC Sets

- DTCs P0597, P0598, and P0599 are Type B DTCs.
- The engine control module commands the engine cooling fans ON.

Conditions for Clearing the DTC

DTCs P0597, P0598, and P0599 are Type B DTCs.

Diagnostic Aids

The thermostat has a mechanical fail-safe in case of an electrical condition with the thermostat heater. The mechanical thermostat will open at approximately 80°C (176°F). The mechanical thermostat will cycle from approximately 85°C (185°F) to approximately 102°C (215°F).

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Ignition ON, engine running, observe the DTC information with a scan tool. DTC P0685, P0689, P0690 or P1682 should not be set.
If a DTC is set, refer to [DTC P0685, P0689, P0690, or P1682](#) .
2. Engine running, observe the following scan tool control circuit status parameters.
 - Engine Coolant Thermostat Heater Control Circuit Low Voltage Test Status
 - Engine Coolant Thermostat Heater Control Circuit Open Test Status
 - Engine Coolant Thermostat Heater Control Circuit High Voltage Test StatusEach parameter should display OK or Not Run.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the E41 engine coolant thermostat heater.
2. Service Mode active, verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance. If the circuit tests normal and the ignition circuit fuse is open, test all the components connected to the ignition circuit and replace as necessary.
3. Command the Engine Coolant Thermostat Heater to 10 % with a scan tool. Test for 2.5-3.5 V between the control circuit terminal 2 and ground.
If less than the specified range, test the control circuit for a short to ground or an open/high resistance. If the circuit/connections test normal, replace the K20 ECM.
If greater than the specified range, test the control circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
4. Command the Engine Coolant Thermostat Heater to 100 % with a scan tool. The DMM should transition from 2.5-3.5 V when commanded to 10 % to less than 0.1 V when commanded to 100 %.
If the circuit voltage does not correspond to the specified values, replace the K20 ECM.
5. If all circuits test normal, test or replace the E41 engine coolant thermostat heater.

[Repair Instructions](#)

DTC P1485-P1487

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P1485: Cooling Fan Output Circuit

DTC P1486: Cooling Fan Output Circuit Low Voltage

DTC P1487: Cooling Fan Output Circuit High Voltage

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cooling Fan Output Circuit	P148B, P1486	P148A, P1485	P148C, P1487	-
Fans operate at 90% with all malfunctions				

[Circuit/System Description](#)

The hybrid powertrain control module 2 (HPCM 2) controls the radiator cooling fans with a pulse width modulated (PWM) signal to the cooling fan control modules. The HPCM 2 supplies a regulated 12 volts to the engine control module (ECM) via the cooling fan output circuit. The ECM modulates the output circuit to ground to request operation of the engine radiator cooling fans in response to predetermined internal combustion engine (ICE) coolant temperatures. The HPCM 2 uses the request from the ECM, along with other inputs such as the need for power electronics, high voltage battery, or HVAC cooling to determine the total percentage of cooling fan operation in a range of 0-100 percent. The ECM cooling fan output circuit is controlled with a solid state device called a driver. The driver is equipped with a feedback circuit which is pulled up to a voltage within the controller. The ECM can determine if the output circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

[Conditions for Running the DTC](#)

- DTC P2537 is not set.
- The 12 V battery voltage is equal to or greater than 11 V.
- The accessory circuit is active for greater than 5 seconds.
- DTCs P1485, P1486, and P1487 run continuously when the conditions above are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the output circuit do not match for greater than 5 seconds.

Action Taken When the DTC Sets

DTCs P1485, P1486 and P1487 are type B DTCs.

Conditions for Clearing the DTC

DTCs P1485, P1486 and P1487 are type B DTCs.

Diagnostic Aids

DTCs P1485, P1486 and P1487 will not keep the cooling fans from operating. If one of these DTCs is set the HPCM 2 commands the cooling fans to 90%. If the cooling fans do not operate, refer to [Cooling Fan Malfunction - DTC P148A-P148C](#) for further diagnosis.

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Engine running. Observe the DTC information with a scan tool. DTC P1485, P1486, or P1487 should not be set.
2. Observe the scan tool parameters listed below:
 - Cooling Fan Control Circuit Open Test Status
 - Cooling Fan Control Circuit Low Voltage Test Status
 - Cooling Fan Control Circuit High Voltage Test StatusEach of the parameters should display OK or Not Run.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K114B HPCM 2.

Note: The cooling fan output circuit is pulled-up to a voltage within the ECM. 3-4 V measured on this circuit with the HPCM 2 harness connector disconnected is normal.

2. Vehicle in Service Mode, test for 3-4 V between the ECM cooling fan output circuit terminal X2-9 and ground.
If less than the specified range, test the circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
3. If all circuits test normal, replace the K114B HPCM 2.

DTC P2181

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P2181: Engine Cooling System Performance

Circuit/System Description

The engine control module (ECM) monitors temperature difference between the engine coolant temperature (ECT) sensor and the radiator coolant temperature (RCT) sensor during a cold start-up. The purpose of this diagnostic is to analyse the engine coolant thermostat for being stuck open.

Conditions for Running the DTC

- DTCs P00B3, P00B4, P00B6, P0101, P0102, P0103, P0111, P0112, P0113, P0114, P0116, P0117 or P0118 are not set.
- The engine run time is between 70 s and 30 min.
- The engine coolant temperature (ECT) sensor at start-up is between -10°C to +59°C (14°F to 138°F).
- The inlet air temperature (IAT) sensor is between -7°C to +60°C (-4°F to +140°F).
- The airflow into the engine is between 1 to 100 g/s.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM detects the engine coolant thermostat is stuck open for at least 2.5 min.

Action Taken When the DTC Sets

DTC P2181 is a Type B DTC

[Conditions for Clearing the DTC](#)

DTC P2181 is a Type B DTC

[Diagnostic Aids](#)

- Insufficient vehicle interior heating is an indication of incorrect thermostat operation.
- The scan tool Desired ECT Sensor and the ECT Sensor parameters should be within 5°C (9°F) when the engine is at operating temperature.
- A resistance condition in the ECT sensor circuits may cause this DTC. This condition results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Engine running, observe the DTC information with a scan tool. DTC P00B3, P00B4, P00B6, P0117 or P0118 should not be set.
If a DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
2. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks. Refer to [Cooling System Draining and Filling](#) and [Loss of Coolant](#).

Note: Depending on ambient temperature, it may take up to 4 min for the temperature to increase above the specified value.

3. Engine idling for 15 min with the A/C OFF. Verify the engine cooling fan is not ON at all times.
4. Command the Engine Coolant Thermostat Heater to 0 % with a scan tool. Increase the engine speed to wide open throttle. Observe the scan tool ECT sensor parameter. The temperature should increase to greater than 102°C (215°F).
If less than the specified value, replace the E41 engine coolant thermostat heater.
5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Water Inlet Replacement

Symptoms - Engine Cooling

Important Preliminary Inspections Before Starting

Before using the Symptom diagnosis, perform the following:

- Perform [Diagnostic System Check - Vehicle](#) and verify all of the following items:
 - Ensure that the engine control module (ECM) and indicator lamp are operating correctly.
 - Ensure that there are no diagnostic trouble codes (DTCs) that are stored.
 - Scan tool data is within a normal operating range.
- Verify the customer concern.
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important, and can lead to correcting a condition without additional testing. It may also help reveal the cause of an intermittent condition.
- Locate the correct symptom. Perform the tests and inspections associated with the symptom.

Review the entire cooling system operation in order to familiarise yourself with the system functions. Refer to [Cooling System Description and Operation](#) and [Hybrid Cooling System Description and Operation](#) .

Visual/Physical Inspection

Caution: Use the connector test adapter kit EL-35616-F for any test that requires probing the following items:

- The control module harness connectors
- The electrical centre fuse/relay cavities
- The component terminals
- The component harness connector

Using this kit will prevent damage caused by the improper probing of connector terminals.

Several of the symptom procedures call for a careful visual and physical inspection. This can lead to correcting a condition without further tests and can save time. This inspection should include the following areas:

- Ensure that all control module grounds are clean, tight, and correctly located.
- Inspect cooling system hoses and pipes for splits, kinks, and proper connections. Inspect thoroughly for any type of a leak or a restriction.

- Inspect for a dirty or restricted engine cooling radiator and HVAC condenser.
- Inspect for aftermarket devices which could affect the operation of the Cooling System.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the surge tank reservoirs for the proper coolant level.

[Identifying Intermittent Conditions](#)

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movement of a component. Refer to the following for a list to help isolate an intermittent condition:

- Moisture and water intrusion in connectors, terminals, and components
- Connector mating
- Terminal contact
- High circuit or component resistance-High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Harnesses that are routed too tight, or chafed circuits
- High or low ambient temperature
- High or low engine coolant temperatures
- High underhood temperatures
- Heat build up in component or circuit due to circuit resistance, poor terminal contact, or high electrical load
- High or low system voltage
- High vehicle load conditions
- Rough road surface
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge
- Incorrect installation of non-factory, aftermarket, and after factory add on accessories

If an intermittent is detected, refer to [Testing for Intermittent Conditions and Poor Connections](#) for specific strategies in diagnosing intermittent conditions.

[Symptom List](#)

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Cooling Fan Malfunction - DTC P148A-P148C](#)
 - [Engine Overheating](#)
 - [Loss of Coolant](#)
 - [Thermostat Diagnosis](#)
 - [Engine Fails To Reach Normal Operating Temperature](#)
-

13	<p>Is the repair complete?</p>		System OK	-

Engine Fails To Reach Normal Operating Temperature

Step	Action	Value(s)	Yes	No
1	Check the coolant level in the radiator surge tank. Refer to Cooling System Draining and Filling . Is the coolant at the proper level?	-	Go to Step 3	Go to Step 2
2	Add coolant to the radiator surge tank as necessary. Does the engine still fail to reach normal operating temperatures?	-	Go to Step 3	System OK
3	Check for a blockage in the coolant passages. Are there any blockages in the coolant passages?	-	Go to Step 4	Go to Step 5
4	Flush the cooling system or flow check the radiator. Does the engine still fail to reach normal operating temperatures?	-	Go to Step 5	System OK
5	Check to see if the incorrect thermostat was installed or if it is stuck or sticks in the open position. Was the incorrect thermostat installed, or is it stuck or does it stick in the open position?	-	Go to Step 6	-
6	Replace the thermostat. Refer to Water Inlet Replacement . Does the engine still fail to reach normal operating temperature?	-	-	System OK

Pressure Cap Testing

Special Tools

- *GE-42401-A* Radiator Cap and Surge Tank Test Adapter
- *EN-24460-A* Cooling System Pressure Tester

For equivalent regional tools, Refer to [Special Tools](#)

[Pressure Cap Testing](#)

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the pressure cap.
2. Wash the pressure cap sealing surface with water.

Note: Lubricate *GE-42401-A* Radiator Cap and Surge Tank Test Adapter and pressure cap O-rings with coolant and press cap to seat O-ring on *GE-42401-A* Radiator Cap and Surge Tank Test Adapter before turning to engage threads.

3. Use the *EN-24460-A* Cooling System Pressure Tester (1) with *GE-42401-A* Radiator Cap and Surge Tank Test Adapter (2) in order to test the pressure cap.
4. Test the pressure cap for the following conditions:
 - Pressure release when the *EN-24460-A* Cooling System Pressure Tester exceeds the pressure rating of the pressure cap.
 - Maintain the rated pressure for at least 10 seconds.
Note the rate of pressure loss.
5. Replace the pressure cap under the following conditions:
 - The pressure cap does not release pressure which exceeds the rated pressure of the cap.
 - The pressure cap does not hold the rated pressure.

Cooling System Leak Testing

Special Tools

- *EN-24460-A* Cooling System Pressure Tester
- *GE-42401-A* Radiator Cap and Surge Tank Test Adapter

For equivalent regional tools, Refer to [Special Tools](#)

Warning: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, wings, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

Warning: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

1. Remove the pressure cap.
2. Test the operation of the pressure cap. Refer to [Pressure Cap Testing](#) .
3. Wash the pressure cap mating surface with water.

4. Use the *EN-24460-A* Cooling System Pressure Tester with the *GE-42401-A* Radiator Cap and Surge Tank Test Adapter in order to apply pressure to the cooling system.

Do not exceed the pressure cap rating.

5. The cooling system should hold the rated pressure for at least 2 minutes.

Observe the gauge for any pressure loss.

6. Repair any leaks as required.

Cooling System Draining and Filling

Special Tools

- GE-26568 Coolant and Battery Tester
- GE-47716 Vac-N-Fill Coolant Refill Tool
- GE-42401-A Radiator Cap and Surge Tank Test Adapter

For equivalent regional tools, Refer to [Special Tools](#)

Draining Procedure

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. To drain the engine radiator, remove the engine coolant temperature sensor from the radiator. Refer to [Engine Coolant Temperature Sensor Replacement](#)

2. Attach the venturi assembly to the vacuum tank.

3. Attach a shop air hose to the venturi assembly.

Ensure the valve on the venturi assembly is closed.

4. Attach the vacuum hose to the vacuum tank.

5. Attach the extraction hose to the vacuum hose.
6. Insert the extraction hose into the radiator outlet front hose until the extraction hose contacts the bottom of the radiator outlet hose.

7. Open the valve on the venturi assembly to start a vacuum draw.
8. Use the extraction hose to draw out coolant until the radiator is empty.
9. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

10. If a complete engine block drain is required, remove the engine block drain plug.
11. To drain the heater cooling loop, remove the hose from the inlet of the heater water auxiliary pump. Refer to [Heater Water Auxiliary Pump Replacement](#)
12. Inspect the coolant.
13. Follow the appropriate procedure based on the condition of the coolant.
 - Normal in appearance--Follow the filling procedure.
 - Discolored--Follow the flush procedure. Refer to [Flushing](#)

[Vac-N-Fill Procedure](#)

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

Note: To prevent boiling of the coolant/water mixture in the vehicles cooling system, do not apply vacuum to a cooling system above 49°C (120°F). The tool will not operate properly when the coolant is boiling.

1. Install *GE-42401-2* Radiator Cap and Surge Tank Test Adapter into the surge tank fill neck.
2. Install *GE-42401-3* Radiator Cap and Surge Tank Test Adapter to the surge tank fill neck.
3. Attach the Vac N Fill cap to the *GE-42401-3* Radiator Cap and Surge Tank Test Adapter .

4. Attach the vacuum gauge assembly to the Vac N Fill cap.

5. Attach the fill hose to the barb fitting on the vacuum gauge assembly.

Ensure that the valve is closed.

Note: Use a 50/50 mixture of DEX-COOL antifreeze and de-ionized water.

Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

6. Pour the coolant mixture into the graduated reservoir.
7. Place the fill hose in the graduated reservoir.

Note: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

8. Install the vacuum tank on the graduated reservoir with the fill hose routed through the cut-out area in the vacuum tank.

9. Attach the venturi assembly to the vacuum tank.

10. Attach a shop air hose to the venturi assembly.

Ensure the valve on the venturi assembly is closed.

11. Attach the vacuum hose to the vacuum gauge assembly and the vacuum tank.

12. Position the passenger compartment heater coolant control solenoid valve to normal using GDS. The hybrid powertrain control module 2 controls the passenger compartment heater coolant control solenoid Valve

13. Open the valve on the venturi assembly. The vacuum gauge will begin to rise and a hissing noise will be present.

14. Continue to draw vacuum until the needle stops rising. This should be 610-660 mm Hg (24-26 in Hg).

Cooling hoses may start to collapse. This is normal due to vacuum draw.

15. To aid in the fill process, position the graduated reservoir above the coolant fill port.

16. Slowly open the valve on the vacuum gauge assembly. When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.

17. Close the valve on the venture assembly.

18. If there is a suspected leak in the cooling system, allow the system to stabilise under vacuum and monitor for vacuum loss.

If vacuum loss is observed, refer to [Loss of Coolant](#) .

19. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

20. Once the vacuum gauge reaches zero, close the valve on the vacuum gauge.

21. Repeat steps 14-21 one time.

22. Detach the Vac N Fill cap from the *GE-42401-3* Radiator Cap and Surge Tank Test Adapter .
23. Remove *GE-42401-2* Radiator Cap and Surge Tank Test Adapter from the surge tank fill neck.
24. Add coolant to the system as necessary.
25. Turn on the auxiliary coolant pump for 2 minutes using the GDS. The remote HVAC module controls the auxiliary coolant pump.
26. Start the engine.
27. Using GDS, increase the speed to 2000 rpm until the thermostat opens (approximately 100C).

Note: Do not allow engine coolant temperature to exceed 110C or damage to the Coolant Heater Control Module could occur.

28. Turn engine off.
29. Turn on the auxiliary coolant pump for 1 minute using GDS.
30. Turn off the auxiliary coolant pump and wait 5 minutes.
31. Repeat steps 24-30, three times.
32. Inspect the concentration of the coolant mixture using *GE-26568* Coolant and Battery Tester .

Note: After filling the cooling system, the extraction hose can be used to remove excess coolant to achieve the proper coolant level.

33. Detach the vacuum hose from the vacuum gauge assembly.
34. Attach the extraction hose to the vacuum hose.

35. Open the valve on the venturi assembly to start a vacuum draw.

36. Use the extraction hose to draw out coolant to the proper level.
37. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

Flushing

Note: This procedure is intended for the engine cooling system only. Never use this procedure to flush the hybrid cooling system.

Note: Do not use a chemical flush.

Store used coolant in the proper manner, such as in a used engine coolant holding tank. Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical. Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.

Various methods and equipment can be used to flush the cooling system. If special equipment is used, such as a back flusher, follow the manufacturer's instruction. Always remove the thermostat before flushing the cooling system.

When the cooling system becomes contaminated, the cooling system should be flushed thoroughly to remove the contaminants before the engine is seriously damaged.

1. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) .
2. Remove the coolant recovery reservoir. Refer to [Coolant Recovery Reservoir Replacement](#) .
3. Clean and flush the coolant recovery reservoir with clean, drinkable water.
4. Install the coolant recovery reservoir. Refer to [Coolant Recovery Reservoir Replacement](#) .
5. Follow the drain and fill procedure using only clean, drinkable water. Refer to [Cooling System Draining and Filling](#) .
6. Run the engine for 20 minutes.
7. Stop the engine.
8. Drain the cooling system. Refer to [Cooling System Draining and Filling](#)
9. Repeat the procedure if necessary, until the fluid is nearly colorless.
10. Fill the cooling system. Refer to [Cooling System Draining and Filling](#) .

Radiator Cleaning

Warning: NEVER spray water on a hot heat exchanger. The resulting steam could cause personal injury.

Caution: The heat exchanger fins are necessary for good heat transfer. Do not brush the fins. This may cause damage to the fins, reducing heat transfer.

Note: Remove bugs, leaves, dirt and other debris by blowing compressed air through the engine side of the radiator.

- Some conditions may require the use of warm water and a mild detergent.
- Clean the A/C condenser fins.
- Clean between the A/C condenser and radiator.
- Clean the radiator cooling fins.
- Straighten any damaged cooling fins.

Coolant Recovery Reservoir Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Drain the coolant. Refer to Cooling System Draining and Filling2. Disconnect the heater outlet hose vapor vent hose from the reservoir. Refer to Heater Outlet Hose Vapor Vent Hose Replacement3. Disconnect the heater vent hose from the reservoir. Refer to Heater Vent Hose Replacement	

4. Disconnect the heater coolant heater air supply hose from the reservoir. Refer to [Heater Coolant Heater Air Supply Hose Replacement](#)
5. Disconnect the heater water auxiliary pump inlet hose from the reservoir. Refer to [Heater Water Auxiliary Pump Inlet Hose Replacement](#)

1	Coolant Recovery Reservoir Nuts (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Coolant Recovery Reservoir Retainer
3	Coolant Recovery Reservoir

Radiator Inlet Hose Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, Refer to [Special Tools](#)

Removal Procedure

Note: Replace corroded hose clamps and brackets.

1. Drain the cooling system. Refer to [Cooling System Draining and Filling](#)
2. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#)

3. Remove the radiator inlet hose clamp (1) at the engine using *BO-38185* Hose Clamp Pliers .
4. Remove the radiator inlet hose (2) from the engine.

5. Remove the radiator inlet hose clamp (1) at radiator using *BO-38185* Hose Clamp Pliers .
6. Remove the radiator inlet hose (2) from the radiator.
7. Remove the radiator inlet hose from the vehicle.

[Installation Procedure](#)

1. Install the radiator inlet hose to the vehicle.
2. Install the radiator inlet hose (2) to the radiator .
3. Install the radiator inlet hose clamp (1) at radiator using *BO-38185* Hose Clamp Pliers .

4. Install the radiator inlet hose (2) to the engine.
5. Install the radiator inlet hose clamp (1) at engine using *BO-38185* Hose Clamp Pliers .
6. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#)
7. Fill the cooling system. Refer to [Cooling System Draining and Filling](#)

Radiator Outlet Front Hose Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, Refer to [Special Tools](#)

Removal Procedure

Note: Replace corroded hose clamps and brackets.

1. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#)
2. Remove the heater coolant heater air supply hose from the radiator outlet front hose. Refer to [Heater Coolant Heater Air Supply Hose Replacement](#)

3. Disconnect the radiator outlet front hose quick connect (1) at engine.
4. Remove the radiator outlet front hose (2) from the engine.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

5. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

6. Remove the radiator outlet front hose clamp (1) at radiator using *BO-38185* Hose Clamp Pliers .
7. Remove the radiator outlet front hose (2) from the radiator.
8. Remove the radiator outlet front hose from the vehicle.

[Installation Procedure](#)

1. Install the radiator outlet front hose to the vehicle.
2. Install the radiator outlet front hose (2) to the radiator.
3. Install the radiator outlet front hose clamp (1) at radiator using *BO-38185* Hose Clamp Pliers .

4. Install the radiator outlet front hose (2) to the engine.
5. Connect the radiator outlet front hose quick connect (1) at engine.
6. Lower the vehicle.
7. Install the heater coolant heater air supply hose to the radiator outlet front hose. Refer to [Heater Coolant Heater Air Supply Hose Replacement](#)
8. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#)
9. Fill the cooling system. Refer to [Cooling System Draining and Filling](#)

Radiator Upper Bracket Replacement

Callout	Component Name
Preliminary Procedure	
Remove front compartment front sight shield. Refer to Front Compartment Front Sight Shield Replacement : Volt → Ampera	
	Radiator Upper Bracket Bolt (Qty 2)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 22 N·m (16 lb ft)
2	Radiator Upper Bracket (Qty 2)

Cooling Fan and Shroud Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the drive motor battery radiator surge tank. Refer to Drive Motor Battery Radiator Surge Tank Replacement2. Remove the drive motor battery coolant pump. Refer to Drive Motor Battery Coolant Pump Replacement3. Disconnect the electrical connector from the coolant fans.	

4. Disconnect all wire retainers from shroud.

1	Cooling Fan and Shroud Bolts (Qty: 2). Caution: Refer to Fastener Caution in the Preface section. Tighten 5 N·m (44 lb in)
2	Cooling Fan and Shroud

Engine Coolant Thermostat Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Drain the cooling system. Refer to Cooling System Draining and Filling .2. Remove the water inlet pipe. Refer to Water Inlet Replacement	

1	Thermostat Retainer Tab
2	Seal Tip Inspect the seal for damage, replace as necessary.
3	Water Inlet Pipe
4	Thermostat (Part of water inlet assembly) Procedure Push in on the thermostat tabs (1) to unclip the thermostat from the water inlet pipe (3), and rotate clockwise.

Engine Coolant Air Bleed Hose Connector Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Drain the cooling system. Refer to Cooling System Draining and Filling .2. Remove the air cleaner resonator outlet duct. Refer to Air Cleaner Resonator Outlet Duct Replacement .	

	Engine Coolant Air Bleed Hose Clamps (Qty 2)
	Procedure
1	Reposition the engine coolant air bleed hose clamps using <i>BO 38185</i> Hose Clamp Pliers
	Special Tools
	<i>BO 38185</i> Hose Clamp Pliers For equivalent regional tools, Refer to Special Tools
2	Retainer Clips (Qty 2)
	Engine Coolant Air Bleed Hose
3	Tip Replace corroded hose clamps and brackets.

Water Outlet Replacement

[Removal Procedure](#)

1. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) .
2. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .

3. Disconnect the engine coolant temperature sensor (ECT) connector (1).

4. Disconnect the radiator inlet hose (1), the engine coolant air bleed hose (2) and the heater outlet hose (3), from the water outlet.

5. Remove the water outlet bolts (1).
6. Remove the water outlet (3) and discard the seal (2).

[Installation Procedure](#)

1. Position the water outlet (3) and a NEW seal (2) , to the cylinder head.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the water outlet bolts (1) and tighten to **8 N·m (71 lb in)**.

3. Install the A/C compressor front hose, if necessary. Refer to [Air Conditioning Compressor Front Hose Replacement](#) .

4. Install the engine coolant temperature sensor (1) and the battery positive cable (3), to the A/C compressor hose (2).
5. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
6. Fill the radiator coolant system. Refer to [Cooling System Draining and Filling](#) .
7. Start the engine and check for coolant leaks.

Water Inlet Replacement

[Removal Procedure](#)

1. Drain coolant fluid. Refer to [Cooling System Draining and Filling](#) .
2. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .

3. Remove the radiator inlet hose (2) and disconnect the engine coolant temperature sensor connector (1), from the water inlet pipe (3).

4. Remove the water inlet pipe bolts (1).
5. Inspect the seal (2) and replace as necessary.

Installation Procedure

1. Clean the sealing surfaces.

2. Install the water inlet pipe (3) and seal (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Tighten the water inlet pipe bolts (1) to **8 N·m (71 lb in)**.

4. Connect the engine coolant temperature sensor (1) and the radiator inlet hose (2).
5. Install the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .
6. Fill up the coolant fluid. Refer to [Cooling System Draining and Filling](#) .
7. Start the engine and check for coolant leaks.

Water Pump Belt Replacement

[Removal Procedure](#)

1. Remove the air cleaner assembly (1). Refer to [Air Cleaner Assembly Replacement](#)
2. Install the engine support fixture. Refer to [Engine Support Fixture](#)

3. Remove the right engine mount (1). Refer to [Engine Mount Replacement - Right Side](#)

4. Remove the right engine mount bracket (1). Refer to [Engine Mount Bracket Replacement - Right Side](#)

5. Cut the water pump belt (1) with a appropriate cutting tool as shown.
6. Remove and discard the water pump belt.

[Installation Procedure](#)

Note: Position the water pump pulley (2) as shown. The position of the pulley bolts (3) will help prevent the belt from catching on the bolts and provide ease of installation.

1. Position a NEW water pump belt (1) on the crankshaft pulley and water pump pulley (2) as shown.

Note: Using the thumb of your free hand, hold the water pump belt on the water pump pulley. Push the belt onto the pulley with your thumb while rotating the crankshaft pulley.

2. Using a socket and ratchet on the crankshaft pulley bolt, rotate the crankshaft in the direction of the arrow until the belt is fully installed on the water pump pulley.
3. After the belt is on the water pump pulley, rotate the crankshaft an additional complete revolution and ensure the water pump belt is fully seated on the crankshaft and water pump pulleys.

4. Install the right engine mount bracket (1). Refer to [Engine Mount Bracket Replacement - Right Side](#) .

5. Install the right engine mount (1). Refer to [Engine Mount Replacement - Right Side](#) .
6. Remove the engine support fixture.

7. Install the air cleaner assembly (1). Refer to [Air Cleaner Assembly Replacement](#)

Water Pump Replacement

[Removal Procedure](#)

1. Drain coolant fluid. Refer to [Cooling System Draining and Filling](#) .
2. Remove the water pump pulley. Refer to [Water Pump Pulley Replacement](#) .

3. Remove the radiator inlet hose (2) and the engine coolant temperature sensor connector (1), from the water inlet pipe (3).

4. Remove the heater water shutoff hose (1).

5. Remove the 5 short water pump bolts (2) and the 5 long water pump bolts (1).
6. Remove the water pump (4).
7. Remove the water pump gasket (3).
8. If replacing the water pump, transfer the water inlet pipe and thermostat to the new water pump. Refer to [Water Inlet Replacement](#) .

Installation Procedure

1. Clean the sealing surfaces.

2. Install the water pump (4) and a NEW water pump gasket (3).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 5 short water pump bolts (2) and the 5 long water pump bolts (1) and tighten in a cross sequence to **8 N·m (71 lb in)**.

4. Install the water pump pulley. Refer to [Water Pump Pulley Replacement](#) .

5. Install the heater water shutoff hose (1).

6. Install the radiator inlet hose (2) and the engine coolant temperature sensor connector (1), to the water inlet pipe (3)..
7. Fill up the coolant fluid. Refer to [Cooling System Draining and Filling](#) .
8. Start the engine and check for coolant leaks.

Engine Coolant Temperature Sensor Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Drain the coolant. Refer to Cooling System Draining and Filling2. Remove the front wheelhouse front liner on the passenger side. Refer to Front Wheelhouse Front Liner Replacement3. Disconnect the electrical connector from the coolant temperature sensor.	

1	Engine Coolant Temperature Sensor Retaining Clip.
2	Engine Coolant Temperature Sensor

Radiator Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Drain the coolant. Refer to Cooling System Draining and Filling2. Remove cooling fan and shroud. Refer to Cooling Fan and Shroud Replacement3. Remove transmission fluid auxiliary cooler. Refer to Transmission Fluid Auxiliary Cooler Replacement	

4. Disconnect the drive motor battery coolant/air separator from the radiator. Refer to [Drive Motor Battery Coolant/Air Separator Replacement](#)
5. Disconnect the heater vent hose from the radiator. Refer to [Heater Vent Hose Replacement](#)
6. Remove the radiator inlet hose. Refer to [Radiator Inlet Hose Replacement](#)
7. Remove radiator outlet front hose. Refer to [Radiator Outlet Front Hose Replacement](#)
8. Disconnect the electrical connector from the engine coolant temperature sensor.

1

Radiator

Radiator Air Lower Baffle and Deflector Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera	
1	Radiator Air Lower Baffel and Deflector Retainers (Qty 3)
2	Radiator Air Lower Baffel and Deflector

Radiator Air Side Baffle Replacement - Left Side

Callout	Component Name
Preliminary Procedure	
Remove front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera	
1	Radiator Air Side Baffel Retainers (Qty 5)
2	Radiator Air Side Baffel

Radiator Air Side Baffle Replacement - Right Side

Callout	Component Name
Preliminary Procedure 1. Remove front bumper fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera 2. Remove the ambient air temperature sensor. Refer to Ambient Air Temperature Sensor Replacement	

1	Radiator Air Side Baffle Retainers (Qty 6)
2	Radiator Air Side Baffle

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V or greater than 18 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information centre message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the 12 V charging system.
- A possible cause of this DTC could be overcharging with a 12 V battery charger or jump starting.

Circuit/System Verification

1. Vehicle OFF, disconnect the T18 Battery Charger cord set. Measure and record the 12 V battery voltage at the battery terminals. The battery voltage should stabilise

between 12.4-12.8 V within a few minutes of turning the Vehicle OFF.

If not within the specified range, refer to [Battery Inspection/Test](#) .

2. Vehicle in Service Mode, accessories OFF, measure and record the 12 V battery voltage at the battery terminals. The voltage should be at least 1 V greater than the voltage measured in step 1 but less than 15 V.

If not within the specified range, refer to [DC Power Conversion Test](#) .

3. Observe the appropriate module scan tool B+ and ignition voltage parameters. The voltage readings should be within 1 V of the battery voltage.

Circuit/System Testing

Note: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- The control modules ground, B+, and Ignition circuit terminal IDs and connectors

1. Vehicle OFF, disconnect the harness connectors at the appropriate control module.

Note: Some control module ground circuits may require up to 20 minutes to achieve a resistance reading of less than 10 Ω . In most cases the readings will drop below 20 Ω within 1 minute indicating the control modules are going to sleep.

2. Vehicle OFF, scan tool disconnected, open and close the driver door and wait 1 minute. Test for less than 10 Ω between each ground circuit terminal and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, verify that a test lamp illuminates between each B+ circuit terminal and ground.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. If equipped, Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and ground.
If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. If all circuits test normal, replace the control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[DTC Descriptors](#)

DTC B1516 08: Battery Current Sensor Performance - Signal Invalid

DTC B1516 66: Battery Current Sensor Incorrect Mounting

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5V Reference	B1516 08	B1516 08	-	-
Signal	B1516 08	B1516 08	B1516 08	B1516 08, B1516 66
Low Reference	-	B1516 08	-	-

[Circuit/System Description](#)

The battery current sensor is a 3 wire hall effect current sensor. The body control module (BCM) supplies 5 V and ground to the battery current sensor. The battery current sensor measures the amount of current flowing to or from the battery, and supplies a pulse width modulation (PWM) signal to the BCM.

[Conditions for Running the DTC](#)

B1516 08

The BCM is awake.

B1516 66

- The BCM is awake.
- The engine is OFF.

[Conditions for Setting the DTC](#)

B1516 08

The battery current signal is less than 4% or greater than 96% duty cycle for 2 min.

B1516 66

The battery current polarity is positive for 2 min.

[Action Taken When the DTC Sets](#)

The regulated voltage control is disabled.

[Conditions for Clearing the DTC](#)

The DTC passes when the battery current returns to the normal range for 15 s.

[Diagnostic Aids](#)

DTC B1516 08 could be set by overcharging with a battery charger or jump starting.

[Circuit/System Testing](#)

B1516 08

1. Vehicle OFF, disconnect the harness connector at the B18 Battery Current Sensor.
2. Vehicle OFF and scan tool disconnected, open and close the driver door, and wait 1 minute. Test for less than 30 Ω between the low reference circuit terminal B and ground.
If greater than specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
4. Vehicle in Service Mode, test for 4.8-5.2 V between the signal circuit terminal C and ground.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K9 Body Control Module.
5. If all circuits test normal, test or replace the B18 Battery Current Sensor.

B1516 66

1. Verify that the B18 Battery Current Sensor is installed securely around the negative battery cable, with the tape tab pointing away from the negative terminal on the C1 Battery.
If the B18 Battery Current Sensor is not installed correctly, remove and reinstall the sensor properly.
2. Replace the B18 Battery Current Sensor.

[DTC Descriptor](#)

DTC B151A 58: Battery Capacity Performance

[Circuit/System Description](#)

The body control module (BCM) monitors the battery voltage level during an engine crank event to detect a low battery voltage condition.

[Conditions for Running the DTC](#)

The vehicle is ON

[Conditions for Setting the DTC](#)

A minimum crank battery voltage is less than the minimum crank battery voltage threshold for 16 consecutive crank events.

[Action Taken When the DTC Sets](#)

A driver information centre message is displayed.

[Conditions for Clearing the DTC](#)

The DTC will clear if the minimum crank voltage is greater than the minimum crank voltage threshold during a crank event.

DTC B1527

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527: Parasitic Load

Circuit/System Description

The body control module (BCM) monitors the state of charge of the electrical system. If the BCM senses that the state of charge at Vehicle in Service Mode is 30% lower than what it was when the engine was running.

Conditions for Running the DTC

The ignition must be in Accessory or Run mode for this code to set.

Conditions for Setting the DTC

The state of charge at Vehicle in Service Mode is 30% lower than when the engine was running and battery drain is more than 2 A.

Action Taken When the DTC Sets

There is no battery indicator illuminated or driver information centre message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.

- The DTC will clear when run state of charge is greater than or equal to 80%.

Circuit/System Verification

Refer to [Battery Electrical Drain/Parasitic Load Test](#) .

Symptoms - Engine Electrical

The following steps must be completed before using the symptom tables.

- Perform [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - The power modes are correct.
 - The control modules can communicate via the serial data link.
 - There are no DTCs set.
- Review the system descriptions and operations in order to familiarise yourself with the system functions. Refer to one of the following system operations:
 - [Battery Description and Operation](#)
 - [Charging System Description and Operation](#)
 - [Starting System Description and Operation](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the 12 V charging system. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Battery Inspection/Test](#)
- [Battery Charging](#)
- [Battery Electrical Drain/Parasitic Load Test](#)
- [Charging System Test](#)

Battery Inspection/Test

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Aids](#)

Warning: Refer to [Battery Disconnect Warning](#) in the Preface section.

Note:

- The battery test using the EL 50313 Battery Tester requires correct connections to the battery terminals. A failure to obtain the correct connections during the test may result in a failed test on a good battery.
- Use the Out of Vehicle test for each battery when testing a vehicle with dual batteries.

Follow these instructions in order to avoid an incorrect diagnosis because of connections:

- If testing the vehicle with the battery cables still connected, wiggle the *EL 50313* battery tester clips on the terminal. This may cut through any coating or through any oxidation that may be present on the terminal.
- If correct connections to the battery terminals in the vehicle are in doubt, perform the following steps:
 1. Disconnect the negative battery cable.
 2. Disconnect the positive battery cable.
 3. Follow the instructions for testing a removed battery.
- If the tester displays a REPLACE BATTERY or BAD CELL REPLACE result for a battery tested in the vehicle with the battery cables connected, perform the following steps:
 1. Disconnect the negative battery cable.
 2. Disconnect the positive battery cable.

Note: Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the second, or Out of Vehicle test.

3. Follow the instructions for testing a removed battery.
4. Replace the battery only if the second test shows a REPLACE BATTERY or BAD CELL REPLACE result.

Use the test code from the second test for any warranty purposes.

Scan Tool Reference

[Control Module References](#) for scan tool information

Special Tools

EL 50313 Battery Tester

For equivalent regional tools, refer to [Special Tools](#) .

[Circuit/System Testing](#)

Warning: Unless directed otherwise, the ignition and start switch must be in the OFF or LOCK position, and all electrical loads must be OFF before servicing any electrical

component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar®module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power (RAP) should be allowed to time out or be disabled (simply opening the driver door should disable RAP) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with RAP activated may cause activation of the OnStar® Back-Up Battery (BUB) system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The BUB is not rechargeable and once activated the BUB must be replaced.

1. Inspect the C1 Battery for a cracked, broken or damaged case, which may be indicated by battery acid leakage.
If there is any apparent damage, replace the C1 Battery.
2. Verify the cold cranking amperage and amperage hour rating of the battery to the original battery.
If the C1 Battery does not meet or exceed specifications, replace the C1 Battery.
3. Verify that the battery cables are clean and tight.
If the battery cables need to be cleaned, clean as required and tighten as specified.
If the battery cables are damaged, replace then tighten as specified.
4. Install the *EL 50313* battery tester and follow directions supplied by the tester.
If the tester calls for charging the battery, refer to [Battery Charging](#) .
5. The battery should not have a history of being discharged or having low voltage.
If the battery has frequently been discharged or had low voltage while the engine is running, refer to [Charging System Test](#) .
If the battery has frequently been discharged or had low voltage while the ignition is OFF, refer to [Battery Electrical Drain/Parasitic Load Test](#) .

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Battery Positive and Negative Cable Replacement](#)
- [Battery Replacement](#)

Battery Charging

[12 V Battery](#)

The following procedure is for the 12 V battery only.

Special Tools

EL 42000 Battery Tester

For equivalent regional tools, refer to [Special Tools](#) .

[Diagnostic Aids](#)

- For best results, use an automatic taper rate battery charger with a voltage capability of 16 V.
- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the *EL 42000* battery tester before charging.
- The maximum permissible voltage is 14.8 V (at room temperature) for the absorbent glass mat battery equipped on this vehicle.

[Battery State of Charge](#)

Note: Using voltage to determine the batteries state of charge is only accurate after the battery has been at rest for 24 h. This is enough time for the acid in each cell to equalise. If the battery has been charged or discharged in the past 24 h, the battery state of charge will only be an estimate.

The maintenance free batteries state of charge is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the batteries state of charge:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 h.
 - If the answer is no, the terminal voltage will be stabilised and no action is necessary before reading the voltage. Skip to step 3.
 - If the answer is yes, terminal voltage will not be stabilised and you should wait 12 h since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been exposed for the past 12 h.

Note: The table is accurate to 10% only after the battery has been at rest for 12 h.

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the state of charge according to the estimated battery temperature:

Battery Voltage	% Charge at 0°C (32°F)	% Charge at 25°C (75°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%
12.2 V	65%	45%
12.0 V	40%	20%

Use the state of charge information as follows:

- A battery with a state of charge that is below 65% must always be recharged before returning it to service or continuing storage.
- A battery with a state of charge that is 65% or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90%, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity--The higher the charger amperage, the less time it will take to charge the battery.
- The state of charge of the battery--A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 V, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturers instructions for operating this circuitry.
- The temperature of the battery--The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

Caution: Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jump leads. Failure to do so may damage the ECM/PCM or other electronic components.

Caution: Refer to [Fastener Caution](#) in the Preface section.

When charging side terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When

charging side terminal batteries with the battery cables disconnected, install the battery side terminal adaptors and connect the charger to the adaptors.

Tighten

Tighten the battery side terminal adapters to 15 N·m (11 lb ft).

Use the following procedure to charge the battery:

1. Turn OFF the charger.
2. Ensure that all of the battery terminal connections are clean and tight.
3. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud under-bonnet.

Caution: Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.

4. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
5. Turn ON the charger and set to the highest setting for normal charging.
6. Inspect the battery every half hour after starting the battery charger.
 - Charge the battery until the taper rate charger indicates that the battery is fully charged.
 - Estimate the battery temperature by feeling the side of the battery. If it feels hot to the touch or its temperature is over 45°C (125°F), discontinue charging and allow the battery to cool before resuming charging.
7. After charging, test the battery. Refer to [Battery Inspection/Test](#) .

Battery Electrical Drain/Parasitic Load Test

12 V Battery

The following procedure is for the 12 V battery only.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

Components most likely to cause a parasitic draw on the vehicles battery are switches, relays, and control modules. After the vehicle is turned OFF the control modules will begin to go to sleep (shut OFF). All control modules do not go to sleep at the same time, some may take up to 30 min or longer after turning the Vehicle OFF before going to sleep, like the HVAC and body control modules. Others such as the telematics communication interface control module and remote control door lock receiver may periodically wake up then go back to sleep. These are all normal conditions.

Diagnostic Aids

- Rule out any possible aftermarket equipment causing an unacceptable parasitic current drain. Aftermarket accessories installed into the courtesy lamp circuit can cause the inadvertent power timer in the body control module (BCM) to keep resetting. This may cause the BCM to remain awake and cause a current drain on the battery.
- Rule out customer driving habits such as regular short trips that do not allow enough time to properly charge the battery. Refer to [Battery Description and Operation](#) .
- Verify that the battery and charging system are in proper working order. Refer to [Battery Charging](#) and [Charging System Test](#) .
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a interior light or stuck relay.
- Some systems and modules such as OnStar®, and regulated voltage control, if equipped, are designed to wake up, perform a task, and go back asleep at regular intervals. Refer to [Body Control System Description and Operation](#) for the system or modules description and operation.
- An engine off natural vacuum evaporative test can occur if the engine control module (ECM) determines the drive cycle has met the appropriate criteria immediately after key off. The ECM will stay awake and the vent solenoid will stay energised for as long as 45 min. The typical current draw for this is about 1 A.
- The telematics communication interface control module current draw is very low, less than 40 mA, so the OnStar system is left in that "awake" state for up to the first 48 h. Parasitic draw of up to 40 mA with an occasional spike as high as 80 mA through the telematics communication interface control module for the first 48 h is normal.

- Some automatic climate control systems can remain in a semi awake state for up to 3 h, actual draw amounts vary by vehicle platform but are typically not greater than 50 mA.
- An extremely low mA current level is consumed by the remote keyless entry receiver for monitoring purposes, actual system wake up only occurs when the fobs for the vehicle are used. When other devices on the same remote keyless entry operating frequency are activated, such as the 4 tire pressure monitoring sensors and other vehicle transmitters in the vicinity, the remote keyless entry receiver will have a 100 mA spike. These spikes are normal and occur too briefly to have a significant effect on battery drain. Competing signals may cause remote keyless entry performance issues such as jamming but should not cause excessive battery draw.
- If an excessive current draw is not present during initial testing, continue periodic testing over a 2 h period to see if the current draw increases and stays above an unacceptable level.

Note: The battery specification listed below is a generic specification, use manufacturer specifications when testing the battery.

- The battery run down time will vary depending on the batteries reserve capacity. If the reserve capacity is higher, then the battery run down time may be longer. If the reserve capacity is lower, then the battery run down time may be shorter. The graph below indicates roughly how many days a 690 cold cranking amperage battery with a 110 min reserve capacity starting at 80 percent state of charge will last with a constant current draw until it reaches 50 percent state of charge. Differences in battery reserve capacity and temperature will affect the results.

Current Drain	Days
25 mA	33
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

Special Tools

EL 38758 Parasitic Draw Test Switch

For equivalent regional tools, refer to [Special Tools](#) .

[Circuit/System Verification](#)

Note:

- Most vehicle systems will go to sleep within 30 min but it can take up to 2 h before all systems power down allowing the parasitic draw test to pass. An occasional increase in the parasitic draw is normal as long as it returns within 1 s.
- Closing the door latches/ajar switch while leaving the doors open is recommended, this allows the vehicle systems to perform in a "doors closed" mode while allowing vehicle interior access that may be needed to complete the diagnostic steps.
- Locking doors will arm the vehicle content theft deterrent system if equipped. Failure to arm the system may cause a theft system fault to not be present during testing.
- There are many things that can prevent the vehicle from completely going to sleep and passing the parasitic draw test. Make sure all the conditions listed below are met before performing the parasitic current draw test.
 - Vehicle OFF
 - Retained Accessory Power OFF - open and close the driver door after Vehicle OFF
 - Scan tool not communicating with a vehicle control module - in some cases it may need to be disconnected from the data link connector.
 - All access doors closed
 - Headlamps OFF - auto headlamps disabled
 - Any delay lighting OFF
 - If equipped with an under bonnet lamp disable it
 - HVAC after blow OFF
 - Any accessory that can work with Vehicle OFF inactive or OFF
 - Wait up to 2 min or longer, after all other listed conditions are met

Using an Inductive Pickup Probe

1. Connect an inductive pickup probe to the negative battery cable that can read down to 1 mA.
2. Vehicle OFF, as the vehicle systems shut down test for less than 30 mA of parasitic current drain.
If greater than the specified range, refer to Circuit/System Testing.

Using the EL 38758 Parasitic Draw Test Switch

Warning: Refer to [Battery Disconnect Warning](#) in the Preface section.

Caution: When a fused jumper wire or digital multimeter is connected to the test switch terminals, always turn the test switch ON before opening any access door, turning the ignition on, or turning any accessory on. This is to prevent damaging the jumper wire or digital multimeter fuse.

Note: The switch knob on the *EL 38758* switch is marked ON and OFF. When the switch knob is in the ON position, the circuit is closed and electrical current will pass through the switch. When the switch knob is in the OFF position, the circuit is open and electrical current will not pass through the switch.

1. Vehicle OFF, disconnect the battery negative cable from the battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .
2. Turn the *EL 38758* switch knob to the OFF position.
3. Install the male end of the *EL 38758* switch to the battery ground terminal.
4. Install the battery negative cable to the female end of the *EL 38758* switch.
5. Turn the *EL 38758* switch knob to the ON position.
6. Road test the vehicle and activate all of the accessories such as the radio and air conditioning.
7. Vehicle OFF, connect a 10 A fused jumper wire to the test switch tool terminals.
8. Turn the *EL 38758* switch knob to the OFF position. The current now flows through the jumper wire.
9. Check the fuse in the jumper wire. The fuse should be OK.
Failed: If the jumper wire fuse is blown, refer to Circuit/System Testing.
Passed
10. Turn the *EL 38758* switch knob to the ON position. Remove the fused jumper wire.
11. Connect a digital multimeter set to the 10 A DC scale between the test switch tool terminals.
12. Turn the *EL 38758* switch knob to the OFF position. The current now flows through the DMM.
13. As the vehicle systems shut down test for less than 30 mA of parasitic current drain.
If greater than the specified range, refer to Circuit/System Testing.

[Circuit/System Testing](#)

Note:

- Removing or installing a fuse, relay, or connector, to determine the area causing high parasitic draw may wake up control modules. You must wait for the control modules to go back to sleep before retesting. It is best to install any removed or disconnected components after the diagnosis is completed.
- Fuses for power mode master components such as the BCM should be removed last to avoid misdiagnosis.
- If a scan tool is connected to the DLC, either disconnect it or subtract the scan tool current draw from the DMM reading to get the actual vehicle parasitic current draw.

If the vehicle has an unacceptable amount of parasitic current draw, remove each fuse one at a time until the current draw falls to an acceptable level. A drop of more than 10-20 mA, when disabling a single system or circuit, is an indication of an overly high current draw that could be causing the battery drain. Refer to [Power Distribution Schematics](#) to diagnose exactly which circuit of the suspect system is causing the high parasitic drain. The follow is a list of common components that could cause a high current draw:

- Stuck switch
- Stuck relay
- Control module

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

Charging System Test

The accessory power module supplies the energy that flows between the high voltage (300 V) direct current (DC) and low voltage (14 V) DC to charge the 12 V battery and power accessories. To test the charging system, refer to [DC Power Conversion Test](#).

Battery Positive and Negative Cable Replacement

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage. Refer to [High Voltage Disabling](#) .
2. Remove the rear compartment floor stowage trim compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .
3. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

4. Unlock the retaining tab (2) on the battery fuse box cover.
5. Open the battery fuse box flap (1).

Note: Note: Pull the battery fuse box housing. DO NOT pull the flap.

6. Unlock the retaining tab (3) and open the battery fuse box cover.

7. Remove the accessory DC power control module nut (1).
8. Remove the 2 battery cable retainers (2).
9. Remove the battery positive and negative cable nut (3).
10. Remove the battery positive and negative cable (4).

[Installation Procedure](#)

1. Install the battery positive and negative cable (4).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the battery positive and negative cable nut (3) and tighten to **12 N·m (106 lb in)**.

3. Install the 2 battery cable retainers (2).

4. Install the accessory DC power control module nut (1) and tighten to **22 N·m (16 lb ft)**.

5. Close the battery fuse box cover (1) and lock the retaining tabs (2, 3).
6. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
7. Install the rear compartment floor stowage trim compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

8. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

© Copyright Chevrolet. All rights reserved

Battery Positive Cable Replacement

[Removal Procedure](#)

1. Remove the rear floor storage compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .
2. Disconnect the battery negative cable from the battery. Refer to [Battery Negative Cable Disconnection and Connection](#) .

3. Unlock the retaining tab (2) on the battery fuse box cover.
4. Open the battery fuse box flap (1).

Note: Pull the battery fuse box housing. DO NOT pull the flap.

5. Unlock the retaining tab (3) and open the battery fuse box cover.

6. Remove the battery positive cable fuse block nut (1) and terminal (2) from the battery fuse block.
7. Remove the quarter inner trim finish panel. Refer to [Quarter Inner Trim Finish Panel Replacement](#) .
8. Separate the battery positive cable from the body harness, while working from the rear compartment towards the passenger compartment.

9. Remove the rear side door floor covering retainer. Refer to [Rear Side Door Opening Floor Carpet Retainer Replacement](#) .
10. Detach the battery positive cable (1) from the rear passenger compartment.

11. Remove the interior trim panels (1). Refer to [Centre Pillar Trim Panel Replacement](#) and [Front Side Door Opening Floor Carpet Retainer Replacement](#) .
12. Remove the battery positive cable (2) from the left rocker channel.

13. Detach the battery positive terminal (2), from the engine wiring junction block (3), with the nut (1).

14. Pull the battery positive cable (2) through the harness grommet (1).
15. Remove the battery positive cable from the vehicle.

[Installation Procedure](#)

1. Push the battery positive cable terminal (2) through the grommet (1) and into the front engine compartment.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the battery positive cable terminal (2) to the engine wiring junction block (3). Tighten the nut (1) to **17 N·m (12 lb ft)**.

3. Install the battery positive cable into the rocker channel below the interior trim panels (1).

4. Secure the battery positive cable (1) to the body harness, while transferring the remaining cable into the rear compartment.

5. Attach the battery positive cable to the body harness along the left rear wheelhouse.
6. Install the battery positive cable terminal (2) to the battery fuse block and tighten nut (1) to **12 N·m (106 lb in)**.

7. Close the battery fuse box cover (1) and lock the retaining tabs (2, 3).
8. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
9. Install the quarter inner trim finish panel, rear compartment floor stowage trim panel and the interior trim panels. Refer to [Quarter Inner Trim Finish Panel Replacement](#) , [Rear Compartment Floor Stowage Trim Compartment Replacement](#) , [Rear Side Door Opening Floor Carpet Retainer Replacement](#) , and [Front Side Door Opening Floor Carpet Retainer Replacement](#) .

Battery Replacement

Special Tools

GE-49379 Battery Remover / Installer

For equivalent regional tools, refer to [Special Tools](#) .

[Disconnect Procedure](#)

Warning: Refer to [Battery Disconnect Warning](#) in the Preface section.

1. Turn off all the lamps and accessories.
2. Turn the ignition OFF.
3. Remove the rear compartment floor stowage trim compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .
4. Disconnect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
5. Remove the battery vent hose.

6. Unlock the retaining tab (2) on the battery fuse box cover.
7. Open the battery fuse box flap (1).

Note: Pull the battery fuse box housing. DO NOT pull the flap.

8. Unlock the retaining tab (3) and open the battery fuse box cover.

9. Remove the battery positive cable to fuse block nut (1).
10. Reposition the positive battery cable (2) away from the battery.

11. Loosen the battery positive clamp nut (1).
12. Remove the fuse block retainer clips (2) and reposition the fuse block (3).

13. Remove the battery retainer bolt (1).

14. Remove the battery hold down strap (2) and the hold down retainer (3).

15. Remove the battery (1) from the rear compartment area, using the *GE-49379* remover .

[Connect Procedure](#)

Warning: Refer to [Battery Disconnect Warning](#) in the Preface section.

Note: Clean any existing corrosion from the battery terminal and the battery cable end.

1. Position the battery (1) onto the tray with the posts towards the rear of the vehicle, using the *GE-49379* installer .

2. Install the battery hold down retainer (3) and hold down strap (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Tighten the battery retainer bolt (1) to **9 N·m (80 lb in)**.

4. Install the fuse block (3) to the top of the battery with tabs (2).
5. Slide the battery clamp (1) onto the battery post and tighten the nut (1) to **9 N·m (80 lb in)**.

6. Install the battery positive terminal (2) to the fuse block and tighten nut (1) to **9 N·m (80 lb in)**.

7. Close the battery fuse box cover (1) and lock the retaining tabs (2, 3).
8. Connect the negative battery cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
9. Install the rear compartment floor stowage trim compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .

Battery Description and Operation

[300 V Battery](#)

For information about the 355 V hybrid drive motor battery, refer to [Drive Motor Battery System Description](#) .

[Absorbent Glass Mat Battery](#)

This vehicle is equipped with an absorbent glass mat battery. This is similar to current vehicle lead acid flood batteries, except they use glass mats that absorb electrolytes that are pressed between the plates instead of immersing the plates in electrolytes. This allows a smaller, lighter battery with the same amount of power and is less susceptible to heat.

The maximum permissible voltage allowed for the absorbent glass mat battery is 14.8 V (at room temperature).

[12 V Battery](#)

Warning: Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to naked flames or sparks.
- Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.
- Follow each step of the jump starting procedure in order.
- Treat both the booster and the discharged batteries carefully when using the jump leads.

Note: Because of the materials used in the manufacture of automotive lead acid batteries, dealers and service shops that handle them are subject to various regulations issued by OSHA, EPA, DOT, and various state or local agencies. Other regulations may also apply in other locations. Always know and follow these regulations when handling batteries.

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the rubbish or sent to a landfill.

Batteries that are not part of the vehicle itself, not the battery under the bonnet, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in garages must meet various requirements for ventilation, safety equipment, material segregation, etc.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

Battery Ratings

A battery has 2 ratings:

- Cold cranking amperage
- Amperage hours

When a battery is replaced use a battery with similar ratings. Refer to the manufacturer specifications label on the original battery.

Amperage Hours

The amperage hour rating tells you how much amperage is available when discharged evenly over a 20 h period. The amperage hour rating is cumulative, so in order to know how many constant amperes the battery will output for 20 h, you have to divide the amperage hour rating by 20. Example: If a battery has an amperage hour rating of 74, dividing by 20 = 3.75. Such a battery can carry a 3.75 A load for 20 h before dropping to 10.5 V. (10.5 V is the fully discharged level, at which point the battery needs to be recharged.) A battery with an amperage hour rating of 55 will carry a 2.75 A load for 20 h before dropping to 10.5 V.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 s at -18°C (0°F) while maintaining at least 7.2 V.

Charging System Description and Operation

[12 V Battery](#)

The following information is for the 12 V battery only.

For information about charging the high voltage drive motor batteries, refer to [Drive Motor Battery System Description](#) .

[Electrical Power Management Overview](#)

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems. This electrical power management system primarily utilises existing on board computer capability to maximise the effectiveness of the charging system, manage the load, improve battery state of charge and life, and minimise the systems impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during Vehicle OFF and during Vehicle in Service Mode. During Vehicle OFF the state of charge of the battery is determined by measuring the open circuit voltage. The state of charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state of charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. During Vehicle ON mode, the algorithm continuously estimates state of charge based on adjusted net amperage hours, battery capacity, initial state of charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amperage hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state of charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state of charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

[Charging System Components](#)

Drive Motor/Generators

The drive motor/generators are serviceable components located within the transmission housing. When the rotors are spun, an alternating current (AC) is induced into the stator windings. This AC voltage is then sent to the drive motor generator power inverter module where it is converted to high voltage direct current (DC) power. The output of the powertrain interface module is converted into low voltage electrical power by the accessory DC power converter module for use by the vehicles electrical system to maintain electrical loads and battery charge.

Body Control Module (BCM)

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management operation. The BCM determines the desired voltage set point and sends the information to the accessory power module. The BCM monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge.

Battery Current Sensor

The battery current sensor is a serviceable component that is connected to the negative battery cable at the battery. The battery current sensor is a 3 wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5 V pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100%. Normal duty cycle is between 5-95%. Between 0-5% and 95-100% are for diagnostic purposes.

Engine Control Module (ECM)

The ECM receives control decisions based on messages from the BCM.

Instrument Panel Cluster

The instrument panel cluster provides a means of customer notification in case of a failure and a voltmeter. There are 2 means of notification, a charge indicator and a driver information centre message of SERVICE BATTERY CHARGING SYSTEM.

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulphation Mode
- Normal Mode
- Fuel Economy Mode
- Headlamp Mode
- Voltage Reduction Mode
- Plant Assembly Mode

Battery Sulphation Mode

Battery sulfation mode is used to help maintain the battery life. The charging system will enter a battery sulfation mode which tries to increase the vehicle charging when the charging system voltage is less than 13.2 V for about 30 minutes. Once in this mode, the BCM will set a targeted output voltage between 13.9-15.5 V for about 5 minutes. Following this 5 minutes, the BCM will then determine which mode to enter depending on the system voltage requirements.

Normal Mode

The BCM will enter Normal Mode whenever one of the following conditions are met:

- The wipers are ON for more than 3 s.
- GMLAN Climate Control Voltage Boost Mode Request is true, as sensed by the HVAC control head. High speed cooling fan, rear demister and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0°C (32°F).
- Vehicle Speed is greater than 145 km/h (90 mph)
- Current Sensor Fault Exists
- System Voltage was determined to be below 12.56 V
- Tow/Haul Mode is enabled

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9-15.5 V, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the ambient air temperature is at least 0°C (32°F) but less than or equal to 80°C (176°F), the calculated battery current is greater than -8 A but less than 5 A, and the battery state of charge is greater than or equal to 85%. Its targeted accessory power module set point voltage is the open circuit voltage of the battery and can be between 12.6-13.2 V. The BCM will exit this mode and enter Normal Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode whenever the main or dipped beam headlamps are ON. Voltage will be regulated between 13.9-14.5 V.

Voltage Reduction Mode

The BCM will enter Voltage Reduction Mode when the calculated battery temperature is above 0°C (32°F) and the calculated battery current is greater than -7 A but less than 1 A. Its targeted accessory power module set point voltage is 12.9-13.2 V. The BCM will exit this mode once the criteria are met for Normal Mode.

Plant Assembly Mode

The BCM will increase charging voltage for the first 500 mi of operation in an effort to ensure that the 12 V battery is fully charged when the vehicle is delivered to the customer.

Instrument Panel Cluster Operation

Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a charging system warning message in the driver information centre when the one or more of the following occurs:

- The engine control module (ECM) detects system voltage less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The BCM determines that the system voltage is less than 11 V or greater than 16 V.
- The instrument panel cluster receives a GMLAN message from the BCM indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each Vehicle ON cycle. The indicator illuminates for approximately 3 s.
- Vehicle ON, with the engine OFF.

Battery Voltage Gauge Operation

The instrument panel cluster displays the system voltage as received from the BCM over the GMLAN serial data circuit. If there is no communication with the BCM then the gauge will indicate minimum.

This vehicle is equipped with a regulated voltage control system. This will cause the voltmeter to fluctuate between 12-14 V, as opposed to non regulated systems which usually maintain a more consistent reading of 14 V. This fluctuation with the regulated voltage control system is normal system operation and NO repairs should be attempted.

SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the driver information centre for the SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is displayed whenever the charge indicator is commanded ON due to a failure.

Electrical Power Management Description and Operation

Electrical Power Management

The electrical power management is used to monitor and control the charging system and alert the driver of possible problems within the charging system. The electrical power management system makes the most efficient use of the generator output, improves the battery state-of-charge, extends battery life, and manages system electrical loads.

The load shed operation is a means of reducing electrical loads during a low voltage or low battery state-of-charge condition.

The idle boost operation is a means of improving generator performance during a low voltage or low battery state-of-charge condition.

Each electrical power management function, either idle boost or load shed, is discrete. No two functions are active at the same time. Idle boost is activated in incremental steps, idle boost 1 must be active before idle boost 2 can be active. The criteria used by the body control module (BCM) to regulate electrical power management are outlined below:

Function	Battery Temperature Calculation	Battery Voltage Calculation	Amp-Hour Calculation	Action Taken
Idle Boost 1 Start	Less Than -15°C (5°F)	Less Than 13 V	-	First level Idle boost requested
Idle Boost 1 Start	-	-	Battery has a net loss greater than 0.6 AH	First level Idle boost requested
Idle Boost 1 Start	-	Less Than 10.9 V	-	First level Idle boost requested
Idle Boost 1 End	Greater Than -15°C (5°F)	Greater Than -12 V	Battery has a net loss less than 0.2 AH	First level Idle boost request cancelled
Load Shed 1 Start	-	-	Battery has a net loss of 4 AH	Rear Defrost, Heated Mirrors, Heated Seats cycled OFF for 20% of their cycle
Load Shed 1 Start	-	Less Than 10.9 V	-	Rear Defrost, Heated Mirrors, Heated Seats cycled OFF for 20% of their cycle
Load Shed 1 End	-	Greater Than 12 V	Battery has a net loss of less than 2 AH	Clear Load Shed 1

Idle Boost 2 Start	-	-	Battery has a net loss greater than 1.6 AH	Second level Idle boost requested
Idle Boost 2 Start	-	Less Than 10.9 V	-	Second level Idle boost requested
Idle Boost 2 End	-	Greater Than 12 V	Battery has a net loss less than 0.8 AH	Second level Idle boost request cancelled
Idle Boost 3 Start	-	-	Battery has a net loss of 10.0 AH	Third level Idle boost requested
Idle Boost 3 Start	-	Less Than 10.9 V	-	Third level Idle boost requested
Idle Boost 3 End	-	Greater Than 12 V	Battery has a net loss of less than 6.0 AH	Third level Idle boost request cancelled
Load Shed 2 Start	-	Less Than 10.9 V	Battery has a net loss greater than 12 AH	Rear Defrost, Heated Mirrors, Heated Seats cycled OFF for 50% of their cycle. The BATTERY SAVER ACTIVE message will be displayed on the DIC
Load Shed 2 Start	-	Less Than 10.9 V	-	Rear Defrost, Heated Mirrors, Heated Seats cycled OFF for 50% of their cycle. The BATTERY SAVER ACTIVE message will be displayed on the DIC
Load Shed 2 End	-	Greater Than 12.6 V	Battery has a net loss of less than 10.5 AH	Clear Load Shed 2
Load Shed 3 Start	-	Less Than 11.9 V	Battery has a net loss greater than 20 AH	Rear Defrost, Heated Mirrors, Heated Seats cycled OFF for 100% of their cycle. The BATTERY SAVER ACTIVE message will be displayed on the DIC
Load Shed 3 End	-	Greater Than 12.6 V	Battery has a net loss of less than 15 AH	Clear Load Shed 3

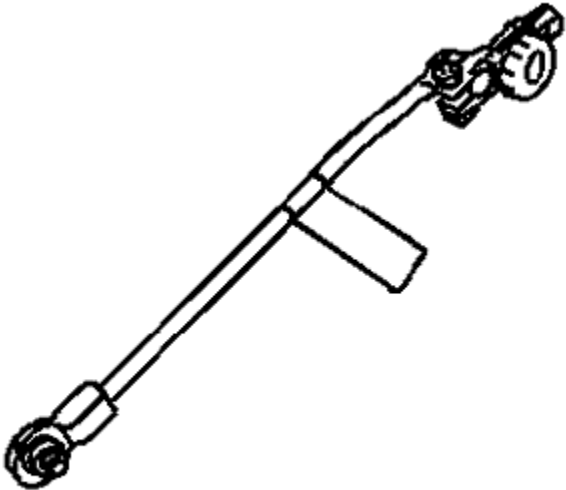

Starting System Description and Operation

The HQ1 Hybrid System does not use a conventional starter. Refer to [Hybrid Modes of Operation Description](#) for information about the starting system.

Special Tools

Illustration	Tool Number/Description
 A technical line drawing of a parasitic draw test switch. It features a long, thin handle with a rectangular grip in the middle. At one end, there is a circular component with a central screw. Symptoms - Engine Exhaust

- Review the Exhaust System Description and Operation in order to familiarise yourself with the system functions. Refer to [Exhaust System Description](#) .
- All diagnostics on a vehicle should follow a logical process. Strategy Based diagnostics is a uniform approach for repairing all systems. The diagnostic flow is the place to start when repairs are necessary and may always be used in order to resolve a system problem.

Visual/Physical Inspection

- Inspect for aftermarket or non-OEM devices such as, but not including; tailpipe extensions, headers, and exhaust cutouts. This could affect the operation and proper performance of the exhaust system.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, engine temperature, engine load, and frequency of concern.
- Inspect the easily accessible or visible system components for obvious damage or conditions, which could cause any symptom.

Intermittents

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating as designed.

Symptom List

- Loss of power--Refer to [Restricted Exhaust](#) .
- Poor acceleration--Refer to [Restricted Exhaust](#) .
- Poor fuel economy--Refer to [Restricted Exhaust](#) .
- Excessive smoke-diesel--Refer to [Restricted Exhaust](#) .
- Exhaust hissing noise--Refer to [Exhaust Leakage](#) .
- Exhaust popping noise--Refer to [Exhaust Leakage](#) .
- Exhaust rattle noise--Refer to [Exhaust Noise](#) .
- Loud Exhaust noise--Refer to [Exhaust Noise](#) .
- Exhaust buzz, groan, hum noise--Refer to [Exhaust Noise](#) .

Restricted Exhaust

[Diagnostic Aids](#)

A quick check of exhaust flow will help determine for gasoline engines.

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table.

3. The exhaust system has very low back pressure under normal conditions. If the exhaust system is restricted, a significant increase in the exhaust pressure is noticed on the exhaust back pressure gauge.

Removing the heated oxygen sensor may set a DTC. When finishing this diagnostic table, be sure to clear all codes.

4. This step will isolate the catalytic converter from the remainder of the exhaust system.
7. Confirming that the condition has been fixed is essential. If the symptom still exists and the vehicle has a dual exhaust system, proceed to Step 2 and repeat diagnostic procedure on the opposite exhaust pipe.

Step	Action	Value(s)	Yes	No

Exhaust Leakage

Problem	Action
<p>Warning: While engine is operating, the exhaust system will become extremely hot. To prevent burns avoid contacting a hot exhaust system.</p>	
<p>DEFINITION: An exhaust leak may show stains at the area of the leak. The leak may be felt by holding a hand close to the suspected areas or using a smoke pencil. The leak may make a popping or hissing noise.</p>	
<p>Refer to Symptoms - Engine Exhaust prior to beginning this table.</p>	
<p>Misaligned or improperly installed exhaust system components</p>	<p>Align and tighten the components to the specifications. Refer to Fastener Tightening Specifications .</p>
<p>Exhaust leaks at the following connections:</p> <ul style="list-style-type: none"> • Exhaust manifold to pipe • Flanges • Pipe clamps 	<p>Tighten the components to the specifications. Refer to Fastener Tightening Specifications .</p>
<p>Seals or gaskets leaking.</p> <ul style="list-style-type: none"> • Exhaust manifold to cylinder head • Exhaust pipes to exhaust manifold • Catalytic converter connection • EGR connections • AIR connections to the exhaust manifold or cylinder head 	<p>Replace the leaking seal or gasket. Refer to the affected components procedure for service.</p>
<p>Irregularities at the mating surfaces on the flange connections</p>	<p>Repair as required or replace the affected component. Refer to the affected components procedure for service.</p>
<p>Exhaust manifold cracked or broken</p>	<p>Replace the exhaust manifold. Refer to Exhaust Manifold with Catalytic Converter Replacement .</p>
<p>Exhaust system component connection welds leaking</p>	<p>Replace the leaking component. Refer to the affected component's procedure for service.</p>
<p>Silencer or resonator, if equipped, damaged or leaking at the seams</p>	<p>Replace the affected silencer. Refer to Exhaust Rear Silencer Replacement .</p>

Exhaust Noise

Condition	Action
<p>Warning: While engine is operating, the exhaust system will become extremely hot. To prevent burns avoid contacting a hot exhaust system.</p>	
<p>DEFINITION: An audible or physical noise due to a faulty component or damaged components causing a loose or misaligned exhaust system resulting in a rattle or vibration noise, i.e. buzz, groan, hum.</p>	
<p>Refer to Symptoms - Engine Exhaust prior to beginning this table.</p>	
Popping or hissing noise	Exhaust leak. Refer to Exhaust Leakage .
Loud exhaust	<ol style="list-style-type: none"> 1. Compare to a known good vehicle. 2. Inspect for a damaged or failed silencer. 3. Replace the faulty silencer. Refer to Exhaust Rear Silencer Replacement .
External rattle or vibration noise	<ol style="list-style-type: none"> 1. Inspect for a bent or loose hanger, loose heat shield, or loose clamp. 2. Inspect for an exhaust pipe causing interference. 3. Repair or replace the affected component. Refer to the affected component's service procedure.
Internal rattle	<ol style="list-style-type: none"> 1. Test the components by tapping with a rubber mallet to confirm a rattle. 2. Replace the faulty catalytic converter, or silencer. Refer to one of the following procedures: <ul style="list-style-type: none"> • Catalytic Converter Replacement • Exhaust Rear Silencer Replacement

Exhaust Manifold with Catalytic Converter Replacement

Callout	Component Name
Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Warning: Refer to Hot Exhaust System Warning in the Preface section.	

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Disconnect the heated oxygen sensor. Refer to [Heated Oxygen Sensor Replacement - Sensor 1](#) .
3. Remove the catalytic converter. Refer to [Catalytic Converter Replacement](#) .

1	Catalytic Converter Nut (Qty: 8) Caution: Refer to Fastener Caution in the Preface section. Tighten 22 N·m (16 lb ft)
2	Exhaust Gasket Tip Replace the gasket with a NEW one.
3	Exhaust Manifold Brace Bolt (Qty: 2) Tighten 22 N·m (16 lb ft)
4	Exhaust Manifold with Catalytic Converter Tip If replacing the catalytic converter, transfer the heated oxygen sensor over to the new catalytic converter.

Exhaust System Replacement

[Removal Procedure](#)

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Warning: Refer to [Hot Exhaust System Warning](#) in the Preface section.

Warning: Refer to [Exhaust Service Warning](#) in the Preface section.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Lower the rear suspension to gain clearance for the exhaust system removal. Refer to [Rear Axle Replacement](#) .

3. Loosen the exhaust muffler clamp nut (1).
4. Remove the exhaust muffler from the catalytic converter (2).

5. Remove the rear exhaust muffler (1) from the rear exhaust hanger isolators (2)..

6. Remove the exhaust muffler isolator (1) from the exhaust isolator rod.

7. With the aid of an assistant, carefully lower the exhaust muffler assembly (1).

[Installation Procedure](#)

Note: Lubricate the isolator and rod for ease of assembly.

1. With the aid of an assistant, position the exhaust muffler isolator (1) onto the exhaust muffler isolator rod.

Note: Make sure the exhaust muffler clamp is fully seated into the slot on the catalytic converter before tightening the exhaust clamp nut.

2. Slide the exhaust muffler clamp (1) onto the 3-way catalytic converter (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Tighten the exhaust muffler clamp to **55 N·m (41 lb ft)**

4. Install the rear exhaust muffler (1) into the rear exhaust isolators (2).

Note: Lubricate the exhaust isolator rods for ease of assembly.

5. Raise the rear suspension. Refer to [Rear Axle Replacement](#) .

6. Start the engine and check for exhaust leaks.

Catalytic Converter Replacement

Callout

Component Name

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

Warning: Refer to [Hot Exhaust System Warning](#) in the Preface section.

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Disconnect the heated oxygen sensor. Refer to [Heated Oxygen Sensor Replacement - Sensor 2](#) .
3. Remove the exhaust muffler clamp. Refer to [Exhaust System Replacement](#) .

1	Catalytic Converter Nut (Qty: 3) Caution: Refer to Fastener Caution in the Preface section. Tighten 22 N·m (16 lb ft)
2	Exhaust Gasket Tip Replace the gasket with a NEW one.
3	Exhaust Clamp Tighten 55 N·m (41 lb ft)
4	Exhaust Isolator
5	Catalytic Converter Tip If replacing the catalytic converter, transfer the heated oxygen sensor over to the new catalytic converter.

Catalytic Converter Brace Replacement

Callout	Component Name
Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Warning: Refer to Hot Exhaust System Warning in the Preface section.	

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the exhaust manifold with catalytic converter. Refer to [Exhaust Manifold with Catalytic Converter Replacement](#) .

1	Catalytic Converter Brace Bolt (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 22 N·m (16 lb ft)
2	Catalytic Converter Brace

Exhaust Resonator Replacement

[Removal Procedure](#)

Warning: Refer to [Hot Exhaust System Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

2. Make a cut on the exhaust resonator pipe (1), a distance of 60 mm, from the edge of the muffler flange (a).

3. If replacing the rear muffler, remove the rear exhaust muffler bracket bolts (1) and lower to the floor.

4. Loosen the exhaust muffler clamp (1), from the 3-way catalytic converter.

Note: Replace exhaust muffler clamp with a NEW clamp.

5. Remove the exhaust resonator pipe from the exhaust isolator (1).

6. Carefully lower the exhaust resonator pipe (1) from the vehicle.

[Installation Procedure](#)

1. Install the exhaust resonator pipe onto the exhaust isolator (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Make sure the exhaust muffler clamp is fully seated into the slot on the catalytic converter before tightening the exhaust clamp nut.

2. Install the exhaust muffler resonator pipe into the 3-way converter (2) and tighten the clamp to **55 N·m (41 lb ft)**.

3. Install the rear exhaust muffler (1) to the rear pipe with a NEW service clamp and tighten the nut (2) to **55 N·m (41 lb ft)**.

4. Install the rear exhaust muffler hanger bolts (1) and tighten to **22 N·m (16 lb ft)**.
5. Lower the vehicle.
6. Start the engine and check for exhaust leaks.

Exhaust Pipe Heat Shield Replacement - Front

Callout	Component Name
<p>Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.</p> <p>Warning: Refer to Hot Exhaust System Warning in the Preface section.</p>	

Preliminary Procedure

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

1	Front Exhaust Pipe Heat Shield Nut (Qty: 5) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Front Exhaust Pipe Heat Shield Screw Tighten 9 N·m (80 lb in)
3	Front Exhaust Pipe Heat Shield

Exhaust Pipe Heat Shield Replacement - Centre

Callout	Component Name
Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.	Warning: Refer to Hot Exhaust System Warning in the Preface section.

Preliminary Procedures

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Lower and reposition the exhaust muffler. Refer to [Exhaust System Replacement](#) .

1	Centre Exhaust Pipe Heat Shield Retainer (Qty: 6) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Centre Exhaust Pipe Heat Shield

Exhaust Pipe Heat Shield Replacement - Rear

Callout	Component Name
Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Warning: Refer to Hot Exhaust System Warning in the Preface section.	

Preliminary Procedure

Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

1	Rear Exhaust Pipe Heat Shield Retainer (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Rear Exhaust Pipe Heat Shield

Exhaust Rear Silencer Replacement

[Removal Procedure](#)

Warning: Refer to [Hot Exhaust System Warning](#) in the Preface section.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

2. Measure the distance "a" between the muffler and the connection of the exhaust on the new replacement muffler.
3. Transfer the measurement "a" to the exhaust pipe (1).
4. Separate the muffler at the determined cut line with a suitable tool.
5. Remove the exhaust muffler hanger bracket.

Installation Procedure

Caution: Refer to [Fastener Caution](#) in the Preface section.

1. Install the rear exhaust muffler clamp onto the rear cut exhaust pipe.
2. Install the rear muffler exhaust hanger bracket and tighten the bolts to **22 N·m (16 lb ft)**.
3. Install the rear exhaust muffler (1) to the rear pipe and tighten the clamp nut (2) to **55 N·m (41 lb ft)**.
4. Lower the vehicle.
5. Start the engine and check for exhaust leaks.

Exhaust System Description

Note: Use of non-OEM parts may cause driveability concerns.

The exhaust system carries exhaust gases, treated by the catalytic converter, through a resonator, if applicable and into the exhaust muffler where exhaust noise is lessened.

In order to secure the exhaust pipe to the exhaust manifold, a flange and seal-joint coupling is utilised. The exhaust system may utilise a slip-joint coupling design with a clamp and a U-bolt or a flange connection with a gasket.

Exhaust hangers and rubber insulators help to support the weight of the exhaust pipe along with insulating any exhaust system vibration, rattle, or noise.

Exhaust hangers also space the exhaust system away from the underbody of the vehicle and allows the exhaust system to expand as the exhaust system warms up.

Exhaust heat shields are used to protect the body and other components from damage due to the heat from the exhaust system.

The exhaust system may be comprised of the following components:

- Exhaust manifold with Catalytic Converter
- Exhaust pipes
- Catalytic converter
- Exhaust hangers
- Exhaust heat shields
- Exhaust isolators and rods
- Exhaust muffler
- Exhaust resonator, if equipped
- Exhaust tail pipe, if equipped

Resonator

Some exhaust systems are equipped with a resonator. The resonator, located either before or after the muffler, allows the use of mufflers with less back pressure. Resonators are used when vehicle characteristics require specific exhaust tuning.

Catalytic Converter

The catalytic converter is an emission control device added to the engine exhaust system in order to reduce hydrocarbons (HC), carbon monoxide (CO), and oxides of

nitrogen (NOx) pollutants from the exhaust gas.

The catalytic converter is comprised of a ceramic monolith substrate, supported in insulation and housed within a sheet metal shell. The substrate may be washcoated with 3 noble metals:

- Platinum (Pt)
- Palladium (Pd)
- Rhodium (Rh)

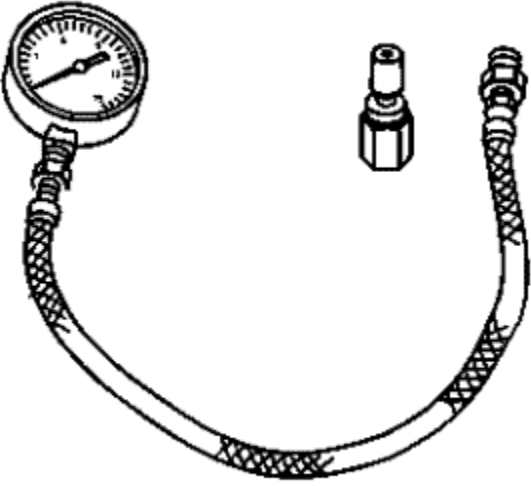

The catalyst in the converter is not serviceable.

Muffler

The exhaust muffler reduces the noise levels of the engine exhaust by the use of tuning tubes. The tuning tubes create channels inside the exhaust muffler that lower the sound levels created by the combustion of the engine.

Engine Identification

[Engine Number](#)

Note: The engine identification number must be stamped to the cylinder block in case of engine replacement.

The engine number is stamped to the engine block (1).

Symptoms - Engine Mechanical

Strategy Based Diagnostics

All diagnosis on a vehicle should follow a logical process. Strategy based diagnostics is a uniform approach for repairing all systems. The diagnostic flow may always be used in order to resolve a system condition. The diagnostic flow is the place to start when repairs are necessary.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the engine.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for the correct oil level, proper oil viscosity, and correct filter application.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, ambient temperature, engine temperature, amount of engine warm-up time, and other specifics.
- Compare the engine sounds, if applicable, to a known good engine and make sure you are not trying to correct a normal condition.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating properly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Base Engine Misfire without Internal Engine Noises](#)
- [Base Engine Misfire with Abnormal Internal Lower Engine Noises](#)
- [Base Engine Misfire with Abnormal Valve Train Noise](#)
- [Base Engine Misfire with Coolant Consumption](#)
- [Base Engine Misfire with Excessive Oil Consumption](#)
- [Engine Noise on Start-Up, but Only Lasting a Few Seconds](#)
- [Upper Engine Noise, Regardless of Engine Speed](#)
- [Lower Engine Noise, Regardless of Engine Speed](#)
- [Engine Noise Under Load](#)

- [Engine Will Not Crank - Crankshaft Will Not Rotate](#)
- [Engine Compression Test](#)
- [Oil Consumption Diagnosis](#)
- [Oil Pressure Diagnosis and Testing](#)
- [Drive Belt Chirping, Squeal, and Whine Diagnosis](#)
- [Drive Belt Rumbling and Vibration Diagnosis](#)
- [Drive Belt Falls Off and Excessive Wear Diagnosis](#)

Oil Consumption Diagnosis

Checks	Causes
The causes of excessive oil consumption may include the following conditions:	
Preliminary	<ul style="list-style-type: none"> • External oil leaks. • Incorrect oil level or improper reading of the oil level indicator. With the vehicle on a level surface, run the engine for a few minutes, allow adequate drain down time (2-3 minutes) and check for the correct engine oil level. • Improper oil viscosity. Refer to the vehicle owners manual and use the recommended SAE grade and viscosity for the prevailing temperatures. • Continuous high speed driving and/or severe usage. • Crankcase ventilation system restrictions or malfunctioning components. • Worn valve guides and/or valve stems. • Worn, missing or improperly installed valve stem oil seals. • Piston rings broken, worn, not seated properly. Allow adequate time for the rings to seat. Replace worn piston rings as necessary. • Piston and rings improperly installed or miss-fitted to the cylinder bore.

Engine Noise Under Load

Cause	Correction
Low oil pressure	Insufficient or poor oil supply to components. 1. Perform oil pressure test. 2. Repair or replace all damaged components.
Loose torque converter bolts	1. Inspect the torque converter bolts and flywheel. 2. Repair or replace all damaged components.
Loose and/or damaged flywheel	1. Inspect the flywheel and flywheel attaching bolts. 2. Repair or replace all damaged components.
Excessive piston-to-cylinder bore clearance	1. Inspect the piston rings for low ring tension, broken or worn rings, inspect cylinder bore. 2. Repair or replace all damaged components.
Excessive crankshaft thrust bearing clearance	1. Inspect the crankshaft end play and crankshaft thrust bearings. 2. Repair or replace all damaged components.
Excessive crankshaft bearing clearance	1. Inspect the crankshaft bearings and crankshaft journals. 2. Repair or replace all damaged components.

Engine Noise on Start-Up, but Only Lasting a Few Seconds

Cause	Correction
Incorrect oil filter without anti-drainback feature	Install the correct oil filter.
Incorrect oil viscosity	Drain the engine oil and replace with the correct viscosity oil.
High stationary hydraulic lash adjuster (SHLA), tappet, leak down rate	Replace the SHLAs, tappets, as required.
Worn crankshaft thrust bearing	<ul style="list-style-type: none">• Inspect the thrust bearing and crankshaft.• Repair or replace as required.
Damaged or faulty oil filter by-pass valve	<ul style="list-style-type: none">• Inspect the oil filter by-pass valve for proper operation.• Repair or replace as required.

Base Engine Misfire without Internal Engine Noises

Condition	Action
Abnormalities (severe cracking, bumps, or missing areas) in the accessory drive belt. Also worn, damaged, or misaligned accessory drive components or excessive pulley runout.	<p>Abnormalities in the accessory drive belt and/or components may cause engine RPM variations, noises similar to a faulty lower engine and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect the accessory drive components. 2. Repair or replace all damaged components.
Loose and/or damaged crankshaft pulley	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect crankshaft pulley and pulley bolt. 2. Repair or replace all damaged components.
Loose torque converter bolts	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect torque converter bolts and flywheel. 2. Repair or replace all damaged components.
Loose and/or damaged flywheel	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect flywheel and flywheel attaching bolts. 2. Repair or replace all damaged components.
Restricted exhaust system	<p>A severe restriction in the exhaust flow can cause significant loss of engine performance and may set a misfire code. Possible causes of restrictions include collapsed or dented pipes, plugged silencers and/or catalytic converters. Repair or replace all damaged components.</p>
Air in fuel system	<ol style="list-style-type: none"> 1. Inspect fuel filter, fuel system for leaks and/or restrictions. 2. Repair or replace all damaged components.
Bent and/or worn valve bridge and finger-follower	<ol style="list-style-type: none"> 1. Inspect valve bridge and valve finger-follower. 2. Repair or replace all damaged components.
	Carbon on the valve stem or valve seat may cause the valve to stick.

Sticking valve	<ol style="list-style-type: none"> 1. Inspect valves and valve guides. 2. Repair or replace all damaged components.
Damaged or misaligned timing gears	<ol style="list-style-type: none"> 1. Inspect timing gears. 2. Replace all damaged components.
Worn or faulty camshaft lobes	<ol style="list-style-type: none"> 1. Inspect camshaft lobes. 2. Repair or replace all damaged components.
Excessive piston-to-cylinder bore clearance	<ol style="list-style-type: none"> 1. Perform compression tests. 2. Inspect the piston, piston rings and cylinder bore. 3. Repair or replace all damaged components.
Faulty cylinder head gaskets and/or cracking or other damage to the cylinder heads and engine block cooling system passages. (Coolant consumption may or may not cause the engine to overheat.)	<ol style="list-style-type: none"> 1. Perform compression tests. 2. Inspect the piston, piston rings and cylinder bore. 3. Repair or replace all damaged components.

Base Engine Misfire with Abnormal Internal Lower Engine Noises

Condition	Actions
Abnormalities (server cracking, bumps or missing areas) in the accessory drive belt	<p>Abnormalities in the accessory drive belt and/or components may cause engine RPM variations, noises similar to faulty lower engine and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect the accessory drive components. 2. Repair or replace all damaged components.
Worn, damaged, or misaligned accessory drive components or excessive pulley runout	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect the accessory drive components. 2. Repair or replace all damage components.
Loose and/or damaged crankshaft pulley	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Repair or replace all damaged components. 2. Inspect crankshaft pulley and pulley bolt.
Loose torque converter bolts	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect torque converter bolts and flywheel. 2. Repair or replace all damaged components.
Loose and/or damaged flywheel	<p>A misfire code may be present without an actual misfire condition.</p> <ol style="list-style-type: none"> 1. Inspect flywheel and flywheel attaching bolts. 2. Repair or replace all damaged components.
Excessive piston-to-cylinder bore clearance	<ol style="list-style-type: none"> 1. Perform cylinder leak down and compression tests. 2. Inspect the piston, piston rings and cylinder bore. 3. Repair or replace all damaged components.
	<p>Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit for and aft movement of the crankshaft and create a misfire code without an actual misfire condition.</p>

Excessive crankshaft thrust bearing clearance

1. Inspect the crankshaft end play and crankshaft thrust bearings.
2. Repair or replace all damaged.

Base Engine Misfire with Abnormal Valve Train Noise

Condition	Action
Loose, worn or damaged valve bridge and finger-follower	<ol style="list-style-type: none">1. Inspect valve bridge and finger-follower.2. Repair or replace all damaged components.
Broken valve springs	<ol style="list-style-type: none">1. Inspect valve springs.2. Repair or replace all damaged components.
Sticking valve	<p>Carbon on the valve stem or valve seat may cause the valve to stick.</p> <ol style="list-style-type: none">1. Inspect valves and valve guides.2. Repair or replace all damaged components.
Worn or faulty camshaft lobes	<ol style="list-style-type: none">1. Inspect camshaft lobes.2. Repair or replace all damaged components.

Base Engine Misfire with Coolant Consumption

Inspection	Action
DEFINITION: Base engine misfire with coolant consumption	
Preliminary Inspection	Verify that there are no external coolant leaks.
Isolate Affected Cylinders	<ul style="list-style-type: none"> • Cylinder balance test with scan tool • Cooling system pressurisation • Inspection of glow plugs • Compression test
EGR System Inspection	<ul style="list-style-type: none"> • Inspect EGR valve and inlet system for evidence of coolant leakage. • Replace the EGR cooler if any problem is found.
Cylinder Head Gasket Leakage	<ul style="list-style-type: none"> • Remove cylinder heads of the affected cylinder bank and inspect for damage. • Replace components as necessary.
Cylinder Head or Engine Block Damage	<ul style="list-style-type: none"> • Inspect the cylinder head for cracks. • Inspect the cylinder block for damage. • Inspect the cylinder block to head mating surface for straightness. • Replace components as necessary.

Base Engine Misfire with Excessive Oil Consumption

Condition	Action
Worn valve guides	<ol style="list-style-type: none">1. Inspect the valves and valve guides.2. Repair or replace all damaged components.
Worn valve stem oil seals	<ol style="list-style-type: none">1. Inspect the valve stem oil seals.2. Repair or replace all damaged components.
Excessive piston-to-cylinder bore clearance	<ol style="list-style-type: none">1. Perform compression tests to determine the cause.2. Inspect the piston rings for low ring tension, broken or worn rings.3. Inspect cylinder bore.4. Repair or replace all damaged components.

Upper Engine Noise, Regardless of Engine Speed

Condition	Action
Low oil pressure	<p>Insufficient or poor oil supply to valve train.</p> <ol style="list-style-type: none"> 1. Perform oil pressure test. 2. Repair or replace all damaged components.
Improper lubrication to the valve finger-follower	<ol style="list-style-type: none"> 1. Inspect valve finger-follower, valve bridge, valve finger follower lifter, oil pump and engine block oil galleries. 2. Repair or replace all damaged components.
Worn or damaged valve finger-follower	<ol style="list-style-type: none"> 1. Inspect valve bridge and finger-follower. 2. Repair or replace all damaged components.
Sticking valve	<p>Carbon on the valve stem or valve seat may cause the valve to stick.</p> <ol style="list-style-type: none"> 1. Inspect valves and valve guides. 2. Repair or replace all damaged components.
Worn or faulty camshaft lobes	<ol style="list-style-type: none"> 1. Inspect camshaft lobes. 2. If damaged replace camshaft and all valve finger-followers.
Damaged or misaligned timing gears	<ol style="list-style-type: none"> 1. Inspect timing gears. 2. Replace all damaged components.

Lower Engine Noise, Regardless of Engine Speed

Condition	Action
Worn accessory drive components (abnormalities such as severe cracking, bumps or missing areas in the accessory drive belt and/or misalignment of the system components.)	<ol style="list-style-type: none"> 1. Inspect the accessory drive components. 2. Repair or replace all damaged components.
Low oil pressure	<p>Insufficient or poor oil supply to crankshaft and big end bearings.</p> <ol style="list-style-type: none"> 1. Perform oil pressure test. 2. Repair or replace all damaged components.
Leaking and/or sticking fuel injection nozzle (A stuck fuel injection nozzle can cause a noise similar to a damaged piston, rod or rod bearing.)	<ol style="list-style-type: none"> 1. Inspect the cylinder balance with scan tool to help locate the cylinder that is the source of the noise. 2. If you cannot locate the cylinder that is the source of the noise, diagnose the engine for mechanical damage. 3. If it has been determined that the fuel injection nozzle is causing the noise, replace the fuel injection nozzle.
Loose and/or damaged crankshaft pulley	<ol style="list-style-type: none"> 1. Inspect crankshaft pulley and pulley bolt. 2. Repair or replace all damaged components.
Loose torque converter bolts	<ol style="list-style-type: none"> 1. Inspect torque converter bolts and flywheel. 2. Repair or replace all damaged components.
Loose and/or damaged flywheel	<ol style="list-style-type: none"> 1. Inspect flywheel and flywheel attaching bolts. 2. Repair or replace all damaged components.
Excessive gudgeon pin-to-bore clearance	<ol style="list-style-type: none"> 1. Inspect the piston, gudgeon pin, and the connecting rod. 2. Repair or replace all damaged components.
Misaligned or bent connecting rod	<ol style="list-style-type: none"> 1. Inspect connecting rod and big end bearings. 2. Repair or replace all damaged components.
	<ol style="list-style-type: none"> 1. Inspect the big end bearings, connecting rods, crankshaft and

Excessive big end bearing clearance	crankshaft journals. 2. Repair or replace all damaged components.
Excessive crankshaft bearing clearance	1. Inspect the crankshaft bearings and crankshaft journals. 2. Repair or replace all damaged components.

Engine Will Not Crank - Crankshaft Will Not Rotate

Cause	Correction
Seized accessory drive system component	<ol style="list-style-type: none"> 1. Inspect the accessory drive system components. 2. Repair or replace all damaged components.
Hydraulically locked cylinder <ul style="list-style-type: none"> • Coolant/antifreeze in cylinder • Oil in cylinder • Fuel in cylinder 	<ol style="list-style-type: none"> 1. Inspect for broken head gasket(s). 2. Inspect for cracked engine block or cylinder head. 3. Inspect for a sticking fuel injector.
Seized automatic transmission torque converter	<ol style="list-style-type: none"> 1. Remove the engine assembly. The torque converter bolts are not accessible with the engine installed to the transmission. 2. Rotate the crankshaft at the pulley.
Seized manual gearbox	<ol style="list-style-type: none"> 1. Disengage the clutch. 2. Rotate crankshaft at the pulley.
Material in cylinder <ul style="list-style-type: none"> • Broken valve • Piston material • Foreign material 	<ol style="list-style-type: none"> 1. Inspect the cylinder for damaged components and/or foreign materials. 2. Repair or replace as required.
Seized crankshaft or big end bearing	<ol style="list-style-type: none"> 1. Inspect the crankshaft and big end bearings. 2. Repair as required.
Bent or broken connecting rod	<ol style="list-style-type: none"> 1. Inspect the connecting rods. 2. Repair as required.
Broken crankshaft	<ol style="list-style-type: none"> 1. Inspect the crankshaft. 2. Repair as required.

Drive Belt Chirping, Squeal, and Whine Diagnosis

[Diagnostic Aids](#)

- A chirping or squeal noise may be intermittent due to moisture on the drive belts or the pulleys. It may be necessary to spray a small amount of water on the drive belts in order to duplicate the customer's concern. If spraying water on the drive belt duplicates the symptom, cleaning the belt pulleys may be the probable solution.
- If the noise is intermittent, verify the accessory drive components by varying their loads making sure they are operated to their maximum capacity. An overcharged A/C system, power steering system with a pinched hose or wrong fluid, or a generator failing are suggested items to inspect.
- A chirping, squeal or whine noise may be caused by a loose or improper installation of a body or suspension component. Other items of the vehicle may also cause the noise.
- The drive belts will not cause a whine noise.

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table.

2. The noise may not be engine related. This step is to verify that the engine is making the noise. If the engine is not making the noise do not proceed further with this table.
3. The noise may be an internal engine noise. Removing the drive belts one at a time and operating the engine for a brief period will verify the noise is related to the drive belt. When removing the drive belt the water pump may not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belts removed.
4. Inspect all drive belt pulleys for pilling. Pilling is the small balls or pills or it can be strings in the drive belt grooves from the accumulation of rubber dust.
6. Misalignment of the pulleys may be caused from improper mounting of the accessory drive component, incorrect installation of the accessory drive component pulley, or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found refer to that accessory drive component for the proper installation procedure for that pulley.
10. Inspecting of the fasteners can eliminate the possibility that a wrong bolt, nut, spacer, or washer was installed.
12. Inspecting the pulleys for being bent should include inspecting for a dent or other damage to the pulleys that would prevent the drive belt from not seating properly in all of the pulley grooves or on the smooth surface of a pulley when the back side of the belt is used to drive the pulley.
14. This test is to verify that the drive belt tensioner operates properly. If the drive belt tensioner is not operating properly, proper belt tension may not be achieved to keep

the drive belt from slipping which could cause a squeal noise.

15. This test is to verify that the drive belt is not too long, which would prevent the drive belt tensioner from working properly. Also if an incorrect length drive belt was installed, it may not be routed properly and may be turning an accessory drive component in the wrong direction.
16. Misalignment of the pulleys may be caused from improper mounting of the accessory drive component, incorrect installation of the accessory drive component pulley, or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found refer to that accessory drive component for the proper installation procedure for that pulley.
17. This test is to verify that the pulleys are the correct diameter or width. Using a known good vehicle compare the pulley sizes.
19. Replacing the drive belt when it is not damaged or there is not excessive pilling will only be a temporary repair.

Step	Action	Yes	No
<p>Caution: Do not use belt dressing on the drive belt. Belt dressing causes the breakdown of the composition of the drive belt. Failure to follow this recommendation will damage the drive belt.</p>			
<p>DEFINITION: The following items are indications of chirping:</p>			
<ul style="list-style-type: none"> • A high pitched noise that is heard once per revolution of the drive belt or a pulley. • Chirping may occur on cold damp start-ups and will subside once the vehicle reaches normal operating temp. 			
<p>DEFINITION: The following items are indications of drive belt squeal:</p>			
<ul style="list-style-type: none"> • A loud screeching noise that is caused by a slipping drive belt. This is unusual for a drive belt with multiple ribs. • The noise occurs when a heavy load is applied to the drive belt, such as an air conditioning compressor engagement snapping the throttle, or slipping on a seized pulley or a faulty accessory drive component. 			
<p>DEFINITION: The following items are indications of drive belt whine:</p>			
<ul style="list-style-type: none"> • A high pitched continuous noise. • The noise may be caused by an accessory drive component failed bearing. 			
1	Did you review the Drive Belt Symptom operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Verify that there is a chirping, squeal or whine noise. Does the engine make the chirping squeal or whine noise?	Go to Step 3	Go to Diagnostic Aids
	<ol style="list-style-type: none"> 1. Remove the drive belt. <p>If the engine has multiple drive belts, remove the belts one at a time and perform the test below each time a belt is removed.</p>		

3	<p>2. Operate the engine for no longer than 30–40 seconds. 3. Repeat this test if necessary by removing the remaining belt(s).</p> <p>Does the chirping, squeal or whine noise still exist?</p>	Go to Symptoms - Engine Mechanical	Go to Step 4
4	<p>If diagnosing a chirping noise, inspect for severe pilling exceeding 1/3 of the belt groove depth.</p> <p>If diagnosing a squeal or whine noise, proceed to Step 13.</p> <p>Do the belt grooves have pilling?</p>	Go to Step 5	Go to Step 6
5	<p>Clean the drive belt pulleys with a suitable wire brush.</p> <p>Did you complete the repair?</p>	Go to Step 20	Go to Step 6

11	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>1. Tighten any loose fasteners. Refer to Fastener Tightening Specifications . 2. Replace any improper or missing fasteners.</p> <p>Did you complete the repair?</p>	Go to Step 20	Go to Step 12
12	<p>Inspect for a bent pulley.</p> <p>Did you find the condition?</p>	Go to Step 18	Go to Step 19
13	<p>Inspect for an accessory drive component seized bearing or a faulty accessory drive component.</p> <p>If diagnosing a whine noise and the condition still exist, proceed to Diagnostic Aids.</p> <p>Did you find and correct the condition?</p>	Go to Step 20	Go to Step 14

14	<p>Test the drive belt tensioner for proper operation.</p> <p>Did you find and correct the condition?</p>	Go to Step 20	Go to Step 15
15	<p>Inspect for the correct drive belt length.</p> <p>Did you find and correct the condition?</p>	Go to Step 20	Go to Step 16
16	<p>Inspect for misalignment of a pulley.</p> <p>Did you find and correct the condition?</p>	Go to Step 20	Go to Step 17
17	<p>Inspect for the correct pulley size.</p> <p>Did you find and correct the condition?</p>	Go to Step 20	Go to Diagnostic Aids
18	<p>Replace the bent pulley.</p> <p>Did you complete the repair?</p>	Go to Step 20	Go to Step 19
19	<p>Replace the drive belt. Refer to Symptoms - Engine Mechanical .</p> <p>Did you complete the repair?</p>	Go to Step 20	Go to Diagnostic Aids
20	<p>Operate the system in order to verify the repair.</p> <p>Did you correct the condition?</p>	System OK	Go to Step 3

Drive Belt Rumbling and Vibration Diagnosis

[Diagnostic Aids](#)

The accessory drive components can have an affect on engine vibration. Vibration from the engine operating may cause a body component or another part of the vehicle to make rumbling noise. Vibration can be caused by, but not limited to the A/C system over charged, the power steering system restricted or the incorrect fluid, or an extra load on the generator. To help identify an intermittent or an improper condition, vary the loads on the accessory drive components.

The drive belt may have a rumbling condition that cannot be seen or felt. Sometimes replacing the drive belt may be the only repair for the symptom.

If replacing the drive belt, completing the diagnostic table, and the noise is only heard when the drive belts are installed, there might be an accessory drive component with a failure. Varying the load on the different accessory drive components may aid in identifying which component is causing the rumbling noise.

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table.

2. This test is to verify that the symptom is present during diagnosing. Other vehicle components may cause a similar symptom.
3. This test is to verify that one of the drive belts is causing the rumbling noise or vibration. Rumbling noise may be confused with an internal engine noise due to the similarity in the description. Remove only one drive belt at a time if the vehicle has multiple drive belts. When removing the drive belts the water pump may not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belts removed.
4. Inspecting the drive belts is to ensure that they are not causing the noise. Small cracks across the ribs of the drive belt will not cause the noise. Belt separation can be recognised at the edge of the belt or felt as a lump in the belt.
5. Small amounts of pilling is normal condition and acceptable. When the pilling is severe the drive belt does not have a smooth surface for proper operation.
9. Inspecting of the fasteners can eliminate the possibility that the wrong bolt, nut, spacer, or washer was installed.
11. This step should only be performed if the water pump is driven by the drive belt. Inspect the water pump shaft for being bent. Also inspect the water pump bearings for smooth operation and excessive play. Compare the water pump with a known good water pump.
12. Accessory drive component brackets that are bent, cracked, or loose may put extra strain on that accessory component causing it to vibrate.

Step	Action	Yes	No
------	--------	-----	----

DEFINITION: The following items are indications of drive belt rumbling:

- A low pitch tapping, knocking, or thumping noise heard at or just above idle.
- Heard once per revolution of the drive belt or a pulley.
- Rumbling may be caused from:
 - Pilling, the accumulation of rubber dust that forms small balls (pills) or strings in the drive belt pulley groove
 - The separation of the drive belt
 - A damaged drive belt.

DEFINITION: The following items are indications of drive belt vibration:

- The vibration is engine-speed related.
- The vibration may be sensitive to accessory load.

1	Did you review the Drive Belt Symptom operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
2	Verify that there is a rumbling noise or that the vibration is engine related. Does the engine make the rumbling noise or vibration?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belt. If the engine has multiple drive belts, remove the belts one at a time and perform the test below each time a belt is removed. 2. Operate the engine for no longer than 30–40 seconds. 3. Repeat this test if necessary by removing the remaining belt(s). Does the rumbling or vibration still exist?	Go to Symptoms - Engine Mechanical	Go to Step 4
4	Inspect the drive belts for wear, damage, separation, sections of missing ribs, and debris build-up. Did you find any of these conditions?	Go to Step 7	Go to Step 5
5	Inspect for severe pilling of more than 1/3 of the drive belt pulley grooves. Did you find severe pilling?	Go to Step 6	Go to Step 7
6	1. Clean the drive belt pulleys using a suitable wire brush. 2. Reinstall the drive belts. Did you correct the condition?	Go to Step 8	Go to Step 7
7	Install a new drive belt. Did you complete the replacement?	Go to Step 8	Go to Step 9

8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 9
9	Inspect for improper, loose or missing fasteners. Did you find any of these conditions?	Go to Step 10	Go to Step 11
10	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <ol style="list-style-type: none"> 1. Tighten any loose fasteners. Refer to Fastener Tightening Specifications . 2. Replace improper or missing fasteners. Did you complete the repair?	Go to Step 12	Go to Step 11
11	Inspect for bent or cracked brackets. Did you find and correct the condition?	Go to Step 12	Go to Diagnostic Aids
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

Drive Belt Falls Off and Excessive Wear Diagnosis

[Diagnostic Aids](#)

If the drive belt repeatedly falls off the drive belt pulleys, this is because of pulley misalignment.

An extra load that is quickly applied on released by an accessory drive component may cause the drive belt to fall off the pulleys. Verify the accessory drive components operate properly.

If the drive belt is the incorrect length, the drive belt tensioner may not keep the proper tension on the drive belt.

Excessive wear on a drive belt is usually caused by an incorrect installation or the wrong drive belt for the application.

Minor misalignment of the drive belt pulleys will not cause excessive wear, but will probably cause the drive belt to make a noise or to fall off.

Excessive misalignment of the drive belt pulleys will cause excessive wear but may also make the drive belt fall off.

[Test Description](#)

The numbers below refer to the step numbers on the diagnostic table.

2. This inspection is to verify the condition of the drive belt. Damage may of occurred to the drive belt when the drive belt fell off. The drive belt may of been damaged, which caused the drive belt to fall off. Inspect the belt for cuts, tears or sections of ribs missing.
4. Misalignment of the pulleys may be caused from improper mounting of the accessory drive component, incorrect installation of the accessory drive component pulley, or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found refer to that accessory drive component for the proper installation procedure of that pulley.
5. Inspecting the pulleys for being bent should include inspecting for a dent or other damage to the pulleys that would prevent the drive belt from not seating properly in all of the pulley grooves or on the smooth surface of a pulley when the back side of the belt is used to drive the pulley.
6. Accessory drive component brackets that are bent or cracked will let the drive belt fall off.
7. Inspecting of the fasteners can eliminate the possibility that a wrong bolt, nut, spacer or washer was installed. Missing. loose, or the wrong fasteners may cause pulley misalignment from the bracket moving under load. Over tightening of the fasteners may cause misalignment of the accessory component bracket.

13. The inspection is to verify the drive belt is correctly installed on all of the drive belt pulleys. Wear on the drive belt may be caused by mis-positioning the drive belt by one groove on a pulley.
14. The installation of a drive belt that is too wide or too narrow will cause wear on the drive belt. The drive belt ribs should match all of the grooves on all of the pulleys.
15. This inspection is to verify the drive belt is not contacting any parts of the engine or body while the engine is operating. There should be sufficient clearance when the drive belt accessory drive components load varies. The drive belt should not come in contact with an engine or a body component when snapping the throttle.

Step	Action	Yes	No
DEFINITION: The drive belt falls off the pulleys or may not ride correctly on the pulleys.			
DEFINITION: Wear at the outside ribs of the drive belt due to an incorrectly installed drive belt.			
1	Did you review the Drive Belt Symptom operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Engine Mechanical
	If diagnosing high wear, proceed to Step 13 .		
2	If diagnosing a drive belt that falls off, inspect for a damaged drive belt. Did you find the condition?	Go to Step 3	Go to Step 4
3	Install a new drive belt. Does the drive belt continue to fall off?	Go to Step 4	System OK
4	Inspect for misalignment of the pulleys. Did you find and repair the condition?	Go to Step 12	Go to Step 5
5	Inspect for a bent or dented pulley. Did you find and repair the condition?	Go to Step 12	Go to Step 6
6	Inspect for a bent or a cracked bracket. Did you find and repair the condition?	Go to Step 12	Go to Step 7
7	Inspect for improper, loose or missing fasteners. Did you find loose or missing fasteners?	Go to Step 8	Go to Step 9
8	Caution: Refer to Fastener Caution in the Preface section. 1. Tighten any loose fasteners. Refer to Fastener Tightening Specifications . 2. Replace improper or missing fasteners. Does the drive belt continue to fall off?	Go to Step 9	System OK
9	Test the drive belt tensioner for operating correctly.		

	Does the drive belt tensioner operate correctly?	Go to Step 11	Go to Step 10
10	Replace the drive belt tensioner.		
	Does the drive belt continue to fall off?	Go to Step 11	System OK
11	Inspect for failed drive belt idler and drive belt tensioner pulley bearings.		
	Did you find and repair the condition?	Go to Step 12	Go to Diagnostic Aids
12	Operate the system in order to verify the repair.		
	Did you correct the condition?	System OK	Go to Step 2
13	Inspect the drive belt for the proper installation.		
	Did you find this condition?	Go to Step 16	Go to Step 14
14	Inspect for the proper drive belt.		
	Did you find this condition?	Go to Step 16	Go to Step 15
15	Inspect for the drive belt rubbing against a bracket, hose, or wiring harness.		
	Did you find and repair the condition?	Go to Step 17	Go to Diagnostic Aids
16	Replace the drive belt.		
	Did you complete the replacement?	Go to Step 17	-
17	Operate the system in order to verify the repair.		
	Did you correct the condition?	System OK	-

Engine Mount Replacement - Right Side

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .2. Install engine support fixture. Refer to Engine Support Fixture .3. Prior to removing the mount, mark the mount location using spray paint or a marker for correct positioning during installation.	

1	<p>Engine Mount Fastener</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tip Perform the powertrain mount balancing - lower after installation of the fastener.</p> <p>Tighten 50 N·m (37 lb ft)</p>
2	<p>Engine Mount Fastener (Qty: 2)</p> <p>Tighten 58 N·m (43 lb ft)</p>
3	<p>Engine Mount Fastener (Qty: 3)</p> <p>Procedure Ensure the washer is in place before installing the bolt.</p> <p>Tighten 58 N·m (43 lb ft)</p>
4	<p>Engine Mount</p> <p>Procedure Transfer components as necessary.</p>

Engine Mount Inspection

1. Install the engine support fixture. Refer to [Engine Support Fixture](#) .
2. Observe the engine mount while raising the engine. Raising the engine removes the weight from the engine mount and creates slight tension on the rubber.
3. Replace the engine mount if the engine mount exhibits any of the following conditions:
 - The hard rubber is covered with heat check cracks.
 - The rubber is separated from the metal plate of the engine mount.
 - The rubber is split through the center of the engine mount.
4. For engine mount replacement, refer to [Engine Mount Replacement - Right Side](#) .
5. For rear transmission mount replacement, refer to [Transmission Rear Mount Replacement](#) .
6. For left transmission mount replacement, refer to [Transmission Mount Replacement - Left Side](#) .

Engine Mount Bracket Replacement - Right Side

Callout

Component Name

Preliminary Procedures

1. Remove the engine mount. Refer to [Engine Mount Replacement - Right Side](#) .
2. Remove the front wheelhouse front liner. Refer to [Front Wheelhouse Front Liner Replacement](#) .
3. Remove the nuts retaining the drive motor battery to charge cable to the frame rail and reposition. Refer to [300-Volt Battery Positive and Negative Cable Replacement](#) :

1	<p>Engine Mount Bracket Fastener (Qty: 2)</p> <p>Caution: This component uses torque-to-yield bolts. When servicing this component do not reuse the bolts, New torque-to-yield bolts must be installed. Reusing used torque-to-yield bolts will not provide proper bolt torque and clamp load. Failure to install NEW torque-to-yield bolts may lead to engine damage.</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <ol style="list-style-type: none">1. Raise and lower the engine as needed to access the bolts.2. Ensure to follow the tighten sequence. <p>Tighten</p> <ol style="list-style-type: none">1. First pass: 60 N·m (44 lb ft)2. Final pass: additional 45-60 degrees
2	<p>Engine Mount Bracket Fastener</p> <p>Procedure</p> <p>Ensure to follow the tighten sequence.</p> <p>Tighten</p> <ol style="list-style-type: none">1. First pass: 60 N·m (44 lb ft)2. Final pass: additional 45-60 degrees

Inlet Manifold Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#) .
3. Remove the fuel injection fuel rail assembly only. Refer to [Fuel Injection Fuel Rail Assembly Replacement](#)

4. Remove the evaporative emission canister purge solenoid valve hose (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
5. Unclip and reposition the engine coolant air bleed hose without draining coolant. Refer to [Engine Coolant Air Bleed Hose Connector Replacement](#)

6. Remove the inlet manifold bolts (1).

7. Remove the inlet manifold from the vehicle (1).
8. Disconnect electrical connectors as necessary.
9. To disassemble the inlet manifold. Refer to [Inlet Manifold Disassemble](#)
10. For cleaning and inspection of the inlet manifold. Refer to [Inlet Manifold Cleaning and Inspection](#) .
11. Transfer components as necessary.

[Installation Procedure](#)

1. Ensure the surface of the inlet manifold is clean before installing the new gasket.
2. Install the manifold gasket (1).

3. Install the inlet manifold in the vehicle (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the inlet manifold bolts (1).

Tighten

Tighten the inlet manifold bolts 20 N·m (15 lb ft).

5. Install the evaporative emission canister purge solenoid valve hose (1). Refer to [Plastic Collar Quick Connect Fitting Service](#) .
6. Install the fuel injection fuel rail assembly only. Refer to [Fuel Injection Fuel Rail Assembly Replacement](#) .
7. Install the Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#) .
8. Fill the coolant fluid. Refer to [Cooling System Draining and Filling](#) .
9. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

Camshaft Timing Chain Replacement

Special Tools

EN-955-1 Locking Pin

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

1. Remove the engine front cover. Refer to [Engine Front Cover with Oil Pump Replacement](#) .

2. Push the timing chain (2) in direction to the timing chain tensioner (1) and install the *EN-955-1* pin (3).

3. Remove the two upper timing chain guide bolts (1).
4. Remove the upper timing chain guide (2).

5. Remove the two timing chain guide right side bolts (2).
6. Remove the timing chain guide right side (1).

7. Remove the timing chain tensioner shoe bolt (2).
8. Remove the timing chain tensioner shoe (1).

9. Remove the timing chain (1) and crankshaft sprocket (2) together as a unit.

10. Remove the engine front cover gasket (1).

[Installation Procedure](#)

1. Clean the engine front cover sealing surfaces on engine block and cylinder head.

2. Apply a 2 mm (0.0787 in) bead of RTV sealant the areas shown above (1, 2).

3. Install the engine front cover gasket (1).

4. Install the timing chain (1) and crankshaft sprocket (2) together as a unit.

5. Install the timing chain tensioner shoe (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

6. Install the timing chain tensioner shoe bolt (2) and tighten to **20 N·m (15 lb ft)**.

7. Install the timing chain guide right side (1).
8. Install the timing chain guide right side bolts (2) and tighten to **8 N·m (71 lb in)**.

9. Push the timing chain (2) in direction of the timing chain tensioner (1) and remove *EN-955-1* pin (3).
10. Install the engine front cover. Refer to [Engine Front Cover with Oil Pump Replacement](#) .

Timing Chain Tensioner Replacement

Callout	Component Name
Preliminary Procedure	
Remove the camshaft timing chain. Refer to Camshaft Timing Chain Replacement	
	Timing Chain Tensioner Fastener (Qty: 2)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tip The timing chain is installed in the graphic for location use only. But is required to be removed to perform the procedure.</p> <p>Tighten 8 N·m (71 lb in)</p>
2	<p>Timing Chain Tensioner</p> <p>Procedure</p> <p>Transfer parts as necessary.</p>

Hydraulic Valve Clearance Adjuster Arm Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1458 1150 1490">1. Remove the inlet camshaft. Refer to Inlet Camshaft Replacement .<li data-bbox="163 1495 1257 1528">2. Remove the exhaust camshaft. Refer to Exhaust Camshaft Replacement .	

Remove the hydraulic valve clearance adjuster arms

Procedure

1

1. Mark the hydraulic valve clearance adjuster arms upon removal to ensure installation is in the correct position.
2. Lubricate the hydraulic valve clearance adjuster arms with engine oil before installing the arms.
3. Transfer Parts as necessary.

Hydraulic Valve clearance Adjuster Replacement

Callout	Component Name
Preliminary Procedures	
Remove the hydraulic valve clearance adjuster arms. Refer to Hydraulic Valve Clearance Adjuster Arm Replacement	
	Remove the hydraulic valve lash adjuster

Procedure

1

1. Mark the hydraulic valve clearance adjuster upon removal to ensure installation is in the correct position.
2. Lubricate the hydraulic valve lash adjuster with engine oil before installation.
3. Transfer Parts as necessary.

Camshaft Inlet and Exhaust Sprocket Replacement

Special Tools

EN-955-1 Locking Pin

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
2. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) .
3. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
4. Remove the camshaft cover. Refer to [Camshaft Cover Replacement](#) .
5. Remove both camshaft position actuator solenoid valves. Refer to [Camshaft Position Actuator Solenoid Valve Replacement](#) : [Exhaust](#) → [Intake](#) .
6. Adjust the engine to TDC. Refer to [Camshaft Timing Chain Adjustment](#) .
7. Remove the engine mount bracket. Refer to [Engine Mount Bracket Replacement - Right Side](#) .
8. Place a floor jack with block of wood under the oil sump.
9. Remove engine support fixture. Refer [Engine Support Fixture](#) .

10. Remove the heater water shutoff valve inlet hose clamp (1) at engine.
11. Remove the heater water shutoff valve inlet hose (2) from engine.
12. Disconnect the heater water shutoff valve inlet hose from the engine.

13. Remove the timing chain tensioner plug (1) from the engine front cover.

14. Install a wrench (1) on the cast hexagonal portion of the inlet camshaft, rotate the camshaft toward the exhaust camshaft in order to apply tension.

15. Install *EN-955-1* pin (2) to the timing chain tensioner bore (1).
16. Remove the wrench from inlet camshaft.

17. Remove the 2 upper timing chain guide bolts (1).
18. Remove the upper timing chain guide (2).

19. Loosen the inlet camshaft sprocket bolt (2) while holding up the hexagon of the inlet camshaft with a wrench (1).
20. Loosen the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft with a wrench.

21. Remove the camshaft sprocket bolts (2) and the camshaft position exciter wheels (1).

22. Remove the camshaft sprockets (2) and timing chain (1) as one unit.
23. Remove the inlet and exhaust camshaft sprocket.
24. Allow the chain to rest on the front cover.

[Installation Procedure](#)

1. Install the camshaft sprockets (2) and timing chain (1) as one unit.

2. Install the camshaft position exciter wheels (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the camshaft sprocket bolts (2) and tighten to **50 N·m plus 45+15 degrees (37 lb ft) plus 45+15 degrees**.

4. Remove the *EN-955-1* pin .

5. Adjust the camshaft timing chain. Refer to [Camshaft Timing Chain Adjustment](#) .

6. Install the upper timing chain guide (2).
7. Install the upper timing chain guide bolts (1) and tighten to **8 N·m (71 lb in)**.

8. Install the timing chain tensioner plug (1) and tighten to **50 N·m (37 lb ft)**.
9. Install both camshaft position actuator solenoid valves. Refer to Camshaft Position Actuator Solenoid Valve Replacement : [Exhaust](#) → [Intake](#) .

10. Connect the heater water shutoff valve inlet hose (2) to the engine.
11. Install the heater water shutoff valve inlet hose clamp (1).
12. Install the engine mount bracket. Refer to [Engine Mount Bracket Replacement - Right Side](#) .
13. Install the camshaft cover. Refer to [Camshaft Cover Replacement](#) .
14. Fill the cooling system. Refer to [Cooling System Draining and Filling](#) .
15. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

Cylinder Head Replacement

Special Tools

- *EN-470-B* Angular Torque Wrench .
- *EN-955* Fixing Pin .

For equivalent regional tools, refer to [Special Tools](#)

[Removal Procedure](#)

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove the camshaft cover. Refer to [Camshaft Cover Replacement](#)
3. Remove the exhaust manifold. Refer to [Exhaust Manifold with Catalytic Converter Replacement](#)
4. Remove the Inlet manifold. Refer to [Inlet Manifold Replacement](#)
5. Install engine support fixture. Refer to [Engine Support Fixture](#)
6. Remove the Water Pump. Refer to [Water Pump Replacement](#)
7. Remove the water outlet. Refer to [Water Outlet Replacement](#)
8. Remove the Camshaft Position Actuator Solenoid Valve inlet and exhaust. Refer to [Camshaft Position Actuator Solenoid Valve Replacement](#) : [Exhaust](#) → [Intake](#)
9. Remove the Camshaft Position Sensor Exhaust only. Refer to [Camshaft Position Sensor Replacement](#) : [Intake](#) → [Exhaust](#)
10. Adjust the engine to TDC. Refer to [Camshaft Timing Chain Inspection](#)

11. Remove the timing chain tensioner plug (1) from the engine front cover.

12. Install a wrench (1) on the cast hexagonal portion of the inlet camshaft, rotate the camshaft toward the exhaust camshaft in order to apply tension.

13. Install *EN-955* Locking Pin (2) to the timing chain tensioner bore (1).
14. Remove the wrench from inlet camshaft.

15. Remove the 2 upper timing chain guide bolts (1).
16. Remove the upper timing chain guide (2).

17. Loosen the inlet camshaft sprocket bolt (2) while holding up the hexagon of the inlet camshaft with a wrench (1).
18. Loosen the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft with a wrench.

19. Remove the camshaft sprocket bolts (2) and the camshaft position exciter wheels (1).

20. Remove the camshaft sprockets (2) and timing chain (1) as one unit.
21. Disconnect electrical connectors as necessary.
22. Reposition electrical harness aside.
23. Allow the camshaft sprockets (2) and timing chain (1) rest on the front cover Do NOT remove sprockets or chain.
24. Place a floor jack with block of wood under the oil sump.
25. Remove engine support fixture. Refer [Engine Support Fixture](#)

26. Loosen the 12 cylinder head bolts in the sequence as shown above. Use the following procedure:

- First pass: Loosen the cylinder head bolts 90 degrees.
- Final pass: Loosen the cylinder head bolts 180 degrees.

Note: Do not damage the guide sleeves (4) and (5).

27. Remove the cylinder head bolts (1).
28. With the aid of helper, lift the timing chain side of the cylinder head assembly slightly in direction of the transmission.
29. Remove the cylinder head (2).
30. Remove the cylinder head gasket (3) and discard the gasket.

31. With the cylinder head out of vehicle bend the top third of the engine front cover gasket (1) back and forth until snaps off at the breaking point.
32. Transfer parts as necessary.
33. Clean and inspect the cylinder head. Refer to [Cylinder Head Cleaning and Inspection](#)
34. For disassembly of the cylinder head. Refer to [Cylinder Head Disassemble](#)

[Installation Procedure](#)

1. For disassembly of the cylinder head. Refer to [Cylinder Head Assemble](#)
2. Clean sealing surfaces of engine front cover and engine block from grease and old gasket material.

Note: The engine front cover gasket comes as a complete unit.

3. Before installation the of the new front cover gasket, bend the top third of the engine front cover gasket (1) back and forth until snaps off at the breaking point.

4. Install the engine front cover gasket (1) to ensure for a proper fit and alignment.
5. Clean the surface of the cylinder head and engine front cover.
6. Install the cylinder head gasket to engine block.

7. Apply a 2 mm (0.0787 in) bead of RTV sealant to the areas shown (1).

8. Install engine front cover bolts (1) in order to guide the NEW upper engine front cover gasket.
9. Apply a 2 mm (0.0787 in) bead of RTV sealant to the areas shown (2).

10. Ensure the guide sleeves are in place (4) and (5) before installing the cylinder head.
11. Install a NEW cylinder head gasket (3). The marking "Top" should point to the cylinder head.
12. Install the cylinder head (2).
13. Install the cylinder head bolts (1) and hand tighten only.

14. Adjust the cylinder head to the engine front cover. Use a rubber mallet.
15. Position the engine front cover to cylinder head by installing 3 bolts (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

16. Tighten the 3 bolts (1) to **8 N·m (71 lb in)**.

17. Using a *EN-470-B* angular torque wrench tighten the cylinder head bolts in the sequence as shown above. Tighten the cylinder head bolts to **25 N·m (18 lb ft) plus 180 degrees**.

18. Loosen the bolts from engine front cover (1).

19. Install the remaining bolts to engine front cover and water pump.
20. Tighten the engine front cover bolts (1) and (2) to **8 N·m (71 lb in)**.
21. Tighten the water pump bolts (3) to **8 N·m (71 lb in)**.
22. Install the water pump pulley. Refer to [Water Pump Pulley Replacement](#)
23. Install engine mount bracket. Refer to [Engine Mount Bracket Replacement - Right Side](#)
24. Install the engine mount. Refer to [Engine Mount Replacement - Right Side](#)

25. Install the camshaft sprockets (2) and timing chain (1) as one unit.

26. Install the camshaft position exciter wheels (1).
27. Install the camshaft sprocket bolts (2) and tighten to **50 N·m (37 lb ft) plus 45 + 15 degrees**.
28. Remove the *EN-955* locking pin .
29. Adjust the camshaft timing chain. Refer to [Camshaft Timing Chain Inspection](#)

30. Install the upper timing chain guide (2).
31. Install the upper timing chain guide bolts (1) and tighten to **8 N·m (71 lb in)**.

32. Install the timing chain tensioner plug and tighten to **50 N·m (37 lb ft)**.
33. Install the Camshaft Position Actuator Solenoid Valve inlet and exhaust. Refer to [Camshaft Position Actuator Solenoid Valve Replacement](#) : [Exhaust](#) → [Intake](#)
34. Install the Camshaft Position Sensor Exhaust only. Refer to [Camshaft Position Sensor Replacement](#) : [Intake](#) → [Exhaust](#)
35. Install the camshaft cover. Refer to [Camshaft Cover Replacement](#)
36. Install the exhaust manifold. Refer to [Exhaust Manifold with Catalytic Converter Replacement](#)
37. Install Inlet manifold. Refer to [Inlet Manifold Replacement](#)
38. Install the water outlet. Refer to [Water Outlet Replacement](#)
39. Fill coolant fluid. Refer to [Cooling System Draining and Filling](#)
40. Enable the high voltage system. Refer to [High Voltage Enabling](#)
41. Test the vehicle using the following procedure:
 - Crank the engine several times. Listen for any unusual noises or evidence that parts are binding.
 - Start the engine and listen for unusual noises.
 - Check the vehicle oil pressure gauge or light and confirm that the engine has acceptable oil pressure.
 - Run the engine speed at about 1,000 RPM until the engine has reached normal operating temperature.
 - Listen for sticking lifter and other unusual noises.

- Inspect for fuel, oil and/or coolant leaks while the engine is running.
42. Road test the vehicle for normal operation.
 43. Inspect for coolant, oil, gas or exhaust leaks.

Sump Replacement

Special Tools

EN-49980 Guidance Pins

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

1. Remove the oil filter and drain the engine oil. Refer to [Engine Oil and Oil Filter Replacement](#) .
2. Remove the catalytic converter. Refer to [Catalytic Converter Replacement](#) .
3. Remove the heater inlet and outlet pipes. Refer to [Heater Inlet And Outlet Pipe Replacement](#) .
4. Remove the crankshaft pulley. Refer to [Crankshaft Balancer Replacement](#) .

5. Remove the sump to transmission bolts (1).

6. Remove the oil sump bolts (1).

7. Remove the sump.

Installation Procedure

1. Clean the sealing surface of crankshaft bearing cap tie plate and the groove in the engine front cover from old gasket material, oil, dirt and grease.

2. Install the 2 *EN-49980* guide pins (1) to the sump screw bores as shown.

Note: The sealing bead should be applied close to the inner edge of the oil sump. Take care that the oil suction gallery (4) will not get contaminated with sealing compound or dirt.

3. Apply **2 mm (0.0787 in)** thickness of sealing compound (3, 2, 1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: The complete installation procedure of the oil sump should be done in 10 minutes.

4. Loosely install the sump bolts (1) in all but the guide pin locations.
5. Remove the *EN-49980* guide pins and install the remaining sump bolts.
6. Tighten the oil sump bolts to **10 N·m (89 lb in)**.
7. Position the transmission converter cover and hand tighten the cover to transmission bolt.

8. Install the sump to transmission bolts (1), and tighten to **40 N·m (30 lb ft)**.
9. Install a NEW oil filter and fill the engine with oil. Refer to [Engine Oil and Oil Filter Replacement](#) .
10. Install the catalytic converter. Refer to [Catalytic Converter Replacement](#) .
11. Install the crankshaft pulley. Refer to [Crankshaft Balancer Replacement](#) .
12. Install the heater inlet and outlet pipes, and refill the coolant system. Refer to [Heater Inlet And Outlet Pipe Replacement](#)

Automatic Transmission Flex Plate Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the transmission. Refer to Transmission Replacement .
Special Tools	

- *EN-470-B* Angular Torque Wrench
- *EN-956-1* Extension
- *EN-49979* Crankshaft Shock Mount Retainer

For equivalent regional tools, refer to [Special Tools](#) .

1	<p>Automatic Transmission Flex Plate Fastener (Qty: 6)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten</p> <ul style="list-style-type: none"> • 35 N·m (26 lb ft) • Tighten the bolt an additional 30 degrees, and one more pass at 15 degrees using <i>EN-470-B</i> wrench .
2	Flex Plate
3	<p>Automatic Transmission Flex Plate</p> <p>Procedure</p> <p>Inspect the engine flywheel for the following:</p> <ol style="list-style-type: none"> 1. Stress cracks around the engine flywheel 2. Cracks at welded areas that retain the ring gear onto the engine flywheel 3. Damaged or missing ring gear teeth 4. Do not attempt to repair the welded areas that retain the ring gear to the engine flywheel plate. Install a new engine flywheel.

Crankshaft Balancer Replacement

Callout

Component Name

Preliminary Procedures

1. Mark the balancer to the cover relationship or Set to TDC.
2. Remove the water pump belt. Refer to [Water Pump Belt Replacement](#) .
3. Remove the heater water auxiliary pump. Refer to [Heater Water Auxiliary Pump Replacement](#)

4. Remove the drive motor battery coolant cooler Inlet hose assembly. Refer to [Drive Motor Battery Coolant Cooler Inlet Hose Assembly Replacement](#)

Crankshaft Pulley Fastener

Caution: Refer to [Fastener Caution](#) in the Preface section.

1

Tighten

- 150 N·m (111 lb ft)
- Tighten the bolt an additional 60 degrees.

Crankshaft Pulley

Procedure

1. Use *EN-49979* retainer and *EN-956-1* extension to remove the crankshaft pulley.
2. To ensure correct installation of the crankshaft pulley, measure the distance between the pulley and the front cover. Refer to [Crankshaft Balancer Installation](#) .

2

Special Tools

- *EN-470-B* Angular Torque Wrench
- *EN-956-1* Extension
- *EN-49979* Crankshaft Shock Mount Retainer

For equivalent regional tools, refer to [Special Tools](#) .

Crankshaft Front Oil Seal Replacement

Callout	Component Name
Preliminary Procedure	
Remove the crankshaft balancer. Refer to Crankshaft Balancer Replacement .	
	Camshaft Front Oil Seal

Procedure

1

1. Using a flat-bladed tool, remove the crankshaft front oil seal.
2. Use *EN-960* installer to install the new crankshaft front oil seal.

Special Tools

EN-960 Crankshaft Front Oil Seal Installer

For equivalent regional tools, refer to [Special Tools](#) .

Crankshaft Rear Oil Seal Replacement

Special Tools

EN-658 Rear Main Seal Installer

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

1. Remove the automatic transmission flex plate. Refer to [Automatic Transmission Flex Plate Replacement](#) .

Note: Do not damage the outside diameter of the crankshaft or chamber with any tool.

2. Using a flat-bladed tool, remove the rear crankshaft oil seal (1).

Installation Procedure

1. Install the crankshaft rear oil seal (1) with *EN-658* installer (2).

2. Using the *EN-658* installer (2) , install a NEW crankshaft rear oil seal (1).
3. Install the automatic transmission flex plate. Refer to [Automatic Transmission Flex Plate Replacement](#) .

Engine Front Cover with Oil Pump Replacement

Callout	Component Name
---------	----------------

Preliminary Procedures

1. Remove the camshaft cover. Refer to [Camshaft Cover Replacement](#) .
2. Remove both camshaft position actuator solenoid valves. Refer to [Camshaft Position Actuator Solenoid Valve Replacement](#) : [Exhaust](#) → [Intake](#) .
3. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .

4. Set the crankshaft to TDC. Refer to [Camshaft Timing Chain Inspection](#)
5. Install the engine support fixture. Refer to [Engine Support Fixture](#) .
6. Remove the water pump pulley and the water pump. Refer to [Water Pump Replacement](#) .
7. Remove the sump. Refer to [Sump Replacement](#) .

1	<p>Engine Front Cover with Oil Pump Fastener (Qty: 13)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Ensure to mark the location of each bolt.</p> <p>Tighten 8 N·m (71 lb in)</p>
2	<p>Engine Front Cover with Oil Pump Fastener (Qty: 2)</p> <p>Tighten 35 N·m (26 lb ft)</p>
3	<p>Engine Front Cover with Oil Pump Gasket</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the camshaft timing chain out of the way before removing the engine front cover gasket. Refer to Camshaft Timing Chain Replacement . 2. Replace the engine front cover gasket whenever the cover is removed. 3. Adjust timing chain on installation. Refer to Camshaft Timing Chain Adjustment <p>Tip Removal of timing chain is necessary to get access to engine front cover gasket.</p>
4	<p>Engine Front Cover RTV Sealant</p> <p>Procedure</p> <p>Apply a 2 mm (0.0787 in) bead of RTV sealant to the areas shown (3).</p>
5	<p>Engine Front Cover with Oil Pump</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. To disassemble oil pump, refer to Engine Front Cover and Oil Pump Disassemble . 2. For cleaning and inspection of the oil pump, refer to Engine Front Cover and Oil Pump Cleaning and Inspection .

3. Reposition coolant hoses as necessary.
4. Disconnect electrical connector as necessary.
5. Transfer components as necessary.

Engine Oil Pressure Indicator Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner resonator outlet duct. Refer to Air Cleaner Resonator Outlet Duct Replacement	
	Engine Oil Pressure Sensor and/or Switch

Caution: Refer to [Component Fastener Tightening Caution](#) in the Preface section.

1

Procedure

1. Disconnect the oil pressure sensor electrical connector.
2. Transfer components as necessary.

Tighten

20 N·m (15 lb ft)

Engine Replacement

Special Tools

- CH-904 Base Frame
- CH-49289 Centring Frame
- EN-470-B Angle Meter
- EN-6015 Closure Plugs
- EN-49290 Engine Support Tool

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

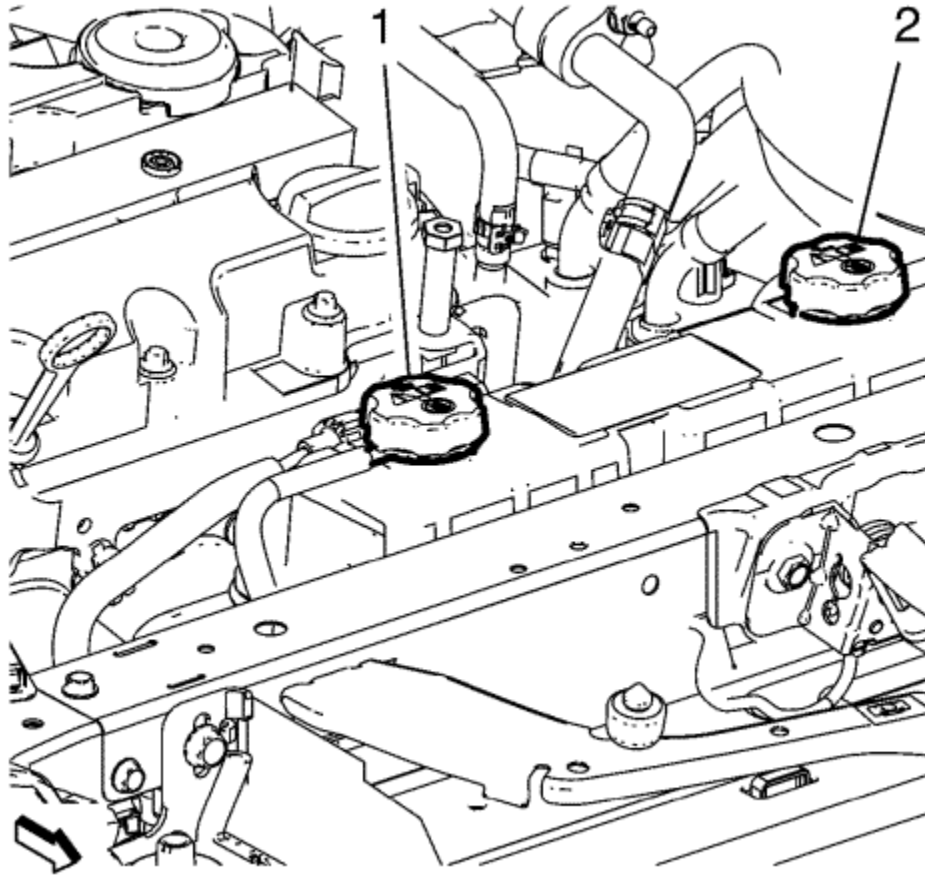

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
2. Disconnect the intermediate steering shaft from the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

3. Open the drive motor battery coolant reservoir cap (1).
4. Open the drive motor generator power inverter module coolant reservoir cap (2).
5. Remove both front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .
6. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
7. Place a basin underneath.

8. Disconnect the drive motor battery radiator inlet pipe connector (1).
9. Disconnect the drive motor battery coolant cooler outlet pipe connector (2).
10. Disconnect the drive motor battery coolant cooler inlet pipe connector (3).

11. Disconnect the heater water shutoff valve outlet hose (1).

12. Remove the clamp (3) and disconnect the drive motor power inverter module cooling outlet hose (2) from the drive motor power inverter module cooling pump (1).
13. Drain the engine cooling system. Refer to [Cooling System Draining and Filling](#) .
14. Recover the air conditioning refrigerant. Refer to [Refrigerant Recovery and Recharging : High Voltage Electric Compressor](#) .
15. Remove the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
16. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .
17. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .

18. Disconnect the canister purge pipe (1) from the canister purge valve. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
19. Plug the connections with the *EN-6015* plugs .
20. Disconnect the fuel feed pipe (2) from the fuel rail assembly. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
21. Plug the connections with the *EN-6015* plugs .

22. Press the locking tab (1) rearward in order to release the transmission range selector lever cable (2) from the cable bracket.

23. Disconnect the transmission range selector lever cable terminal (1) from the transmission manual pin, then position the cable out of the way.

24. Unlock the connector (1) and disconnect the heater water shutoff valve inlet hose (2) from the valve assembly.

25. Disconnect the heater water shutoff valve outlet hose (1) from the valve assembly.

Note: Do not remove any hoses from the reservoir.

26. Remove the engine coolant reservoir and lay down on the engine. Refer to [Coolant Recovery Reservoir Replacement](#) .

27. Unlock the connector (2) and release the clamp (3).
28. Remove the drive motor power inverter module coolant radiator hose (1).

29. Disconnect the drive motor power inverter module cooling outlet hose (2) from the charger (1).

30. Remove the nut (1) and separate the air conditioning compressor and evaporator hose (2) at the connection above the valve cover.
31. Disconnect the air conditioning evaporator thermal expansion valve tube from the condenser. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement](#) .

32. Unclip the ambient temperature sensor (1) and the wiring harness from the radiator air baffle (2) and hang aside.

33. Remove all radiator air baffle clips (2).

34. Remove the left and the right radiator air baffles (1, 3).

35. Remove the ground cable nut (3) and the ground cable (1).
36. Disconnect the AC pressure sensor wiring harness plug (2).

37. Disconnect and unclip the coolant fan wiring harness plug (1).

38. Remove the left headlamp. Refer to Headlamp Replacement : [Volt](#) → [Ampera](#) .

39. Disconnect 3 ECM wiring harness plugs (4) and remove the clip (3).

40. Unclip the drive motor power inverter module ground cable clip (3) and open the cable retainer (2).

41. Disconnect the wiring harness plug (1).

42. Loosen the 3 bolts (1) of the accessory wiring junction block (2).

43. Lift up the upper part of the accessory wiring junction block while unclipping it from the lower part of the accessory wiring junction block (3).

44. Remove the wiring harness (1) from the lower part of the accessory wiring junction block and lay the wiring harness aside.

45. Remove the electronic power steering (EPS) ground cable nut (3) and the EPS ground cable (2).
46. Remove the cover (1).

47. Remove the EPS power supply cable nut (1) and the EPS power supply cable (2).
48. Lay EPS ground cable and power supply cable aside.
49. Unclip the wiring harness from the transmission.

50. Disconnect the Wiring Harness Plug (2). Refer to [High Voltage Connectors](#) .
51. Disconnect the high voltage-wiring harness plug (1). Refer to [High Voltage Connectors](#) .
52. Raise the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

53. Disconnect the heater water auxiliary pump wiring harness plug (1).

54. Remove the ground cable nut (1) and unclip the ground cable (2).

55. Disconnect the drive motor generator power inverter module coolant pump wiring harness plug (3) and unclip the clip (1).
56. Disconnect and unclip the wiring harness plug (2).

57. Disconnect the left and right wheel speed sensor wiring harness plug and unclip the wiring harness (1) from the lower control arms and the suspension frame, then position out of the way.
58. Remove the left and right anti-roll bar links from the strut assemblies. Refer to [Anti-roll Bar Link Replacement](#) .
59. Disconnect the steering linkage outer track rods from the steering knuckles. Refer to [Steering Linkage Outer Track Rod Replacement](#) .
60. Disconnect the left and right lower control arms from the steering knuckles. Refer to [Lower Control Arm Replacement](#) .
61. Disconnect the left and right front wheel shafts from the wheel hubs. Refer to [Front Wheel Drive Shaft Replacement](#) .
62. Remove the catalytic converter. Refer to [Catalytic Converter Replacement](#) .

Note: The SPX installation manual is supplied with the special tool and is also available online from SPX directly. Go to www.spxtools-shop.com.

63. Assemble the *EN-49290* support tool (1) according to the details provided in the SPX installation manual.
64. Support the *CH-904* base frame on a jack.
65. Support the *EN-49290* support tool on the *CH-904* base frame .

Note: The SPX installation manual is supplied with the special tool and is also available online from SPX directly. Go to www.spxtools-shop.com.

66. Install the *EN-49290* support tool (1) according to the details provided in the SPX manual.
67. Lower the vehicle.
68. Place the ECM and the accessory wiring junction block wiring harnesses on the top of engine assembly.
69. Place all wiring harnesses and hoses on the powertrain unit if possible or ensure at least that they are free.

70. Remove and DISCARD the 3 engine mount bolts (1) from the engine mount (3) and the engine mount bracket (2).

71. Remove and DISCARD the 3 transmission mount bolts (1) from the transmission mount (2) and the transmission mount bracket (3).
72. Raise the vehicle.

Note: The SPX installation manual is supplied with the special tool and is also available online from SPX directly. Go to www.spxtools-shop.com.

73. Assemble the *CH-49289* centring frame (1) according to the details provided in the SPX manual.
74. Support the *CH-904* base frame on a jack.
75. Support the *CH-49289* centring frame on the *CH-904* base frame .

Note: The SPX installation manual is supplied with the special tool and is also available online from SPX directly. Go to www.spxtools-shop.com.

76. Install the *CH-49289* centring frame (1) according to the details provided in the SPX manual.

Note: Simplified graphic. Engine/transmission unit is fixed with engine support tool to suspension frame. Suspension frame is supported by centring adapter and underframe.

77. Remove the suspension frame bolts (1, 2).
78. Remove the frame reinforcements (3).

Note: A second technician is required.

79. Slowly and carefully lower the suspension frame (4) with the powertrain (PT) unit and the radiator assembly from the vehicle. Thereby take care on coolant hoses, wiring harnesses and other components which could be caught on the vehicle.

80. Disconnect the coolant hose (6) from the radiator outlet hose tee.
81. Disconnect the coolant vent hose (5) from the engine coolant radiator.
82. Disconnect the engine coolant air bleed hose (4) from the water outlet.
83. Disconnect the heater water shutoff valve inlet hose (2) from the water pump.
84. Disconnect the heater water shutoff valve outlet hose (3) from the water outlet.
85. Lay the engine coolant reservoir (1) along with the coolant hoses aside.

86. Disconnect the radiator outlet hose (1) from the engine coolant thermostat housing.
87. Disconnect the radiator inlet hose (2) from the water outlet.
88. Loosen the coolant hose assembly from the suspension frame.
89. Disconnect the transmission oil cooler pipes from the radiator. Refer to [Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection](#) .
90. Remove the entire radiator assembly from the suspension frame.
91. Remove left and right front wheel drive shafts from the transmission. Refer to [Front Wheel Drive Shaft Replacement](#) .
92. Disconnect and unclip all wiring harnesses and wiring harness plugs from the transmission.
93. Disconnect the steering gear assist motor connectors. Refer to [FEP Connectors : Steering Gear](#) .
94. Install a suitable cable to the 3 engine lift brackets.
95. Install a suitable engine lifting device to the cable.
96. Extend the engine lifting device until the steel cables are slightly tensioned.

97. Remove the rear transmission mount through bolt (2) from the rear transmission mount (1).

Note: A second technician is required.

98. Using the engine lifter, remove the PT-unit from the suspension frame.

99. Lay the PT-unit down on a wooden pallet.

100. Remove the 2 starter opening cover bolts (2).
101. Remove the starter opening cover (1).
102. Remove the 4 torque dampener bolts.
103. Remove the 9 transmission fasteners.

Note: A second technician is required.

104. Using an engine lifter, remove the transmission from the engine.
105. Install the engine to a suitable engine stand.
106. Transfer all parts as needed.

Installation Procedure

1. Remove the engine from the engine stand and lay it down on a wooden pallet, using an engine lifter.

Note: A second technician is required.

2. Position the engine to the transmission assembly.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 9 transmission to engine fasteners and tighten to **80 N·m (59 lb ft)**.

4. Install the 4 torque dampener bolts and tighten to **62 N·m (46 lb ft)**.

5. Install the starter opening cover (2).

6. Install the 2 starter opening cover bolts (2) and tighten to **20 N·m (15 lb ft)**.

7. Using the engine lifter, position the PT-unit to the suspension frame.

8. Install the rear transmission mount through bolt (2) to the rear transmission mount (1) and tighten to **100 N·m (74 lb ft)**.
9. Remove the engine lifter from the engine lift brackets.
10. Connect the steering gear assist motor connectors. Refer to [FEP Connectors : Steering Gear](#) .
11. Connect and clip in all wiring harnesses and wiring harness plugs to the transmission.
12. Install left and right front wheel drive shafts to the transmission. Refer to [Front Wheel Drive Shaft Replacement](#) .
13. Install the entire radiator assembly to the suspension frame.
14. Fasten the coolant hose assembly to the suspension frame.

15. Connect the radiator inlet hose (2) to the water outlet.
16. Connect the radiator outlet hose (1) to the engine coolant thermostat housing.
17. Connect the transmission oil cooler pipes to the radiator. Refer to [Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection](#) .

18. Connect the coolant hose (6) to the radiator outlet hose tee.
19. Connect the coolant vent hose (5) to the engine coolant radiator.
20. Connect the engine coolant air bleed hose (4) to the water outlet.
21. Connect the heater water shutoff valve inlet hose (2) to the water pump.
22. Connect the heater water shutoff valve outlet hose (3) to the water outlet.
23. Lay the engine coolant reservoir (1) down on the engine.

Note: A second technician is required.

24. Position the suspension frame with the PT-unit and the radiator assembly to the vehicle. Thereby take care on wiring harnesses, coolant hoses and other components.
25. Position the suspension frame, so that the positioning pins (1) of the *CH-49289* centring frame match to the appropriate under body holes.

26. Install the frame reinforcements (3) and the frame reinforcement bolts. Hand tighten only.
27. Install the 4 suspension frame bolts (1, 2) and tighten to **160 N·m (118 lb ft)**.
28. Tighten the frame reinforcement bolts to **58 N·m (43 lb ft)**.

29. Lower the *CH-49289* centering frame (1) with the *CH-904* base frame and a jack.
30. Remove the *CH-49289* centring frame (1) from the *CH-904* base frame .

Note: The SPX installation manual is supplied with the special tool and is also available online from SPX directly. Go to www.spxtools-shop.com.

31. Disassemble the *CH-49289* centring frame (1) according to the details provided in the SPX manual.
32. Lower the vehicle.

33. Install the 3 NEW engine mount bolts (1) to the engine mount (3) and the engine mount bracket (2) and tighten to **58 N·m (43 lb ft)**.

Caution: Refer to [Torque-to-Yield Fastener Caution](#) in the Preface section.

34. Install the 3 NEW transmission mount bolts (1) to the transmission mount (2) and the transmission mount bracket (3) and tighten in a first pass to **100 N·m (74 lb ft)**.
35. Tighten the transmission mount bolts in a second pass to additional **90 - 105 degrees**, using the *EN-470-B* meter .
36. Raise the vehicle.

37. Lower the *EN-49290* support tool (1) with the *CH-904* base frame and a jack.
38. Remove the *EN-49290* support tool (1) from the *CH-904* base frame .

Note: The SPX installation manual is supplied with the special tool and is also available online from SPX directly. Go to www.spxtools-shop.com.

39. Disassemble the *EN-49290* support tool (1) according to the details provided in the SPX installation manual.
40. Install the catalytic converter. Refer to [Catalytic Converter Replacement](#) .
41. Connect the left and right front wheel shafts to the wheel hubs. Refer to [Front Wheel Drive Shaft Replacement](#) .
42. Connect the left and right lower control arms to the steering knuckles. Refer to [Lower Control Arm Replacement](#) .
43. Connect the steering linkage outer track rods to the steering knuckles. Refer to [Steering Linkage Outer Track Rod Replacement](#) .
44. Install the left and right anti-roll bar links to the strut assemblies. Refer to [Anti-roll Bar Link Replacement](#) .

45. Connect the left and right wheel speed sensor wiring harness plug and clip the wiring harness (1) to the lower control arms and the suspension frame.

46. Connect the drive motor generator power inverter module coolant pump wiring harness plug (3) and clip in the clip (1).
47. Connect and clip in the wiring harness plug (2).

48. Install the ground cable (2).
49. Install and tighten the cable nut (1)

50. Connect the heater water auxiliary pump wiring harness plug (1).
51. Lower the vehicle.

52. Connect the high voltage wiring harness plug (1). Refer to [High Voltage Connectors](#) .
53. Connect the wiring harness plug (2). Refer to [High Voltage Connectors](#) .

54. Install the EPS power supply cable (2).
55. Install and tighten the EPS power supply cable nut (1).
56. Clip the wiring harness to the transmission.

- 57. Install the EPS ground cable (2).
- 58. Install and tighten the EPS ground cable nut (3).
- 59. Install the cover (1).

60. Install the wiring harness (1) to the lower part of the accessory wiring junction block.

61. Clip the upper part of the accessory wiring junction block (2) to the lower part of the accessory wiring junction block (3).
62. Tighten the 3 bolts (1) of the accessory wiring junction block (2) to **10 N·m(89 lb in)**.

63. Connect the wiring harness plug (1).

64. Connect 3 ECM wiring harness plugs (4) and install the clip (3).
65. Clip the drive motor power inverter module ground cable clip (3) and close the cable retainer (2).
66. Install the left headlamp. Refer to [Headlamp Replacement](#) : [Volt](#) → [Ampera](#) .

67. Connect and clip in the coolant fan wiring harness plug (1).

68. Install the ground cable (1) and the ground cable nut (3) and tighten.
69. Connect the A/C pressure sensor wiring harness plug (2).

- 70. Install the left and the right radiator air baffles (1, 3).
- 71. Install all radiator air baffle clips (2).

72. Clip in the ambient temperature sensor (1) and the wiring harness to the radiator air baffle (2).

73. Install the air conditioning compressor and evaporator hose (2) at the connection above the valve cover.
74. Install the nut (1) and tighten to **22 N·m(16 lb ft)**.
75. Connect the air conditioning evaporator thermal expansion valve tube to the condenser. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement](#) .

76. Connect the drive motor power inverter module cooling outlet hose (2) to the charger (1).

77. Install the drive motor power inverter module coolant radiator hose (1).

78. Lock the connector (2) and fasten the clamp (3).

79. Reposition and tighten the engine coolant reservoir. Refer to [Coolant Recovery Reservoir Replacement](#) .

80. Connect the heater water shutoff valve outlet hose (1) to the valve assembly.

81. Connect the heater water shutoff valve inlet hose (2) to the valve assembly and lock the connector (1).

82. Connect the transmission range selector lever cable terminal (1) to the transmission manual pin.

83. Press the locking tab (1) forward in order to lock the transmission range selector lever cable (2) to the cable bracket.

84. Connect the canister purge pipe (1) to the canister purge valve. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
85. Connect the fuel feed pipe (2) to the fuel rail assembly. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
86. Connect the fuel feed pipe (1) to the fuel rail assembly. Refer to [Fuel Feed Pipe Replacement](#) : [Chassis](#) → [Engine Compartment](#) .
87. Raise the vehicle.

88. Connect the drive motor generator module cooling outlet hose (2) to the drive motor generator module cooling pump (1) and install the clamp (3).

89. Connect the heater water shutoff valve outlet hose (1).

90. Connect the drive motor battery radiator inlet pipe connector (1).
91. Connect the drive motor battery coolant cooler outlet pipe connector (2).
92. Connect the drive motor battery coolant cooler inlet pipe connector (3).
93. Install both front wheelhouse liners. Refer to [Front Wheelhouse Front Liner Replacement](#) .
94. Install the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#) .
95. Lower the vehicle.
96. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
97. Install the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .

Note: High voltage system stays disabled.

98. Install the drive motor generator power inverter module. Refer to [Drive Motor Generator Power Inverter Module Replacement](#) .
99. Fill the engine cooling system. Refer to [Cooling System Draining and Filling](#) .
100. Fill the drive motor generator battery cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#) .
101. Fill the drive motor generator cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#) .
102. Charge the air conditioning system. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#) .

103. Check engine oil level. Refer to [Engine Oil and Oil Filter Replacement](#) .

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

104. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

105. Connect the intermediate steering shaft to the steering gear. Refer to [Intermediate Steering Shaft Replacement](#) .

106. Check and correct transmission fluid level. Refer to [Transmission Fluid Level and Condition Check](#) .

Engine Oil and Oil Filter Replacement

[Removal Procedure](#)

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Place a drain pan under the sump drain plug.

3. Remove the sump drain plug (1), and allow the oil to drain completely.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the oil sump drain plug and tighten to **14 N·m (124 lb in)**.

Warning: Refer to [Hot Exhaust System Warning](#) in the Preface section.

5. Place the drain pan under the oil filter (1).
6. Remove the oil filter. Allow the oil to drain completely.

[Installation Procedure](#)

1. Lubricate the NEW oil filter gasket with clean engine oil.
2. Tighten the oil filter (1) to **25 N·m (18 lb ft)**.
3. Lower the vehicle.
4. Refill the engine oil. Refer to [Approximate Fluid Capacities](#) .
5. Start the engine and inspect for leaks.
6. Reset the oil life monitor.

Camshaft Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the ignition coil. Refer to Ignition Coil Replacement .	
1	Remove the oil level indicator
2	Remove the oil cap

3	<p>Camshaft Cover Fastener (Qty: 15)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Ensure to follow the tighten sequence shown.</p> <p>Tighten 8 N·m (71 lb in)</p>
4	<p>Camshaft Cover Gasket</p> <p>Procedure</p> <p>Do not reuse the camshaft gasket. Also use a new gasket when removing or replacing camshaft cover.</p>
5	<p>Camshaft Cover</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove or reposition the clips as necessary.2. Disconnect electrical connector as necessary.3. Transfer components as necessary.

Inlet Camshaft Replacement

[Removal Procedure](#)

1. Remove the camshaft sprocket. Refer to [Camshaft Inlet and Exhaust Sprocket Replacement](#).

2. Remove the camshaft bearing cap bolts in sequence shown. Ensure to remove the bolts one turn at a time until there is no spring tension pushing on the camshaft.

3. Remove the camshaft bearing cap bolts (1).
4. Remove the camshaft bearing caps (2).
5. Remove the inlet camshaft (3).

[Installation Procedure](#)

Note: Ensure that the camshaft sealing rings are in place in the camshaft grooves. Camshaft sealing rings must be in place below the surface of the camshaft journal in order to avoid being pinched between the cylinder head and the camshaft caps.

1. Lubricate the camshaft and camshaft bearing caps with engine oil.
2. Install the inlet camshaft (3).
3. Install the camshaft bearing caps (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the camshaft bearing cap and hand tighten the bolts (1).

5. Install and tighten the camshaft bearing cap bolts one turn at a time in sequence as shown to **8 N·m (71 lb in)**.
6. Install the camshaft intake sprocket. Refer to [Camshaft Inlet and Exhaust Sprocket Replacement](#) .

Exhaust Camshaft Replacement

[Removal Procedure](#)

1. Remove the camshaft exhaust sprocket. Refer to [Camshaft Inlet and Exhaust Sprocket Replacement](#) .

2. Remove the camshaft bearing cap bolts in sequence shown. Ensure to remove the bolts one turn at a time until there is no spring tension pushing on the camshaft.

3. Remove the camshaft bearing cap bolts (1).
4. Remove the camshaft bearing caps (2).
5. Remove the exhaust camshaft (3).

[Installation Procedure](#)

Note: Ensure that the camshaft sealing rings are in place in the camshaft grooves. Camshaft sealing rings must be in place below the surface of the camshaft journal in order to avoid being pinched between the cylinder head and the camshaft caps.

1. Lubricate camshaft and camshaft bearing caps with engine oil.
2. Install the exhaust camshaft (3).
3. Install the camshaft bearing caps (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the camshaft bearing cap and hand tighten the bolts (1).

5. Install and tighten the camshaft bearing cap bolts one turn at a time in sequence as shown **8 N·m (71 lb in)**.
6. Install the camshaft exhaust sprocket. Refer to [Camshaft Inlet and Exhaust Sprocket Replacement](#) .

Valve Stem Oil Seal and Valve Spring Replacement

Special Tools

- *EN-958* Installer
- *EN-6086* Basic Kit, Spring and Wedge Replacer
- *EN-840* Pliers / Remover
- *EN-952* Fixing Pin

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
2. Remove the right front wheel house liner. Refer to [Front Wheelhouse Rear Liner Replacement](#) .
3. Lower the vehicle.
4. Remove the hydraulic valve clearance adjuster arms. Refer to [Hydraulic Valve Clearance Adjuster Arm Replacement](#) .
5. Remove the spark plugs. Refer to [Spark Plug Replacement](#) .
6. Adjust the engine to TDC of cylinder 1 and fix the crankshaft. Refer to [Camshaft Timing Chain Adjustment](#) .

Inlet Valve Stem Oil Seal Removal Cylinder 1

1. Prepare the 2 *EN-6086-6* supports (1) for the installation by tightening the support head in a centred position to the rail with the bolt (2).

2. Install the *EN-6086-5* mounting shaft (3) along with the 2 *EN-6086-6* supports (4) and the *EN-6086-8* handle to the cylinder head.

Note: The demounting piece must point to the inlet side.

3. Install the *EN-6086-7* lever (2) along with the *EN-6086-11* demounting piece (1) to the mounting shaft.
4. Position the mounting shaft centred above the spark plug bores and tighten the 4 fasteners (6).
5. Install the *EN-6086-15* pneumatic adapter (5) to the spark plug screw bore of cylinder 1.
6. Apply air pressure to cylinder 1.

7. Remove the valve keys, valve spring retainers and the valve springs of the intake valves of cylinder 1, using the following procedure:

Caution: The demounting piece part of EN-6086 Basic Kit, Spring and Wedge Replacer must be applied parallel to the valve retainers in order to prevent damage to the tools or the valve train components. If demounting piece is not applied parallel it could cause damage to the valve stem keys or the valve retainers.

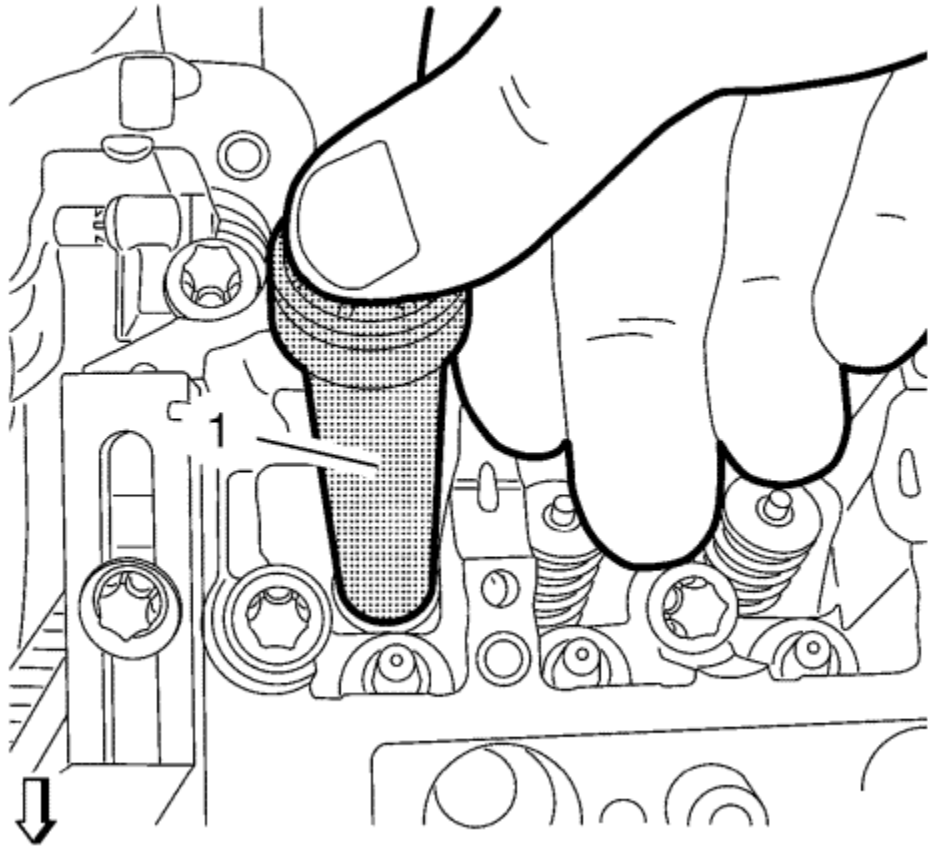

7.1. Apply tension to the valve springs, using the *EN-6086-7* lever (1) and the *EN-6086-11* demounting piece (2) until the valve keys are discharged from spring load and remove the valve keys.

7.2. Release tension from the valve springs and remove the valve spring retainers and the valve springs.

8. Remove the inlet valve stem oil seals (2) of cylinder 1, using the *EN-840* pliers (1).

[Inlet Valve Stem Oil Seal Installation Cylinder 1](#)

Note: Lubricate the NEW inlet valve stem oil seals with clean engine oil.

1. Install the NEW inlet valve stem oil seals of cylinder 1, using the *EN-958* installer (1).

2. Prepare the *EN-6086-200-1* mounting piece for the valve key installation. The mounting piece must be assembled in the following order:
 - 2.1. Support (6)
 - 2.2. Bushing (5)
 - 2.3. Spring (4)
 - 2.4. *EN-6086-200-10* plunger (3)
 - 2.5. Screw Connection (2)
 - 2.6. Lever Adapter (1)

3. Install the valve keys (1) to the mounting piece (2) and fix them with the bushing.

4. Install the inlet valve springs, the inlet valve spring retainers and the inlet valve keys, using the following procedure:
 - 4.1. Replace the *EN-6086-11* demounting piece with the assembled *EN-6086-200-1* mounting piece (1).
 - 4.2. Install the inlet valve springs and the inlet valve spring retainers to the cylinder head.

Caution: The demounting piece part of EN-6086 Basic Kit, Spring and Wedge Replacer must be applied parallel to the valve retainers in order to prevent damage to the tools or the valve train components. If demounting piece is not applied parallel it could cause damage to the valve stem keys or the valve retainers.

Note: The cone side of the valve keys must point to the valve stem.

- 4.3. Push down the mounting piece (1) using the lever (2) until the valve keys are audible engaged.

4.4. Inspect the inlet valve keys (1) for proper seating.

Exhaust Valve Stem Oil Seal Removal Cylinder 1

Remove the exhaust valve stem oil seals of cylinder 1:

1. Transfer the *EN-6086-7* lever to the exhaust side of cylinder 1.
2. Replace the *EN-6086-200-1* mounting piece with the *EN-6086-11* demounting piece .
3. Remove the exhaust valve keys, exhaust valve spring retainers, exhaust valve springs and the exhaust valve stem oil seals as described above.

Exhaust Valve Stem Oil Seal Installation Cylinder 1

1. Replace the *EN-6086-11* demounting piece with the assembled *EN-6086-200-1* mounting piece (1).
2. Install the exhaust valve keys, exhaust valve spring retainers, exhaust valve springs and the exhaust valve stem oil seals of cylinder 1 as described above.

[Inlet Valve Stem Oil Seal Removal Cylinder 4](#)

1. Release the air pressure from cylinder 1.
2. Transfer the *EN-6086-15* pneumatic adapter from cylinder 1 to the spark plug bore of cylinder 4.
3. Apply air pressure to cylinder 4.
4. Transfer the *EN-6086-7* lever to the inlet side of cylinder 4.
5. Replace the *EN-6086-200-1* mounting piece with the *EN-6086-11* demounting piece .
6. Remove the inlet valve keys, inlet valve spring retainers, inlet valve springs and the inlet valve stem oil seals of cylinder 4 as described above.

[Inlet Valve Stem Oil Seal Installation Cylinder 4](#)

1. Replace the *EN-6086-11* demounting piece with the assembled *EN-6086-200-1* mounting piece .
2. Install the inlet valve keys, inlet valve spring retainers, inlet valve springs and the inlet valve stem oil seals of cylinder 4 as described above.

[Exhaust Valve Stem Oil Seal Removal And Installation Cylinder 4](#)

Replace the exhaust valve keys, exhaust valve spring retainers, exhaust valve springs and the exhaust valve stem oil seals of cylinder 4 as described above.

[Inlet Valve Stem Oil Seal Removal Cylinder 2](#)

1. Release the air pressure from cylinder 4.
2. Transfer the *EN-6086-15* pneumatic adapter from cylinder 4 to the spark plug bore of cylinder 2.
3. Apply air pressure to cylinder 2.
4. Transfer the *EN-6086-7* lever to the inlet side of cylinder 2.
5. Replace the *EN-6086-200-1* mounting piece with the *EN-6086-11* demounting piece .
6. Remove the inlet valve keys, inlet valve spring retainers, inlet valve springs and the inlet valve stem oil seals of cylinder 2 as described above.

[Inlet Valve Stem Oil Seal Installation Cylinder 2](#)

1. Transfer the *EN-6086-7* lever to the exhaust side of cylinder 2.
2. Replace the *EN-6086-11* demounting piece with the assembled *EN-6086-200-1* mounting piece (1).
3. Install the inlet valve keys, inlet valve spring retainers, inlet valve springs and the inlet valve stem oil seals of cylinder 2 as described above.

[Exhaust Valve Stem Oil Seal Removal And Installation Cylinder 2](#)

Replace the exhaust valve keys, exhaust valve spring retainers, exhaust valve springs and the exhaust valve stem oil seals of cylinder 2 as described above.

[Inlet Valve Stem Oil Seal Removal Cylinder 3](#)

1. Release the air pressure from cylinder 2.

2. Transfer the *EN-6086-15* pneumatic adapter from cylinder 2 to the spark plug bore of cylinder 3.
3. Apply air pressure to cylinder 3.
4. Transfer the *EN-6086-7* lever to the intake side of cylinder 3.
5. Replace the *EN-6086-200-1* mounting piece with the *EN-6086-11* demounting piece .
6. Remove the inlet valve keys, inlet valve spring retainers, inlet valve springs and the inlet valve stem oil seals of cylinder 3 as described above.

Inlet Valve Stem Oil Seal Installation Cylinder 3

1. Transfer the *EN-6086-7* lever to the exhaust side of cylinder 3.
2. Replace the *EN-6086-11* demounting piece with the assembled *EN-6086-200-1* mounting piece .
3. Install the inlet valve keys, inlet valve spring retainers, inlet valve springs and the inlet valve stem oil seals of cylinder 3 as described above.

Exhaust Valve Stem Oil Seal Removal And Installation Cylinder 3

Replace the exhaust valve keys, exhaust valve spring retainers, exhaust valve springs and the exhaust valve stem oil seals of cylinder 3 as described above.

Installation Procedure

1. Release air pressure from cylinder 3.
2. Remove the *EN-6086-15* pneumatic adapter.
3. Remove all parts of *EN-6086* spring and wedge replacer .
4. Shift to neutral gear and release the park brake.
5. Install the spark plugs. Refer to [Spark Plug Replacement](#) .
6. Install the hydraulic valve clearance adjuster arms. Refer to [Hydraulic Valve Clearance Adjuster Arm Replacement](#) .
7. Raise the vehicle.
8. Remove the *EN-952* fixing pin and install the crankshaft bearing cap tie plate hole plug. Refer to.
9. Install the right front wheelhousing lining. Refer to [Front Wheelhouse Rear Liner Replacement](#) .
10. Lower the vehicle.

Engine Mount Bracket Removal

1. Remove the 3 engine mount bracket bolts (1).
2. Remove the engine mount bracket (2).

Camshaft Timing Chain Inspection

Special Tools

- *EN-952* Fixing Pin
- *EN-953-A* Fixing Tool
- *EN-49977-100* Transmitter Disc Fixation

For equivalent regional tools, refer to [Special Tools](#) .

1. Remove the ignition coil. Refer to [Ignition Coil Removal](#) .
2. Remove the camshaft cover. Refer to [Camshaft Cover Removal](#) .
3. Remove the air conditioning compressor bracket. Refer to [Air Conditioning Compressor Bracket Removal](#) .

4. Rotate the engine clockwise until the bore (2) in the crankshaft balancer aligns with the mark (1) on the engine front cover.

5. Ensure that the camshaft grooves (1) are visible as shown. If the camshaft grooves are not visible rotate the crankshaft **360°**.

6. Remove the crankshaft bearing cap tie plate hole plug (2) and the seal ring (1).

Caution: To ensure proper crankshaft top dead centre (TDC) alignment, the retention pin should fit easily through the bore in the crankshaft tie plate and into the crankshaft. Binding of the retention pin could affect proper engine timing.

7. Install *EN-952* fixing pin (1) in order to fix the crankshaft in TDC position.

Note: The fixing tool should be installed completely to both camshaft grooves without extreme effort.

8. Install *EN-953-A* fixing tool (1) to the camshafts.

9. Install *EN-49977-100* fixation (1) in order to inspect the correct position of the camshaft position exciter wheels.

Note: A wrong installation position is possible. Make sure that the fixation tool is installed without clearance to the cylinder head in areas (3) and (4).

10. Tighten the bolts (2) of *EN-49977-100* fixation.

11. If *EN-953-A* fixing tool or *EN-49977-100* fixation can not be installed, refer to [Camshaft Timing Chain Adjustment](#) .

12. Remove *EN-49977-100* fixation.

13. Remove *EN-953-A* fixing tool.

14. Remove *EN-952* fixing pin.

Caution: Refer to [Fastener Caution](#) in the Preface section.

15. Install crankshaft bearing cap tie plate hole plug and seal ring and tighten to **40 N·m (30 lb ft)**.

16. Install the camshaft cover. Refer to [Camshaft Cover Installation](#) .

17. Install the ignition coil. Refer to [Ignition Coil Installation](#) .

18. Install the air conditioning compressor bracket. Refer to [Air Conditioning Compressor Bracket Installation](#) .

© Copyright Chevrolet. All rights reserved

Camshaft Timing Chain Adjustment

Special Tools

- *EN-952* Fixing Pin
- *EN-953-A* Fixing Tool
- *EN-49977-100* Transmitter Disc Fixation

For equivalent regional tools, refer to [Special Tools](#) .

1. Remove the ignition coil. Refer to [Ignition Coil Removal](#) .
2. Remove the camshaft cover. Refer to [Camshaft Cover Removal](#) .
3. Remove the air conditioning compressor bracket. Refer to [Air Conditioning Compressor Bracket Removal](#) .
4. Remove the camshaft position actuator solenoid valves. Refer to [Camshaft Position Actuator Solenoid Valve Removal](#) .

5. Rotate the engine clockwise until the bore (2) in the crankshaft balancer aligns with the mark (1) on the engine front cover.

6. Remove the crankshaft bearing cap tie plate hole plug (2) and the seal ring (1).

Caution: To ensure proper crankshaft top dead centre (TDC) alignment, the retention pin should fit easily through the bore in the crankshaft tie plate and into the crankshaft. Binding of the retention pin could affect proper engine timing.

7. Install *EN-952* fixing pin (1) in order to fix the crankshaft in TDC position.

8. Loosen the inlet camshaft sprocket bolt (2) while holding up the hexagon of the inlet camshaft with a spanner (1) until the camshaft position exciter wheel is clearly rotatable.
9. Loosen the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft with a spanner until the camshaft position exciter wheel is clearly rotatable.

Note: The fixing tool should be installed completely to both camshaft grooves without extreme effort.

10. Adjust camshafts that *EN-953-A* fixing tool (1) can be installed.

11. Remove 2 upper timing chain guide bolts (1).
12. Remove upper timing chain guide (2).

Note: Push the fixing tool in the direction of the arrow to ensure it engages without clearance.

13. Install *EN-49977-200* fixing tool (2) and adjust that the gearing (1) of the fixing tool engages with the inlet camshaft sprocket gearing (1).

14. Tighten the 2 fastening bolts (1) of *EN-49977-200* fixing tool while pushing the fixing tool in direction of the arrow.
15. Tighten the adjuster bolt (2).

Note: A wrong installation position is possible. Make sure that the fixation tool is installed without clearance to the cylinder head in areas (3) and (5).

16. Install *EN-49977-100* fixation (2) in order to find and fix the correct position of the camshaft position exciter wheels.
17. Tighten the 3 fastening bolts (6) of *EN-49977-100* fixation.

Caution: Refer to [Fastener Caution](#) in the Preface section.

18. Tighten the intake camshaft sprocket bolt (4) while holding up the hexagon (1) of the intake camshaft to **50 N·m (37 lb ft)**.
19. Tighten the intake camshaft sprocket bolt (4) while holding up the hexagon (1) of the intake camshaft to an additional **60°**.
20. Tighten the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft to **50 N·m (37 lb ft)**.
21. Tighten the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft to an additional **60°**.
22. Remove *EN-49977-100* transmitter disc fixation and *EN-49977-200* fixing tool.

23. Install upper timing chain guide (2).
24. Install 2 upper timing chain guide bolts (1) and tighten to **8 N·m (71 lb in)**.
25. Remove *EN-953-A* fixing tool.
26. Remove *EN-952* fixing pin.
27. Rotate the crankshaft for **720°** and check the engine timing again. Repeat the adjustment procedure if necessary.
28. Install crankshaft bearing cap tie plate hole plug and seal ring and tighten to **40 N·m (30 lb ft)**.
29. Install the camshaft position actuator solenoid valves. Refer to [Camshaft Position Actuator Solenoid Valve Installation](#) .
30. Install the camshaft cover. Refer to [Camshaft Cover Installation](#) .
31. Install the ignition coil. Refer to [Ignition Coil Installation](#) .
32. Install the air conditioning compressor bracket. Refer to [Air Conditioning Compressor Bracket Installation](#) .

Draining Fluids and Oil Filter Removal

Special Tools

EN-726-A Oil Filter Spanner

For equivalent regional tools, refer to [Special Tools](#).

1. Remove the oil sump drain plug (4) and the seal ring (1) allow the oil to drain out.

2. Remove the oil filter (2). Use *EN-726-A* wrench (3).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the oil pan drain plug and a NEW seal ring and tighten to **14 N·m (124 lb in)**.

4. Remove the water pump drain plug (1) and the water pump drain plug seal ring (2) and allow the remaining coolant fluid to drain out.

5. Install the water pump drain plug and a NEW seal ring and tighten to **15 N·m (11 lb ft)**.

Engine Lift Bracket Removal

1. Remove the sidwise engine lift bracket bolt (3).
2. Remove the sidwise engine lift bracket (2).
3. Remove the 2 engine lift bracket bolts (4).
4. Remove the engine lift bracket (1).

Exhaust Manifold Removal

1. Remove the 2 catalytic converter bracket bolts (1) from the catalytic converter bracket (2).

2. Remove the 9 exhaust manifold nuts (1).

3. Remove the exhaust manifold (1) and the exhaust manifold gasket (2).

Engine Coolant Thermostat Housing Removal

1. Remove the 3 engine coolant thermostat housing bolts (1).
2. Remove the engine coolant thermostat housing (2) and the engine coolant thermostat housing seal ring (3).

Water Outlet Removal

1. Remove the 4 water outlet bolts (1).
2. Remove the water outlet (2) and the 2 water outlet seal rings (3).

Air Conditioning Compressor Bracket Removal

1. Remove the 3 air conditioning compressor bracket bolts (1).
2. Remove the air conditioning compressor bracket (2).

Water Pump Pulley Removal

1. Loosen the 3 water pump pulley bolts (2) while holding up the water pump pulley hub with a spanner.
2. Remove the 3 water pump pulley bolts (2).
3. Remove the water pump pulley (1).

Crankshaft Balancer Removal

Special Tools

- *EN-49979* Crankshaft Shock Mount Retainer.
- *EN-956-1* Extension .

For equivalent regional tools, refer to [Special Tools](#) .

1. Install *EN-49979* retainer to *EN-956-1* extension .

2. Loosen the crankshaft balancer bolt (4) while fixing the crankshaft balancer (3) with *EN-49979* retainer (1) and *EN-956-1* extension (2).

3. Remove the crankshaft balancer bolt (2).
4. Remove the crankshaft balancer (1).

Water Pump Removal

1. Remove the 5 short water pump bolts (4) and the 5 long water pump bolts (3).
2. Remove the water pump (2).
3. Remove the water pump gasket (1).

Throttle Body Removal

1. Remove the 4 throttle body bolts (1).
2. Remove the throttle body (2) and the throttle body seal ring (3)

Inlet Manifold Removal

1. Loosen the 6 intake manifold bolts (1).

Note: Intake manifold bolts remain in intake manifold screw bores.

2. Remove the intake manifold (1) in compound with the intake manifold gasket.

Ignition Coil Removal

Special Tools

EN-6009 Remover and Installer Ignition Module

For equivalent regional tools, refer to [Special Tools](#) .

1. Remove the 2 ignition coil bolts (1).

2. Install *EN-6009* remover and installer (2) and remove the ignition coil (1).

Camshaft Cover Removal

1. Remove the oil level indicator (1).

2. Remove the 15 camshaft cover bolts (1).
3. Remove the camshaft cover (2) and the camshaft cover gasket (3).

Camshaft Position Actuator Solenoid Valve Removal

1. Remove the 4 camshaft position actuator solenoid valve bolts (1).

2. Move the intake camshaft position actuator solenoid valve (1) carefully counter clockwise in the position shown.
3. Move the exhaust camshaft position actuator solenoid valve (2) carefully clockwise in the position shown.

Caution: The camshaft position actuator solenoid valves must be kept parallel to the engine front cover during removal and installation. The camshaft position actuator solenoid valves can be damaged if they become wedged or stuck during this process.

4. Carefully remove the 2 camshaft position actuator solenoid valves (2) and the seal rings (1).

Sump Removal

1. Remove the 16 oil sump bolts (1).

Note: Work with care. Do not damage the oil sump or crankshaft bearing tie plate sealing surfaces.

2. Install a mounting lever to the area (1) and loosen the oil sump by cautiously levering.

3. Remove the oil sump (2) and the seal rings (1).

Engine Front Cover and Oil Pump Removal

1. Set engine to TDC. Refer to [Camshaft Timing Chain Inspection](#) .

2. Remove the 13 engine front cover bolts M6 (1).
3. Remove the 2 engine front cover bolts M10 (2).
4. Remove the engine front cover.

Camshaft Timing Chain Removal

Special Tools

- *EN-952* Fixing Pin
- *EN-953-A* Fixing Tool
- *EN-955-1* Fixing Pin from *EN-955* Kit

For equivalent regional tools, refer to [Special Tools](#) .

1. The engine should be adjusted to TDC.
2. The crankshaft should be fixed with *EN-952* fixing pin.
3. The camshaft should be fixed with *EN-953-A* fixing tool.

4. Push the timing chain (2) in direction to the timing chain tensioner (1) and fix the tensioner with *EN-955-1* fixing pin (3).

5. Remove the 2 upper timing chain guide bolts (1).
6. Remove the upper timing chain guide (2).

7. Remove the 2 timing chain guide right side bolts (2).
8. Remove the timing chain guide right side (1).

9. Remove the timing chain tensioner shoe bolt (2).
10. Remove the timing chain tensioner shoe (1).

11. Remove the timing chain (1) in compound with the crankshaft sprocket (2).

Timing Chain Tensioner Removal

1. Remove the 2 timing chain tensioner bolts (1).
2. Remove the timing chain tensioner (2).

Engine Front Cover Gasket Removal

Remove the engine front cover gasket (1).

Camshaft Sprocket Removal

1. Loosen the inlet camshaft sprocket bolt (1) while holding the hexagon of inlet camshaft (2) with a spanner.

2. Remove the inlet camshaft sprocket bolt (1) and the inlet camshaft position exciter wheel (2).
3. Remove the inlet camshaft sprocket (3).
4. Loosen the exhaust camshaft sprocket bolt while holding the hexagon of exhaust camshaft with a spanner.
5. Remove the exhaust camshaft sprocket bolt and the exhaust camshaft position exciter wheel.
6. Remove the exhaust camshaft sprocket.

Intake Camshaft Removal

1. Remove the camshaft bearing cap bolts in a spiral sequence as shown one turn at a time until there is no spring tension pushing on the camshaft.

Note: Mind the markings on the camshaft bearing caps to ensure they will be installed in the same position.

2. Remove the 10 camshaft bearing cap bolts (1).
3. Remove the 5 camshaft bearing caps (2).
4. Remove the intake camshaft (3).

Exhaust Camshaft Removal

1. Remove the camshaft bearing cap bolts in a spiral sequence as shown one turn at a time until there is no spring tension pushing on the camshaft.

Note: Mind the markings on the camshaft bearing caps to ensure they will be installed in the same position.

2. Remove the 10 camshaft bearing cap bolts (1).
3. Remove the 5 camshaft bearing caps (2).
4. Remove the exhaust camshaft (3).

Hydraulic Valve Clearance Adjuster Arm Removal

Note: Mind the installation position of the hydraulic valve clearance adjuster arms.

Remove the 16 hydraulic valve clearance adjuster arms (1).

Hydraulic Valve clearance Adjuster Removal

Note: Mind the installation position of the hydraulic valve clearance adjusters.

Remove the 16 hydraulic valve clearance adjusters (1).

Cylinder Head Removal

1. Loosen the 12 cylinder head bolts in the sequence as shown. Use the following procedure:
 - 1.1. Loosen the cylinder head bolts **90°**.
 - 1.2. Loosen the cylinder head bolts **180°**.

Note: Do not damage the guide sleeves (4) and (5).

2. Remove the 12 cylinder head bolts (1).
3. Remove the cylinder head (2).
4. Remove the cylinder head gasket (3).

Piston, Connecting Rod, and Bearing Removal

Note: Mark the installation position of the connecting rod bearing caps. The connecting rod bearings and bearing caps must not be interchanged with other connecting rods.

1. Remove the 4 connecting rod bearing cap bolts (1) of cylinder 2 and 3.
2. Remove the 2 connecting rod bearing caps (2) and the 2 connecting rod bearings of cylinder 2 and 3.
3. Rotate the crankshaft **180°**.

4. Remove the 4 connecting rod bearing cap bolts (1) of cylinder 1 and 4.
5. Remove the 2 connecting rod bearing caps (2) and the 2 connecting rod bearings of cylinder 1 and 4.

6. Remove the 4 pistons (1) and connecting rods (2) and the 4 upper connecting rod bearings (3) from the cylinder block.

Crankshaft and Bearing Removal

1. Remove the crankshaft position sensor bolt (3).
2. Remove the crankshaft position sensor (1) and the crankshaft position sensor seal ring (2).

3. Remove the 12 outer crankshaft bearing cap tie plate bolts (1).

4. Loosen the 10 inner crankshaft bearing cap tie plate bolts in a sequence as shown.

5. Remove the 10 crankshaft bearing cap tie plate bolts (1)

Remove the crankshaft bearing cap tie plate (2).

6. Remove the 4 lower crankshaft bearings (3) and the lower crankshaft thrust bearing (4).

7. Remove the crankshaft rear oil seal (5).

8. Remove the crankshaft (1), the 4 upper crankshaft bearings (2) and the upper crankshaft thrust bearing (3).

Cylinder Head Disassemble

Special Tools

- *EN-6215* Mounting Equipment
- *EN-6167* Support Set
- *EN-6086* Spring And Wedge Replacer Kit
- *EN-6171* Release Tool
- *EN-849* Assembly Tray
- *EN-840* Pliers / Remover

For equivalent regional tools, refer to [Special Tools](#) .

1. Install the cylinder head (1) to *EN-6215-1* mounting table (2) in compound with *EN-6215-5* sidewise support (3). Fix the cylinder head with the appropriate short bolts.

2. Install *EN-6215-4* handle (1) to *EN-6215-1* mounting table.
3. Turn the cylinder head **180°**.
4. Rework the spark plug threads.

5. Install 4 *EN-6167-1* brace (1) and fix with *EN-6167-5* bolts (2) in order to support the valves.

6. Solve the valve spring retainers with an easy hammer hit. Use a rubber mallet (1) and *EN-6171* release tool (2).

7. Install *EN-6086-7* lever arm (2) to the handle (1).
8. Install *EN-6086-11* demounting piece (4) in compound with *EN-6086-1* adapter (3) to the lever.

Note: The demounting piece must be applied parallel to the valve spring retainers in order to prevent damage to the tools or the valve train components.

9. Press down the valve springs and the upper valve spring retainers until the valve keys are discharged from spring load. Remove the valve keys.

Note: Mind the installation position of valve springs, valve spring retainers and valve keys

10. Remove valve springs and valve spring retainers and place to *EN-849* assembly tray to ensure they will be installed in their original position.

11. Remove the valve stem oil seals (2). Use *EN-840* pliers (1).
12. Remove *EN-6167-5* bolts and *EN-6167-1* brace.

Note: Mind the installation position of the valves.

13. Remove the valves and place to *EN-849* assembly tray (1) to ensure they will be installed in their original position.

Cylinder Head Cleaning and Inspection

Special Tools

- *EN-6216* Gauge
- *EN-6216-200/300/400* Gauge Instruments
- *GE-571-B* Gauge

For equivalent regional tools, refer to [Special Tools](#) .

Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant.
2. Clean all cylinder head surfaces with non-corrosive sealant.

Warning: Refer to [Safety Glasses Warning](#) in the Preface section.

3. Blow out all the oil galleries using compressed air.
4. Remove any carbon deposits from the combustion chamber.

Visual Inspection

1. Inspect the cylinder head camshaft bearing surfaces for the following conditions:
 - Excessive scoring or pitting
 - Discolouration from overheating
 - Deformation from excessive wear
 - If the camshaft bearing journals appear to be scored or damaged, you must replace the cylinder head. DO NOT machine the camshaft bearing journals.
2. If any of the above conditions exist on the camshaft bearing surfaces, replace the cylinder head.
3. Inspect the cylinder head for the following:
 - Cracks, damage or pitting in the combustion chambers.
 - Swarf in the oil galleries -- Continue to clean the galleries until all swarf is removed.
 - Coolant leaks or damage to the deck face sealing surface -- If coolant leaks are present, measure the surface warpage as described under cylinder head measurement - deck flatness inspection.

- Damage to any gasket surfaces.
 - Burnt or eroded areas in the combustion chamber.
 - Cracks in the exhaust ports and combustion chambers.
 - External cracks in the water passages.
 - Restrictions in the inlet or exhaust passages.
 - Restrictions in the cooling system passages.
 - Rusted, damaged or leaking core plugs.
4. If the cylinder head is cracked or damaged, it must be replaced. No welding or patching of the cylinder head is allowed.

Valve Inspection And Measurement

1. Clean the valves of carbon and oil. Carbon can be removed with a wire brush.

2. Inspect the valves for the following conditions:
 - 2.1. Inspect the valve faces for burning and cracking (1). If pieces are broken, replace the valve and inspect the corresponding piston and cylinder head area for damage.
 - 2.2. Inspect the valve for straightness and distortion (2). Distorted valve must be replaced.
 - 2.3. Inspect the valve stem for wear (3).
 - 2.4. Inspect the valve key grooves for chipping and wear (5). Replace the valve if chipped or worn.

3. Measure the valve length (2). Use a slide gauge (1). Refer to [Engine Mechanical Specifications](#) to find the permitted values.

4. Measure the valve stem diameter. Use a micrometer gauge (2). Refer to [Engine Mechanical Specifications](#) to find the permitted values. Note the measurement results.

[Cylinder Head Measurement](#)

1. Inspect the cylinder head sealing surface for flatness. Use a straightedge (1).

2. Prepare the gauge for valve stem to guide clearance measurement. Assemble the *EN-6216* gauge and the *EN-6216-200/300/400* gauge instruments as follows:
 - 2.1. Install the extension (5) to the support (4).
 - 2.2. Install the inside calliper (2) to the extension (5).
 - 2.3. Install the gauge (3) to the support (4) and pretension to **1 mm (0.0394 in)**.
 - 2.4. Install the calibration washer (1) as shown to justify the gauge.
 - 2.5. Adjust the gauge to **0 mm (0 in)** by rotating the instrument dial.
 - 2.6. Carefully remove the calibration washer (1).

3. Measure the valve guide inner diameter (2) as shown in different areas (3). Use *EN-6216* gauge (1) and gauge instruments. Note the measurement results. Refer to [Engine Mechanical Specifications](#) to find the permitted values.
4. Subtract the valve stem diameter from valve guide inner diameter to calculate the valve stem to guide clearance. Refer to [Engine Mechanical Specifications](#) to find the permitted values.
5. Turn the cylinder head upside down.

Cylinder Head Assemble

Special Tools

- *EN-6215* Mounting Equipment
- *EN-6167* Support Set
- *EN 6086* Spring And Wedge Replacer Kit
- *EN-840* Pliers / Remover
- *EN-835-A* Installer

For equivalent regional tools, refer to [Special Tools](#) .

Note: Lubricate the valve guides and the valve stems with engine oil.

Note: Examine that the valves will be installed in their original position.

1. Install the 16 valves to the cylinder head.

2. Install *EN-6167-1* braces (1) and fix with *EN-6167-5* bolts (2) in order to support the valves.
3. Install the 16 valve stem oil seals. Use *EN-835-A* installer to push down the valve stem oil seals.

Note: Examine that the valve springs and the valve spring retainers will be installed in their original position.

4. Install the 16 valve springs and the 16 valve spring retainers.

Note: A wrong combination of mounting piece and plunger can cause damage to the plunger or the valve keys.

5. Prepare *EN-6086-200-1* mounting piece for the valve key installation. The mounting piece must be assembled in the following order:
 - 5.1. Support (6)
 - 5.2. Bushing (5)
 - 5.3. Spring (4)
 - 5.4. *EN-6086-200-10* plunger (3)
 - 5.5. Screw connection (2)
 - 5.6. Lever adapter (1)

6. Install the valve keys (1) to the mounting piece (2) as shown and fix them with the bushing.

7. Install *EN-6086-7* lever (2) in compound with the lever adapter (3) and the mounting piece (4) to the handle (1).
8. Push the mounting piece slightly down until the valve keys audibly engage.
9. Repeat the procedure on the remaining 15 valves.
10. Remove *EN-6167-1* braces and *EN-6167-5* bolts.
11. Remove the cylinder head from the *EN-6215-1* mounting table.

Engine Block Disassemble

1. Remove the knock sensor bolt (3).
2. Remove the knock sensor (2).
3. Remove the 2 cylinder head guide sleeves (1). Use suitable pliers.
4. Remove the 2 transmission guide sleeves (4, 5). Use suitable pliers.

Engine Block Assemble

1. Install the knock sensor (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the knock sensor bolt (3) and tighten to **20 N·m (15 lb ft)**.
3. Install the 2 cylinder head guide sleeves (1). Use a rubber mallet.
4. Install the 2 transmission guide sleeves (4, 5). Use a rubber mallet.

Piston and Connecting Rod Disassemble

Warning: Handle the piston carefully. Worn piston rings are sharp and may cause bodily injury.

1. Remove the piston rings. Use piston ring pliers (1)

2. The piston rings are ordered as followed:

- Upper compression ring (1)
- Lower compression ring (2)
- Oil rings and oil ring spacer (3, 4)

In case of damage on piston, piston pin or connecting rod all components of the piston assembly have to be replaced. The piston pin cannot be removed and reinstalled due to the shrink fit of connecting rod and piston pin.

Piston, Connecting Rod, and Bearing Cleaning and Inspection

[Visual Inspection And Cleaning Procedure](#)

Connecting Rod

Warning: Wear safety glasses when using compressed air in order to prevent eye injury.

1. Clean the connecting rods in solvent and dry with compressed air.
2. Inspect the connecting rod for the following:
 - Signs of being twisted, bent, nicked or cracked
 - Scratches or abrasion on the connecting rod bearing seating surfaces

Piston

1. Clean the piston with a cleaning solvent. DO NOT wire brush any parts of the piston.
2. Clean the piston ring grooves.
3. Inspect the piston on the following:
 - Cracked ring lands, skirts or pin bosses
 - Ring grooves for nicks
 - Eroded areas on the top of the piston (1)
 - Scuffed or damaged skirts (2)
 - Worn gudgeon pin bores (3)
4. If there is any excessive wear, replace the piston.
5. Measure the clearance between piston pin and piston bore.

[Piston And Connecting Rod Measurement Procedure](#)

Piston Ring Clearance

1. Install the piston rings to the cylinder as shown and measure the piston ring end gap (1). Compare the measurements with those provided below:
 - The upper compression ring end gap should be **0.250 mm - 0.400 mm (0.0098 in - 0.0157 in)**
 - The lower compression ring end gap should be **0.400 mm - 0.600 mm (0.0157 in - 0.0236 in)**
 - The oil ring end gap should be **0.250 mm - 0.750 mm (0.0098 in - 0.0295 in)**
2. If the clearance is greater than the provided specifications, the piston rings must be replaced.

3. Measure the piston ring side clearance as shown (1). Compare the measurements with those provided below:
 - The upper compression ring side clearance should be **0.025 mm - 0.070 mm (0.001 in - 0.0028 in)**
 - The lower compression ring side clearance should be **0.025 mm - 0.070 mm (0.001 in - 0.0028 in)**
 - The oil ring side clearance should be **0.040 mm - 0.120 mm (0.0016 in - 0.0047 in)**
4. If the clearance is greater than the provided specifications, replace the piston rings.
5. If the clearance is still too great, replace the pistons.

Connecting Rod Bearing Clearance (With Micrometer Gauge Internal Measuring Device)

1. Install the connecting bearings and the connecting rod bearing caps.
2. Tighten the connecting rod bearing cap bolts in the following sequence:

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: The old bolts can be reused for the measuring procedure.

- 2.1. Tighten the connecting rod bearing cap bolts to **10 N·m (89 lb in)**.
- 2.2. Tighten the bolts to an additional **60°**.
- 2.3. Tighten the bolts to an additional **15°**.

3. Measure the connecting rod bearing diameters at 3 points as shown (1). Use an internal measuring device.
4. Calculate the average connecting rod inner diameter.

Formula: $1. \text{ result} + 2. \text{ result} + 3. \text{ result} / 3$

5. Measure the connecting rod journal diameter at 2 points between 1 and 3 and between 2 and 4. Use a micrometer gauge.
6. Calculate the average connecting rod journal diameter.

Formula: $1. \text{ result} + 2. \text{ result} / 2.$

7. Subtract the average connecting rod journal diameter from the average connecting rod bearing diameter in order to determine the connecting rod bearing clearance.

The clearance should be **0.013 mm - 0.061 mm (0.0005 in - 0.0024 in)**

Piston and Connecting Rod Assemble

In case of damage on piston, piston pin or connecting rod, all components of the piston assembly have to be replaced. The piston pin cannot be removed and reinstalled due to the shrink fit of connecting rod and piston pin. In case of replacement use a suitable, customary assembly tool.

1. Install the piston rings. Use piston ring pliers (1).

Note: Mind the TOP marking on the piston rings.

2. The piston rings must be ordered as follows:
 - Upper compression ring (1)
 - Lower compression ring (2)
 - Piston oil rings with spacer (3, 4)

3. The piston ring joints should be displaced as followed:

- Upper compression ring joint (2)
- Lower compression ring joint (5)
- Oil ring joint, upper part (1)
- Oil ring joint, lower part (4)
- Oil ring spacer joint (3)

Inlet Manifold Disassemble

1. Remove the evaporative emission canister purge solenoid valve bolt (1).
2. Remove the evaporative emission canister purge solenoid valve (2) from intake manifold.

3. Remove the 2 fuel rail bolts (2).
4. Remove the fuel rail (1).

5. Remove the fuel injector retainer clamp (3).
6. Separate the fuel injector (2) from fuel rail (1).

7. Remove the inlet manifold gasket (1).
8. Remove the manifold absolute pressure sensor bolt (2).
9. Remove the manifold absolute pressure sensor (3).

Inlet Manifold Cleaning and Inspection

1. Clean the sealing surfaces (1, 2).
2. Inspect the inlet manifold for cracks and fractures.

Inlet Manifold Assemble

1. Install a NEW inlet manifold gasket (1).
2. Install the manifold absolute pressure sensor (3).
3. Install the manifold absolute pressure sensor bolt (2) and tighten.

4. Install the fuel injector (2) to fuel rail.
5. Install the fuel injector retainer clamp (3).

6. Install the fuel rail (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

7. Install the 2 fuel rail bolts (2) and tighten to **7 N·m (62 lb in)**.

8. Install the evaporative emission canister purge solenoid valve (2) to the inlet manifold.
9. Install the evaporative emission canister purge solenoid valve bolt (1) and tighten.

Crankshaft and Bearing Cleaning and Inspection

Special Tools

- *EN-470-B* Angular Torque Wrench .
- *GE-571-B* Dial Gauge.

For equivalent regional tools, refer to [Special Tools](#) .

[Crankshaft End Play, Check](#)

Note : Crankshaft attached with crankshaft bearing caps.

1. Install the *GE-571-B* gauge (1).
 - Install the holder on the front of the engine block.
 - Place the dial gauge plunger against the crankshaft and adjust.
2. Measure the longitudinal play of the crankshaft.
 - Move the crankshaft in the longitudinal direction.
 - Permissible crankshaft end play **0.100-0.202 mm (0.0039-0.0080 in)**.
3. Remove the *GE-571-B* gauge.

[Crankshaft Out-of-Round, Check](#)

Note: Crankshaft removed.

1. Insert the crankshaft in the engine block.
2. Install the *GE-571-B* gauge (1).
 - Attach holder to the engine block.
 - Place the dial gauge plunger against the crankshaft bearing journal and adjust.
3. Check the rotational play of the crankshaft.
 - Turn the crankshaft evenly.
 - Maximum permissible rotational play **0.03 mm (0.001 in)**.
4. Remove the *GE-571-B* gauge.

[Check Crankshaft Bearing Clearance \(With Plastigage\)](#)

Note:

- Crankshaft removed.
- Do not rotate the crankshaft.

1. Lay out plastigauge. Refer to electronic parts catalog to find the recommended plastigage.

Lay out plastigauge (flexible plastic thread) around the entire width of the crankshaft bearing journal (1).

Note: The bolts can be reused for checking the crankshaft bearing play.

2. Install the 4 lower crankshaft bearings (3) and the lower crankshaft thrust bearing (4).
3. Install the crankshaft bearing cap tie plate (2).
4. Install the 10 inner crankshaft bearing cap tie plate bolts (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

5. Tighten the 10 inner crankshaft bearing cap tie plate bolts in a sequence as shown and in the following order:
 - 5.1. Tighten the inner crankshaft bearing cap tie plate bolts to **25 N·m (18 lb ft)**.
 - 5.2. Tighten the inner crankshaft bearing cap tie plate bolts an additional **60°**. Use *EN-470-B* wrench .
 - 5.3. Tighten the inner crankshaft bearing cap tie plate bolts an additional **15°**. Use *EN-470-B* wrench .
6. Remove the crankshaft bearing cap tie plate bolts and the crankshaft bearing cap tie plate.

Note: When reading the value, do not confuse millimetres and inches on the measuring scale.

7. Measure the crankshaft bearing play.
 - Compare the width of the flattened plastic thread (arrow) to the measuring scale (1).
 - The crankshaft bearing play should be **0.007-0.031 mm (0.00028-0.00122 in)**.

[Check Crankshaft Bearing Clearance \(With Micrometer Gauge Internal Measuring Device\)](#)

Note: The bolts can be reused for checking the crankshaft bearing play.

1. Install and tighten the crankshaft bearing cap tie plate and the crankshaft bearings as shown above.

2. Measure the crankshaft bearing diameter at 3 points.

Measure in areas as shown (1) with an internal measuring device.

Calculate the average crankshaft bearing diameter.

Formula: $1. \text{ result} + 2. \text{ result} + 3. \text{ result} / 3.$

3. Measure the crankshaft bearing journal diameter at 2 points between (1) and (3) and between (2) and (4) with the micrometer gauge.
4. Calculate the average crankshaft bearing journal diameter.

Formula: $1. \text{ result} + 2. \text{ result} / 2.$

5. Determine the crankshaft bearing play.

Calculation formula: average crankshaft bearing diameter minus average crankshaft bearing journal diameter.

6. The crankshaft bearing play should be **0.007-0.031 mm (0.00028-0.00122 in).**

Engine Front Cover and Oil Pump Cleaning and Inspection

Engine Front Cover Cleaning Procedure

1. Clean the engine front cover sealing surface.

Warning: Wear safety glasses when using compressed air in order to prevent eye injury.

Caution: To ensure proper engine lubrication, clean clogged or contaminated oil galleries in an approved solvent and with compressed air. Failure to clean oil galleries

may cause engine damage.

2. Clean the shown oil gallery with solvent and compressed air. Blow compressed air from bore (2) to bore (1).

Engine Front Cover Visual Inspection

Inspect the engine front cover for cracks, scratches and damage.

Oil Pump Visual Inspection and Measurement

1. Inspect the oil pump cover and the engine front cover for flatness.
2. Inspect the oil pump vanes, the oil pump vane rotor, the oil pump vane rings and the oil pump slide for localised flattening.
3. Inspect the oil pump slide pivot pin for firm seat.

Note: Oil pump components are installed.

4. Measure the oil pump axial clearances. Use a straight edge (1) and a feeler gauge.
- 4.1. The maximal axial clearance between engine front cover and oil pump vane rotor should be **0.1 mm (0.004 in)**.
- 4.2. The maximum axial clearance between engine front cover and oil pump vane should be **0.09 mm (0.0035 in)**.
- 4.3. The maximum axial clearance between engine front cover and oil pump vane ring should be **0.4 mm (0.016 in)**.
- 4.4. The maximum axial clearance between engine front cover and oil pump slide should be **0.08 mm (0.0031 in)**.
- 4.5. The maximum axial clearance between engine front cover and oil pump slide seal should be **0.09 mm (0.0035 in)**.

5. Measure the oil pump radial clearance. Use a feeler gauge (1). Measure the clearance between oil pump vane rotor and oil pump vane (3).

The maximum clearance should be **0.05 mm (0.002 in)**.

6. Measure the clearance between oil pump vane and oil pump slide (2).

The maximum clearance should be **0.2 mm (0.008 in)**.

Engine Front Cover and Oil Pump Disassemble

[Engine Front Cover Disassemble](#)

1. Remove the intake camshaft position sensor bolt (1).
2. Remove the intake camshaft position sensor (2) and the seal ring (3).
3. Remove the exhaust camshaft position sensor bolt (6).
4. Remove the exhaust camshaft position sensor (5) and the seal ring (4).

5. Remove the oil pressure relief valve (7, 8 and 9)
6. Remove the crankshaft front oil seal (10).

Oil Pump Removal

1. Remove the 8 oil pump cover bolts (1).
2. Remove the oil pump cover (2).

Warning: Before removing the spring, cover the spring with a towel to prevent the spring from flying and possibly causing damage or personal injury.

Note: Position a screw driver between the oil pump slide spring windings (2).

3. Protect the engine front cover edge (1) with a suitable piece of plastic.
4. Compress the oil pump slide spring with a screw driver and remove the oil pump slide spring along with the oil pump slide spring pin.

Note: Mind the installation position of the oil pump components.

5. Remove the oil pump components in the following order:
 - 5.1. Outer oil pump vane ring (1).
 - 5.2. Oil pump vane rotor (3) and the 7 oil pump vanes (2).
 - 5.3. Inner oil pump vane ring (6).
 - 5.4. Oil pump slide (4) and the 2 oil pump slide seals with the 2 oil pump slide seal springs (5).

Sump Cleaning and Inspection

Warning: Wear safety glasses when using compressed air in order to prevent eye injury.

Caution: To ensure proper engine lubrication, clean clogged or contaminated oil galleries in an approved solvent and with compressed air. Failure to clean oil galleries may cause engine damage.

1. Clean the oil suction gallery (2) with compressed air. Ensure that there are no remains of dirt or old gasket material.

2. Remove all remains of old gasket material from sealing surface (1) and screw bores (3).
3. Clean the sealing surfaces from dirt and grease.
4. Inspect the sealing surface for cracks and damage.

Crankshaft and Bearing Installation

Special Tools

- *EN-470-B* Angular Torque Wrench .
- *EN-658-1* Installer from *EN-658* Kit.
- *EN-235-6* Installer from *EN-235-D* Kit.

For equivalent regional tools, refer to [Special Tools](#) .

1. Lubricate crankshaft, crankshaft bearings and crankshaft bearing cap tie plate with engine oil.

2. Install the 4 upper crankshaft bearings (2) and the crankshaft thrust bearing (3).
3. Install the crankshaft (1).

Note: Refer to the electronic parts catalogue to find a suitable sealing compound.

4. Apply sealing compound (1) to the outer rim of the groove on the crankshaft bearing cap tie plate. The thickness of the sealing bead should be **2 mm (0.0787 in)**.

Note: The complete installation procedure should be done in 10 minutes.

5. Install the 4 lower crankshaft bearings (3) and the lower crankshaft thrust bearing (4).
6. Install the crankshaft bearing cap tie plate (2).

Note: Do not reuse the old bolts.

7. Install the 10 inner crankshaft bearing cap tie plate bolts (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

8. Tighten the 10 NEW inner crankshaft bearing cap tie plate bolts in a sequence as shown and in the following order:
 - 8.1. Tighten the inner crankshaft bearing cap tie plate bolts to **25 N·m (18 lb ft)**.
 - 8.2. Tighten the inner crankshaft bearing cap tie plate bolts an additional **60°**. Use *EN-470-B* wrench .
 - 8.3. Tighten the inner crankshaft bearing cap tie plate bolts an additional **15°**. Use *EN-470-B* wrench .

Note: Do not reuse the old bolts.

9. Install the 12 NEW outer crankshaft bearing cap tie plate bolts (1) and tighten in the following order:
 - 9.1. Tighten the outer crankshaft bearing cap tie plate bolts to **10 N·m (89 lb in)**.
 - 9.2. Tighten the outer crankshaft bearing cap tie plate bolts an additional **60°**. Use *EN-470-B* wrench .
 - 9.3. Tighten the outer crankshaft bearing cap tie plate bolts an additional **15°**. Use *EN-470-B* wrench .

10. Install the crankshaft position sensor (1) and a NEW crankshaft position sensor seal ring (2).
11. Install the crankshaft position sensor bolt (3) and tighten to **8 N·m (71 lb in)**.

Note: Lubricate the crankshaft rear oil seal.

12. Install the crankshaft rear oil seal (1) with *EN-235-6* installer (2).

13. Use *EN-658-1* installer (1) to strike the crankshaft rear oil seal.

Piston, Connecting Rod, and Bearing Installation

Special Tools

EN-470-B Angular Torque Wrench .

For equivalent regional tools, refer to [Special Tools](#) .

1. Adjust the piston ring joints as follows:

- 1.1. Upper compression ring (1).
- 1.2. Lower compression ring (4).
- 1.3. Oil rings (2) or (3).
- 1.4. Oil ring spacer (5).

- 2. The arrow (1) on the piston head must point to the timing side.
- 3. The markings on the connecting rods (2) must point to the transmission side.

4. Install a suitable piston ring compressor tool in order to compress the piston rings.
5. Install the pistons (1) in compound with connecting rods (2) and upper connecting rod bearings (3) to the engine block and to the crankshaft.

Note: The connecting rod bearing caps must be installed in their original position.

6. Verify that the flarings (1) on the connecting rod bearing caps point to the transmission side.

7. Install the 2 connecting rod bearings and the 2 connecting rod bearing caps (2) of cylinder 1 and 4.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Do not reuse the old bolts.

8. Install the 4 NEW connecting rod bearing cap bolts (1) and tighten in the following sequence:
 - 8.1. Tighten the connecting rod bearing cap bolts to **25 N·m (18 lb ft)**.
 - 8.2. Tighten the connecting rod bearing cap bolts an additional **45°**. Use *EN-470-B* spanner .
9. Rotate the crankshaft **180°**.

10. Install the 2 connecting rod bearings and the 2 connecting rod bearing caps (2) of cylinder 3 and 2.

Note: Do not reuse the old bolts.

11. Install the 4 connecting rod bearing cap bolts (1) and tighten in the following sequence:

11.1. Tighten the connecting rod bearing cap bolts to **25 N·m (18 lb ft)**.

11.2. Tighten the connecting rod bearing cap bolts an additional **45°**. Use *EN-470-B* spanner .

Cylinder Head Installation

Special Tools

EN-470-B Angular Torque Wrench .

For equivalent regional tools, refer to [Special Tools](#) .

Warning: Wear safety glasses when using compressed air in order to prevent eye injury.

1. Clean the sealing surfaces and remove all remains of dirt and old gasket material from thread bores, water galleries and oil galleries.

Note: Mind the guide sleeves (4) and (5).

2. Install a NEW cylinder head gasket (3). The marking "Top" should point to the cylinder head.
3. Install the cylinder head (2).
4. Install the 12 cylinder head bolts (1) and hand-tighten.

5. Lay on a straight edge (1) to engine block and cylinder head and adjust the transition in area (2) until there is no clearance between cylinder head and straight edge. Use a rubber mallet.

Caution: Refer to [Fastener Caution](#) in the Preface section.

6. Tighten the cylinder head bolts in the sequence as shown and in the following order:
 - 6.1. Tighten the cylinder head bolts to **35 N·m (26 lb ft)**.
 - 6.2. Tighten the cylinder head bolts an additional **180°**. Use *EN-470-B* wrench .

Hydraulic Valve clearance Adjuster Installation

Note: Mind the installation position of the hydraulic valve clearance adjusters.

1. Lubricate the hydraulic valve clearance adjusters with engine oil.
2. Install the 16 hydraulic valve clearance adjusters (1).

Hydraulic Valve Clearance Adjuster Arm Installation

Note: Hydraulic valve clearance adjuster arms should be installed in their original position.

1. Lubricate the hydraulic valve clearance adjuster arms with engine oil.
2. Install the 16 hydraulic valve clearance adjuster arms (1).

Intake Camshaft Installation

Note: Mind the markings on the camshaft bearing caps. Camshaft bearing caps should be installed in their original position.

1. Lubricate camshaft and camshaft bearing caps with engine oil.
2. Install the intake camshaft (3).
3. Install the 5 camshaft bearing caps (2).
4. Install the 10 camshaft bearing cap bolts (1) and hand-tighten.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Tighten the camshaft bearing cap bolts one turn at a time in order to avoid shape distortion of the camshaft.

5. Tighten the camshaft bearing cap bolts one turn at a time and in a spiral sequence as shown to **8 N·m (71 lb in)**.

Exhaust Camshaft Installation

Note: Mind the markings on the camshaft bearing caps. Camshaft bearing caps should be installed in their original position.

1. Lubricate camshaft and camshaft bearing caps with engine oil.
2. Install the exhaust camshaft (3).
3. Install the 5 camshaft bearing caps (2).
4. Install the 10 camshaft bearing cap bolts (1) and hand-tighten.

Caution: Refer to [Fastener Caution](#) in the Preface section.

Note: Tighten the camshaft bearing cap bolts one turn at a time in order to avoid shape distortion of the camshaft.

5. Tighten the camshaft bearing cap bolts one turn at a time and in a spiral sequence as shown to **8 N·m (71 lb in)**.

Camshaft Sprocket Installation

1. Install the inlet camshaft sprocket (3).
2. Install the inlet camshaft position sensor exciter wheel (2) and the inlet camshaft sprocket bolt (1).
3. Install the exhaust camshaft sprocket.
4. Install the exhaust camshaft position sensor exciter wheel and the exhaust camshaft sprocket bolt.

Tightening of camshaft sprocket bolts will be done after engine front cover installation.

Timing Chain Tensioner Installation

1. Install the timing chain tensioner (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 2 timing chain tensioner bolts (1) and tighten to **8 N·m (71 lb in)**.

Engine Front Cover Gasket Installation

Note: The complete installation procedure should be done in 10 minutes.

1. Clean the sealing surfaces and remove all remains of old sealing compound material.

Note: Refer to electronic parts catalogue to find a suitable sealing compound.

2. Apply sealing compound to the shown areas (1) and (2). The thickness of the sealing bead should be **2 mm (0.0787 in)**.

Note: Mind the guide sleeves.

3. Install the engine front cover gasket (1).
4. Install the timing chain. Refer to [Camshaft Timing Chain Installation](#) .
5. Install the engine front cover. Refer to [Engine Front Cover and Oil Pump Installation](#) .

Camshaft Timing Chain Installation

Special Tools

- *EN-952* Fixing Pin
- *EN-953-A* Fixing Tool
- *EN-955-1* Fixing Pin from *EN-955* Kit

For equivalent regional tools, refer to [Special Tools](#) .

1. The engine should be adjusted to TDC.
2. The crankshaft should be fixed with *EN-952* fixing pin.
3. The camshaft should be fixed with *EN-953-A* fixing tool.

4. Install the timing chain (1) in compound with the crankshaft sprocket (2).

5. Install the timing chain tensioner shoe (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

6. Install the timing chain tensioner shoe bolt (2) and tighten to **20 N·m (15 lb ft)**.

7. Install the timing chain guide right side (1).
8. Install the 2 timing chain guide right side bolts (2) and tighten to **8 N·m (71 lb in)**.

9. Push the timing chain (2) in direction to the timing chain tensioner (1) and remove *EN-955-1* fixing pin (3).

The upper timing chain guide will be installed after the installation of the engine front cover and the fastening of the camshaft sprockets.

Engine Front Cover and Oil Pump Installation

Special Tools

- *EN-952* Fixing Pin
- *EN-953-A* Fixing Tool
- *EN-49977-100* Transmitter Disc Fixation
- *EN-49977-200* Fixing Tool

For equivalent regional tools, refer to [Special Tools](#) .

Note: Mind the guide sleeves when installing engine front cover.

1. Install the engine front cover (3).
2. Install the 13 engine front cover bolts M6 (1).
3. Install the 2 engine front cover bolts M10 (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Tighten the 13 engine front cover bolts M6 to **8 N·m (71 lb in)**.
5. Tighten the 2 engine front cover bolts M10 to **35 N·m (26 lb ft)**.

[Camshaft Sprocket Fastening](#)

Note: Push the fixing tool in the direction of the arrow to ensure it engages without clearance.

1. Install *EN-49977-200* fixing tool (2) and adjust that the gearing (1) of the fixing tool engages with the inlet camshaft sprocket gearing (1).

2. Tighten the 2 fastening bolts (1) of *EN-49977-200* fixing tool while pushing the fixing tool in direction of the arrow.
3. Tighten the adjuster bolt (2).

Note: A wrong installation position is possible. Make sure that the fixation tool is installed without clearance to the cylinder head in areas (3) and (5).

4. Install *EN-49977-100* transmitter disc fixation (2) in order to find and fix the correct position of the camshaft position exciter wheels.
5. Tighten the fastening bolts (6) of *EN-49977-100* transmitter disc fixation.

Caution: Refer to [Fastener Caution](#) in the Preface section.

6. Tighten the intake camshaft sprocket bolt (4) while holding up the hexagon (1) of the intake camshaft to **50 N·m (37 lb ft)**.
7. Tighten the intake camshaft sprocket bolt (4) while holding up the hexagon (1) of the intake camshaft to an additional **60°**.
8. Tighten the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft to **50 N·m (37 lb ft)**.
9. Tighten the exhaust camshaft sprocket bolt while holding up the hexagon of the exhaust camshaft to an additional **60°**.
10. Remove *EN-49977-100* transmitter disc fixation and *EN-49977-200* fixing tool.

[Upper timing chain guide installation](#)

1. Install the upper timing chain guide (2).
2. Install the 2 upper timing chain guide bolts (1) and tighten to **8 N·m (71 lb in)**.
3. Remove *EN-953-A* fixing tool and *EN-952* fixing pin.
4. Install crankshaft bearing cap tie plate hole plug and seal ring and tighten to **40 N·m (30 lb ft)**.

Sump Installation

Special Tools

EN-49980 Guidance Pins

For equivalent regional tools, refer to [Special Tools](#) .

Note: Refer to electronic parts catalogue to find a suitable sealing compound.

1. Clean the sealing surfaces from old sealing material, dirt, oil and grease.

Note: The sealing bead should be applied close to the inner edge of the oil sump. Take care that the oil suction gallery (4) will not get contaminated with sealing compound or dirt.

2. Apply sealing compound to the oil sump. The thickness of the sealing bead (3) should be **2 mm (0.0787 in)**.
3. Apply sealing compound to the groove of the engine front cover (1).
4. Apply sealing compound around the screw bore (2) of the crankshaft bearing cap tie plate.
5. Install the oil sump seal rings to the grooves of the engine front cover.

Note: The complete installation procedure of the oil sump should be done in 10 minutes.

6. Install the 2 *EN-49980* pins (1) and (2) to the shown oil sump screw bores.

Note: Take care that the sealing bead will not get smeared while the installation procedure. A smeared sealing bead in the area around the oil suction gallery will cause engine damage.

7. Cautiously install the oil sump. Guide the oil sump with *EN-49980* pins (2) and the equivalent screw bores (1).
8. Fix the oil sump with 4 oil sump bolts.
9. Remove *EN-49980* pins.
10. Install the remaining 12 sump bolts and hand tighten.

11. Lay on a straight edge (1) to oil sump and engine block and adjust the transition in area (2) until there is no clearance between oil sump and straight edge. Use a rubber mallet.

Caution: Refer to [Fastener Caution](#) in the Preface section.

12. Tighten the 16 oil sump bolts to **10 N·m (89 lb in)**.

Camshaft Position Actuator Solenoid Valve Installation

Caution: The camshaft position actuator solenoid valves must be kept parallel to the engine front cover during removal and installation. The camshaft position actuator solenoid valves can be damaged if they become wedged or stuck during this process.

1. Install the 2 camshaft position actuator solenoid valves (2) and the 2 seal rings (1) by carefully and evenly pressing.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 4 camshaft position actuator solenoid valve bolts (1) and tighten to **8 N·m (71 lb in)**.

3. The 2 camshaft position actuator solenoid valves should be installed in the position as shown (1) and (2).

Camshaft Cover Installation

1. Clean the sealing surfaces.

Note: The thickness of the sealing bead should be **2 mm (0.0787 in)**.

2. Apply sealing compound to areas (1) and (2). Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) .

Note: The installation procedure should not take longer than 10 minutes.

3. Install the camshaft cover (2) and a NEW gasket (3).
4. Install the 15 camshaft cover bolts (1).

5. Tighten the 15 camshaft cover bolts in a sequence as shown to **8 N·m (71 lb in)**.

6. Install the oil level indicator (1).

Ignition Coil Installation

Special Tools

EN-6009 Remover and Installer Ignition Module

For equivalent regional tools, refer to [Special Tools](#) .

1. Install the ignition coil (1) and remove *EN-6009* remover and installer (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 2 ignition coil bolts (1) and tighten to **8 N·m (71 lb in)**.

Oil Filter Installation

Special Tools

EN-726-A Oil Filter Spanner

For equivalent regional tools, refer to [Special Tools](#).

1. Install the *EN-726-A* wrench (2) to the oil filter (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the oil filter to the oil sump and tighten to **20 N·m (15 lb ft)**.
3. Remove the *EN-726-A* wrench.

Inlet Manifold Installation

1. Clean the sealing surfaces.

2. Install the inlet manifold (1) along with the inlet manifold gasket.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 6 inlet manifold bolts (1) and tighten to **20 N·m (15 lb ft)**.

Throttle Body Installation

1. Install the throttle body (2) and a NEW throttle body seal ring (3)

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 4 throttle body bolts (1) and tighten to **9 N·m (80 lb in)**.

Water Pump Installation

1. Clean the sealing surfaces.

2. Install the water pump (2) and a NEW water pump gasket (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 5 short water pump bolts (4) and the 5 long water pump bolts (3) and tighten in a cross sequence to **8 N·m (71 lb in)**.

Crankshaft Balancer Installation

Special Tools

- *EN-49979* Crankshaft Shock Mount Retainer.
- *EN-956-1* Extension
- *EN-470-B* Angular Torque Wrench

For equivalent regional tools, refer to [Special Tools](#) .

Note: The crankshaft balancer flange must fit the hexagon of the oil pump rotor (2) and to the dihedral of the crankshaft (1).

1. Install the crankshaft balancer by cautious reciprocating and pressing.

2. Measure the distance **a** between the crankshaft balancer (2) and the mark on the engine front cover (1). The distance **a** should be **4.5 mm (0.1772 in)**.
3. Install the crankshaft balancer bolt.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Tighten the crankshaft balancer bolt (4) to while fixing the crankshaft balancer (3) with *EN-49979* retainer (1) and *EN-956-1* extension (2) in the following order:
 - 4.1. Tighten the crankshaft balancer bolt to **150 N·m (111 lb ft)**.
 - 4.2. Tighten the crankshaft balancer bolt to an additional **60°**. Use *EN-470-B* wrench .

Water Pump Pulley Installation

1. Install the water pump pulley (1).
2. Install the 3 water pump pulley bolts (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Tighten the 3 water pump pulley bolts (2) to **10 N·m (89 lb in)** while holding up the water pump pulley hub with a spanner.

Air Conditioning Compressor Bracket Installation

1. Install the air conditioning compressor bracket (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 3 air conditioning compressor bracket bolts (1) and tighten to **22 N·m (16 lb ft)**.

Water Pump Belt Installation

1. Pre-install the water pump belt (2) to the crankshaft balancer.
2. Guide the water pump belt (2) over the water pump pulley (1) and push it with the thumb in the water pump pulley groove.
3. Slowly rotate the crankshaft by means of the crankshaft balancer bolt (3) to install the water pump belt while pushing the belt in the water pump pulley groove.
4. Rotate the crankshaft and check proper seat of the water pump belt in the grooves of the water pump pulley and the crankshaft balancer.

Water Outlet Installation

1. Clean the sealing surfaces.

2. Install the water outlet (2) and 2 NEW water outlet seal rings (3).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 4 water outlet bolts (1) and tighten to **8 N·m (71 lb in)**.

Engine Coolant Thermostat Housing Installation

1. Clean the sealing surfaces.

2. Install the engine coolant thermostat housing (2) and a NEW engine coolant thermostat housing seal ring (3).

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the 3 engine coolant thermostat housing bolts (1) and tighten to **8 N·m (71 lb in)**.

Exhaust Manifold Installation

1. Clean the exhaust manifold and the cylinder head sealing surfaces from old gasket material.

2. Install a NEW exhaust manifold gasket (2).
3. Install the exhaust manifold (1).

4. Install the 9 exhaust manifold nuts (1) and hand-tighten.

5. Install the 2 catalytic converter bracket bolts (1) to the catalytic converter bracket (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

6. Tighten the 9 exhaust manifold nuts to **22 N·m (16 lb ft)**.

7. Tighten the 2 catalytic converter bracket bolts to **10 N·m (89 lb in)**.

Engine Lift Bracket Installation

1. Install the engine lift bracket (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the 2 engine lift bracket bolts (4) and tighten to **22 N·m (16 lb ft)**.

3. Install the sidewise engine lift bracket (2).

4. Install the sidewise engine lift bracket bolt (3) and tighten to **22 N·m (16 lb ft)**.

© Copyright Chevrolet. All rights reserved

Engine Mount Bracket Installation

1. Install the engine mount bracket (2).

Caution: Refer to [Fastener Caution](#) in the Preface section.

Caution: Refer to [Torque-to-Yield Fastener Caution](#) in the Preface section.

2. Install the 3 engine mount bracket bolts and tighten to **60 N·m (44 lb ft) + 45-60°**.

Engine Front Cover and Oil Pump Assemble

[Oil Pump Installation](#)

Note: Oil pump slide spring pin and oil pump slide spring, as well as slide seal and slide seal spring can be ordered as single parts. All other oil pump components can only be ordered as a replacement kit.

1. Install the oil pump components in the following order:

Note: The bore (8) in the oil pump slide must fit smooth-running and without clearance to the oil pump slide pivot pin (7)

- 1.1. Install the oil pump slide (6).
- 1.2. Install the inner oil pump vane ring (5).

Note: Mind the installation position of the oil pump vane rotor (4). The mark (9) must point in the direction of the oil pump cover.

- 1.3. Install the oil pump vane rotor (4).

Note: Mind the localised flattings (3) on the oil pump vanes (2) caused by the oil pump vane rings. The localised flattings must point to the oil pump vane rotor.

- 1.4. Install the 6 oil pump vanes (2).
- 1.5. Install the outer oil pump vane ring (1).

2. Install the 2 oil pump slide seals and the 2 oil pump slide seal springs (2) in the position as shown to the 2 grooves (1) of the oil pump slide.

3. Protect the engine front cover edge (5) with a suitable piece of plastic.

Note: The length of the removed oil pump slide spring (2) should be **76.5 mm (3.0118 in)**.

4. Install the oil pump slide spring pin along with the oil pump slide spring (4). Use a screwdriver to compress the oil pump slide spring. The flat side of oil pump slide spring pin must face upwards.
5. Measure the oil pump clearances to ensure a correct installation of the oil pump components. Refer to [Engine Front Cover and Oil Pump Cleaning and Inspection](#) .
6. Lubricate the oil pump vanes, the oil pump vane rotor, the oil pump slide spring and the area (3) with engine oil.
7. Inspect the oil pump slide spring mechanism for practicability.

8. Install the oil pump cover (2) and the 8 oil pump cover bolts (1).

Caution: Refer to [Fastener Caution](#) in the Preface section.

9. Tighten the oil pump cover bolts in a sequence as shown to **8 N·m (71 lb in)**.

10. Install the crankshaft balancer (1) and rotate in shown direction (2) in order to inspect the function of the oil pump mechanism. Crankshaft balancer should be rotated easily.

[Engine Front Cover Assemble](#)

1. Install the crankshaft front oil seal (10).
2. Install the oil pressure relief valve (7), (8) and (9) and tighten to **50 N·m (37 lb ft)**.
3. Install the exhaust camshaft position sensor (5) and the seal ring (4).
4. Install the exhaust camshaft sensor bolt (6) and tighten to **6 N·m (53 lb in)**.
5. Install the intake camshaft position sensor (2) and the seal ring (3).
6. Install the intake camshaft sensor bolt (1) and tighten to **6 N·m (53 lb in)**.

Water Pump Belt Removal

1. Cut the water pump belt (1) with a suitable cutting tool.
2. Remove the water pump belt.

Automatic Transmission Flex Plate Removal

Special Tools

- *EN-49979* Crankshaft Shock Mount Retainer.
- *EN-956-1* Extension .

For equivalent regional tools, refer to [Special Tools](#) .

1. Install *EN-49979* retainer to *EN-956-1* extension .

2. Install *EN-49979* retainer (1) in compound with *EN-956-1* extension (2) to the crankshaft balancer as shown.

3. Loosen the 6 flex plate bolts (3) while holding up the crankshaft balancer.
4. Remove the 6 flex plate bolts and the flex plate bolt washer (2).
5. Remove the flex plate (1).

Engine Block Cleaning and Inspection

Special Tools

EN-8087 Cylinder Bore Gauge

For equivalent regional tool, refer to [Special Tools](#) .

Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant.
2. Clean all the following areas with solvent:
 - Sealing surfaces
 - Cooling passages
 - Oil passages
3. Clean all threaded and through holes with solvent.

Warning: Wear safety glasses when using compressed air in order to prevent eye injury.

4. Dry the engine block with compressed air.

Visual Inspection

1. Inspect the crankshaft bearings journals for damage or spun bearings. The crankshaft bearing journals are not repairable, if the crankshaft bearing journals are damaged the engine block assembly must be replaced.
2. Inspect all sealing and mating surfaces for damage, repair or replace the engine block assembly if necessary.
3. Inspect all threaded and through holes for damage or excessive debris.
4. Inspect all bolts for damage, if damaged replace with NEW bolts only.
5. Inspect the cylinder walls for cracks or damage. The cylinder sleeves are not serviced separately, if the cylinders are damaged the cylinder block assembly must be replaced.
6. Inspect the engine block for cracks. Do not repair any cracks. If cracks are found, the cylinder block assembly must be replaced.

Measuring Procedure

Engine Block Flatness Inspection

1. Inspect the engine block as shown for distortion. Use a straightedge (1).

2. Inspect the engine block as shown for deflection. Use a straightedge (1).

Cylinder bore and crankshaft bearing bore

Note: Old bolts can be used for the measuring procedure.

1. Install the crankshaft bearing cap tie plate and tighten.

2. Inspect the crankshaft main bearing bores. Use the *EN-8087* gauge (1) to measure the bearing bore concentricity and alignment. Refer to [Engine Mechanical Specifications](#) to find the permitted values.
3. Replace the engine block and crankshaft bearing cap tie plate if the crankshaft bearing bores are out of specification.

4. Inspect the cylinder bores using the *EN-8087* gauge (1). Inspect for the following items:

- Wear
 - Taper
 - Runout
 - Ridging
5. Refer to [Engine Mechanical Specifications](#) to find the permitted values.
 6. If the cylinder bores are out of specification, replace the engine block.
 7. Remove the crankshaft bearing cap tie plate.

Automatic Transmission Flex Plate Installation

Special Tools

- *EN-49979* Crankshaft Shock Mount Retainer.
- *EN-956-1* Extension .
- *EN-470-B* Angular Torque Wrench .

For equivalent regional tools, refer to [Special Tools](#) .

1. Install the flex plate (1).
2. Install the flex plate bolt washer (2) and the 6 flex plate bolts (3).
3. Install *EN-49979* retainer to *EN-956-1* extension .

4. Install *EN-49979* retainer (1) in compound with *EN-956-1* extension (2) to the crankshaft balancer as shown.

Caution: Refer to [Fastener Caution](#) in the Preface section.

5. Tighten the 6 flex plate bolts to **35 N·m (26 lb ft)**.
6. Tighten the 6 flex plate bolts to an additional **30°**. Use *EN-470-B* wrench .
7. Tighten the 6 flex plate bolts to an additional **15°**. Use *EN-470-B* wrench .

Engine Component Description

[Cylinder Block](#)

The cylinder block is a hollow frame structured in-line 4 cylinder. The block has 5 crankshaft bearings with the thrust bearing located on the third bearing from the front of the engine.

[Crankshaft](#)

The crankshaft is a steel crankshaft. It is supported in 5 main journals with main bearings which have oil clearance for lubrication. The 3rd bearing which controls the proper axial end play of the crankshaft.

[Oil Pump](#)

The engine is equipped with a variable oil pump. The oil pump is integrated into the engine front cover and provides different oil pressure values depending on the engine speed.

[Sump](#)

The sump is a structural aluminium sump with transmission attachment points. The oil suction gallery for the oil pump is integrated into the sump.

[Piston and Connecting Rod](#)

The pistons are aluminium pistons. The connecting rods are made of fractured steel. The piston pin is floating in piston bore and shrunk in connecting rod.

[Cylinder Head](#)

This cylinder head is a double over head camshaft (DOHC) type and has 2 camshafts that open 4 valves per cylinder with hydraulic valve clearance adjusters and hydraulic valve clearance adjuster arms. The cylinder head is made of cast aluminum alloy for strength and hardness while remaining light weight. The combustion chamber of the cylinder head is designed for increasing of squish and swirl efficiency to help maximise petrol combustion efficiency.

[Camshaft Drive with Variable Camshaft Timing](#)

A timing chain is used for camshaft drive. There is a tensioner to control the tension of the chain. The engine is equipped with a variable camshaft timing system. The

camshaft adjuster will readjust itself depending on the engine speed. The valve timing readjusts to reduce fuel consumption and provides optimal power and torque. The variable camshaft timing makes an exhaust gas recirculation unnecessary.

Inlet Manifold

The inlet manifold provides the air flow passage to the combustion chambers through the throttle body. The inlet manifold along with the throttle body have an effect on engine torque, power, noise, driveability, emission, fuel economy and performance. The inlet manifold is made of plastic for better strength while maintaining light weight.

Exhaust Manifold

The exhaust manifold is located to the cylinder head and channels the exhaust gas out of the combustion chamber. It is designed to endure on high pressure and high temperature. The exhaust manifold includes the catalytic converter.

Volt

Lubrication Description

[General Lubrication Description](#)

Oil is applied under pressure to the crankshaft bearings (6), connecting rod bearings (5), camshaft bearings (2) and hydraulic clearance adjusters (3). In addition, the variable oil pump (8), variable camshaft phaser (1), and hydraulic chain tensioner (13) are supplied with pressurised oil. Oil is sucked from the oil sump through the fixed screen into the variable vane type oil pump. The pump is integrated in the front cover and directly driven by the crankshaft. Also integrated into the front cover is a pressure relief valve (7) that opens when the oil pressure is too high at a cold start. When that valve is open some oil flows directly into the oil sump. Normally the pressurised oil passes into the engine oil gallery leading to the oil filter (4). The oil is cleaned by passing the filter from the outer to the inner side of the filter. Then the oil flows into the main oil gallery. A filter by-pass valve in the oil filter ensures continuous oil flow in case the oil filter should be restricted by more than 1.7 bar. From the oil filter the oil is distributed to the

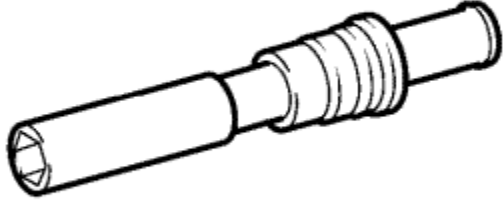

crankshaft bearings, oil pump displacement control chamber (9) and cylinder head feed (10). The connecting rod bearings are supplied by oil flow passages through the crankshaft connecting the main journals to the rod journals. A groove around each upper main bearing furnishes oil to the drilled crankshaft passages. In the cylinder head the oil is distributed to the variable camshaft phasers, chain tensioner, oil pressure switch (11) and through the restrictor orifice (12) into the camshaft feed oil gallery. From there the hydraulic tappets and camshaft bearings are supplied with oil.

Variable Oil Pump Description

The engine is equipped with a variable displacement vane oil pump. It is indirectly regulated by the oil pressure out of the main oil gallery. The purpose of this indirect regulation is to keep a defined maximum pressure in the main oil gallery independently of the individual pressure drop between the pump outlet and the main gallery inlet and the individual oil flow to the consumers (bearing clearances differ, wear differs, [mldr]) The purpose of the variable displacement is to reduce the power consumption of the pump to reduce the overall fuel consumption of the engine. The oil flow of a static displacement oil pump is linear to the speed of the pump. This would lead to a too high oil pressure after a certain engine speed (approx. 1000 rpm at cold oil temperature, approx. 3000 rpm at hot oil temperatures). To reduce that high oil pressure, normal pumps have a relieve valve: a portion of the pressurised, already pumped oil is fed back to the intake of the pump. This is waste of power. The oil flow of a Variable Displacement Vane Pump (VDVP) as used in Fam 0 Gen 3 is linear to the speed and to the eccentricity of the rotor to the slide. The slide is movable, so it is possible to reduce the oil flow for a given speed by reducing the eccentricity. With a lower flow the oil pressure is reduced; pump oil flow now equals engine oil flow.

Special Tools

Illustration	Tool Number / Description
 A technical line drawing of a spark plug key. It consists of a long, thin cylindrical shaft with a hexagonal end on the left. The right end of the shaft has a series of concentric rings, forming a threaded section.	<p>EN-194-E KM-194-E Spark Plug Key</p>

Air Conditioning System	Lubricant	12356150	10953485
POE Oil	Lubricant	88862657	88862658

Refrigerant System Specifications

Application	Specification	
	Metric	English
POE Oil GM P/N 88862657 for United States		
POE Oil GM P/N 88862658 for Canada		
Refrigerant Charge, R134a	950 g	2.1 lb
Total System POE Oil Capacity	180 ml	6.1 oz
Compressor ²	85 ml ¹	2.9 oz ¹
Condenser	20 ml ¹	0.7 oz ¹
Desiccant Cartridge	10 ml ¹	0.3 oz ¹
Evaporator	10 ml ¹	0.3 oz ¹
Drive Motor Battery Cooler	10 ml ¹	0.3 oz ¹
Abrupt Refrigerant Loss	60 ml ³	2.0 oz ³

¹If more than the specified amount of POE oil was drained from a component, add the equal amount of oil drained.

²The service compressor contains 85ml (2.9 oz) of POE oil.

³Abrupt refrigerant loss due to large leak, hose rupture, collision, or pressure relief valve opening. Conditions that allow the refrigerant to seep or bleed off over time do not cause this oil loss. Upon replacement of a component that caused a large refrigerant loss, also add the required amount of oil for the particular component.

Handling of Refrigerant Lines and Fittings

Caution: To avoid system damage use only R-134a dedicated tools when servicing the A/C system.

- Keep all metal tubing lines free of dents or kinks. Any line restrictions will cause the loss of system capacity.
- Never bend a flexible hose line to a radius of less than four times the diameter of the hose.
- Never allow a flexible hose line to come within 65 mm (2-1/2 in) of the exhaust manifold.
- Inspect flexible hose lines regularly for leaks or brittleness.
- Replace flexible hose lines with new lines if you find signs of deterioration or leaking.
- Discharge the refrigeration system of all refrigerant before disconnecting any fitting in the refrigeration system.
- Proceed very cautiously regardless of the gauge readings.

Warning: For personal protection, goggles and lint-free gloves should be worn and a clean cloth wrapped around fittings, valves, and connections when doing work that includes opening the refrigerant system. If refrigerant comes in contact with any part of the body severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

- Open the fittings very slowly.
- If you notice pressure when you loosen a fitting, allow the pressure to bleed off as described Discharging, Adding Oil, Evacuating, and Charging Procedures for A/C System.
- Cap or tape any refrigerant line immediately after it is opened. This will prevent the entrance of moisture and dirt, which can cause internal compressor wear or plugged lines in the condenser, the evaporator core, the expansion valve, or the compressor inlet screens.

Note: Use two proper wrenches to connect the fittings.

- Back up the opposing fitting to prevent distortion of the connecting lines or the components.
- Keep the sealing surfaces in perfect condition. A burr or a piece of dirt may cause a refrigerant leak.
- When seal washers are used, always install the seal washer without lubrication.
- When O-rings are used, always lightly coat the new O-ring seal with mineral base 525 viscosity refrigerant oil prior to installation.

Leak Testing

Special Tools

- *GE-50078* Infrared Refrigerant Leak Detector
- *GE-42220* Universal 12V Leak Detection Lamp
- *GE-43872* Fluorescent Dye Cleaner

For equivalent regional tools, refer to [Special Tools](#) .

[Refrigerant Leak Testing](#)

Note: All A/C system repairs must be verified using electronic leak detection. Dye detection may take up 2 or 3 days to be reliable.

Note: General Motors vehicles are now manufactured with fluorescent dye installed directly into the air conditioning (A/C) system.

Note: Directive 2006/40/EC: If a high amount of refrigerant has escaped, the needed repair must be completed before the air conditioning is filled with refrigerant (Article 6 section 3 and 3 chemicals climate protection order).

The fluorescent dye mixes and flows with the refrigerant oil throughout the refrigerant system.

Verifying some passive leaks may require using the *GE-50078* detector, even though the A/C system contains fluorescent dye.

[Visual Inspection](#)

Visually trace the entire refrigerant system and look for signs of lubricant leakage, damage, and corrosion on all lines hoses and components (Oil can be an indication of a leak). Each questionable area should be checked for leaks using an electronic leak detector.

[Fluorescent Leak Detector](#)

Note: Always use UV protective eyewear when working with UV light.

Fluorescent dye will assist in locating any leaks in the A/C system.

Note: POE oil is water soluble.

- Condensation on the evaporator core or the refrigerant lines may wash the POE oil and fluorescent dye away from the actual leak. Condensation may also carry dye through the HVAC module drain.
- Leaks in the A/C system will be indicated in a light green or yellow colour when using the leak detection lamp.
Use the leak detection lamp in the following areas:
 - All fittings or connections that use seal washers or O-rings
 - All of the A/C components
 - The A/C hoses and pressure switches
 - The HVAC module drain tube, if the evaporator core is suspected of leaking
 - The service port sealing capsThe sealing cap is the primary seal for the service ports.
- Follow the instructions supplied with the *GE-42220* lamp .
- To prevent false diagnosis in the future, thoroughly clean the residual dye from any area where leaks were found. Use a rag and the approved *GE-43872* cleaner.

Replacing System Dye After Flushing

Note: Do not add dye to the refrigerant system equipped with high voltage electric compressors. The only means of replenishing dye after flushing is by replacing components containing the dye. Currently a compatible dye wafer is contained in the O.E. desiccant package. Adding dye that is not compatible with the high voltage electric compressor may cause compressor damage and high voltage isolation faults.

To prevent false diagnosis, thoroughly clean any residual dye from the service port with a rag and the approved fluorescent dye cleaner *GE-43872* cleaner.

Electronic Leak Detection

Infrared detectors operate differently than heated sensor type detectors. They detect changes in concentration of refrigerant rather than absolute concentration. If the tip is held at a detected leak for more than 5 seconds the detector will saturate and zero to that concentration and will no longer detect leaks at that concentration or less. Move tip away from the leak saturation area for 30 seconds to reset the sensitivity of the detector.

Adequate system pressure is required for effective leak detection.

- If system is empty install 10% of system charge.
- Temperature must be above 60 F.

Do not use:

- Soap solutions (not effective for leak detection)
- Shop air (will introduce contamination to the refrigerant system)
- High pressure gasses i.e nitrogen (may cause system damage)

Air movement from the engine cooling fan can affect the detectors ability to detect leaks. Always leak test with engine off and if possible after engine has reached normal operating temperature.

- All fittings and components should be checked.
- Take care not to contaminate the probe tip if the part being tested is contaminated.
- No cleaners containing solvents should be used prior to using electronic leak detector.
- Always follow the refrigerant system around in a continuous path so that no areas of potential leaks are missed. Move the tip along the refrigerant system at a rate of no more than 75 mm per second and a distance of 10 mm from the surface being tested. If a leak is found, always continue to test the remainder of the system.

Follow the instructions supplied with the *GE-50078* detector .

[Leak Detection with Nitrogen](#)

If a leak test with fluorescent leak detector or halogen leak detector is not possible, then a leak test with nitrogen must take place. Use the Air Conditioning Leak Detector Nitrogen Kit+ for this test.

Using soap suds or a leak detection spray, coat the suspected leak area and look for visible bubbles caused by nitrogen escaping from the leak.

Air Conditioning (A/C) System Performance Test

Table 1: [A/C Performance Table](#)

This test measures the operating efficiency of the A/C system under the following conditions:

- The current ambient air temperature
- The current relative humidity
- The high side pressure of the A/C system
- The low side pressure of the A/C system
- The temperature of the air being discharged into the passenger compartment

Test Description

The numbers below refer to the step numbers on the diagnostic table.

1. This step determines if the A/C system has at least the minimum refrigerant charge required to operate the system without damage.
2. This step measures the performance of the A/C system.
3. This step is to allow for vehicle variations as well as high ambient temperatures.

Step	Action	Values	Yes	No
Note:				
<ul style="list-style-type: none"> • The ambient air temperature must be at least 16°C (60°F). • Do not induce additional air flow across the front of the vehicle during the test. • If you were sent here from a DTC diagnostic table, clear the DTC upon completion of this test. 				
	<ol style="list-style-type: none"> 1. Park the vehicle inside or in the shade. 2. Open the windows in order to ventilate the interior of the vehicle. 3. If the A/C system was operating, allow the A/C system to equalise for about 2 minutes. 4. Turn OFF the ignition. 5. Install the <i>J-43600</i> ACR 2000 Air Conditioning Service Centre or <i>GE-48800</i> 	<p>More than 16°C (60°F) - 345 kPa (50 psi)</p> <p>More than 24°C (75°F) -</p>		

1	<p>CoolTech A/C Recharge Machine .</p> <ol style="list-style-type: none"> 6. Record the ambient air temperature and humidity. 7. Record the low and high side STATIC pressure readings. <p>Are both the low side and high side pressures within the specified value?</p>	<p>483 kPa (70 psi)</p> <p>More than 33°C (90°F) - 690 kPa (100 psi)</p>	<p>Go to Step 2</p>	<p>Go to Leak Testing</p>
2	<p>Note: Record the relative humidity and the ambient air temperature at the time of the test.</p> <ol style="list-style-type: none"> 1. Close the vehicle doors and windows. 2. Open the driver's door window 12.7-15.2 cm (5-6 in). 3. Select the following HVAC control settings: <ul style="list-style-type: none"> • The A/C is ON. • The coldest temperature setting • The maximum blower speed • Recirculation mode • The instrument panel (I/P) outlet mode • All I/P outlets are OPEN. 4. Install thermometers in the left and right centre panel air outlets. 5. Apply the handbrake. 6. Place the transaxle/transmission in one of the following positions: <ul style="list-style-type: none"> • PARK (Automatic) • NEUTRAL (Manual) 7. Start the engine and warm to operating temperature. 8. Operate the A/C system for 5 minutes. 9. Inspect A/C components for the following conditions: <ul style="list-style-type: none"> • Abnormal frost areas • Unusual noises 10. Record the following information: <ul style="list-style-type: none"> • The panel outlet air temperatures • The low-side pressure • The high-side pressure 11. Compare the low and high side pressures and the panel output temperatures to the A/C Performance Table below. <p>Does all the data recorded fall within the specified ranges of the A/C Performance Table below?</p>	<p>-</p>	<p>Go to Step 5</p>	<p>Go to Step 3</p>

3	<p>If the pressures and temperatures recorded do not fall within the specified ranges:</p> <ol style="list-style-type: none"> 1. Continue to operate the A/C system for an additional 5 minutes. 2. Record the pressures and temperatures again. 3. Compare the low and high side pressures and the panel output temperature to the A/C Performance Table below. <p>Does all the data recorded fall within the specified ranges of the A/C Performance Table below?</p>	-	Go to Step 5	Go to Step 4

Noise Diagnosis - Blower Motor

Step	Action	Yes	No
DEFINITION: Noise originating from the blower motor.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - HVAC Systems - Automatic
2	Inspect the air inlet grille for debris. Is debris present?	Go to Step 8	Go to Step 3
3	<ol style="list-style-type: none"> Sit inside the vehicle. Close the vehicle doors and windows. Turn the ignition to the accessory position. Cycle the blower motor through all of the speeds and modes in order to determine where and when the noise occurs. Is a noise evident during the blower operation?	Go to Step 4	Go to Step 11
4	Inspect for excessive vibration at each blower motor speed by feeling the blower case. Is excess vibration present?	Go to Step 6	Go to Step 5
5	Listen to the blower motor at each speed. Is the blower motor making a squeaking or chirping noise?	Go to Step 9	Go to Step 11
6	<ol style="list-style-type: none"> Remove the blower motor. Refer to Blower Motor Replacement . Inspect the blower motor impeller for deposits of foreign material. Inspect the blower motor for deposits of foreign material. Did you find any foreign material on the blower motor or blower motor impeller?	Go to Step 8	Go to Step 7
7	Inspect the blower motor for the following conditions: <ul style="list-style-type: none"> Cracked blades A loose impeller retainer Improper impeller alignment Did you find any of these conditions?	Go to Step 9	Go to Step 10

8	Remove the foreign material. Is the action complete?	Go to Step 10	-
9	Replace the blower motor. Refer to Blower Motor Replacement . Is the repair complete?	Go to Step 11	-
10	Install the blower motor. Refer to Blower Motor Replacement . Is the action complete?	Go to Step 11	-
11	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Air Conditioning Compressor Oil Diagnosis

Note: To avoid repeat compressor failure, always inspect the condition of the refrigerant oil and take the appropriate corrective action before installing the replacement compressor.

Condition	Corrective Action
Clean Oil no debris present	No corrective action necessary.
Clean Oil with debris present	<ul style="list-style-type: none"> Inspect the suction port of the replacement compressor for presence of a suction screen. If the replacement compressor does NOT contain a suction screen, install suction screen in the line. Replace desiccant or component containing the desiccant. Replace desiccant filter if applicable. Remove and inspect high pressure side filter (if applicable). Remove, inspect, clean, or replace orifice tube. If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean, or replace the filter. If the system has a front orifice tube and is not equipped with a filter in the rear auxiliary line, remove the filter in the auxiliary TXV and install a universal inline A/C Filter P/N 89016656 (AC Delco P/N 15-10413) as close to the rear TXV as possible.
Dark brown/black and/or pungent/unusual odour with no debris present	<ul style="list-style-type: none"> Replace desiccant or component containing the desiccant. Replace desiccant filter if applicable. Flush refrigerant system. Refer to Flushing.
Dark brown/black and/or pungent/unusual odour with debris present	<ul style="list-style-type: none"> Replace desiccant or component containing the desiccant. Replace desiccant filter if applicable. Flush refrigerant system. Refer to Flushing. Inspect the suction port of the replacement compressor for presence of a suction screen. Hybrid Polyolester Refrigerant Oil (POE) Contamination	<ul style="list-style-type: none">• Flush refrigerant system. Refer to Flushing .• Replace desiccant or component containing the desiccant.• Replace desiccant filter if applicable.

Noise Diagnosis - HVAC Module

Step	Action	Yes	No
DEFINITION: Noise originating from the HVAC module.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - HVAC Systems - Automatic
2	<ol style="list-style-type: none"> Start the engine. Cycle through all of the following: <ul style="list-style-type: none"> Blower motor speeds HVAC modes Temperature control settings Determine the type of noise: <ul style="list-style-type: none"> Scrape, pop Tick/click, chirp or groaning Air rush/whistle <p>Is a scrape or pop noise evident when selecting modes or temperature settings?</p>	Go to Step 6	Go to Step 3
3	Is a tick/click, chirping, groaning or scraping noise present, but decreases as blower motor speed is decreased?	Go to Step 6	Go to Step 4
4	Is an air rush/whistle noise evident in all modes but not all temperature settings?	Go to Step 6	Go to Step 5
5	Is an air rush/whistle noise evident only in defrost or floor mode?	Go to Step 6	Go to Step 6
6	<p>Remove the HVAC module. Refer to Air Conditioning and Heater Module Assembly Removal and Installation .</p> <p>Is the action complete?</p>	Go to Step 7	-
7	<ol style="list-style-type: none"> Inspect the air flow doors for proper operation. Inspect the ducts for obstructions or foreign materials. <p>Were any of these conditions found?</p>	Go to Step 10	Go to Step 8
8	<p>Inspect the mode and temperature doors and seals for warping or cracking.</p> <p>Are the doors in normal condition?</p>	Go to Step 11	Go to Step 9

9	Replace the appropriate door and/or seals. Is the repair complete?	Go to Step 11	-
10	Remove any obstructions or foreign material found. Is the action complete?	Go to Step 11	-
11	Install the HVAC Module. Refer to Air Conditioning and Heater Module Assembly Removal and Installation . Is the action complete?	Go to Step 12	-
12	Operate the system to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Odour Diagnosis

Step	Action	Yes	No
DEFINITION: Odour originating or noticed through the HVAC system.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - HVAC Systems - Automatic
2	<ol style="list-style-type: none"> 1. Sit inside the vehicle. 2. Close all of the doors and windows. 3. Start Turn ignition to on. 4. Select the maximum blower speed. 5. Select the PANEL air outlet mode. 6. Select the coldest temperature setting. 7. Cycle through all of the blower speeds, modes and temperatures to define what type of odour is present. <ul style="list-style-type: none"> • Musty smell • Coolant smell • Oil smell <p>Does the odour have a musty smell?</p>	Go to Step 3	Go to Step 8
3	<p>Inspect the HVAC filter and the air inlet grille for debris.</p> <p>Is debris present?</p>	Go to Step 4	Go to Step 5
4	<p>Remove any debris.</p> <p>Is the action complete?</p>	Go to Step 15	-
5	<p>Inspect for wet carpeting.</p> <p>Is the carpet wet?</p>	Go to Step 6	Go to Step 8
6	<p>Inspect for the following conditions:</p> <ol style="list-style-type: none"> 1. Water leaks around the windscreen 2. Blockage of the HVAC module drain 3. Leaks around the door seals 	Go to	

	Is a leak present?	Step 7	Go to Step 15
7	Repair the leak as necessary. Is the repair complete?	Go to Step 15	-
8	Does the odour have a coolant smell?	Go to Step 9	Go to Step 12
9	Inspect the cooling system for leaks. Refer to Loss of Coolant . Is a leak present?	Go to Step 10	Go to Step 12
10	Inspect for coolant leaking inside the vehicle or for a film build-up on the windscreen. Is the condition present?	Go to Step 11	Go to Step 15
11	Replace the heater core. Refer to Heater Core Replacement . Is the repair complete?	Go to Step 15	-
12	Does the odour have an oily smell?	Go to Step 13	Go to Step 15
13	1. Inspect the engine compartment for any leaks. Refer to the following procedures: <ul style="list-style-type: none"> • Oil Leak Diagnosis • Fluid Leak Diagnosis 2. Repair any oil leaks. Is the repair complete?	Go to Step 15	-
14	A musty odour can be caused by mould or mildew build-up on the evaporator or the heater core or inside of the HVAC module. Refer to Odour Correction . Is the action complete?	Go to Step 15	-
15	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Odour Correction

[Eliminating Air Conditioning Odour](#)

1. Odours may be emitted from the air conditioning system primarily at start up in hot, humid climates. The following conditions may cause the odour:
 - Debris is present in the HVAC module assembly.
 - Microbial growth on the evaporator core.
2. When the blower motor fan is turned on, the microbial growth may release an unpleasant musty odour into the passenger compartment. To remove odours of this type, the microbial growth must be addressed. Perform the following procedure:
 - Remove evaporator core. Refer to [Air Conditioning Evaporator Replacement](#) .
 - Clean evaporator core with a solution of 40% vinegar and 60% water.
 - Refit evaporator core. Refer to [Air Conditioning Evaporator Replacement](#) .

Refrigerant Recovery and Recharging - High Voltage Electric Compressor

Special Tools

- GE 43600 Hybrid A/C Oil Injector Adapter Hose
- GE-45037-A A/C Oil Injector
- GE-48800 CoolTech A/C Recharge Machine
- GE 48997 Hybrid A/C Oil Injector Adapter Hose

For equivalent regional tools, refer to [Special Tools](#) .

Danger: This A/C system's high voltage A/C Compressor uses Polyolester (POE) refrigerant oil. Use of any refrigerant oil other than POE may result in compressor failure and/or loss of high voltage isolation which may result in serious danger or death. For applicable equipment please refer to TIS Newsletter/repair equipment information.

Warning: To prevent personal injury, avoid breathing A/C Refrigerant and lubricant vapour or mist. Work in a well ventilated area. To remove refrigerant from the A/C System, use service equipment designed for recovery that is certified to meet the requirements of the appropriate SAE Standards. If an accidental system discharge occurs, ventilate the work area before continuing service. Additional health and safety information may be obtained from the refrigerant, refrigerant recovery, and lubricant manufacturers.

Warning: For personal protection, goggles and lint-free gloves should be worn and a clean lint free cloth wrapped around fittings, valves, and connections when doing work that includes opening the refrigerant system. If refrigerant comes in contact with any part of the body severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

Caution: This A/C refrigerant system is equipped with a High Voltage electric A/C compressor and you must replace the desiccant if the A/C refrigerant system has been open to atmosphere for more than thirty minutes, or if the A/C refrigerant oil has been contaminated. Failure to replace the desiccant will result in damage to the A/C refrigerant system.

Caution: R-134a is the only approved refrigerant for use in this vehicle. The use of any other refrigerant may result in poor system performance or component failure and potentially void the vehicle warranty for the refrigerant system.

Caution: Do not lubricate A/C line seal washers as mineral oil will damage the seal and cause leaks. Use only 525 viscosity mineral oil to lubricate o-rings as well as fitting threads for the prevention of fitting seizure.

Caution: Failure to flush the refrigerant recovery recharge equipment hoses before adding refrigerant to a hybrid vehicle with an electric compressor may result in an unacceptable amount of Polyalkylene Glycol (PAG) oil entering the refrigerant system. This could result in reduced electrical resistance of the Polyolester (POE) oil and reduce its ability to provide the required level of high voltage isolation.

Both the *GE 43600* Hybrid A/C Oil Injector Adapter Hose and *GE-48800* CoolTech A/C Recharge Machine are a complete air conditioning service centre for R-134a. The ACR 2000 recovers, recycles, evacuates and recharges A/C refrigerant quickly, accurately and automatically. The unit has a display screen that contains the function controls and displays prompts that will lead the technician through the recover, recycle, evacuate and recharge operations. R-134a is recovered into and charged out of an internal storage vessel. Both units automatically replenish this vessel from an external source tank in order to maintain a constant 5.45-6.82 kg (12-15 lbs) of A/C refrigerant.

The ACR 2000 has a built in A/C refrigerant identifier that will test for contamination, prior to recovery and will notify the technician if there are foreign gases present in the A/C system. If foreign gases are present, the ACR 2000 will not recover the refrigerant from the A/C system.

The ACR 2000 also features automatic air purge, single pass recycling and an automatic oil drain.

GE-48800 CoolTech A/C Recharge Machine is released as a required replacement for the previously essential *GE 43600* Hybrid A/C Oil Injector Adapter Hose . The *GE-48800* CoolTech A/C Recharge Machine is SAE J2788 compliant and meets GM requirements for A/C Refrigerant System Repairs on all General Motors vehicles, including Hybrid systems with Polyolester (POE) refrigerant oil.

Refer to the *GE 43600* Hybrid A/C Oil Injector Adapter Hose and *GE-48800* CoolTech A/C Recharge Machine ACR 2000 manual for operation and setup instruction. Always recharge the A/C System with the correct amount of R-134a. Refer to [Refrigerant System Specifications](#) for the correct amount.

[A/C Refrigerant System Oil Charge Replenishing](#)

If oil was removed from the A/C system during the recovery process or due to component replacement, the oil must be replenished. If no oil was removed from the A/C system during recovery, do not charge any POE oil into the A/C system. POE refrigerant oil can be injected into a charged A/C system using *GE-45037-A* injector along with *GE 48997* adapter . For the proper quantities of oil to add to the A/C refrigerant system, refer to [Refrigerant System Specifications](#) .

Flushing

Special Tools

- GE-42220 Universal 12V Leak Detection Lamp
- GE-48800 CoolTech A/C Recharge Machine
- GE-45268 Flush Adaptor Kit

For equivalent regional tools. Refer to [Special Tools](#) .

[ACR2000 \(GE-48800\) Hose Flush Procedure](#)

Note:

- The following hose flushing procedure must be performed every time the ACR2000 (GE-48800) is used on the hybrid vehicles. It must be completed before the ACR2000 (GE-48800) is connected to the vehicle to begin a diagnostic or service procedure.
- The high voltage (HV) electric air conditioning (A/C) compressor uses a polyolester (POE) refrigerant oil instead of a polyalkylene glycol (PAG) synthetic refrigerant oil. This is due to the better electrical resistance of the POE oil and its ability to provide HV isolation.
- The following hose flush procedure is required to prevent oil cross-contamination. Laboratory testing has shown that flushing the ACR2000 (GE-48800) using the following procedure will minimise oil cross-contamination to a negligible amount (<500ppm).
- Failure to flush the ACR2000 (GE-48800) hoses before adding refrigerant to a hybrid vehicle with an electric A/C compressor may result in an unacceptable amount of PAG oil entering the refrigerant system. It may also cause a battery energy control module hybrid battery voltage system isolation lost diagnostic trouble code (DTC P1AE7) to be set. Additionally the A/C system warranty will be voided.
- The ACR2000 (GE-48800) will need to be retrofitted with a GE-48800-50 (Hose-ACR2000 Oil Flush Loop) to be able to perform the following procedure. All hybrid dealers will receive a GE-48800-50, with installation instructions, which is a component of the hybrid essential tool package. Dealers not included in the hybrid marketing plan and needing to service a hybrid vehicle can obtain the GE-48800-50 from SPX Kent Moore, 1-800-GM-TOOLS (1-800-468-6657).
 - The GE-48800-50 Retrofit Kit replaces the existing hose mount fittings on the ACR2000. Installation instructions are included to properly update the ACR2000 for hybrid vehicle A/C service.
 - New hybrid compliant A/C refrigerant recharging equipment (GE-48800) will replace current ACR2000 equipment. GE-48800 meets new SAE refrigerant recovery standard J-2788 and is specially designed for GM hybrid vehicle A/C service.

Before Beginning the Hose Flushing Procedure

1. Always allow the ACR2000 to complete the hose flush cycle to assure that all oil and refrigerant is removed from the hoses and the ACR2000 flow control circuit.

2. Assure the ACR2000 has at least 4.08 kg (9 lb) of chargeable refrigerant before proceeding.
3. A Low Filter Flow message displayed during the hose flushing process indicates that the hose couplers are not connected or open.

Hose Flushing Procedure

1. Connect the ACR2000 service hose couplers to the GE-48800-50 hose flush adapter fittings and open the service hose coupler valves.
2. Power on the ACR2000.
3. If there is positive pressure in the ACR2000 service hoses, press START to recover the service hoses. If there is 88-98 kPa (26-29 Hg) of vacuum showing on the display screen, skip to step 7.
4. Press Vacuum.
5. Press Start. Allow the vacuum programme to run until the display screen shows between 88-98 kPa (26-29 Hg).
6. Press Pause.
7. Press Main Menu.
8. Press Scroll Menu.
9. Press Oil Flush.
10. Press Next.
11. Enter 03:00 (for a three minute flush) and press Start.
12. The ACR2000 will now flush the service hoses for three minutes and then recover the refrigerant
13. Close the ACR2000 service hose couplers and remove the GE-48800-50 hose flush adapter.
14. The ACR2000 can now be connected to the hybrid vehicle to perform the A/C system diagnostic or service procedures.

Note: Flushing with the ACR 2000 is not intended to remove metal from the A/C system.

Flushing is intended to remove the following contaminants:

- Contaminated polyolester (POE) oil
- Desiccant, following a desiccant bag failure
- Overcharge of POE oil
- Refrigerant contamination

Note: Warmer engine or ambient temperature decreases the refrigerant recovery time during the A/C flush procedure.

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging : [High Voltage Electric Compressor](#) .
2. Remove the air conditioning refrigerant desiccant. Refer to [Air Conditioning Refrigerant Desiccant Replacement](#) .
3. Remove the air conditioning refrigerant desiccant plug from the desiccant cartridge.
4. Install the air conditioning refrigerant desiccant plug without the desiccant cartridge.
5. Remove the evaporator thermal expansion valve. Refer to Air Conditioning Evaporator Thermal Expansion Valve Replacement : [Drive Motor Battery Coolant Cooler](#) → [A/C Evaporator](#)
6. Install GE-45268-115 to the evaporator.
7. Remove the drive motor battery cooler thermal expansion valve. Refer to Air Conditioning Evaporator Thermal Expansion Valve Replacement : [Drive Motor Battery Coolant Cooler](#) → [A/C Evaporator](#)

8. Install another GE-45268-115 to the drive motor battery cooler.
9. Install A/C evaporator tube to both GE-45268-115.
10. Install A/C evaporator TXV tube to both GE-45268-115 using an oversized seal washer.
11. Remove the A/C and drive motor battery cooling compressor. Refer to [Air Conditioning and Drive Motor Battery Cooling Compressor Replacement](#)
12. Inspect the end of the suction hose for a suction screen.
13. Remove the suction screen, if installed.
14. Install GE-45268-4 to the A/C compressor suction hose.
15. Install GE-452688-5 to the A/C compressor discharge hose.

16. Forward flow refrigerant flushing is recommended for contaminated refrigerant or POE oil.
17. Perform the following procedure:

Note: The filter inside the GE-45268-1 is serviceable. Remove and discard the check valve from the filter.

17.1. Service the filter with ACDelco P/N GF 470 before each flush.

Connect the GE-45268-1 flush filter to the suction port of the GE-45268-4 flush adapter.

17.2. Connect the blue hose from the *GE-48800* ACR 2000 Air Conditioning Service Centre to the J 45268-1 flush filter adapter.

17.3. Connect the red hose from the *GE-48800* ACR 2000 Air Conditioning Service Centre to the GE-45268-5 flush adapter.

18. Reverse flow refrigerant flushing is recommended for desiccant cartridge failure.

Note: The filter inside the J 45268-1 is serviceable. Remove and discard the check valve from the filter.

18.1. Service the filter with AC P/N GF 470, before each flush. Connect the J 45268-1 flush filter to the discharge port of the GE-45268-5 flush adapter.

18.2. Connect the blue hose from the *GE-48800* ACR 2000 Air Conditioning Service Centre to the J 45268-1 flush filter adapter.

18.3. Connect the red hose from the *GE-48800* ACR 2000 Air Conditioning Service Centre to the suction port of the GE-45268-4 flush adapter.

Note: Close the valve on the external refrigerant tank, before starting the flush process.

19. Flush the front A/C system. Follow the instructions supplied with the *GE-48800* ACR 2000 Air Conditioning Service Centre .

Note: Close the valve on the external refrigerant tank, before starting the flush process.

20. Flush the A/C system. Follow the instructions supplied with the *GE-48800* ACR 2000 Air Conditioning Service Centre
21. Remove the GE-45268-4 from the A/C compressor suction hose.
22. Remove the GE-45268-5 from the A/C compressor discharge hose.

Note: Flushing will remove all the POE oil from the A/C system.

The A/C system must be replenished with the correct amount of POE oil.

23. If the removed A/C compressor is being reinstalled, perform the following procedure:
 - Drain the POE oil from the A/C compressor.
 - Add the total system capacity of POE oil to the A/C compressor. Refer to [Refrigerant System Specifications](#) .
24. If you will replace the A/C compressor after flushing the system, perform the following procedure:
 - 24.1. Refer to the [Refrigerant System Specifications](#) .
 - 24.2. DO NOT drain the new POE oil from the compressor.
 - 24.3. Deduct the amount of POE oil shipped with the service compressor from the amount of POE oil listed in the capacities table. Refer to [Refrigerant System Specifications](#) .
 - 24.4. Add the calculated amount to the compressor, as needed.
25. Install the air conditioning and drive motor battery cooling compressor. Refer to [Air Conditioning and Drive Motor Battery Cooling Compressor Replacement](#)

Note: Flushing will remove the fluorescent leak detection dye from the A/C system.

26. Replace the air conditioning refrigerant desiccant. Refer to [Air Conditioning Refrigerant Desiccant Replacement](#) .

Note: The air conditioning refrigerant desiccant is manufactured with POE fluorescent leak detection dye wafer inside.

27. Remove A/C evaporator TXV tube from both GE-45268-115.
28. Remove A/C evaporator tube from both GE-45268-115.
29. Remove both GE-45268-115.
30. Install the drive motor battery cooler thermal expansion valve. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Replacement](#) : [Drive Motor Battery Coolant Cooler](#) → [A/C Evaporator](#)
31. Install the evaporator thermal expansion valve. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Replacement](#) : [Drive Motor Battery Coolant Cooler](#) → [A/C Evaporator](#)
32. Evacuate and recharge the A/C system. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#)
33. Leak test the fittings using *GE-42220* Universal 12V Leak Detection Lamp

Air Conditioning and Drive Motor Battery Cooling Compressor Replacement

Callout

Component Name

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: This A/C system's high voltage A/C Compressor uses Polyolester (POE) refrigerant oil. Use of any refrigerant oil other than POE may result in compressor failure and/or loss of high voltage isolation which may result in serious danger or death. For applicable equipment please refer to TIS Newsletter/repair equipment information.

Preliminary Procedure

1. Disable hybrid high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Recover the refrigerant. Refer to [Refrigerant Recovery and Recharging : High Voltage Electric Compressor](#) .
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
4. Remove the air conditioning compressor and evaporator hose from air conditioning compressor front. Refer to [Air Conditioning Compressor and Evaporator Hose Replacement](#) .
5. Remove the exhaust manifold with catalytic converter. Refer to [Exhaust Manifold with Catalytic Converter Replacement](#) .
6. Remove the air conditioning compressor front hose. Refer to [Air Conditioning Compressor Front Hose Replacement](#) .
7. Disconnect the electrical connectors from the air conditioning and drive motor cooling compressor. Refer to [High Voltage Connectors](#) .

1	Air Conditioning and Drive Motor Cooling Compressor Nut Caution: Refer to Fastener Caution in the Preface section. Tighten 22 N·m (16 lb ft)
2	Air Conditioning and Drive Motor Cooling Compressor Stud Tighten 10 N·m (89 lb in)
3	Air Conditioning and Drive Motor Cooling Compressor Bolts (Qty: 2) Tighten 22 N·m (16 lb ft)
4	Air Conditioning and Drive Motor Cooling Compressor Procedure <ol style="list-style-type: none"> 1. Remove the air conditioning compressor and condenser hose from the air conditioning and drive motor cooling compressor. Refer to Air Conditioning Compressor and Condenser Hose Replacement . 2. A/C compressor oil balancing is not required. The service A/C compressor contains enough oil; however, add any oil that was removed during the A/C system

recovery process. Refer to Refrigerant Recovery and Recharging : [High Voltage Electric Compressor](#) .

3. Reprogramme the A/C compressor. Refer to [Air Conditioning Compressor Control Module Programming and Setup](#) .

Air Conditioning Compressor and Evaporator Hose Replacement

[Removal Procedure](#)

1. Recover the refrigerant. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#)
2. Remove the throttle body. Refer to [Throttle Body Assembly Replacement](#) .
3. Remove wire retainers from air conditioning compressor and evaporator hose.
4. Disconnect the EVAP purge solenoid hose from the purge solenoid and reposition. Refer to [Plastic Collar Quick Connect Fitting Service](#) .

5. Remove the air conditioning compressor and evaporator hose nut (1) at air conditioning compressor front hose.
6. Remove the air conditioning compressor and evaporator hose (2) from air conditioning compressor front hose.

7. Remove the air conditioning compressor and evaporator hose nut (1) at the air conditioning evaporator.
8. Remove the air conditioning compressor and evaporator hose nut (2) at the drive motor battery coolant cooler
9. Remove the air conditioning compressor and evaporator hose (3) from the vehicle.

[Installation Procedure](#)

1. Install the air conditioning compressor and evaporator hose (3) to the vehicle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the air conditioning compressor and evaporator hose nut (2) at the drive motor battery coolant cooler and tighten to **17 N·m (13 lb ft)**

3. Install the air conditioning compressor and evaporator hose nut (1) at the air conditioning evaporator and tighten to **17 N·m (13 lb ft)**.

4. Install the air conditioning compressor and evaporator hose (2) to air conditioning compressor front hose.
5. Install the air conditioning compressor and evaporator hose nut (1) at air conditioning compressor front hose and tighten to **22 N·m (16 lb ft)**.
6. Connect the EVAP purge solenoid hose from the purge solenoid. Refer to [Plastic Collar Quick Connect Fitting Service](#) .
7. Install wire retainers from air conditioning compressor and evaporator hose.
8. Install the throttle body. Refer to [Throttle Body Assembly Replacement](#) .
9. Evacuate and charge the refrigerant system. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#) .

Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement

[Removal Procedure](#)

1. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
2. Recover the refrigerant. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#) .
3. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .
4. Remove the coolant recovery reservoir. Refer to [Coolant Recovery Reservoir Replacement](#) .
5. Remove the right headlamp. Refer to [Headlamp Replacement](#) : [Volt](#) → [Ampera](#) .
6. Disconnect electrical connectors and wire retainers from air conditioning evaporator thermal expansion valve tube.

7. Remove the air conditioning evaporator thermal expansion valve tube nut (1) at air conditioning evaporator.
8. Remove the air conditioning evaporator thermal expansion valve tube nut (2) at the drive motor battery coolant cooler.
9. Remove the air conditioning evaporator thermal expansion valve tube (3) from the air conditioning evaporator and the drive motor battery coolant cooler.

10. Remove the air conditioning evaporator thermal expansion valve tube clip (1) from the stud.
11. Remove the air conditioning evaporator thermal expansion valve tube retainer (2) from the body.
12. Remove the air conditioning evaporator thermal expansion valve tube (3).

13. Remove the air conditioning evaporator thermal expansion valve tube nut (1) at the air conditioning condenser.
14. Remove the air conditioning evaporator thermal expansion valve tube (2) from the air conditioning condenser.
15. Remove the air conditioning evaporator thermal expansion valve tube from the vehicle.

[Installation Procedure](#)

1. Install the air conditioning evaporator thermal expansion valve tube to the vehicle.
2. Install the air conditioning evaporator thermal expansion valve tube (2) from the air conditioning condenser.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the air conditioning evaporator thermal expansion valve tube nut (1) at the air conditioning condenser and tighten to **17 N·m (13 lb ft)**.

4. Install the air conditioning evaporator thermal expansion valve tube (3).
5. Install the air conditioning evaporator thermal expansion valve tube retainer (2) from the body.
6. Install the air conditioning evaporator thermal expansion valve tube clip (1) from the stud.

7. Install the air conditioning evaporator thermal expansion valve tube (3) from the air conditioning evaporator and the drive motor battery coolant cooler.
8. Install the air conditioning evaporator thermal expansion valve tube nut (2) at the drive motor battery coolant cooler and tighten to **17 N·m (13 lb ft)**.
9. Install the air conditioning evaporator thermal expansion valve tube nut (1) at air conditioning evaporator and tighten to **17 N·m (13 lb ft)**.
10. Connect electrical connectors and wire retainers from air conditioning evaporator thermal expansion valve tube.
11. Install the right headlamp. Refer to [Headlamp Replacement](#) : [Volt](#) → [Ampera](#) .
12. Install the coolant recovery reservoir. Refer to [Coolant Recovery Reservoir Replacement](#) .
13. Install the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .
14. Evacuate and charge the refrigerant system. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#) .
15. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Air Conditioning Refrigerant Service Valve Core Replacement

Special Tools

- *GE-39400-A* Halogen Leak Detector
- *GE-46246* Valve Core Removal Tool

For equivalent regional tools, Refer to [Special Tools](#)

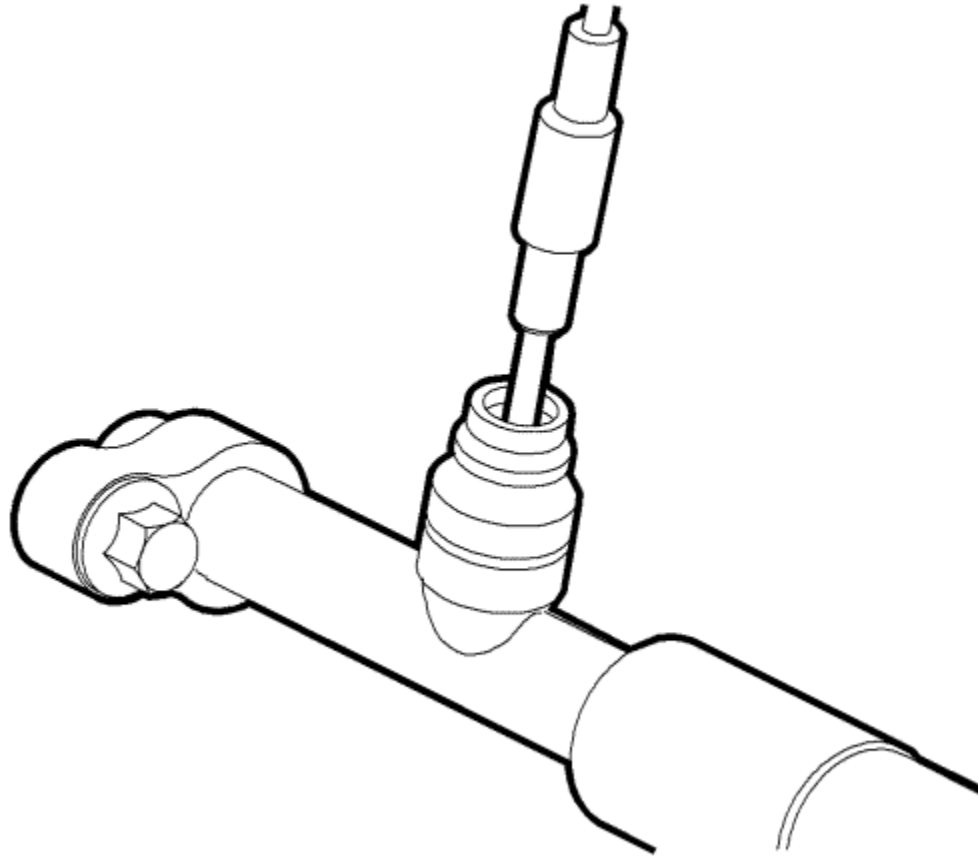

[Removal Procedure](#)

1. Recover the refrigerant. Refer to [Refrigerant Recovery and Recharging](#) : [High Voltage Electric Compressor](#) .

2. Use *GE-46246* Valve Core Removal Tool or equivalent to remove the valve core.

[Installation Procedure](#)

1. Use *GE-46246* Valve Core Removal Tool or equivalent to install and tighten the valve core.
2. Evacuate and charge the A/C system. Refer to Refrigerant Recovery and Recharging : [High Voltage Electric Compressor](#) .

Note: To prevent loss of refrigerant charge, tighten the cap. Replace the cap if the seal is missing or damaged.

3. Test the affected A/C fittings for leaks using *GE-39400-A* Halogen Leak Detector .

Air Conditioning Refrigerant Desiccant Replacement

Special Tools

GE-39400-A Halogen Leak Detector

For equivalent regional tools, Refer to [Special Tools](#)

Removal Procedure

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging : [High Voltage Electric Compressor](#) .
2. Remove the front wheelhouse front liner on the driver side. Refer to [Front Wheelhouse Front Liner Replacement](#)

3. Remove the air conditioning receiver and dehydrator Plug (1)

Note: Cap all A/C components immediately to prevent system contamination.

4. Remove and discard the sealing washers (2).

5. Remove the receiver and dehydrator (3) from the condenser.

[Installation Procedure](#)

1. Install the receiver and dehydrator (3) in the condenser.
2. Install new sealing washers (2).
3. Install the air conditioning receiver and dehydrator Plug (1)
4. Install the front wheelhouse front liner on the driver side. Refer to [Front Wheelhouse Front Liner Replacement](#)
5. Evacuate and charge the refrigerant system. Refer to [Refrigerant Recovery and Recharging : High Voltage Electric Compressor](#) .
6. Leak test the fittings using the *GE-39400-A* Halogen Leak Detector

Refer to Cooling System Draining and Filling .3. Remove the instrument panel tie bar. Refer to Instrument Panel Tie Bar Replacement .	

4. Disconnect the HVAC module electrical connectors.
5. Remove the air conditioning evaporator thermal expansion valve tube. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement](#) .
6. Remove the heater water shutoff valve actuator inlet. Refer to [Heater Water Shutoff Valve Actuator Inlet Hose Replacement](#) .
7. Remove the heater inlet hose. Refer to [Heater Inlet Hose Replacement](#) .

1	HVAC Module Assembly Fastener (Qty: 1) Caution: Refer to Fastener Caution in the Preface section. Tighten 10 N·m (89 lb in)
2	Heater and Air Conditioning Evaporator and Blower Module

Air Conditioning Evaporator Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the heater and air conditioning evaporator and blower module. Refer to Air Conditioning and Heater Module Assembly Removal and Installation .	
2. Remove the heater core. Refer to Heater Core Replacement .	
3. Disconnect the heater and air conditioning evaporator and blower module assembly electrical connectors.	

1	A/C Evaporator Fastener (Qty: 8) Caution: Refer to Fastener Caution in the Preface section.
2	Heater and Air Conditioning Evaporator and Blower Module Lower Case
3	Air Conditioning Evaporator Core

Air Conditioning Evaporator and Blower Module Drain Hose Replacement

Callout	Component Name
Preliminary Procedure	
Remove Front Floor Console Extension Cover. Refer to Front Floor Console Extension Replacement - Right Side	
Air Conditioning Evaporator and Blower Module Drain Hose	

1

Procedure

1. Loosen the carpet in the range of the front floor console.
2. Release and pull off the drain hose from the HVAC module assembly and unsnap the drain fitting grommet from the front floor panel.

Heater Inlet Hose Replacement

Callout	Component Name
<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p> <p>The High Voltage Disabling procedure will perform the following tasks:</p> <ul style="list-style-type: none">Identify how to disable high voltage.	

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedure

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Drain the coolant. Refer to [Cooling System Draining and Filling](#) .
3. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
4. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .
5. Unclip from heater water auxiliary pump inlet hose.

1	<p>Heater Inlet Hose Clamp</p> <p>Procedure</p> <p>Reposition the heater inlet hose clamp using <i>BO-38185</i> pliers</p> <p>Special Tools</p> <p><i>BO-38185</i> Hose Clamp Pliers</p> <p>For equivalent regional tools, refer to Special Tools .</p>
2	Heater Inlet Hose Quick Connect Fitting
3	<p>Heater Inlet Hose</p> <p>Note: Replace corroded hose clamps and brackets.</p>

Heater Inlet And Outlet Pipe Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .
2. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Note: Replace corroded hose clamps and brackets.

3. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) .
4. Remove the front wheelhouse front liner on passenger side. Refer to [Front Wheelhouse Front Liner Replacement](#) .

5. Remove the heater inlet and outlet pipe clamps (1) at heater water auxiliary pump using *BO-38185* pliers .
6. Remove the heater inlet and outlet pipe (2) from the heater water auxiliary pump.

7. Remove the heater inlet and outlet pipe clamps (1) at the heater water auxiliary pump inlet hose and the heater outlet hose using *BO-38185* pliers .
8. Remove the heater inlet and outlet pipe bolts (2) from the cradle.
9. Remove the heater inlet and outlet pipe (3) from the vehicle.

[Installation Procedure](#)

1. Install the heater inlet and outlet pipe (3) to the vehicle.

Caution: Refer to [Fastener Caution](#) in the Preface section.

2. Install the heater inlet and outlet pipe bolts (2) to the cradle and torque to **17 N·m (13 lb ft)**.

3. Install the heater inlet and outlet pipe clamps (1) at the heater water auxiliary pump inlet hose and the heater outlet hose using *BO-38185* pliers .

4. Install the heater inlet and outlet pipe (2) to the heater water auxiliary pump.
5. Install the heater inlet and outlet pipe clamps (1) at the heater water auxiliary pump using *BO-38185* pliers .
6. Install the front wheelhouse front liner on passenger side. Refer to [Front Wheelhouse Front Liner Replacement](#) .
7. Fill the cooling system. Refer to [Cooling System Draining and Filling](#) .
8. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .
9. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

Heater Outlet Hose Replacement

Callout	Component Name
<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p> <p>The High Voltage Disabling procedure will perform the following tasks:</p> <ul style="list-style-type: none">Identify how to disable high voltage.	

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Preliminary Procedure

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Drain the coolant. Refer to [Cooling System Draining and Filling](#) .
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

1	<p>Heater Outlet Hose Clamps (Qty: 2)</p> <p>Procedure</p> <p>Reposition the heater outlet hose clamps using <i>BO-38185</i> pliers</p> <p>Special Tools</p> <p><i>BO-38185</i> Hose Clamp Pliers</p> <p>For equivalent regional tools, refer to Special Tools .</p>
2	<p>Heater Outlet Hose</p> <p>Note: Replace corroded hose clamps and brackets.</p>

Heater Core Outlet Tube Replacement

Callout	Component Name
---------	----------------

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedures

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Remove the air conditioning and heater module assembly. Refer to [Air Conditioning and Heater Module Assembly Removal and Installation](#) .

1	Bracket Heater Core Outlet Tube Bolt Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (23 lb in)
2	Heater Core Outlet Tube Brace
3	Heater Core Outlet Tube Clamp
4	Heater Core Outlet Tube

Heater Core Inlet Tube Replacement

Callout	Component Name
<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p>

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedures

1. Disable high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Remove the heater water shutoff valve actuator inlet hose. Refer to [Heater Water Shutoff Valve Actuator Inlet Hose Replacement](#) .

1	<p>Heater Inlet Pipe Adapter Hose Clamps</p> <p>Procedure</p> <p>Reposition the heater inlet pipe adapter hose clamps using <i>BO-38185</i> pliers.</p> <p>Special Tools</p> <p><i>BO-38185</i> Hose Clamp Pliers</p> <p>For equivalent regional tools, refer to Special Tools .</p>
2	<p>Heater Inlet Pipe Adapter</p> <p>Note: Replace corroded hose clamps and brackets.</p>

Air Inlet Valve Actuator Gear Replacement

Callout	Component Name
Preliminary Procedures	
Remove the air inlet assembly. Air Inlet Assembly Replacement	
	Air Inlet Valve Actuator Gear Screw (Qty: 3)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 1.5 N·m (13 lb in)</p>
2	<p>Air Inlet Valve Actuator Gear</p> <p>Procedure</p> <p>Disconnect the air inlet valve actuator gear electrical connector.</p> <p>Tip Actuator is self-calibrating when connecting the battery.</p>

Passenger Compartment Air Filter Replacement

[Removal Procedure](#)

1. Open the instrument panel lower compartment and remove rubber mat. Refer to [Instrument Panel Lower Compartment Replacement](#)

2. Remove the instrument panel lower compartment filter access door.

3. Unclip 2 clips (1) and remove passenger compartment air filter (2).

[Installation Procedure](#)

1. Install passenger compartment air filter (2) and clip in 2 clips (1).

2. Install the instrument panel lower compartment filter access door.
3. Install instrument panel compartment. Refer to [Instrument Panel Lower Compartment Replacement](#) .

Air Inlet Replacement

Callout	Component Name
Preliminary Procedures	
Remove the heater and air conditioning evaporator and blower module. Refer to Air Conditioning and Heater Module Assembly Removal and Installation .	
	Air Inlet Fastener (Qty: 2)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (23 lb in)
2	Air Inlet

Air Inlet Assembly Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the heater and air conditioning evaporator and blower module. Refer to Air Conditioning and Heater Module Assembly Removal and Installation .2. Remove the air inlet valve actuator gear. Refer to Air Inlet Valve Actuator Gear Replacement .3. Remove the air inlet valve and inside air valve control cam. Refer to Air Inlet Valve and Inside Air Valve Control Cam Replacement .	

1	Air Inlet Housing Fastener (Qty: 4) Caution: Refer to Fastener Caution in the Preface section. Tighten 2.5 N·m (23 lb in)
2	Air Inlet Housing

Blower Motor Control Module Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the I/P Lower Trim Panel Insulator Refer to Instrument Panel Lower Trim Panel Insulator Replacement .2. Remove the right side floor front air outlet duct. Refer to Floor Front Air Outlet Duct Replacement - Right Side3. Reposition any wiring or hoses to gain access to blower motor control.	

1	<p>Blower Motor Control Module Screw (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 2 N·m (17 lb in)</p>
2	<p>Blower Motor Control Module</p> <p>Procedure</p> <p>Disconnect the wiring connector.</p>

Air Inlet Valve and Inside Air Valve Control Cam Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air inlet valve actuator gear. Refer to Air Inlet Valve Actuator Gear Replacement	
	Air Inlet Valve and Inside Air Valve Control Cam

1

Procedure

Release the centre tab and pull off the control cam.

Tip

The air inlet valve and inside air valve control cam can only be fitted in one position.

Air Inlet Valve Lever Replacement

Callout	Component Name
Preliminary Procedure	
Remove the inlet valve and inside air valve control cam gear. Refer to Air Inlet Valve and Inside Air Valve Control Cam Replacement .	
	Mode Valve Lever

Procedure

1

1. Move the inlet valve to the middle position and mark the position of the inlet valve lever notch to the mode valve gear.
2. Remove the inlet valve lever.

Tip

Use the indentation for the correct positioning of the lever arms.

Blower Motor Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the instrument panel lower trim panel insulator - right side. Refer to Instrument Panel Lower Trim Panel Insulator Replacement .2. Remove the floor air outlet duct. Refer to Floor Front Air Outlet Duct Replacement - Right Side .3. Disconnect the blower motor electrical connector.	

1	Blower Motor Fastener (Qty: 3) Caution: Refer to Fastener Caution in the Preface section.
2	Blower Motor

Air Distributor Case Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the HVAC module. Refer to Air Conditioning and Heater Module Assembly Removal and Installation .2. Reposition any wiring harnesses before removal.	

1	<p>Air Distribution Case Screw Qty: (7)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 3 N·m (27 lb in)</p>
2	<p>Air Distribution Case</p> <p>Procedure</p> <ol style="list-style-type: none">1. Prior to removing the air distribution case, note the routing of the wiring to ensure proper reinstallation.2. Disconnect all electrical connections.3. When replacing the air distribution case, transfer all necessary components.

Instrument Panel Outer Air Outlet Replacement - Left Side

Callout	Component Name
1	<p data-bbox="290 1377 916 1414">Instrument Panel Outer Air Outlet Assembly</p> <p data-bbox="290 1458 473 1495">Procedures</p> <ol data-bbox="330 1539 1884 1576" style="list-style-type: none">1. Use a flat bladed plastic trim tool to aid in the removal of the air outlet from the instrument panel assembly.

2. Disconnect the electrical connections.
3. When replacing the air outlet assembly, transfer all necessary parts.

Instrument Panel Centre Air Outlet Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the instrument panel upper trim pad retainer assembly. Refer to Upper Trim Pad Retainer Replacement .2. Remove the instrument panel centre air outlet duct. Refer to Instrument Panel Centre Air Outlet Duct Replacement .	

1	Instrument Panel Centre Air Outlet Fasteners (Qty: 6) (3 per outlet) Caution: Refer to Fastener Caution in the Preface section.
2	Instrument Panel Centre Air Outlet Assemblies (Right or Left)

Instrument Panel Outer Air Outlet Replacement - Right Side

Callout	Component Name
1	<p data-bbox="301 1378 927 1414">Instrument Panel Outer Air Outlet Assembly</p> <p data-bbox="301 1458 465 1494">Procedure</p> <p data-bbox="301 1537 1811 1573">Use a flat bladed plastic trim tool to aid in the removal of the air outlet from the instrument panel assembly.</p>

Floor Front Air Outlet Duct Replacement - Right Side

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel lower compartment. Refer to Instrument Panel Lower Compartment Replacement .	
1	Floor Front Air Outlet Duct Fastener
2	Floor Front Air Outlet Duct - Right Hand Side

Floor Front Air Outlet Duct Replacement - Left Side

Callout	Component Name
1	Floor Front Air Outlet Duct Fastener
2	Floor Front Air Outlet Duct - Left Side

Instrument Panel Centre Air Outlet Duct Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the Upper Trim Pad Retainer Replacement. Refer to Upper Trim Pad Retainer Replacement
	Instrument Panel Centre Air Outlet Duct Fasteners (Qty: 6)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 1.5 N·m (13 lb in)
2	Instrument Panel Centre Air Outlet Duct

Windscreen Defroster Nozzle Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel centre air outlet duct. Refer to Instrument Panel Centre Air Outlet Duct Replacement .	
1	Windscreen Defroster Nozzle Duct Fasteners (Qty: 2)

Caution: Refer to [Fastener Caution](#) in the Preface section.

2

Windscreen Defroster Nozzle Duct

Side Window Defogger Outlet Duct Replacement - Left Side

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the instrument panel centre air outlet duct. Refer to Instrument Panel Centre Air Outlet Duct Replacement .</p>	
	<p>Side Window Defogger Outlet Duct - Left Fasteners</p>

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 1.5 N·m (13 lb in)
2	Side Window Defogger Outlet Duct - Left

Side Window Defogger Outlet Duct Replacement - Right Side

Callout	Component Name
Preliminary Procedure	Remove the instrument panel upper trim pad assembly. Refer to Upper Trim Pad Retainer Replacement .
	Side Window Defogger Outlet Duct Fastener (Qty: 2)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 1.5 N·m (13 lb in)
2	Side Window Defogger Outlet Duct - Right Side

Heater and Air Conditioning Remote Control Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"><li data-bbox="123 1458 2593 1495">1. Prepare the heater and air conditioning remote control for replacement. Refer to Control Module References .<li data-bbox="123 1495 2593 1533">2. Remove Radio Control Assembly. Refer to Radio Control Assembly Replacement .	

Heater and Air Condition Remote Control

1

Procedure

1. Disconnect the heater and air conditioning control harness connector.
2. Programme the heater and air conditioning remote control. Refer to [Control Module References](#) .

Mode Control Cam Actuator Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"><li data-bbox="163 1463 755 1495">1. Disconnect the negative battery cable..<li data-bbox="163 1500 1381 1533">2. Remove the brake pedal assembly. Refer to Brake Pedal Assembly Replacement .	

1	<p>Mode Actuator Screw (Qty: 3)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Procedure</p> <p>Disconnect the mode actuator electrical connector.</p> <p>Tighten 1.5 N·m (13 lb in)</p>
2	<p>Mode Actuator</p> <p>Tip Actuator is self-calibrating when connecting the battery. Refer to Actuator Recalibration</p>

Mode Valve Lever Replacement

Callout	Component Name
Preliminary Procedure	Remove the mode control cam. Refer to Mode Control Cam Actuator Replacement .
	Mode Valve Lever

Procedure

1

1. Move the valve to the middle position and mark the position of the mode valve lever notch to the mode valve gear.
2. Remove the mode valve lever.

Tip

Use the indentation for the correct positioning of the lever arms.

Heater Coolant Heater Heat Shield Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front wheelhouse front liner on the passenger side. Refer to Front Wheelhouse Front Liner Replacement	
1	Heater Coolant Heater Heat Shield Retainers (Qty: 2).
2	Heater Coolant Heater Heat Shield

Heater Core Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Remove the Front Floor Console Extension Replacement - left side. Refer to Front Floor Console Extension Replacement - Left Side .2. Remove the heater inlet hose from the heater core tube. Refer to Heater Inlet Hose Replacement .3. Remove the Heater Water Shutoff Valve Inlet Hose. Refer to Heater Water Shutoff Valve Inlet Hose Replacement .	

4. Remove the heater inlet tube. Refer to [Heater Core Inlet Tube Replacement](#)
5. Remove the heater outlet tube. Refer to [Heater Core Outlet Tube Replacement](#)

1	Heater Core Bracket Fastener Caution: Refer to Fastener Caution in the Preface section. Tighten 1.4 N·m (12.4 lb in)
2	Heater Core Bracket (Qty: 2)
3	Heater Core Procedure Pull out the heater core.

Heater Coolant Heater Air Supply Hose Replacement

Callout	Component Name
<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p> <p>The High Voltage Disabling procedure will perform the following tasks:</p> <ul style="list-style-type: none">Identify how to disable high voltage.	

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedures

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Drain the coolant. Refer to [Cooling System Draining and Filling](#) .
3. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#) .

1	<p>Heater Coolant Heater Air Supply Hose Clamps (Qty 2)</p> <p>Procedure</p> <p>Reposition the heater coolant heater air supply hose clamps using <i>BO-38185</i> pliers</p> <p>Special Tools</p> <p><i>BO-38185</i> Hose Clamp Pliers</p> <p>For equivalent regional tools, refer to Special Tools</p>
2	<p>Heater Coolant Heater Air Supply Hose</p> <p>Note: Replace corroded hose clamps and brackets.</p>

Heater Coolant Heater Replacement

Callout	Component Name
<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p> <p>The High Voltage Disabling procedure will perform the following tasks:</p> <ul style="list-style-type: none">Identify how to disable high voltage.	

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedure

1. Disable hybrid high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Remove the intake manifold. Refer to [Intake Manifold Replacement](#) .
3. Remove the heater outlet hose. Refer to [Heater Outlet Hose Replacement](#) .
4. Remove the heater inlet hose. Refer to [Heater Inlet Hose Replacement](#) .
5. Disconnect the electrical connectors from the heater coolant cooler. Refer to [High Voltage Connectors](#) .

1	Heater Coolant Heater Nuts (Qty: 5) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Heater Coolant Heater Note: Replace corroded hose clamps and brackets.

Heater Water Auxiliary Pump Replacement

Callout	Component Name
<p>Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.</p> <p>The High Voltage Disabling procedure will perform the following tasks:</p> <ul style="list-style-type: none">Identify how to disable high voltage.	

-
- Identify how to test for the presence of high voltage.

Preliminary Procedures

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) and [High Voltage Enabling](#) .
2. Drain the coolant. Refer to [Cooling System Draining and Filling](#) .
3. Remove the front wheelhouse front liner on the passenger side. Refer to [Front Wheelhouse Front Liner Replacement](#) .
4. Remove the heater coolant heater heat shield. Refer to [Heater Coolant Heater Heat Shield Replacement](#) .
5. Remove the heater inlet and outlet pipe. Refer to [Heater Inlet And Outlet Pipe Replacement](#) .
6. Disconnect the electrical connector from the heater water auxiliary pump.

1	Heater Water Auxiliary Pump Nuts (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Heater Water Auxiliary Pump

Accessory DC Power Control Module Cooling Air Inlet Duct Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the floor stowage trim compartment. Refer to Rear Compartment Floor Stowage Trim Compartment Replacement .</p>	
	<p>Accessory DC Power Control Module Cooling Air Inlet Duct Fastener</p>

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 1.5 N·m (13 lb in)
2	Accessory DC Power Control Module Cooling Air Inlet Duct

Accessory DC Power Control Module Cooling Air Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the floor stowage trim compartment. Refer to Rear Compartment Floor Stowage Trim Compartment Replacement .	
	Accessory DC Power Control Module Cooling Air Duct Fastener (Qty: 2)

1	Caution: Refer to Fastener Caution in the Preface section. Tighten 1.5 N·m (13 lb in)
2	Accessory DC Power Control Module Cooling Air Duct

Accessory DC Power Control Module Cooling Blower Replacement

Callout

Component Name

Preliminary Procedures

1. Remove the floor stowage trim compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#) .
2. Remove 12 volt battery. Refer to [Battery Replacement](#) .
3. Disconnect the DC power control module electrical connector.

1	Accessory DC Power Control Module Cooling Blower Fastener (Qty: 3) Caution: Refer to Fastener Caution in the Preface section.
2	Accessory DC Power Control Module Cooling Blower

Heater Water Shutoff Valve Replacement

Callout	Component Name
	<p data-bbox="123 1377 2507 1453">Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Heater Water Shutoff Valve Inlet Hose Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#) .

Note: Replace corroded hose clamps and brackets.

2. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) .
3. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .

4. Disconnect the heater water shutoff valve inlet hose quick connect fitting (1) at the heater water shutoff valve.
5. Remove the heater water shutoff valve inlet hose (2) from the heater water shutoff valve.

6. Remove the heater water shutoff valve inlet hose clamp (1) at engine using *BO-38185* pliers .
7. Remove the heater water shutoff valve inlet hose (2) from engine.
8. Remove the heater water shutoff valve inlet hose from the vehicle.

[Installation Procedure](#)

1. Install the heater water shutoff valve inlet hose to the vehicle.
2. Install the heater water shutoff valve inlet hose (2) to the engine.
3. Install the heater water shutoff valve inlet hose clamp (1) at the engine using *BO-38185* pliers .

4. Install the heater water shutoff valve inlet hose (2) to the heater water shutoff valve.
5. Connect the heater water shutoff valve inlet hose quick connect fitting (1) at heater water shutoff valve.
6. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
7. Fill the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#) .
8. Enable the high voltage system. Refer to [High Voltage Enabling](#) .

Heater Water Auxiliary Pump Inlet Hose Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, refer to [Special Tools](#) .

Removal Procedure

1. Disconnect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Note: Replace corroded hose clamps and brackets.

2. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) .
3. Remove the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .

4. Remove the heater water auxiliary pump inlet hose clamp (1) at the coolant reservoir using *BO-38185* pliers .
5. Remove the heater water auxiliary pump inlet hose (2) from the coolant reservoir.

6. Remove the heater water auxiliary pump inlet hose clamps (1) at engine and heater water shutoff valve using *BO-38185* pliers.
7. Remove the heater water auxiliary pump inlet hose (2) from the engine and heater water shutoff valve.

8. Remove the heater water auxiliary pump inlet hose clamp (1) at the heater inlet and outlet pipe using *BO-38185* pliers.

Danger: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

9. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#) .

10. Remove the heater water auxiliary pump inlet hose (2) from the heater inlet and outlet pipe.

11. Remove the heater water auxiliary pump inlet hose from the vehicle.

[Installation Procedure](#)

1. Install the heater water auxiliary pump inlet hose to the vehicle.
2. Install the heater water auxiliary pump inlet hose (2) to the engine and heater water shutoff valve.
3. Install the heater water auxiliary pump inlet hose clamp (1) at the heater inlet and outlet pipe using *BO-38185* pliers.

4. Install the heater water auxiliary pump inlet hose (2) to the engine and heater water shutoff valve.
5. Install the heater water auxiliary pump inlet hose clamps (1) at the engine and heater water shutoff valve using *BO-38185* pliers.

6. Install the heater water auxiliary pump inlet hose (2) to the coolant reservoir.
7. Install the heater water auxiliary pump inlet hose clamp (1) at the coolant reservoir using *BO-38185* pliers.
8. Lower the vehicle.
9. Install the air cleaner resonator outlet duct. Refer to [Air Cleaner Resonator Outlet Duct Replacement](#) .
10. Fill the cooling system. Refer to [Cooling System Draining and Filling](#) .
11. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#) .

Heating and Air Conditioning System Description and Operation

[Heating](#)

The heating system uses the engine and a high voltage heater to provide heat to the passenger compartment. The high voltage heater is used when the engine is not running and passenger compartment heat is requested. The high voltage heater provides different levels of heat depending on the amount of heat needed and outside temperature.

The HVAC Control Module turns on the coolant pump and monitors the temperature sensors in the passenger compartment, outside air, engine radiator, high voltage heater and the engine to determine the position of the coolant flow control valve and if the high voltage heater is needed. Passenger compartment heat is provided by air flowing through the heater core. The heater core is heated by coolant from either the engine or the high voltage heater.

The engine cooling system circulates a 50/50 mixture of Dex-cool and distilled water.

[Air Conditioning](#)

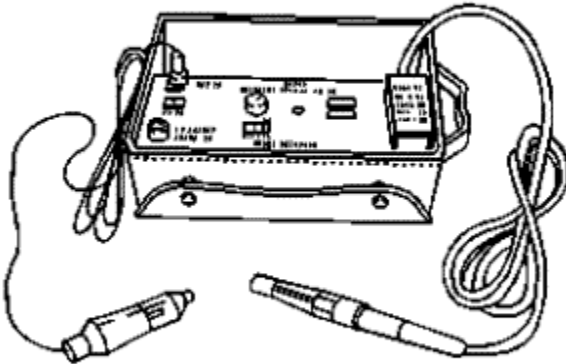

The A/C system uses the refrigerant R-134a which is a gas at very low temperatures and can transfer heat from the passenger compartment and high voltage battery to the outside air. The A/C system is mechanically protected with the use of a high pressure relief valve on the A/C compressor. If the refrigerant pressure sensor were to fail or if the A/C system becomes restricted and the refrigerant pressure continued to rise, the high pressure relief will open and release refrigerant from the system.

The high voltage electric A/C compressor is a self contained high voltage inverter, electric motor, and direct coupled compressor. The electric A/C compressor has the ability to run and provide cooling performance while the vehicle engine is not running. This feature enables the electric A/C compressor to run at a speed independent of the engine. The electronic climate control module and the Vehicle Integration Control Module (VICM) will command the electric A/C compressor to a speed necessary to maintain a desired cooling level rather than cycle the electric A/C compressor on and off.

The electric A/C compressor builds pressure and adds heat to the refrigerant gas. The refrigerant gas flows from the electric A/C compressor to the condenser where heat is transferred to the outside air when the refrigerant condenses from a gas to a liquid. The liquid refrigerant then flows to a thermal expansion valve (TXV) on the battery chiller. The TXV lowers the pressure of the liquid refrigerant which makes the refrigerant expand from a liquid to a vapour. The low pressure refrigerant vapour flows into the battery chiller and begins to boil and change into a gas as the refrigerant absorbs heat from the battery coolant also flowing inside the battery chiller. The battery coolant and refrigerant are separated by several plates inside the battery chiller. The liquid refrigerant also flows to a second TXV on the evaporator. The low pressure refrigerant vapour flows from the TXV into the evaporator and begins to boil and change into a gas as the refrigerant absorbs heat from the passenger compartment air that is flowing through the outside of the evaporator. The moisture in the passenger compartment air condenses on the outside of the evaporator and flows down to the bottom of the HVAC module where it drains outside the passenger compartment through a drain hose. The low pressure refrigerant gas then flows from the battery chiller and the evaporator back to the electric A/C compressor where the cycle is repeated.

Low Reference	-	B0163 05, B0183 05	--	--
1. HVAC Malfunction				

Circuit/System Description

The ambient light/sunload sensor includes the sunload sensor and passenger compartment temperature sensor.

This sensor assembly provides information about:

- Sun heat intensity
- Passenger compartment temperature

The vehicle uses a sunload sensor that is integrated into one sensor assembly along with the passenger compartment temperature sensor. Low reference and signal circuits enable the sensor to operate. The sensor signal varies between 0-5 V.

The passenger compartment temperature sensor is a negative temperature co-efficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0-5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

[Conditions for Running the DTC](#)

- Vehicle in Service Mode.
- The HVAC control module is ON.

[Conditions for Setting the DTC](#)

B0163 02 or B0163 05

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

[Action Taken When the DTC Sets](#)

- The system will use the last valid values as default.
- If no value is read at the time of fault, the HVAC control module uses 0 W/m².

[Conditions for Clearing the DTC](#)

B0163 02 or B0163 05

The sensor signal is within specified range between 0.1-4.9 V.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B10B ambient light/sunload sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 6 and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
 - 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K33 HVAC control module.***If less than 10 Ω***
3. Vehicle in Service Mode.
4. Verify the scan tool parameter Passenger Compartment Air Temperature (Unfiltered) is less than -35°F.
If -35°F or greater
 - 4.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
 - 4.2. Test for infinite resistance between the signal circuit terminal 4 and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the K33 HVAC control module.***If less than -35°F***
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the low reference circuit terminal 6.
6. Verify the scan tool parameter Passenger Compartment Air Temperature (Unfiltered) is greater than 240°F.
If 240°F or less
 - 6.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle in Service Mode.
 - 6.2. Test for less than 1 V between the signal circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V

6.3. Vehicle OFF

6.4. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K33 HVAC control module.

If greater than 240°F

7. Test or replace the B10B ambient light sensor.

1. Air Temperature Malfunction

[Circuit/System Description](#)

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The vehicle uses the following air temperature sensors:

- Air temperature sensor left upper
- Air temperature sensor left lower
- Evaporator temperature sensor

A signal and low reference circuit enables the sensor to operate. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal voltage decreases as the resistance decreases. The sensor operates within a temperature range between -40 to +85°C (-40 to +185°F). The sensor signal varies between 0-5 V. The HVAC control module converts the signal to a range between 0-255 counts. As the air temperature increases the count value will decrease. If the HVAC control module detects a malfunctioning sensor, then the control module software will use a default air temperature value. The default action ensures that the HVAC system can adjust the inside air temperature near the desired temperature until the condition is corrected.

[Conditions for Running the DTC](#)

The vehicle is turned ON.

[Conditions for Setting the DTC](#)

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

[Action Taken When the DTC Sets](#)

A default value is used when the DTC is set.

[Conditions for Clearing the DTC](#)

- The DTC will become history if the HVAC control module no longer detects a failure.
- The history DTC will clear after 100 fault-free ignition cycles.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate temperature sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal B and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
 - 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K33 HVAC control module.***If less than 10 Ω***
3. Vehicle in Service Mode.
4. Verify the scan tool parameter is less than -39°F.
 - Lower Left Duct Air Temperature Sensor
 - Upper Left Duct Temperature Sensor
 - A/C Evaporator Temperature Sensor***If greater than -39°F***
 - 4.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
 - 4.2. Test for infinite resistance between the signal circuit terminal A and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the K33 HVAC control module.***If -39°F or less***

5. Install a 3 A fused jumper wire between the signal circuit and the low reference circuit terminal B.
6. Verify the scan tool parameter is greater than 240°F.
 - Lower Left Duct Air Temperature Sensor
 - Upper Left Duct Temperature Sensor
 - A/C Evaporator Temperature Sensor

If 240°F or less

- 6.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle in Service Mode.
- 6.2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
- 6.3. Vehicle OFF
- 6.4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω, replace the K33 HVAC control module.

If greater than 240°F

7. Test or replace the temperature sensor.

Component Testing

1. Test the air temperature sensor by varying the sensor temperature while monitoring the sensor resistance.
2. Compare the readings with the [Sensor Resistance Table](#) and verify that the resistance is within 5 percent of the specification.
 - If not within the specified range, replace the sensor.

Circuit/System Description

The windscreen temperature and inside moisture sensor integrates the relative humidity sensor, windscreen temperature sensor and humidity sensing element temperature sensor.

This sensor assembly provides information about:

- Relative humidity level on inside windscreen
- Temperature of the inside windscreen
- Temperature of the humidity sensor element

The relative humidity sensor measures the relative humidity on the compartment side of the windscreen. It also detects the temperature of the windscreen surface on the compartment side. Both values are used as control inputs for the HVAC control module application to calculate the fog risk on windscreen compartment side and ability to reduce fuel consumption by decreasing A/C compressor power to a minimum without causing any fog. The sensor will also enable partial recirculation mode in order to improve heat-up performance of the passenger compartment under cold ambient temperature conditions without the risk of mist build-up on the windscreen. The humidity sensor element temperature sensor supplies the temperature of the humidity sensor element. It is only needed if the thermal contact between the humidity sensing element and the inside windscreen surface is not sufficient.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B018A 02, B048C 02, B048C 02 or B1395 03

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V for more than 50 ms.

B018A 05, B048C 05, B048C 05 or B1395 07

The HVAC control module detects the sensor signal out of range. The signal voltage is greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

- The system will use the last valid values as default.
- If no value is read at the time of fault, the HVAC control module uses 60% for humidity.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B160 windscreen temperature and inside moisture sensor. It may take up to 2

minutes for all vehicle systems to power down.

2. Test for less than 10 Ω between the low reference circuit terminal 3 and ground.

If 10 Ω or greater

2.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.

2.2. Test for less than 2 Ω in the low reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K33 HVAC control module.

If less than 10 Ω

3. Vehicle in Service Mode.

4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.

If less than 4.8 V

4.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.

4.2. Test for infinite resistance between the 5 V reference circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

4.3. Test for less than 2 Ω in the 5 V reference circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K33 HVAC control module.

If greater than 5.2 V

4.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle in Service Mode.

4.2. Test for less than 1 V between the 5 V reference circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K33 HVAC control module.

If between 4.8-5.2 V

5. Verify the scan tool Windscreen Temperature and Passenger Compartment Humidity Sensor Temperature parameters are less than -39°F.

If -39°F or greater

5.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle in Service Mode.

5.2. Test for less than 1 V between the signal circuit terminals listed below and ground.

- Windscreen temperature sensor signal terminal 4

- Passenger compartment humidity sensor temperature signal terminal 5

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K33 HVAC control module.

If less than -39°F

6. Verify the scan tool Passenger Compartment Humidity parameters is greater than 95%.

If 95% or less

6.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle in Service Mode.

6.2. Test for less than 1 V between the signal circuit terminal 2 and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K33 HVAC control module.

If greater than 95%

7. Install a 3 A fused jumper wire between the signal circuit terminals listed below and the 5 V reference circuit terminal 1.
 - Windscreen temperature sensor signal terminal 4
 - Passenger compartment humidity sensor temperature signal terminal 5
8. Verify the scan tool Windscreen Temperature and Passenger Compartment Humidity Sensor Temperature parameters are greater than 239°F.

If 239°F or less

- 8.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
- 8.2. Test for infinite resistance between the signal circuit terminals listed below and ground.
 - Windscreen temperature sensor signal terminal 4
 - Passenger compartment humidity sensor temperature signal terminal 5

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

- 8.3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K33 HVAC control module.

If greater than 239°F

9. Install a 3 A fused jumper wire between the passenger compartment humidity sensor signal circuit terminal 2 and the low reference circuit terminal 3.
10. Verify the scan tool Passenger Compartment Humidity Sensor parameter is less than 5%.

If 5% or greater

- 10.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
- 10.2. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K33 HVAC control module.

If less than 5%

11. Test or replace the B160 windscreen temperature and inside moisture sensor.

Low Reference	-	B0163 05, B0183 05	--	--
1. HVAC Malfunction				

[Circuit/System Description](#)

The ambient light/sunload sensor includes the sunload sensor and passenger compartment temperature sensor.

This sensor assembly provides information about:

- Sun heat intensity
- Passenger compartment temperature

The vehicle uses a sunload sensor that is integrated into one sensor assembly along with the passenger compartment temperature sensor. Low reference and signal circuits

enable the sensor to operate. The sensor signal varies between 0-5 V.

The passenger compartment temperature sensor is a negative temperature co-efficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0-5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B0163 02 or B0163 05

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

B0183 02

The 5 V identification pulse is not received.

B0183 05

The input signal is static and greater than 4.8 V.

Action Taken When the DTC Sets

- The system will use the last valid values as default.
- If no value is read at the time of fault, the HVAC control module uses 0 W/m².

Conditions for Clearing the DTC

B0163 02 or B0163 05

The sensor signal is within specified range between 0.1-4.9 V.

B0183 02 or B0183 05

The sensor signal is within specified range between 0.1-4.9 V.

DTC B0193 01: Front Blower Motor Speed Circuit Short to Battery

DTC B0193 06: Front Blower Motor Speed Circuit Low Voltage/Open

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B0193 06	B0193 06	--	--
Control	B0193 06	B0193 06	B0193 01	-
Ground	-	B0193 06	--	--

[Circuit/System Description](#)

The blower motor control module is an interface between the HVAC control module and the blower motor. The blower motor speed control from the HVAC control module, battery positive and ground circuits enable the blower motor control module to operate. The HVAC control module provides a pulse width modulation (PWM) signal to the blower motor control module in order to command the blower motor speed. The blower motor control module transfers the PWM signal into a corresponding blower motor voltage. The voltage resides between 2-13 V and changes linear to the height of the PWM signal.

[Conditions for Running the DTC](#)

- Vehicle in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B0193 01

The voltage at the HVAC control module output to the blower motor control module is always high.

B0193 06

The voltage at the HVAC control module output to the blower motor control module is always low or floating.

Action Taken When the DTC Sets

The blower motor is inoperative.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

 - Med 3 6.0 V-5.0 V
 - Med 4 5.0 V-3.0 V
 - HI 2.0 V-1.0 V

-

If not within the specified range

- 5.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
- 5.2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
- 5.3. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC control module.

If within the specified range

6. Connect the X1 harness connector at the K8 blower motor control module. Disconnect the harness connector at the M8 blower motor..
7. Connect a DMM between the control circuit terminal B and B+.
8. Verify the proper voltages when changing the blower speed positions, with the HVAC in Comfort Mode.
 - OFF 0 V
 - Low 2.0 V-3.0 V
 - Med 1 3.0 V-4.5 V
 - Med 2 4.5 V-6.5 V
 - Med 3 6.5 V-8.5 V
 - Med 4 8.5 V-10.0 V
 - HI 10.0 V-12.0 V

If not within the specified range

- 8.1. Vehicle OFF, disconnect the harness connector X2 at the K8 blower motor control module.
- 8.2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
- 8.3. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K8 blower motor control module.

If within the specified range

9. Verify a test lamp illuminates between B+ circuit terminal A and ground.
 - If the test lamp does not illuminate***
 - 9.1. Vehicle OFF.
 - 9.2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω .

9.3. Test for infinite resistance between the B+ circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the M8 blower motor.

If the test lamp illuminates

10. All OK.

1. HVAC Malfunction				

Circuit/System Description

Stepper motors are used for temperature regulation, air distribution control and recirculation flap control.

With the appropriate switches at the HVAC control, the desired air temperature flap position, air distribution flap position and recirculation flap position can be put in. The selected values are passed to the HVAC control module via serial data. The HVAC control module supplies a 12 V reference voltage to the stepper motors and energises the 4 stepper motor coils with a pulsed ground signal. The stepper motors put the appropriate flap into the calculated position, in order to reach the put in temperature/position.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B023A 02

The stepper motors supply output is shorted to ground.

B0223 01, B0233 01 or B0408 01

At least one control output (of 4 possible outputs) of the appropriate stepper motor is shorted to voltage when motor starts moving. Faults are not detected when motor is already running or target position is already reached.

B0223 06, B0233 06 or B0408 06

At least one control output (of 4 possible outputs) of the appropriate stepper motor is shorted to ground or open when motor starts moving. Faults are not detected when motor is already running or target position is already reached.

Action Taken When the DTC Sets

B023A 02

- The affected output will be switched off for hardware protection.
- All stepper motors are deactivated.

B0223, B0233 or B0408

- The affected output will be switched off for hardware protection.
- The affected stepper motor is deactivated.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate door actuator, vehicle in Service Mode.
2. Connect a test lamp between the B+ circuit terminal 2 and ground.
3. Verify the test lamp turns ON and OFF when commanding the actuator ON and OFF with a scan tool.

If the test lamp is always OFF

- 3.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
- 3.2. Test for infinite resistance between the control circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 3.3. Test for less than 2 Ω in the control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K33 HVAC control module.

If the test lamp is always ON

- 3.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle in Service Mode.
- 3.2. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K33 HVAC control module.

If the test lamp turns ON and OFF

4. Vehicle OFF, disconnect the harness connector at the actuator and disconnect the harness connectors at the K33 HVAC control module, vehicle in Service Mode.
5. Test for less than 1 V between each actuator harness connector terminals listed below and ground.
 - Control Circuit - terminal 1
 - Control Circuit - terminal 3
 - Control Circuit - terminal 4
 - Control Circuit - terminal 6

If 1 V or greater

Repair the short to voltage on the circuit.

If less than 1 V

6. Vehicle OFF.
7. Test for infinite resistance between each actuator harness connector terminals listed below and ground.
 - Control Circuit - terminal 1
 - Control Circuit - terminal 3
 - Control Circuit - terminal 4

- Control Circuit - terminal 6

If less than infinite resistance

Repair the short to ground on the circuit.

If Infinite resistance

8. Test for less than 2 Ω between each harness connector terminal listed below end to end.

Note: See schematic for the K33 HVAC control module terminal numbers.

- HVAC Actuator - terminal 1 and HVAC control module terminal
- HVAC Actuator - terminal 3 and HVAC control module terminal
- HVAC Actuator - terminal 4 and HVAC control module terminal
- HVAC Actuator - terminal 6 and HVAC control module terminal

If 2 Ω or greater

Repair the open/high resistance in the circuit.

If less than 2 Ω

9. Replace the actuator. The DTC should not set.

If the DTC sets

Replace the K33 HVAC control module.

If the DTC does not set

10. All OK.

[Circuit/System Description](#)

The auxiliary heater coolant pump is controlled with a pulse-width modulated control sent from the HVAC control module to the auxiliary heater coolant pump. The higher the duty cycle on the control the higher the pump speed. An enable signal from the HVAC control module to the auxiliary heater coolant pump provides overall control of the pump. When voltage is present, the pump can operate. The auxiliary heater coolant pump provides a hard-wired pulse-width modulated feedback signal to the HVAC control

module. During normal operation, this feedback signal provides pump speed information.

Conditions for Running the DTC

B0468 01

- The 12 V battery system voltage is greater than 9 V.
- The vehicle is in the RUN power mode.
- The HVAC system is turned ON.

B0468 06

- The 12 V battery system voltage is greater than 9 V.
- The vehicle is in the RUN power mode.
- The HVAC system is turned ON.

B046B 00

- The 12 V battery system voltage is greater than 9 V.
- The vehicle is in the RUN power mode.
- The HVAC system is turned ON.

B046C 02

- The 12 V battery system voltage is greater than 9 V.
- The vehicle is in the RUN power mode.
- The HVAC system is turned ON.

B046C 05

- The 12 V battery system voltage is greater than 9 V.
- The vehicle is in the RUN power mode.
- The HVAC system is turned ON.

Conditions for Setting the DTC

B0468 01

Requested PWM is not zero and the feedback from the Auxiliary Heater is always High.

B0468 06

Feedback from the auxiliary heater voltage is always low or floating.

B046B 00

PWM duty cycle/frequency out of range

B046C 02

PWM duty cycle/frequency out of range

B046B 05

PWM duty cycle/frequency out of range

[Action Taken When the DTC Sets](#)

The auxiliary heater coolant pump is disabled.

Vehicle in Service Mode, HVAC system turned ON, with a scan tool, verify that the Auxiliary Heater Coolant Pump Command is between 20%-90% and Auxiliary Heater Coolant Pump Feedback is about 50%

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the G36 auxiliary heater coolant pump.
2. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.

3. Test for less than 10 Ω between the ground circuit terminal 4 and ground.

If 10 Ω or greater

3.1. Vehicle OFF.

3.2. Test for less than 2 Ω in the ground circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , repair the open/high resistance in the ground connection.

If less than 10 Ω

4. Vehicle ON, verify a test lamp illuminates between the B+ circuit terminal 5 and ground.

If the test lamp does not illuminate and the circuit fuse is good

4.1. Vehicle OFF.

4.2. Test for less than 2 Ω in the B+ circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

If the test lamp does not illuminate and the circuit fuse is open

4.1. Vehicle OFF.

4.2. Test for infinite resistance between the B+ circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the G36 auxiliary heater coolant pump..

If the test lamp illuminates

5. Vehicle ON, connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.

6. Verify the test lamp turns ON and OFF when Commanding the Auxiliary Coolant Pump Speed Command ON and OFF with a scan tool.

If the test lamp is always OFF

6.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.

6.2. Test for infinite resistance between the control circuit and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

6.3. Test for less than 2 Ω in the control circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K33 HVAC control module.

If the test lamp is always ON

6.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle ON.

6.2. Test for less than 1 V between the control circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K33 HVAC control module.

If the test lamp turns ON and OFF

7. Connect a DVOM between the control circuit terminal 3 and the enable circuit terminal 1.

8. Verify the voltage changes when Commanding the Auxiliary Coolant Pump Speed Command ON and OFF with a scan tool.

If the voltage stays below 3 volts while commanding ON and OFF

- 8.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
- 8.2. Test for infinite resistance between the control circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 8.3. Test for less than 2 Ω in the control circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K33 HVAC control module.

If the voltage stays greater than 11 volts while commanding ON and OFF

- 8.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle ON.
- 8.2. Test for less than 1 V between the control circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K33 HVAC control module.

If the voltage is 0 volts OFF and 12 volts ON while commanding ON and OFF

9. Verify the scan tool Auxiliary Coolant Pump Speed Feedback Frequency parameter is less than 10%.
If greater than 10%
 - 9.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
 - 9.2. Test for infinite resistance between the signal circuit terminal 2 and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the K33 HVAC control module.

If 10% or less

10. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 4.
11. Verify the scan tool Auxiliary Coolant Pump Speed Feedback Frequency parameter is greater than 90%.

If less than 90%

- 11.1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, vehicle ON.
- 11.2. Test for less than 1 V between the signal circuit terminal 2 and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V
- 11.3. Vehicle OFF
- 11.4. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K33 HVAC control module.

If 90% or greater

12. If all circuits test normal, test or replace the G36 auxiliary heater coolant pump.

[Circuit Description](#)

The HVAC control module supplies the temperature sensor with a low reference circuit and 5 V signal circuit. The HVAC control module determines the voltage drop across the sensor, which is proportional to temperature. As the temperature increases, the sensor resistance decreases and the voltage signal decreases. As the temperature decreases, the sensor resistance increases and the voltage signal increases.

[Conditions for Running the DTC](#)

The ignition is turned ON.

Conditions for Setting the DTC

The HVAC control module detects the temperature sensor signal circuit is less than -38°F or more than 185°F for more than 15 seconds.

Action Taken When the DTC Sets

A default value is used when the DTC is set.

Conditions for Clearing the DTC

- The DTC will become history if the HVAC control module no longer detects a failure.
- The history DTC will clear after 100 fault-free ignition cycles.

[Circuit/System Description](#)

The engine control module (ECM) monitors the high side refrigerant pressure through the A/C refrigerant pressure sensor. The ECM supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the ECM to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. When pressure is high, the ECM commands the cooling fans on.

[Conditions for Running the DTC](#)

- Engine is running.

- Any of the conditions for setting the DTC are met for 15 seconds.
- Battery voltage is between 11-18 V.

Conditions for Setting the DTC

- The ECM detects that the A/C pressure is less than 1 psi (0.01 V).
- The ECM detects that the A/C pressure is more than 428 psi (4.92 V).

Action Taken When the DTC Sets

This is a type D DTC.

Conditions for Clearing the DTC

This is a type D DTC.

Diagnostic Aids

A malfunction within the refrigerant system causing high pressure can cause this DTC to set.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool A/C High Side Pressure Sensor parameter in the ECM data list. The reading should be between 6.8 kPa (1 psi) and 2950 kPa (428 psi).

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B1 A/C refrigerant pressure sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF, disconnect the harness connector at the K20 ECM.
 - 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K20 ECM.**If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.
If less than 4.8 V
 - 4.1. Vehicle OFF, disconnect the harness connector at the K20 ECM control module.
 - 4.2. Test for infinite resistance between the 5 V reference circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 4.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K20 ECM.**If greater than 5.2 V**
 - 4.1. Vehicle OFF, disconnect the harness connector at the K20 ECM control module, vehicle in Service Mode.

4.2. Test for less than 1 V between the 5 V reference circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K20 ECM.

If between 4.8-5.2 V

5. Verify the scan tool A/C High Side Pressure Sensor parameter is less than 4.8-5.2 V.

If 4.8-5.2 V or greater

5.1. Vehicle OFF, disconnect the harness connector at the K20 ECM, vehicle in Service Mode.

5.2. Test for less than 1 V between the signal circuit terminal 3 and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V, replace the K20 ECM.

If less than 4.8-5.2 V

6. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 2.

7. Verify the scan tool A/C High Side Pressure Sensor parameter is greater than .02 V.

If .02 V or less

7.1. Vehicle OFF, disconnect the harness connector at the K20 ECM.

7.2. Test for infinite resistance between the signal circuit terminal 3 and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance

7.3. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K20 ECM.

If greater than .02 V

8. Test or replace the B1 A/C refrigerant pressure sensor.

[DTC Descriptor](#)

DTC P0534: Air Conditioning (A/C) Refrigerant Charge Low

[Circuit/System Description](#)

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down and dehumidify the for the cabin and help maintain the battery temperature. Rather than a more typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High Voltage Battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer selects ECO or Comfort.
- The HVAC system is fan only but the customer selects defrost mode
- The High Voltage Battery Thermal System requests the AC compressor on to help maintain the battery temperature

The Hybrid Powertrain control module 2 (HPCM2) uses values from the A/C refrigerant pressure transducers, A/C refrigerant thermistor, ambient air temperature sensor, cabin climate control request, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This message is sent from the HPCM2 to the A/C compressor control module via serial data message.

[Conditions for Running the DTC](#)

DTC P0534 Case 1

- 12V battery system voltage is equal to or greater than 10.25V

- The air conditioning compressor control module has 300V
- The A/C compressor motor is running for at least 30 seconds.
- Must be in battery active cooling mode for at least 1 minute
- The following DTCs must not be set: P0CE0; P0CE2; P0CE3; P0CE6; P0CE7; P1CE7; P1CE8, P0C47; P0C4A, P1F18, P0C44, P0C45, P0C43,P0CD6, p0CD7, P0CD8, P0071; P0072; P0073

DTC P0534 Case 2

- 12V battery system voltage is equal to or greater than 10.25V
- AC compressor off for greater than 240 seconds
- Outside air temperature greater than 15C. (59F)
- The following DTCs must not be set: P2516, P2517, P2518, P0606, P0071,P0072, P0073

DTC P0534 Case 3

- 12V battery system voltage is equal to or greater than 10.25V
- AC compressor on for greater than 240 seconds
- Outside air temperature greater than 5C (41F).
- The following DTCs must not be set: P2516, P2517, P2518, P0606, P0071,P0072, P0073

DTC P0534 Case 4

- 12V battery system voltage is equal to or greater than 10.25V
- A/C compressor off for greater than 240 seconds
- The following DTCs must not be set: P0531,P0532, P0533,P0606, P0071; P0072; P0073

[Conditions for Setting the DTC](#)

DTC P0534 Case 1

The difference between the hybrid/EV battery pack coolant outlet temperature and hybrid/EV battery pack coolant inlet temperature within the evaluation period of 120 seconds is less than a calibrated amount of 3 to 5 degrees. The required temperature difference requirement is based on outside air temperature and whether the cabin blower is on or off.

DTC P0534 Case 2

Low side pressure is a less than a designated value based on outside air temperature.

DTC P0534 Case 3

Low side pressure is less than 150 kPa (21.75 PSI) for outside air temperature greater than 5C (41F).

DTC P0534 Case 4

High side pressure is greater than 5000 kPa (725 PSI)

Action Taken When the DTC Sets

The A/C compressor control module is disabled.

Conditions for Clearing the DTC

P0534 is a type B DTC.

Diagnostic Aids

P1EC3 is the hybrid/EV battery pack heater circuit fault DTC. It diagnoses three different circuit faults (short-ground, short-battery, open circuit); one of these, short to ground, could cause the hybrid/EV battery pack heater to activate and could cause P0534 to set. Diagnose P1EC3 before diagnosing P0534.

Circuit/System Verification

1. Verify that DTC P1EC3 is not set.
If the DTC is set, Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Verify that DTC P0534 is not set.
If the DTC is set, Refer to [Air Conditioning \(A/C\) System Performance Test](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P0536-P0538 or P153B

[Diagnostic Instructions](#)

DTC P0538: Air Conditioning (A/C) Evaporator Temperature Sensor 2 Circuit High Voltage

DTC P153B: Air Conditioning (A/C) Evaporator Temperature Sensor 2 Not Plausible

[Diagnostic Fault Information](#)

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0537	P0537	P0538	P0536
Low Reference	--	P0537	--	--

[Circuit Description](#)

The A/C refrigerant low side temperature sensor measures the temperature on the low pressure side of the A/C Compressor.

The Hybrid Powertrain control module (HPCM2) supplies the A/C evaporator temperature sensor with a low reference circuit and 5-volt signal circuit. The HPCM2 determines the voltage drop across the sensor, which is proportional to temperature. As the temperature increases, the sensor resistance decreases and the voltage signal decreases. As the temperature decreases, the sensor resistance increases and the voltage signal increases.

Conditions for Running the DTC

- DTC P153B makes comparisons between other temperature sensors to determine if the A/C refrigerant low side temperature sensor reading is close to other temperature readings after a soak period. P153B is intended to run after a long ambient soak period, such as being parked overnight, when a hot engine condition has cooled, etc.
- DTCs P0537 and P0538 monitor A/C refrigerant low side temperature sensor for out of range conditions.
- DTC P0536 looks for the A/C refrigerant low side temperature sensor to go down in temperature when the compressor is operated with a cold engine and after the compressor has been off for one hour.

P1536

- 12 V battery system voltage above 10.25 V
- Hybrid Powertrain Control Module 2 is awake and communicating.
- None of these DTCs may be active: P0537; P0538, P0073; P0072; P0071, P0119; P0118; P0117; P0116, P0606.
- Engine coolant temperature must be within 15 degrees of outside air temperature.
- AC compressor must have been off for an hour since the last time the AC compressor was on.
- AC compressor must be turned on for one minute.

P1537 or P0538

- 12 V battery system voltage above 10.25 V
- Hybrid Powertrain Control Module 2 is awake and communicating.

P153B

- HPCM2 is awake and communicating.
- None of these DTCs may be active: P0537;P0538, P0073; P0072; P0071, P0119; P0118; P0117; P0116, P0531, P0532; P0533, P0606
- Outside air temperature raw and corrected values must have had a chance to settle out. Once this occurs these variables are assigned a status of valid. May need to have some time driving in EV mode
- Engine coolant temperature must be within 15 degrees of outside air temperature (i.e., cool engine)
- Outside air temperature must be between 32°F and 131°F.
- AC compressor must have been off for an hour since the last time the AC compressor was on.

Conditions for Setting the DTC

P0536

The difference between the A/C refrigerant low side temperature sensor before compressor on and after compressor on changes less than 2 degrees over a 30 second period.

P0537

The HPCM2 detects the A/C refrigerant low side temperature sensor signal circuit is less than -38°F for more than 15 seconds.

P0538

The HPCM2 detects the A/C refrigerant low side temperature sensor signal circuit is more than 185°F for more than 4 seconds.

P153B

- The difference between the A/C refrigerant low side temperature sensor and the outside air temperature value is greater than 10°C and
- The difference between the A/C refrigerant low side temperature sensor and the temperature calculated from the current high Side Refrigerant Pressure Sensor reading is greater than 10 degrees.

Action Taken When the DTC Sets

These are type B DTCs.

Conditions for Clearing the DTC

These are type B DTCs.

[Control Module References](#) for scan tool information

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B222 A/C refrigerant low side temperature sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal B and ground.

If 10 Ω or greater

- 2.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
- 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K114B HPCM2.

If less than 10 Ω

3. Vehicle in Service Mode.
4. Verify the scan tool parameter A/C evaporator Temperature sensor is less than -35°F.

If -35°F or greater

- 4.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
- 4.2. Test for infinite resistance between the signal circuit terminal A and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the K114B HPCM2.

If less than -35°F

5. Install a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A.
6. Verify the scan tool parameter A/C evaporator Temperature sensor is greater than 240°F.

If 240°F or less

- 6.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2, vehicle in Service Mode.
- 6.2. Test for less than 1 V between the signal circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V

6.3. Vehicle OFF

6.4. Test for less than 2 Ω in the signal circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K114B HPCM2..

If greater than 240°F

7. Test or replace the B222 A/C refrigerant low side temperature sensor.

Component Testing

1. Test the A/C refrigerant low side temperature sensor by varying the sensor temperature while monitoring the sensor resistance.
2. Compare the readings with the [Sensor Resistance Table](#) and verify that the resistance is within 5 percent of the specification.
If not within the specified range, replace the sensor.

Circuit/System Description

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High Voltage Battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button
- The HVAC control, in AUTO mode, requests the electric AC compressor on to help in cooling the cabin or removing moisture in the defrost mode
- The High Voltage Battery Thermal System requests the AC compressor on to help maintain the battery temperature

The Hybrid Powertrain control module 2 uses values from the A/C refrigerant pressure transducers, A/C refrigerant thermistor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, evaporator temperature sensor, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This speed request message is sent from the Hybrid/EV Powertrain Control Module 2 to the A/C compressor control module via serial data message.

Conditions for Running the DTC

Certain performance DTCs in this group, P0D69, P0D71, P076, are intended to run after a long ambient soak period, such as being parked overnight, when a hot engine condition has cooled, etc.

DTC P0D69

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Main HV battery contactors must be closed.
- DTCs P0D6A; P0D6B, P0ABC, P0ABD, P0ABB, P0AF8, P1A07, U1111, U185A, P0AE4, P0AD9, P0AA1, P0ADD, P1EBC, P0AE2 must not be set.

DTC P0D6A

- 12 V battery system voltage is above 10.25 V.

- A/C compressor control module is awake.
- Difference between the A/C compressor control module high voltage levels and the high voltage Battery Pack Side Voltage is less than 15 V.
- There are no battery pack voltage DTCs set.
- Battery Pack Voltage Sensors are valid.

DTC P0D6B

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Difference between the A/C compressor control module high voltage levels and the high voltage Battery Pack Side Voltage exceeds 15 V.
- Battery Pack Voltage Sensors are valid.
- There are no battery pack voltage DTCs set.
- Main HV Contactors are Closed
- No main HV contactor faults are active

DTC P0D6F

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is greater than 0 RPM

DTC P0D71

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor has been off for > 6 hours
- Outside air temperature is greater than -7°C
- Engine coolant temperature is within 15° of outside air temperature
- DTCs P0D77, P0D78, P0606 P0073; P0072; P0071, P0113, P0112, P0111, P0114, P0119; P0118; P0117; P0116, P0D72; P0D73 must not be set

DTC P0D72

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Outside Air temperature is greater than -7°C (19°F)
- Following DTCs are not set: CPU temp sensor, output driver temp sensor, outside air temperature sensor, engine coolant temperature sensor.

DTC P0D73

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.

DTC P0D76

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Outside Air temperature is greater than -7°C (19°F)
- Engine coolant temperature is within 15° of outside air temperature
- Compressor has been off for > 6 hours
- Following DTCs are not set: P0D77; P0D78, P0606, P0073; P0072; P0071, P0073; P0072; P0071, P0113, P0112, P0111, P0114, P0119; P0118; P0117; P0116

DTC P0D77

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Outside Air temperature is greater than -7°C (19°F)
- Compressor Speed Request is greater than 0 RPM

DTC P0D78

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.

DTC P0D7A

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is 0 RPM

DTC P0D7B

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is 0 RPM

DTC P0D7C

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is 0 RPM

DTC P0D7D

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is 0 RPM

DTC P0D7E

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is 0 RPM

DTC P0D7F

- 12 V battery system voltage is above 10.25 V.
- A/C compressor control module is awake.
- Compressor Speed Request is 0 RPM

[Conditions for Setting the DTC](#)

DTC P0D69

A/C compressor control module high voltage input voltage is not within 10 V of high voltage battery voltage

DTC P0D6A

A/C compressor control module input voltage is greater than 450 V for 6 seconds

DTC P0D6B

A/C compressor control module input voltage is less than 190 V for 6 seconds

DTC P0D6F

A/C compressor control module DC current draw is greater than 27 A for more than 6 seconds.

DTC P0D71

Compressor temperature sensor is not within 10 of intake air temperature sensor and compressor temperature sensor is not within 10° of compressor output driver temperature sensor.

DTC P0D72

less than -40°C (-40°F) for 6 seconds.

DTC P0D73

greater than 135°C (276.6°F) for 6 seconds.

DTC P0D76

Compressor output driver temperature sensor is not within 7° of intake air temperature sensor and compressor output driver temperature sensor is not within 11° of outside air temperature.

DTC P0D77

Air conditioning compressor module output driver temperature sensor is less than -40°C (-40°F)

DTC P0D78

Air conditioning compressor module output driver temperature sensor is greater than 135°C (276.6°F)

DTC P0D7A

Air conditioning compressor motor current U-phase Input \geq 68 A

DTC P0D7B

Air conditioning compressor motor current U-phase Input \leq -68 A

DTC P0D7C

Air conditioning compressor motor current V-phase Input \geq 68 A

DTC P0D7D

Air conditioning compressor motor current V-phase Input<=-68 A

DTC P0D7E

Air conditioning compressor motor current W-phase Input>= 68 A

DTC P0D7F

Air conditioning compressor motor current W-phase Input <= -68 A

Action Taken When the DTC Sets

The A/C compressor control module is disabled.

Conditions for Clearing the DTC

These are all type B DTCs

Circuit/System Verification

Danger: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that DTC P0D69-P0D7F is not set.
If the DTC is set, verify that the A/C compressor control module and the Hybrid/EV powertrain control module 2 have the latest software and reprogramme the modules if needed.
2. Operate the vehicle within the conditions for running the DTC. If the DTC resets, replace the G1 A/C compressor. Refer to [High Voltage Disabling](#) .

[Circuit/System Description](#)

The Hybrid Powertrain control module (HPCM2) monitors the low side refrigerant pressure through the A/C pressure sensor. The HPCM2 supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the HPCM2 to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low.

[Conditions for Running the DTC](#)

P151C

- 12 V battery system voltage above 10.25 V.
- HPCM2 is awake and communicating.
- None of these DTCs may be active: P2517, P2518, P0073; P0072; P0071, P0119; P0118; P0117; P0116, P0531, P0532; P0533, P537,P538, P153B, P0606
- Outside Air Temperature raw and corrected values must have had a chance to settle out. Once this occurs these variables are assigned a status of valid. May need to have some time driving in EV mode
- Engine coolant temperature must be within 15 degrees of outside air temperature
- Outside Air Temperature between 0°C (32°F) and 25°C (77°F).
- AC compressor must have been off for an hour since the last time the AC compressor was on.

P2516

- 12 V battery system voltage above 10.25 V.
- HPCM2 is awake and communicating.
- None of these DTCs may be active: P2517, P2518, P0073; P0072; P0071, P0119; P0118; P0117; P0116, P0606
- Engine coolant temperature must be within 15 degrees of outside air temperature
- AC compressor must have been off for an hour since the last time the AC compressor was on.
- AC compressor must be turned on for one minute. (This may require the service technician to select an HVAC mode that causes the AC compressor to run).

P2517 or P2518

- 12 V battery system voltage above 10.25 V.
- HPCM2 is awake and communicating.

[Conditions for Setting the DTC](#)

DTC P151C

The A/C low side Refrigerant Pressure reading and the A/C high side Refrigerant Pressure reading must be within 200 kPa (29 psi). and the A/C low side Refrigerant Pressure reading and the pressure derived from the A/C Refrigerant Temperature Sensor must be within 200 kPa (29 psi)

DTC P2516

The difference between the A/C low side pressure Sensor before compressor on and after compressor on changes less than 50 kPa (7 psi) over a 15 second period.

DTC P2517

The HPCM2 detects a short to ground or open at the A/C low side pressure sensor signal circuit.

DTC P2518

The HPCM2 detects a short to voltage at the A/C low side pressure sensor signal circuit.

[Action Taken When the DTC Sets](#)

These are type B DTCs.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B1C A/C low side pressure sensor harness connector. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 3 and ground.

If 10 Ω or greater

- 2.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
- 2.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K114B HPCM2.

If less than 10 Ω

3. Vehicle in Service Mode.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.

If less than 4.8 V

- 4.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
- 4.2. Test for infinite resistance between the 5 V reference circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 4.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K114B HPCM2.

If greater than 5.2 V

- 4.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2, vehicle in Service Mode.
- 4.2. Test for less than 1 V between the 5 V reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K114B HPCM2.

If between 4.8-5.2 V

5. Verify the scan tool A/C Low Side Pressure Sensor parameter is less than 4.8-5.2 V.

If 4.8-5.2 V or greater

- 5.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2, vehicle in Service Mode.
- 5.2. Test for less than 1 V between the signal circuit terminal 3 and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K114B HPCM2.

If less than 4.8-5.2 V

6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 2.
7. Verify the scan tool A/C Low Side Pressure Sensor parameter is greater than .02 V.

If .02 V or less

- 7.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
- 7.2. Test for infinite resistance between the signal circuit terminal 1 and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
- 7.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K114B HPCM2.

If greater than .02 V

8. Test or replace the B1C A/C refrigerant pressure sensor.

DTC Descriptors

DTC P1ECA: A/C Compressor Motor Instantaneous High Voltage

DTC P1EC9: A/C Compressor Motor Instantaneous High Current

Circuit/System Description

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High Voltage Battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button
- The HVAC control, in AUTO mode, requests the electric AC compressor on to help in cooling the cabin or removing moisture in the defrost mode
- The High Voltage Battery Thermal System requests the AC compressor on to help maintain the battery temperature

The Hybrid/EV Powertrain Control Module 2 uses values from the A/C refrigerant pressure transducers, A/C refrigerant thermistor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, evaporator temperature sensor, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This speed request message is sent from the Hybrid/EV Powertrain Control Module 2 to the A/C compressor control module via GM LAN message.

Conditions for Running the DTC

DTC P1ECA

- System voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode

DTC P1EC9

- System voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor Speed Request is greater than 0 RPM

[Conditions for Setting the DTC](#)

DTC P1ECA

Sets when the high voltage to the module is greater than 480 V for 3 seconds

DTC P1EC9

Sets when DC Link is above threshold of 60 A for 3 seconds

[Action Taken When the DTC Sets](#)

The A/C compressor control module is disabled but will retry once the compressor speed request goes to 0 RPM and a new speed request greater than 0 RPM is sent.

[Conditions for Clearing the DTC](#)

The DTC can be cleared with the scan tool.

DTC P1F0C: Electric A/C Compressor Control Module A/C Compressor Motor Current Feedback Circuit Low Voltage

DTC P10FD: Electric A/C Compressor Control Module A/C Compressor Motor Current Feedback Circuit High Voltage

[Circuit/System Description](#)

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High voltage battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button
- The HVAC control, in AUTO mode, requests the electric AC compressor on to help in cooling the cabin or removing moisture in the defrost mode
- The High Voltage Battery Thermal System requests the AC compressor on to help maintain the battery temperature

The Hybrid/EV Powertrain Control Module 2 uses values from the A/C refrigerant pressure transducers, A/C refrigerant thermistor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, evaporator temperature sensor, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This message is sent from the Hybrid/EV Powertrain Control Module 2 to the A/C compressor control module via serial data message.

AC Compressor has a motor start up procedure that can take a variable length of time to run to bring the motor up to requested speed. Length of time is dependent on external conditions such as under-bonnet temperature and high side pressure. In hotter conditions, the motor start up time will be longer. The A/C compressor control module monitors an internal parameter known as the DC link current which is based off DC input current. It is not possible to measure this parameter externally.

Conditions for Running the DTC

DTC P1F0A

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

DTC P1F0B

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

DTC P1F0C

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

DTC P1F0D

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

Conditions for Setting the DTC

DTC P1F0A

- A/C compressor control module temperature is greater than 85°C (185°F) and compressor motor speed does not reach to 1800 RPM within 20 seconds after the start of spinning
- A/C compressor control module temperature is less than or equal to 85°C and A/C compressor motor speed does not reach 1800 RPM.

DTC P1F0B

Any A/C compressor control module phase current (U/V/W) \geq -1A during initial motor startup process

DTC P1F0C

A/C compressor control module DC link Current is less than 2.5 A for 6 seconds

DTC P1F0D

A/C compressor control module DC link Current is greater than 36.7 A for 6 seconds

Action Taken When the DTC Sets

The A/C compressor control module is disabled but will retry once the compressor speed request goes to 0 RPM and a new speed request $>$ 0 RPM is sent.

Conditions for Clearing the DTC

These are type B DTCs

DTC P2681, P26A3, P26A6, P26A7, or P26A9

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P2681: Engine Coolant Bypass Valve Control Circuit

DTC P26A3: Engine Coolant Bypass Valve Performance

DTC P26A6: Engine Coolant Bypass Valve Position Sensor Circuit Low Voltage

DTC P26A7: Engine Coolant Bypass Valve Position Sensor Circuit High Voltage

DTC P26A9: Engine Coolant Bypass Valve Position Sensor Stop Performance

[Circuit/System Description](#)

The passenger compartment heater coolant control valve regulates the engine coolant flow into the cabin heater loop depending on engine coolant temperature and ambient temperature conditions. The passenger compartment heater coolant control valve has two positions: ByPass or Link. In the ByPass position, the coolant in the engine loop and heater loop are separated and in the link position the coolant circulates through both loops. The valve movement is controlled by a PWM signal. A 50% duty cycle is a normal duty cycle. A 75% duty cycle represents a valve commanded to the link position. A 25% duty cycle represents a valve commanded to the ByPass position. The passenger compartment heater coolant control valve uses an internal position sensor that sends a signal to the hybrid powertrain control module to determine the valve position.

When the engine coolant temperature heats up, a valve learn procedure takes place. The hybrid powertrain control module 2 commands the valve to the link position and records the voltage coming back from the position sensor. Then the hybrid powertrain control module 2 commands the valve back to the bypass position and records the voltage coming back from the position sensor. The voltage values in both the link and bypass positions must fall within calibrated ranges.

Conditions for Running the DTC

P2681, P26A6 and P26A7

12 V battery system voltage is greater than or equal to 10.25 V.

P26A3 and P26A9

- 12 V battery system voltage is greater than or equal to 10.25 V.
- The propulsion system is active.
- None of the following DTCs are set; P2681, P26A6, P26A7.

Conditions for Setting the DTC

P2681

The hybrid powertrain control module 2 has detected a short to voltage or an open on valve drive circuit.

P26A6

The hybrid powertrain control module 2 has detected a short to ground on feedback circuit. The feedback signal is less than 5% (0.25 V).

P26A7

The hybrid powertrain control module 2 has detected a short to voltage on feedback circuit. The feedback signal is greater than 95% (4.25 V).

P26A3

- The hybrid powertrain control module 2 has detected a stuck valve.
 - The valve did not reach the commanded position within 15 seconds after 3 attempts to move the valve.
 - The coolant temperature is above 50° C.
- OR
- The hybrid powertrain control module 2 has detected a stuck valve.
 - The valve did not reach the commanded position within 15 seconds
 - The coolant temperature is above 65° C.

P26A9

- The feedback signal is between 70% - 95% (3.5 V - 4.75 V) or between 5% - 30% (0.25 V-1.5 V)
OR
- The hybrid powertrain control module 2 has detected the valve feedback has drifted beyond acceptable range.
OR
- The hybrid powertrain control module 2 has detected the valve feedback to be erratic beyond acceptable range.

Action Taken When the DTC Sets

DTCs P2681, P26A3, P26A6, P26A7 and P26A9 are type B DTCs.

Conditions for Clearing the DTC

- DTCs P2681, P26A3, P26A6, P26A7 and P26A9 are type B DTCs.
- DTC P26A3 requires the ignition to cycle from ON to OFF.

Circuit/System Verification

1. Verify that DTC P2518 is not set.
If DTC P0606, P0CE7, P2518 and P26A7 are set, refer to [DTC P151C or P2516-P2518](#)
If DTC P0606, P0CE7 and P26A7 are set, refer to [DTC P0601-P0604, P0606, or P062F](#)
2. With a scan tool, verify that the Passenger Compartment Heater Coolant Control Solenoid Valve Feedback is between 37%-62%.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. Disconnect the harness connector at the Q66 Passenger Compartment Heater Coolant Control Valve. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
If 10 Ω or greater
 - 2.1. Vehicle OFF.
 - 2.2. Test for less than 2 Ω in the ground circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , repair the open/high resistance in the ground connection.**If less than 10 Ω**
3. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
If 10 Ω or greater
 - 3.1. Disconnect the harness connector at the K114B HPCM2.
 - 3.2. Test for less than 2 Ω in the low reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K114B HPCM2.**If less than 10 Ω**
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
If the test lamp does not illuminate and the circuit fuse is good
 - 4.1. Vehicle OFF.
 - 4.2. Test for less than 2 Ω in the B+ circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
If the test lamp does not illuminate and the circuit fuse is open

- 4.1. Vehicle OFF.
- 4.2. Test for infinite resistance between the B+ circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance, replace the X50A Underhood Fuse Block.

If the test lamp illuminates

5. Vehicle ON.
6. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
If less than 4.8 V
 - 6.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
 - 6.2. Test for infinite resistance between the 5 V reference circuit and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 6.3. Test for less than 2 Ω in the 5 V reference circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.
If less than 2 Ω , replace the K114B HPCM2.

If greater than 5.2 V

- 6.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2, vehicle ON.
- 6.2. Test for less than 1 V between the 5 V reference circuit and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K114B HPCM2.

If between 4.8-5.2 V

7. Verify the scan tool Passenger Compartment Heater Coolant Control Valve Feedback parameter is less than 10%.
If 10% or greater
 - 7.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2, vehicle ON.
 - 7.2. Test for less than 1 V between the signal circuit terminal 4 and ground.
If 1 V or greater, repair the short to voltage on the circuit.
If less than 1 V, replace the K114B HPCM2.

If less than 10%

8. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 3.
9. Verify the scan tool Passenger Compartment Heater Coolant Control Valve Feedback parameter is greater than 10%.
If 10% or less
 - 9.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.
 - 9.2. Test for infinite resistance between the signal circuit terminal 4 and ground.
If less than infinite resistance, repair the short to ground on the circuit.
If infinite resistance
 - 9.3. Test for less than 2 Ω in the signal circuit end to end.
If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K114B HPCM2.

If greater than 95%

10. Connect a test lamp between the control circuit terminal 2 and the B+ circuit terminal 1.
11. Verify the test lamp turns ON and OFF when Commanding the Passenger Compartment Heater Coolant Control Valve ON and OFF with a scan tool.

If the test lamp is always OFF

11.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.

11.2. Test for less than 1 V between the control circuit and ground.

If 1 V or greater, repair the short to voltage on the circuit.

If less than 1 V

11.3. Vehicle OFF.

11.4. Test for less than 2 Ω in the control circuit end to end.

If 2 Ω or greater, repair the open/high resistance in the circuit.

If less than 2 Ω , replace the K114B HPCM2.

If the test lamp is always ON

11.1. Vehicle OFF, disconnect the harness connector at the K114B HPCM2.

11.2. Test for infinite resistance between the control circuit terminal 2 and ground.

If less than infinite resistance, repair the short to ground on the circuit.

If infinite resistance, replace the K114B HPCM2.

If the test lamp turns ON and OFF

12. Test or replace the Q66 passenger compartment heater coolant control valve.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Heater Water Shutoff Valve Replacement](#)
- [Control Module References](#) for the hybrid powertrain control module 2 replacement, programming and setup

Symptoms - HVAC Systems - Automatic

Note: The following steps must be completed before using the symptom tables:

1. Perform the [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to [Automatic HVAC Description and Operation](#) .

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns freely and is not seized.
- Verify that the customer is using the correct key to enable personalisation and is not inadvertently activating auxiliary HVAC controls.
- The A/C compressor will not operate in cold outside air temperatures.
- The following conditions may cause window fogging:
 - Wet carpet or mats
 - High humidity
 - Interior water leak
 - Blocked A/C evaporator drain tube
 - Maximum passenger capacity
 - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:
 - Obstructed or dirty passenger compartment air filter, if equipped
 - Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

[Symptom List](#)

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

[HVAC System Malfunction](#)

HVAC System Malfunction

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Diagnostic Aids](#)

Check the following mechanical fault sources:

- Air distribution box
- Air distribution hoses/air distribution ducts

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

Note: Check for bulletins before proceeding.

1. Vehicle in Service Mode, place the blower motor switch in each speed position. Verify that the blower motor operates properly in each position.
If the blower motor does not operate properly in all speeds, refer to [DTC B0193](#) .
2. Using the scan tool observe the mode, temperature, air inlet and recirculation door positions. Verify the actual and commanded door positions are within 4 counts of each other.
If not within the specified range, refer to Circuit/System Testing [DTC B0223, B0233, B023A, or B0408](#) .
3. Engine ON, A/C ON, place the temperature control in the coldest position. Verify that cool air flows from the ducts in the vehicle.
If the air is not cool, refer to [Air Conditioning \(A/C\) System Performance Test](#) .
4. Turn the A/C OFF and place the temperature control in the warmest position.
If the air is insufficiently heated refer to [Heating Performance Diagnostic](#) .
5. Engine OFF, Vehicle in Service Mode, cover the sunload sensor assembly with a workshop towel or other suitable item. Verify the scan tool Sunload Sensor parameter changes.
If it does not change, refer to Circuit/System Testing [DTC B0183](#) .
6. Measure actual inside air temperature using a thermometer. Compare this value to the scan tool Inside Passenger Compartment Air Temp. Sensor parameter. The measured temperature should be within 5 degrees of parameter.
If not within the specified range, refer to Circuit/System Testing [DTC B0163](#) .
7. Vehicle in Service Mode, observe the scan tool A/C Evaporator Temperature Sensor parameter. The reading should be between -39°F and 185°F and change with evaporator air temperature changes.
If not within the specified range, refer to Circuit/System Testing [DTC B0173, B0178, or B3933](#) or [DTC P0536-P0538 or P153B](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [HVAC Component Replacement Reference](#)
- [Control Module References](#) for HVAC control module replacement, programming and setup

Actuator Recalibration

Note: Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.

When replacing the HVAC control module it will be necessary to allow the HVAC control module to perform a calibration process. When installing the HVAC control module be sure to perform the following:

1. Place the ignition switch to the OFF position.
2. Disconnect the scan tool.
3. Install the HVAC control module.
4. Connect all previously disconnected components.
5. Vehicle in Service Mode.
6. Wait 40 seconds for the HVAC control module to self-calibrate.
7. Verify that no DTCs have set as current DTCs.

When replacing the HVAC actuator it will be necessary to allow the HVAC control module to perform a calibration process. When installing the HVAC actuator be sure to perform one of the following:

Preferred Method (with Scan Tool)

Note: Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.

1. Clear all DTCs.
2. Place the ignition switch in the OFF position.
3. Install the HVAC actuator.
4. Connect all previously disconnected components.
5. Start the vehicle.
6. With the scan tool, initiate the HVAC Actuators re-calibration feature of the Remote Heater and Air Conditioning Control Module Special Functions menu.
7. Verify that no DTCs have set as current DTCs.

Alternate Method (without Scan Tool)

Note: Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.

1. Clear all DTCs.

2. Place the ignition switch to the OFF position.
3. Install the HVAC actuator.
4. Connect all previously disconnected components.
5. Remove the HVAC control module fuse for a minimum of 10 seconds.
6. Install the HVAC control module fuse.
7. Vehicle in Service Mode.
8. Wait 40 seconds for the HVAC control module to self-calibrate.
9. Verify that no DTCs have set as current DTCs.

Air Inlet Valve Actuator Replacement

Callout	Component Name
Preliminary Procedures	
Remove the air inlet assembly. Air Inlet Assembly Replacement	
	Air Inlet Valve Actuator Gear Screw (Qty: 3)

1	<p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 1.5 N·m (13 lb in)</p>
2	<p>Air Inlet Valve Actuator Gear</p> <p>Procedure</p> <p>Disconnect the air inlet valve actuator gear electrical connector.</p> <p>Tip Actuator is self-calibrating when connecting the battery. Refer to Actuator Recalibration</p>

Temperature Valve Actuator Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Disconnect the negative and positive cables from the accessory DC power control module. Refer to Battery Positive and Negative Cable Replacement2. Remove the floor air outlet duct- right side. Refer to Floor Front Air Outlet Duct Replacement - Right Side .	

1	Temperature Valve Actuator Screw (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 1.5 N·m (13 lb in)
2	Temperature Valve Actuator Tip Actuator is self-calibrating when connecting the battery. Refer to Actuator Recalibration

Air Conditioning Refrigerant Temperature Sensor Replacement

Callout	Component Name
Preliminary Procedure	
	Remove the floor air outlet duct - right side. Refer to Floor Front Air Outlet Duct Replacement - Right Side .
	Air Conditioning Refrigerant Temperature Sensor

1

Procedure

1. Disconnect the refrigerant temperature sensor electrical connector.
2. Twist and pull the refrigerant temperature sensor from the HVAC module assembly.

Duct Air Temperature Sensor Replacement - Upper

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none">1. Remove Upper Trim Pad Retainer. Refer to Upper Trim Pad Retainer Replacement .2. Disconnect the upper air temperature sensor electrical connector.	

Duct Air Temperature Sensor Replacement - Lower

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Remove the inflatable restraint instrument panel lower module - driver side. Refer to Inflatable Restraint Instrument Panel Lower Module Replacement - Driver Side .2. Remove the front air outlet duct left -- side. Refer to Floor Front Air Outlet Duct Replacement - Left Side .3. Disconnect the lower air temperature sensor electrical connector.	

1

Air Temperature Sensor - Lower

Inside Air Moisture and Windscreen Temperature Sensor Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove the inside rearview mirror mount plate cover. Refer to Inside Rearview Mirror Mount Plate Cover Replacement .</p>	
	<p>Inside Air Moisture and Windscreen Temperature Sensor</p>

Procedure

1

1. Squeeze the two electrical connector tabs and release the connector from the windscreen temperature sensor.
2. Slide the connector upward from the sensor.
3. Slide the sensor from under the multi-function accessory bracket clip.
4. Remove the sensor.

Sun Load Temperature and Headlamp Automatic Control Ambient Light Sensor Replacement

Callout	Component Name
<p>Preliminary Procedure</p> <p>Remove instrument panel upper trim panel. Refer to Instrument Panel Upper Trim Panel Replacement .</p>	
	<p>Sun Load Temperature and Headlamp Automatic Control Ambient Light Sensor</p>

1

Procedure

1. Disconnect the electrical connector.
2. Twist the sensor anti-clockwise to remove.

Automatic HVAC Description and Operation

[HVAC Control Components](#)

HVAC Control

The HVAC control contains all switches, which are required to control the functions of HVAC and serve as interface between the operator and the HVAC control module. The selected values are passed to the HVAC control module via serial data.

HVAC Remote Control Module

The HVAC control module is a serial data device that interfaces between the operator and the HVAC system to maintain and control desired air temperature and air distribution settings. The battery positive voltage circuit provides power that the HVAC control module uses for keep alive memory. If the battery positive voltage circuit loses power, all HVAC DTCs and settings will be erased from keep alive memory. The body control module (BCM), which is the vehicle power mode master, provides a device ON-Signal. The HVAC control module provides blower, air delivery mode and air temperature settings.

The HVAC control module supports the following features:

Feature	Availability
Purge	Yes
Personalisation	Yes
Actuator Calibration	Yes

HVAC Coolant Pump

The HVAC control module will control a cabin coolant heater pump based on a valid flow rate. If the HVAC Heating system requests a coolant flow rate, the HVAC coolant pump will be commanded "on" and to the desired speed.

HVAC Cabin Coolant Sensor

The HVAC control module will monitor a coolant temperature sensor input. This will be used to determine the heat source requirements for the coolant heater control module. This input will also be used along with engine temperature and other vehicle inputs.

Mode Actuator

The mode actuator is a 5-pin stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energises the 4 stepper motor coils with a pulsed ground signal. The stepper motor puts the mode flap into the calculated position in order to reach the selected position. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Air Temperature Actuator

The air temperature actuator is a 5-pin stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energises the 4 stepper motor coils with a pulsed ground signal. The stepper motor puts the mixed air flap into the calculated position, in order to reach the selected temperature. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Recirculation Actuator

The recirculation actuator is a 5-pin stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energises the 4 stepper motor coils with a pulsed ground signal. The stepper motor puts the recirculation flap into the calculated position in order to reach the desired position. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Blower Motor Control Module

The fan motor control module controls the speed of the fan motor by increasing or decreasing the voltage drop on the ground side of the fan motor. The HVAC control module provides a low side pulse width modulation (PWM) signal to the fan motor control module via the fan motor speed control circuit. As the requested blower speed increases, the HVAC control module increases the amount of time that the speed signal is modulated to ground. As the requested blower speed decreases, the HVAC control module decreases the amount of time that the signal is modulated to ground.

Duct Temperature Sensors

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The sensors operate within a temperature range of -40 to +85°C (-40 to +185°F). The sensors are installed in the air distribution ducts and measure the temperature of the air that streams from the ducts. The HVAC control module uses these values to calculate the mixed air flap position.

Evaporator Temperature Sensor

The evaporator temperature sensor is a 2-wire negative temperature co-efficient thermistor. The sensor operates within a temperature range of -40 to +85°C (-40 to +185°F). The sensor is installed at the evaporator and measures its temperature. If the temperature drops close to 3°C (38°F), the A/C compressor will be commanded off by the HVAC control module in order to prevent icing of the evaporator.

A/C Refrigerant Temperature Sensor

The A/C refrigerant temperature sensor is a 2-wire negative temperature co-efficient thermistor. The sensor operates within a temperature range of -40 to +85°C (-40 to +185°F). The sensor is installed in the low side refrigerant line and measures its temperature. If the temperature drops close to 3°C (38°F), the A/C compressor will be commanded off by the Hybrid/EV powertrain control module 2 in order to prevent icing of the evaporator.

Windscreen Temperature and Inside Moisture Sensor

The windscreen temperature and inside moisture sensor includes the relative humidity sensor, windscreen temperature sensor and humidity sensing element temperature sensor.

This sensor assembly provides information about:

- Relative humidity level at windscreen (compartment side)
- Temperature of the windscreen inside (compartment side)
- Temperature of the humidity sensor element

The relative humidity sensor measures the relative humidity of the compartment side of the windscreen. It also detects the temperature of the windscreen surface on the passenger compartment side. Both values are used as control inputs for the HVAC control module application to calculate the fog risk on windscreen compartment side and ability to reduce fuel consumption by decreasing A/C compressor power to a minimum without causing any fog. The sensor will also enable partial recirculation mode in order to improve heat-up performance of the passenger compartment under cold ambient temperature conditions without the risk of mist build-up on the windscreen. The humidity sensor element temperature sensor supplies the temperature of the humidity sensor element.

Ambient Light/Sunload Sensor

The ambient light/sunload sensor includes the sunload sensor and passenger compartment temperature sensor.

This sensor assembly provides information about:

- Sun heat intensity
- Passenger compartment temperature

The solar sensor is connected to ground and to a 5 V stabilised voltage supply through the HVAC control module. As the sunload increases, the sensor signal voltage also increases and vice versa. The signal varies between 1.4-4.5 V and is provided to the HVAC control module.

The passenger compartment temperature sensor is a negative temperature co-efficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0-5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

A/C Compressor

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes high voltage direct current from the vehicle's high voltage battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button or
- The HVAC control, in ECO climate or Comfort Climate Settings, requests the electric AC compressor on to help in cooling the cabin or removing moisture in conditions where the windows may fog or
- The hybrid/EV powertrain control module 2 requests the AC compressor on to help maintain the battery temperature

The hybrid/EV powertrain control module 2 uses values from the A/C refrigerant pressure sensor, A/C refrigerant thermistor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, evaporator temperature sensor, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This message is sent from the hybrid/EV powertrain control module 2 to the A/C compressor control module via serial data message.

[Air Speed](#)

The blower control switch is part of the HVAC faceplate control. The selected value of the blower switch position is sent to the HVAC control module via serial data.

The blower motor control module is an interface between HVAC control module and blower motor. The blower motor control module regulates supply voltage and ground circuits to blower motor. The HVAC control module provides a PWM signal to the blower motor control module in order to command the desired blower motor speed. The blower motor control module supplies battery voltage to the blower motor and uses the blower motor ground as a low side control to adjust the blower motor speed. The voltage amounts between 2-13 V and changes linear to the height of the PWM signal.

[Air Delivery](#)

The HVAC control module controls the distribution of air within the passenger compartment by the use of the mode actuator. The modes that may be selected are:

- Defrost
- Defog
- Panel
- Floor
- BiLevel

In auto mode, the air delivery mode is controlled automatically based on cooling/warming needs of the compartment. The desired air distribution mode can be selected with the air distribution buttons at the HVAC faceplate control. The HVAC control delivers the values to the HVAC control module via serial data. The HVAC control module controls the mode actuator so that it drives the flap to the calculated position. Depending on the position of the flap, air is distributed through various ducts leading to the outlets in the dash. Turning the mode flap to the defrost position, the HVAC control module will move the recirculation actuator to outside air, reducing window fogging. When defrost is selected, the blower motor will be activated. The HVAC control module enables a high volume of air delivered to the front defrost vents. A/C is available in all

modes.

The rear window demister does not affect the HVAC system.

Heating and A/C Operation

The purpose of the heating and A/C system is to provide heated and cooled air to the interior of the vehicle. The A/C system will also remove humidity from the interior and reduce windscreen fogging. Regardless of the temperature setting, the following can affect the rate that the HVAC system can achieve the desired temperature:

- Ambient air temperature
- Difference between inside and desired temperature
- Blower motor speed setting
- Mode setting
- Air conditioning control module operation
- Hybrid/EV powertrain control module 2 operation
- Coolant heater control module

Pressing the climate mode buttons (Comfort Mode or ECO Mode) enables the HVAC control module to determine whether to request A/C compressor and coolant heater activation. Based on the thermal conditions of the vehicle the HVAC control module sends a serial data message to the hybrid/EV powertrain control module 2 for the A/C request. The hybrid/EV powertrain control module 2 will request the A/C compressor control Module to engage A/C. The HVAC control module sends the heating request to the coolant heater control module to produce heat.

Climate Mode button (Fan Only) will disable all heating and cooling of the vehicle unless overridden by dehumidification requirements.

Recirculation Operation

The recirculation button is part of the HVAC faceplate control. The selected recirculation button position is sent to the HVAC control module via serial data. The HVAC control module controls the air intake through the recirculation actuator. The recirculation switch closes and opens the recirculation flap in order to circulate the air within the vehicle, or route outside air into the vehicle.

Inside air recirculation is prevented if the defrost mode is not active. When the defrost mode is active, the recirculation actuator opens the recirculation flap and outside air is circulated to the windscreen to reduce fogging.

In automatic recirculation mode the values of the windscreen temperature and inside moisture sensor are used as control inputs for the HVAC control module application to calculate the fog risk on the passenger compartment side of the windscreen. The A/C compressor and the defrost mode are activated to prevent or remove fog on the passenger compartment side of the windscreen.

Automatic Operation

The user can select to operate the Blower, Recirculation and Air Delivery operations in auto per auto operation mode.

To put the HVAC system in full automatic mode, the following is required:

1. The auto button must be pressed.
2. The system indicates that all 3 functions are being operated automatically by lighting the auto button LED.

When the auto button is pressed, the system responds by putting the blower, air delivery and recirculation into auto mode. If any of these functions are adjusted then the auto button indication will go off and the function will leave auto operation and follow the user requested setting: auto, blower, air delivery and recirculation. In this setting the blower request is adjusted to quickly heat the cabin initially. After comfort is reached, the blower is minimised to reduce noise and temperature drifts.

Under cold ambient temperatures, the automatic HVAC system provides heat in the most efficient manner. The operator can select an extreme temperature setting but the system will not warm the vehicle any faster. Under warm ambient temperatures, the automatic HVAC system also provides air conditioning in the most efficient manner. Selecting an extreme cool temperature will not cool the vehicle any faster.

In automatic mode the values of the windscreen temperature and inside moisture sensor are used as control inputs for the HVAC control module application to calculate the fog risk on the passenger compartment side of the windscreen and ability to reduce fuel consumption by decreasing A/C compressor power to a minimum without causing any fog. The A/C compressor and the defrost mode may be activated to prevent or remove fog on the passenger compartment side of the windscreen. The sensor will also enable partial recirculation mode in order to improve heat-up performance of the passenger compartment under cold ambient temperature conditions without the risk of mist build-up on the windscreen.

Coolant Heater Control Module

The coolant heater control module is an essential element of the hybrid heating system. The hybrid/EV powertrain control module 2 controls the passenger compartment heater coolant control valve, and the HVAC commands the coolant heater control module activation. Heated coolant either from the engine or the coolant heater control module will meet HVAC temperature demands. The coolant heater control module will be commanded "off" if the coolant temperature exceeds the desired temperature. If the coolant temperature reaches an even higher level, the passenger compartment heater coolant control valve will move to the 'bypass' position, preventing coolant from flowing through the coolant heater control module and the cabin heater core.

Coolant heat generated by the engine is also an element of the heating system. Once the engine coolant is warm enough to supply the required heat, the passenger compartment heater coolant control valve will move to the 'link' position, which allows sharing of coolant between the engine, the coolant heater control module and passenger compartment heater core. The coolant heater control module power level will be reduced and/or cycled on/off as the engine turns on/off during charge-sustaining mode, maintaining cabin comfort. When the engine is utilised for charge sustaining mode the thermostat will control the normal engine operating coolant temperature. The thermostat also creates a restriction for the cooling system that promotes a positive coolant flow and helps prevent cavitation.

Heater coolant enters the heater core through the inlet heater hose, in a pressurised state. The heater core is located inside the HVAC module. The ambient air drawn through the HVAC module, absorbs the heat of the coolant flowing through the heater core. Heated air is distributed to the passenger compartment, through the HVAC module, for passenger comfort. Opening or closing the air temperature flap controls the amount of heat delivered to the passenger compartment. The coolant exits the heater core through the return heater hose and recirculates back to the system as controlled by the coolant passenger compartment heater coolant control valve.

A/C Compressor Cycle

Refrigerant is the key element in an air conditioning system. R-134a is presently the only Environmental Protection Agency approved refrigerant for automotive use. R-134a is a very low temperature gas that can transfer the undesirable heat and moisture from the passenger compartment to the outside air.

The compressor builds pressure on the vapour refrigerant. Compressing the refrigerant also adds heat to the refrigerant. The refrigerant is discharged from the compressor, through the discharge hose, and forced to flow to the condenser and then through the balance of the A/C system.

Compressed refrigerant enters the condenser in a high temperature, high pressure vapour state. As the refrigerant flows through the condenser, the heat of the refrigerant is transferred to the ambient air passing through the condenser. Cooling the refrigerant causes the refrigerant to condense and change from a vapour to a liquid state.

The condenser is located in front of the radiator for maximum heat transfer. The condenser is made of aluminium tubing and aluminium cooling fins, which allows rapid heat transfer for the refrigerant. The semi-cooled liquid refrigerant exits the condenser and flows to the Receiver/Dehydrator(R/D).

The R/D contains desiccant that absorbs moisture that may be in the refrigerant system. The R/D also acts as a storage vessel to ensure that a steady flow of liquid reaches the Thermal Expansion Valve (TXV). The refrigerant exits the R/D and flows through the liquid line to the TXV.

The TXV is located at the front of dash and attaches to the evaporator inlet and outlet pipes. The TXV is the dividing point for the high and the low pressure sides of the A/C system. As the refrigerant passes through the TXV, the pressure on the refrigerant is lowered. The TXV also metres the amount of liquid refrigerant that can flow into the evaporator.

Refrigerant exiting the TXV flows into the evaporator core in a low pressure, liquid state. The HVAC control module blows air through the evaporator core. Warm and moist air will cause the liquid refrigerant to boil inside of the evaporator core. The boiling refrigerant absorbs heat from the ambient air and draws moisture onto the evaporator. The refrigerant exits the evaporator through the suction line and back to the A/C compressor, in a vapour state, and completing the A/C cycle of heat removal. At the A/C compressor, the refrigerant is compressed again and the cycle of heat removal is repeated.

The conditioned air is distributed through the HVAC control module for passenger comfort. The heat and moisture removed from the passenger compartment will also change form, or condense, and is discharged from the HVAC control module as water through a drain to the outside (underside) of the vehicle.

The A/C system is mechanically protected with the use of a high pressure relief valve. If the A/C refrigerant pressure sensor fails or if the refrigerant system becomes restricted and refrigerant pressure continued to rise, the high pressure relief will pop open and release refrigerant from the system.

[DTC Descriptor](#)

DTC P0335: Crankshaft Position Sensor Circuit

DTC P0336: Crankshaft Position Sensor Performance

[Circuit/System Description](#)

The crankshaft position sensor detects crankshaft speed and position. The crankshaft position sensor produces an alternating current (AC) voltage of different amplitude and frequency. The frequency depends on the velocity of the crankshaft, and the AC voltage output depends on the crankshaft position and battery voltage. The crankshaft position sensor works in conjunction with a 58 tooth reluctor wheel attached to the crankshaft. The engine control module (ECM) can synchronise the ignition timing, fuel injector timing, and spark knock control based on the crankshaft position sensor and the camshaft position sensor inputs. The crankshaft position sensor is also used to detect misfire. The ECM also sends a replicated signal over a dedicated line to the hybrid powertrain control module.

The hybrid powertrain control module uses crankshaft speed and position to confirm ICE status in various modes; for example to confirm Autostart and Autostop functionality. In addition to the signal sent over the dedicated line, this information is also sent from the ECM to the hybrid powertrain control module over serial data. The serial data status will be used by the hybrid powertrain control module in the event of a failure of this circuit.

[Conditions for Running the DTC](#)

P0335 or P0336

The vehicle is ON.

[Conditions for Setting the DTC](#)

P0335

No signal from the crank sensor for more than 2 seconds.

P0336

The signal from the crank sensor is invalid for more than 1 second.

Action Taken When the DTC Sets

DTCs P0335 and P0336 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0335 and P0336 are Type B DTCs.

Diagnostic Aids

A high-resistance earth at either the power inverter module or the ECM may cause these DTCs to set intermittently.

[Circuit/System Verification](#)

1. Verify that ECM DTCs P0335 or P0336 are not set.
If either of the DTCs are set, refer to Engine Controls and Fuel [DTC P0335 or P0336](#) .
2. With the engine running, observe the hybrid powertrain control module Engine Speed parameter with a scan tool. The parameter should display the current engine speed, matching the tachometer and/or the ECM Engine Speed parameter.
If the hybrid powertrain control module Engine Speed parameter displays a value other than the current engine speed, continue with Circuit/System Testing.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the X1 harness connector at the T6 power inverter module.
2. Vehicle in Service Mode, test for 4.8-5.2 V between the signal circuit terminal 5 and earth.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
3. If the DTC is set, program the T6 power inverter module. If the DTC resets, replace the T6 power inverter module.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0506: Idle Air Control (IAC) System - RPM Too Low

DTC P0507: Idle Air Control (IAC) System - RPM Too High

Circuit/System Description

The hybrid powertrain control module determines the engine speed which is based on the high-voltage battery pack state of charge. The ECM achieves throttle positioning by providing a pulse width modulated voltage to the throttle actuator motor. The throttle blade is spring loaded in both directions, and the default position is slightly open. The hybrid powertrain control module can detect a condition where the engine is cranking but does not start or has stalled, or if the engine speed does not match the commanded speed.

The throttle actuator control (TAC) motor is controlled by the engine control module (ECM). The DC motor located in the throttle body drives the throttle blade. In order to decrease engine speed, along with spark and fuel delivery changes the ECM commands the throttle closed reducing air flow into the engine and the engine speed decreases. In order to increase engine speed, the ECM commands the throttle plate open allowing more air to pass the throttle plate. If the hybrid powertrain control module detects the actual engine speed is not within a predetermined range of the commanded engine speed, this DTC sets.

Conditions for Running the DTC

- DTCs , P0068, P0101, P0102, P0103, P0112, P0113, P0116, P0117, P0118, P0121, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300-P0304, P0351-P0354, P0461-P0463, P0496, P0606, P06A3, P0721, P1516, P2066-P2068, P2101, P2122, P2123, P2127, P2128, P2135, P2138, P2227-P2230 are not set.
- The system voltage is between 9-32 volts.
- The accelerator pedal position is valid.

- The accelerator pedal position is less than 1 percent.
- The engine has been running for greater than 60 seconds.
- The vehicle speed is less than 1.6 km/h (1 mph).
- The barometric pressure (BARO) is greater than 70 kPa (11 psi).
- The engine coolant temperature (ECT) is greater than 60-125°C (140-257°F).
- The intake air temperature (IAT) is warmer than -20°C (-4°F).
- The commanded engine speed is steady within 25 RPM.
- A scan tool output control is not active.
- DTCs P0506 or P0507 run continuously when the above conditions are met for greater than 10 seconds.

Conditions for Setting the DTC

P0506

The actual engine speed is approximately 75 RPM less than the commanded engine speed.

P0507

The actual engine speed is approximately 150 RPM greater than the commanded engine speed.

Action Taken When the DTC Sets

DTCs P0506 and P0507 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0506 and P0507 are Type B DTCs.

Diagnostic Aids

- A stalling condition can cause DTC P0506 to set.
- An intermittent vehicle speed sensor (VSS) signal can cause DTC P0507 to set.

[Circuit/System Verification](#)

1. Verify that there are no other DTCs set.
If any other DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Verify that none of the conditions listed below exist:

P0506

- Excess deposits in the Q38 throttle body. Refer to [Throttle Body Inspection and Cleaning](#) .
- Restricted exhaust
- Mechanical conditions that limit engine speed
- Parasitic load on the engine -- For example, a transmission condition or a belt driven accessory condition.

If a condition is found, repair as necessary.

P0507

- Vacuum leaks
- A throttle valve that does not close correctly

- Verify the correct operation of the crankcase ventilation system. Inspect for the following conditions:
 - The routing of the positive crankcase ventilation (PCV) system
 - Vacuum leaks in the PCV systemIf a condition is found, repair as necessary.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC Descriptor

DTC P061A: Internal Control Module Torque System Circuitry Performance

DTC P061B: Internal Control Module Torque Calculation Performance

Circuit/System Description

The hybrid powertrain control module is responsible for vehicle torque management. To accomplish this, the hybrid powertrain control module constantly monitors all aspects of requested and actual delivered torque from involved controllers. If a torque management fault is detected propulsion power will be reduced or shut down. The hybrid powertrain control module is internal to the power inverter module, often referred to as the drive motor generator power inverter module and is not serviced separately. This fault is handled inside the hybrid powertrain control module and no external circuits are involved.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is at least 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P061A or P061B are Type A DTCs.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTCs P061A and P061B are Type A DTCs.

[DTC Descriptor](#)

DTC P06AF: Torque Management System Performance - Forced Engine Shutdown

[Circuit/System Description](#)

The hybrid powertrain control module monitors a state of health message that the ECM transmits to verify the ECM is functioning properly. The hybrid powertrain control module is part of the power inverter module, often referred to as the drive motor power inverter module, and is not serviced separately.

[Conditions for Running the DTC](#)

The system voltage is greater than 9.5 V.

[Conditions for Setting the DTC](#)

The hybrid powertrain control module does not detect a valid state of health message from the ECM.

[Action Taken When the DTC Sets](#)

- DTC P06AF is a Type A DTC.
- The hybrid powertrain control module requests the hybrid control module 2 to open the high-voltage contactor relays.

[Conditions for Clearing the DTC](#)

DTC P06AF is a Type A DTC.

[Reference Information](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

[Circuit/System Verification](#)

Verify that ECM DTC P0606, P0A1D is not set.

If the DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

[Circuit/System Testing](#)

1. Vehicle OFF, remove the F103 drive motor generator control module sight shield. Refer to [Drive Motor Generator Power Inverter Module Cover Replacement](#) .
2. Disconnect the T6 power inverter module X1 connector and the ECM X1 connector.
3. Test for less than 1 Ω between the serial data circuits listed below:
 - T6 power inverter module X1 connector terminal 10 and K20 ECM X1 connector terminal 43
 - T6 power inverter module X1 connector terminal 11 and K20 ECM X1 connector terminal 29

If greater than the specified range, test the serial data circuit for an open/high resistance condition. If the circuit tests normal, replace the K20 ECM.
4. If the DTC is set, program the T6 power inverter module. If the DTC resets, replace the T6 power inverter module.

[Repair Instructions](#)

DTC P06B5: Sensor Supply Positive Voltage Circuit 2 High Voltage

DTC P06E7: Sensor Supply Positive Voltage Circuit 3 Low Voltage

DTC P06E8: Sensor Supply Positive Voltage Circuit 3 High Voltage

Circuit/System Description

The motor control modules share an internal 15 V reference power supply in order to operate the drive motor sensors processors. This fault is handled inside the power inverter module, often referred to as the drive motor generator power inverter module, and no external circuits are involved. The control modules listed below are part of the power inverter module and are not serviced separately:

- Auxiliary transmission fluid pump control module
- Drive motor control module 1
- Drive motor control module 2
- Hybrid powertrain control module 1

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is 8-18 V.

Conditions for Setting the DTC

P06B1, P06B4, or P06E7

The reference voltage is less than 12 V for 1 second.

P06B2, P06B5, or P06E8

The reference voltage is greater than 18 V for 1 second.

Action Taken When the DTC Sets

- DTCs P06B1, P06B2, P06B4, P06B5, P06E7, and P06E8 are Type A DTCs.
- The power inverter module requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P06B1, P06B2, P06B4, P06B5, P06E7, and P06E8 are Type A DTCs.

Motor Temperature Sensor Low Reference	-	4.45 V	--

[Circuit/System Description](#)

The motor temperature sensor is a non-serviceable part of the power inverter module, often referred to as the drive motor generator assembly. The motor temperature sensor is a thermistor, or a resistor that changes value when the temperature changes. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases, the resistance increases. The motor control module supplies a 5 V reference signal to the sensor and measures the voltage drop in the circuit. When the motor is cold, the sensor resistance is high and the motor control module detects high signal voltage. As the motor temperature increases, the resistance of the sensor decreases, which lowers the signal voltage.

[Conditions for Running the DTC](#)

P0A2B and P0A31

- DTC P0A2C-P0A2D, P0A32, P0A33, P0AEF or P0AF0 is not set.
- The Propulsion System Inactive time is greater than 6 hours, the Charge Off time is greater than 2 hours and the Thermal Conditioning Off time is greater than 2 hours.
- The transmission and power inverter module temperature is greater than -40°C (-40°F).
- The vehicle is ON or the power inverter module is awake.
- Drive motor temperature is greater than -20°C (-4°F).
- Transmission Fluid Temperature is valid.

P0A2C and P0A32

Vehicle is ON or the power inverter module is awake.

P0A2D and P0A33

Vehicle has been driven for at least 90 seconds.

[Conditions for Setting the DTC](#)

P0A2B and P0A31

The Motor temperature is more than 20°C (36°F) greater than the average of the Transmission Fluid Temperature and the power inverter module temperatures.

P0A2C and P0A32

Motor temperature sensor signal is greater than 184°C (363°F) for 3 seconds.

P0A2D and P0A33

Motor temperature sensor signal is less than -41°C (-42°F) when drive motor generator torque is greater than 20 N·m (15 lb ft) for 90 seconds.

Action Taken When the DTC Sets

DTCs P0A2B-P0A2D, P0A31-P0A33 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0A2B-P0A2D, P0A31-P0A33 are Type A DTCs.

Diagnostic Aids

- The motor temperature sensor can be damaged by excessive electric current. Test the sensor for an open condition whenever a short-circuit to voltage condition is observed.
- Test the X175 transmission 20-way connector for proper terminal contact whenever an open or high resistance circuit condition is observed.

Special Tools

DT-44152 Jumper Harness, 20 terminal

For equivalent regional tools, refer to [Special Tools](#) .

[Circuit/System Verification](#)

P0A2B and P0A31

1. Allow the vehicle to cool to ambient temperature by leaving the vehicle OFF and not connected to a charger for at least 6 hours.
2. Vehicle ON, observe Motor 1 temperature, Motor 2 temperature, Transmission Fluid Temperature and Power Inverter Module Temperature scan tool parameters.
All temperature parameters should be within 28°C (50°F) of each other and ambient temperature.

P0A2C, P0A2D, P0A32, and P0A33

Vehicle ON, observe the motor control modules motor temperature scan tool parameter.

The motor temperature parameter should be between -41 and 184°C (-42 and 363°F).

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the transmission X175 20-way harness connector.

Note: The vehicle must be ON to test the low reference circuit. Other DTCs will set with the X175 connector disconnected.

2. Connect *DT-44152* jumper harness to the vehicle harness side only.
3. Vehicle ON, test the jumper harness side for less than 8 ohms between the low reference circuit terminals listed below and earth for the appropriate drive motor generator:
 - Drive motor 1 low reference circuit terminal S
 - Drive motor 2 low reference circuit terminal HIf greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the T6 power inverter module.
4. Vehicle ON, verify the scan tool motor temperature sensor parameter is less than -41°C (-42°F).
If more than the specified value, test the motor temperature sensor signal circuit for a short-circuit to earth. If the circuit tests normal, replace the T6 power inverter module.
5. Install a 3-amp fused jumper wire between the signal circuit terminal and the low reference circuit terminal listed below for the appropriate drive motor generator. Verify the scan tool motor temperature sensor parameter is greater than 184°C (363°F):
 - Drive motor 1 terminals K and S
 - Drive motor 2 terminals J and H

Note: If a short-circuit to voltage is found, test the motor temperature sensor for an open circuit or physical damage.

If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the T6 power inverter module.

6. Vehicle OFF, connect the *DT-44152* jumper harness to the X175 transmission 20-way connector at the transmission. Measure and record the resistance between the sensor signal and low reference terminals. Compare the actual sensor and circuit resistance to the expected sensor resistance. Refer to [Temperature Versus Resistance](#) .
If the resistance is near the expected value, test the transmission internal harness signal circuit for a short-circuit to earth. If the circuit tests normal, replace the M15 drive motor.
If the resistance is not near the expected value, test the transmission internal harness signal and low reference circuits for an open or shorted together condition. If the circuits test normal, replace the M15 drive motor.

DTC Descriptor

DTC P0A2F: Drive Motor 1 High Temperature

Circuit/System Description

The transmission contains two electric motor generators. The drive motors are cooled by the transmission fluid. Hot fluid exits the drive motor housing and flows to the transmission cooler supply line. The supply line connects to the cooler. From the cooler, the fluid returns through the oil cooler return line and enters the lubrication circuits. The motor temperature sensor is part of the drive motor generator assembly and is not serviced separately.

Conditions for Running the DTC

DTC P0A2B is not set.

Conditions for Setting the DTC

The motor temperature sensor is greater than 200°C (392°F) for 3 seconds and has not fallen below 135°C (275°F).

Action Taken When the DTC Sets

- DTC P0A2F is a Type B DTC.
- The hybrid powertrain control module commands the engine into derate mode.
- Autostop is disabled.

Conditions for Clearing the DTC

DTC P0A2F is a Type B DTC.

Diagnostic Aids

- Ask about the customer's driving habits, trailer towing, etc.
- Ensure the engine cooling system is functioning normally.
- The hybrid powertrain control module will reduce drive motor generator torque at temperatures greater than 160°C (320°F). Drive motor generator torque is reduced to zero if the temperature reaches 190°C (374°F).

Circuit/System Verification

1. Verify that DTC P0A2C is not set.
If DTC P0A2C is set, refer to [DTC P0A2B-P0A2D or P0A31-P0A33](#) .
2. Vehicle ON, observe the scan tool ECM engine coolant temperature (ECT) and Transmission Fluid Temperature parameters in freeze frame data. The readings should be below 125°C (257°F).
If the ECT was above 125°C (257°F) when the DTC set, go to [Engine Overheating](#) and correct that concern first.
3. Vehicle ON, observe the scan tool motor 1 temperature and motor 2 temperature parameters in freeze frame data. The reading should be above 200°C (392°F). If greater than the specified value, refer to [Automatic Transmission Overheating](#) . If the transmission tests normal, replace M15A drive motor 1 generator.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P0A35

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A35: Drive Motor 2 High Temperature

Circuit/System Description

The transmission contains two electric drive motors and an auxiliary transmission fluid pump. The drive motor motors and auxiliary transmission fluid pump are cooled by the transmission fluid. Hot fluid exits the drive motor motors and auxiliary transmission fluid pump housing and flows to the transmission cooler supply line. The supply line connects to the cooler. From the cooler, the fluid returns through the oil cooler return line and enters the lubrication circuits. A non-serviceable motor temperature sensor is located in each drive motor assembly.

Conditions for Running the DTC

DTC P0A31 is not set.

Conditions for Setting the DTC

The motor temperature sensor is greater than 200°C (392°F) for 3 seconds, and has not fallen below 135°C (275°F).

Action Taken When the DTC Sets

- DTC P0A35 is a Type B DTC.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTC P0A35 is a Type B DTC.

Diagnostic Aids

- Ask about the customer's driving habits, trailer towing, etc.
- Ensure the engine cooling system is functioning normally.
- The hybrid powertrain control module will reduce drive motor torque at temperatures greater than 160°C (320°F). Drive motor generator torque is reduced to zero if the temperature reaches 190°C (374°F).

Drive Motor 1 Position Sensor Excitation	P0A3F	P0A3F	P0A3F	P1B03, P0A40

[Circuit/System Description](#)

The drive motor position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor generator rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 volt ac, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor generator rotor. The position sensor is a non-serviceable part of the drive motor.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

P0C52, P0C5C

Circuit voltage less than 0.5 V.

P0C53, P0C5D

Circuit voltage greater than 4.5 V.

P0A3F

Sin or Cos signal is less than 2.3 V.

P0A40

Sin or Cos signal is greater than 4 V.

P1B03

The motor control module cannot track the motor position based on the sensor signals.

Action Taken When the DTC Sets

- DTCs P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D and P1B03 are Type A DTCs.
- The hybrid powertrain control module commands GFI State. The vehicle will continue to run in electric mode if there is sufficient hybrid battery SOC.

[Conditions for Clearing the DTC](#)

DTCs P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D and P1B03 are Type A DTCs.

[Diagnostic Aids](#)

- The drive motor generator position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, corrosion and terminal damage. Extreme care must be taken when probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle washing, etc., inspect the sensor wiring for signs of water intrusion. If the DTC is not current, clear all DTCs and simulate the effects of water intrusion by using the following procedure:
 1. Spray the suspected area with a 5 percent saltwater solution. To create a 5 percent saltwater solution, add 2 teaspoons (12 g) of salt to 8 fl oz (237 ml) of water.
 2. Test drive the vehicle at various speeds over various road surfaces such as bumps and turns.
 3. Rinse the area thoroughly when completed.
- The sensor circuit loops are a twisted pair with each pair covered in a foil shield. The shield circuits outside of the transmission are earthed to a stud on the drive motor generator power inverter module assembly.
- The drive motor generator position sensor harness circuits are shielded. Improperly earthed shield circuits may cause inaccurate sensor signals.

- *DT-48493* Jumper Harness

For equivalent regional tools, refer to [Special Tools](#) .

Circuit/System Testing

Note: You must perform the Component Testing before proceeding with Circuit/System Testing.

1. Vehicle OFF, disconnect the X175 harness connector at the transmission.
2. Install the *DT-44152* jumper harness to the vehicle harness side only.
3. Vehicle ON, test for 0.8-1.4 V between the terminals listed below and earth:
 - Terminal U
 - Terminal T
 - Terminal L
 - Terminal M

If greater than the specified range, test the signal circuit for a short-circuit to voltage, short-circuit to earth or an open circuit/high resistance. If the circuit tests normal replace the T6 power inverter module.

4. Vehicle ON, test for 6.5-7.5 V between the terminals listed below and earth:
 - Terminal V
 - Terminal W

If outside the specified range, test the signal circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal replace the T6 power inverter module.

Component Testing

Note: If the transmission control wiring harness extension harness circuits fail the circuit tests, replace the transmission control wiring harness extension harness, do not repair.

1. Verify that DTCs P1AF0, P1AF2 P1B43, P1E1E, P1E22, P1B0B, or P1B0C are not set.
If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
2. Vehicle OFF, disconnect the X175 harness connector at the transmission.

3. Install the *DT-48493* jumper harness to the transmission side only.
4. Test for 10-25 Ω between terminal V and terminal W.
If not within the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal, replace the M15A drive motor with a generator assembly.
5. Test for 20-40 Ω between the signal terminal U and the signal terminal T.
If not within the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal, replace the M15A drive motor with a generator assembly.
6. Test for 30-60 Ω between the signal terminal L and the signal terminal M.
If not within the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal, replace the M15A drive motor with a generator assembly.
7. Test for greater than 10,000 Ω between the terminals listed below and earth:
 - Terminal V
 - Terminal W
 - Terminal U
 - Terminal T
 - Terminal L
 - Terminal MIf not within the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal, replace the M15A drive motor with a generator assembly.
8. Test for infinite resistance between the terminals listed below:
 - Terminals V and U
 - Terminals V and L
 - Terminals U and LIf not within the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit to voltage, short-circuit to earth or an open circuit/high resistance. If the circuits test normal, replace the M15A drive motor with a generator assembly.
9. If the test is passed refer to Circuit/System Testing.

[Circuit/System Description](#)

The drive motor generator position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor generator rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 volt ac, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor generator rotor. The position sensor is a non-serviceable part of the drive motor generator.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

P0C57 or P0C61

Circuit voltage less than 0.5 V.

P0C58 or P0C62

Circuit voltage greater than 4.5 V.

P0A45

The motor control module cannot determine the motor position based upon the sensor signals.

P0A46

The motor control module detects a degraded motor position sensor signal.

P1B04

The motor control module cannot track the motor position based on the sensor signals.

Action Taken When the DTC Sets

- DTCs P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, and P1B04 are Type A DTCs.
- Motor control module 2 stops requesting power for drive motor 2.

[Conditions for Clearing the DTC](#)

DTCs P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, and P1B04 are Type A DTCs.

Circuit/System Testing

Note: You must perform the Component Testing before proceeding with Circuit/System Testing.

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the transmission.
2. Vehicle ON, at the harness side test for 0.8-1.4 V between the terminals listed below and earth:
 - X1 Terminal 1
 - X1 Terminal 2
 - X1 Terminal 3
 - X1 Terminal 4

If not within the specified range, test the signal circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal replace the T6 power inverter module.

3. Vehicle ON, test for 6.5-7.5 V between the terminals listed below and earth:
 - X2 Terminal 1
 - X2 Terminal 2

If outside the specified range, test the signal circuits for a short-circuit to voltage, short-circuit to earth or an open-circuit/high resistance. If the circuits test normal replace the T6 power inverter module.

Component Testing

1. Verify that DTCs P1AF0, P1AF2 P1B43, P1E1E, P1E22 P1B0B, or P1B0C are not set.
If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle OFF, disconnect the X2 harness connector at the transmission.
3. At the transmission side test for 10-25 Ω between terminal 1 and terminal 2.
If not within the specified range, replace the M15B drive motor with a generator assembly.
4. Disconnect the X1 harness connector at the transmission.
5. Test for 30-60 Ω between the signal terminal 1 and the signal terminal 2.
If not within the specified range, replace the M15B drive motor with a generator assembly.
6. Test for 20-40 Ω between the signal terminal 3 and the signal terminal 4.
If not within the specified range, replace the M15B drive motor with a generator assembly.
7. Test for greater than 10,000 Ω between the terminals listed below and earth:
 - X1 Terminal 1
 - X1 Terminal 2

- X1 Terminal 3
- X1 Terminal 4
- X2 Terminal 1
- X2 Terminal 2

If less than the specified value, replace the M15B drive motor with a generator assembly.

8. Test for infinite resistance between the terminals listed below:

- X1 Terminals 1 and 3
- X1 Terminal 1 and X2 Terminal 1
- X1 Terminal 3 and X2 Terminal 1

If less than the specified value, replace the M15B drive motor with a generator assembly.

9. If the test is passed refer to Circuit/System Testing.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A78: Drive Motor 1 Inverter Performance

DTC P0A79: Drive Motor 2 Inverter Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the two drive motor control modules. Each motor control module operates its respective drive motor generator based upon hybrid/EV powertrain control module commands. Each motor control module controls the speed, direction and output torque of its respective drive motor generator through the sequencing actuation of high-current switching transistors called insulated gate bipolar transistors. Each insulated gate bipolar transistor assembly is monitored for fault conditions. The motor control modules are part of the power inverter module and are not serviced separately.

Conditions for Running the DTC

The high voltage contactor relays are closed.

Conditions for Setting the DTC

The motor control module detects excessive current flow through the switched portion of the insulated gate bipolar transistor.

Action Taken When the DTC Sets

- DTCs P0A78 and P0A79 are Type A DTCs.

- The power inverter module requests hybrid powertrain control module 2 to open the high-voltage contactor relays.

[Conditions for Clearing the DTC](#)

DTCs P0A78 and P0A79 are Type A DTCs.

If the DTC is set, clear DTC; Turn the vehicle OFF for 2 minutes. Turn vehicle ON, Operate vehicle within conditions for running and setting DTC. If the DTC resets, go to Circuit/System Testing.

[Circuit/System Testing](#)

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) procedure for servicing at the drive motor generator control module cable connections.
2. Remove the 3-phase cable assembly from the power inverter module distribution box. Refer to [Drive Motor Generator Rotor and Stator Removal - Unit A](#) or [Drive Motor Generator Rotor and Stator Removal - Unit B](#).
3. Test for infinite resistance between the Phase Terminals listed below and earth for each phase of the appropriate M15 drive motor:

Drive Motor 1

- X5 terminal 3-phase U
- X5 terminal 2-phase V
- X5 terminal 1-phase W

Drive Motor 2

- X6 terminal 3-phase U
- X6 terminal 2-phase V
- X6 terminal 1-phase W

If not the specified value, test the AC circuit for a short-circuit to earth or a short-circuit between the AC circuit terminals and the aluminium cable mounting block. If the circuit tests normal, replace the T6 power inverter module. If the DTC resets replace the M15 drive motor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Drive Motor Generator Rotor and Stator Removal - Unit A](#) for Drive Motor 1 or Drive Motor 1 3-Phase Cable Assembly replacement
- [Drive Motor Generator Rotor and Stator Removal - Unit B](#) for Drive Motor 2 or Drive Motor 2 3-Phase Cable Assembly replacement
- [Control Module References](#) for power inverter module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and set-up.

DTC P0A89

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A89: 14 Volt Power Module Current Sensor High Current

Circuit/System Description

The 14 V power module, also called the accessory DC power control module, monitors output current. This sensor is internal to the 14 V power module and is not serviced separately from the control module.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The sensor signal is out of range for more than 5 seconds.

Action Taken When the DTC Sets

- The 14 V power module stops supplying power to the 12 V system.
- DTC P0A89 is a Type C DTC.

Conditions for Clearing the DTC

DTC P0A89 is a Type C DTC.

[Reference Information](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

[Circuit/System Verification](#)

If the DTC is set, program the K1 14V power module. If the DTC resets, replace the K1 14 V power module.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for Accessory DC Power Control Module, also called the 14 V Power Module, replacement, programming and set-up.

DTC P0A8D-P0A8F

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A8D: 14 V Power Module System Voltage Low Voltage

DTC P0A8E: 14 V Power Module System Voltage High Voltage

DTC P0A8F: 14 V Power Module System Performance

Circuit/System Description

The 14 V power module, also referred to as the accessory DC power control module, constantly monitors system input and output voltage. This sensor is internal to the 14 V power module and is not serviced separately from the control module.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

DTC P0A8D, P0A8E or P0A8F: the sensor signal is out of range for greater than 5 seconds.

Action Taken When the DTC Sets

- The 14 V power module stops supplying power to the 12 V system.

- DTCs P0A8D, P0A8E or P0A8F are Type C DTCs.

[Conditions for Clearing the DTC](#)

DTCs P0A8D, P0A8E or P0A8F are Type C DTCs.

[Diagnostic Aids](#)

This DTC may set due to low 12 V system voltage.

[Reference Information](#)

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

[Circuit/System Verification](#)

If the DTC is set, program the K1 14V power module. If the DTC resets, replace the K1 14 V power module.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for Accessory DC Power Control Module, also called the 14 V power module, replacement, programming and set-up.

DTC P0AB9

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P0AB9: Hybrid/EV System Performance

[Circuit/System Description](#)

This vehicle does not use a 12 V starter motor to crank the internal combustion engine. A much more powerful 300 V drive motor 1 located within the transmission is utilised to crank the engine. The 300 V drive motor 1 can rotate the engine to operating speed (800 RPM) within just a few hundred milliseconds. The hybrid powertrain control module can detect a condition where the engine is cranking but does not start or has stalled.

[Conditions for Running the DTC](#)

Drive motor 1 is cranking the engine.

[Conditions for Setting the DTC](#)

The hybrid powertrain control module detects that crankshaft position sensor engine speed has not risen above the commanded cranking speed, indicating the engine has failed to start, or the hybrid powertrain control module detects crankshaft position sensor engine speed has fallen below a specific minimum speed indicating the engine has stalled.

[Action Taken When the DTC Sets](#)

DTC P0AB9 is a Type A DTC.

Cranks But Does Not Start

When the system orders engine Crank, the hybrid powertrain control module will command drive motor generator 1 to rotate the engine. The drive motor will continue to rotate the engine at a specific RPM until the engine starts and causes increased engine RPM. The hybrid powertrain control module will cease engine rotation if an increase in engine RPM is not observed after several seconds. This function may have the appearance of a start/stall condition.

Engine Stall

If stalling occurs after a successful engine start, the hybrid powertrain control module will recognize the drop in engine RPM and command drive motor generator 1 to maintain engine RPM in an attempt to restart the engine. Drive motor generator 1 will continue to rotate the engine until the hybrid powertrain control module commands it to stop. The engine may be rotated for many minutes after the actual engine stall condition occurred and is typically stopped only after the hybrid battery state of charge gets too low. This function may have the appearance of a running engine.

Conditions for Clearing the DTC

DTC P0AB9 is a Type A DTC.

Diagnostic Aids

Any condition that causes the engine to stall and/or not start may set this DTC. Possible conditions include:

- Fuel conditions such as low level, low pressure or contamination.
- Engine conditions such as low compression.
- Restricted exhaust or air intake systems.

Always inspect for DTCs that would cause an engine stall and/or no start condition.

This DTC may set if the vehicle is powered off while driving.

Circuit/System Verification

1. Vehicle ON. Operate the hood release to open the hood. The engine should start and run.
If the engine fails to start, diagnose the engine system. Refer to [Engine Cranks But Does Not Run](#) .
2. If the engine starts, the problem is intermittent and not present at this time.
3. DTC is set, and the engine is running, program the T6 power inverter module.
If the DTC resets, replace the T6 power inverter module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for Drive Motor Generator Power Inverter Module, also called the power inverter module, replacement, programming and set-up.

DTC P0AF5: Drive Motor Inverter Temperature Sensor 2 Circuit High Voltage

DTC P0BD2: Drive Motor Inverter Temperature Sensor 3 Performance

DTC P0BD3: Drive Motor Inverter Temperature Sensor 3 Circuit Low Voltage

DTC P0BD4: Drive Motor Inverter Temperature Sensor 3 Circuit High Voltage

DTC P0BD7: Drive Motor Inverter Temperature Sensor 4 Performance

DTC P0BD8: Drive Motor Inverter Temperature Sensor 4 Circuit Low Voltage

DTC P0BD9: Drive Motor Inverter Temperature Sensor 4 Circuit High Voltage

DTC P0BDC: Drive Motor Inverter Temperature Sensor 5 Performance

DTC P0BDD: Drive Motor Inverter Temperature Sensor 5 Circuit Low Voltage

DTC P0BDE: Drive Motor Inverter Temperature Sensor 5 Circuit High Voltage

DTC P0BE1: Drive Motor Inverter Temperature Sensor 6 Performance

DTC P0BE2: Drive Motor Inverter Temperature Sensor 6 Circuit Low Voltage

DTC P0BE3: Drive Motor Inverter Temperature Sensor 6 Circuit High Voltage

Circuit/System Description

This is an internal fault detection of the drive motor generator power inverter module. This fault is handled inside the drive motor generator power inverter module and no external circuits are involved.

Conditions for Running the DTC

P0AEE, P0AF3, P0BD2, P0BD7, P0BDC and P0BE1

- Ignition ON after the ignition has been OFF for 6 hours.
- Temperature average of the inverter phase temperature sensors is greater than 12°C (10°F).
- Motor temperature sensor is above -40°C (-40°F).
- DTCs P0AEF, P0AF0, P0BD3, P0BD4, P0BDD, P0BDE, P0A2C, and P0A2D are not set.

P0AEF, P0AF4, P0BD3, P0BD8, P0BDD and P0BE2

The ignition is ON.

P0AF0, P0AF5, P0BD4, P0BD9, P0BDE and P0BE3

- The ignition is ON.
- Motor temperature is above -40°C (-40°F). If motor temperature is less than -40°C (-40°F) with Ignition ON, the drive motor must operate at greater than 20 N·m (14.75 lb ft) for a cumulative time of 1.5 minutes before the DTC will run.

Conditions for Setting the DTC

P0AEE, P0AF3, P0BD2, P0BD7, P0BDC and P0BE1

- A 15°C (27°F) difference is observed between the individual inverter phase temperature sensor and the average of all the inverter phase temperatures.
- The above condition is present for 4 seconds.

P0AEF, P0AF4, P0BD3, P0BD8, P0BDD and P0BE2

The inverter phase temperature sensor is greater than 125°C (275°F) for 3 seconds.

P0AF0, P0AF5, P0BD4, P0BD9, P0BDE and P0BE3

The inverter phase temperature sensor is less than -40°C (-40°F) for 3 seconds.

Action Taken When the DTC Sets

- DTCs P0AEE, P0AEF, P0AF0, P0AF3, P0AF4, P0AF5, P0BD2, P0BD3, P0BD4, P0BD7, P0BD8, P0BD9, P0BDC, P0BDD, P0BDE, P0BE1, P0BE2 AND P0BE3 are Type B DTCs.
- The drive motor generator power inverter module commands the battery energy control module to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0AEE, P0AEF, P0AF0, P0AF3, P0AF4, P0AF5, P0BD2, P0BD3, P0BD4, P0BD7, P0BD8, P0BD9, P0BDC, P0BDD, P0BDE, P0BE1, P0BE2 AND P0BE3 are Type B DTCs.

DTC P0BFD or P0BFE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0BFD: Drive Motor 1 Phase U-V-W Correlation

DTC P0BFE: Drive Motor 2 Phase U-V-W Correlation

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains the motor control modules and the hybrid powertrain control module. Each motor control module operates its respective drive motor based upon hybrid powertrain control module commands. Each motor control module controls the speed, direction and output torque of its respective drive motor generator through the sequencing actuation of high-current switching transistors called insulated gate bipolar transistors. Each drive motor generator operates utilising 3-phase alternating current AC electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor generator. Each phase is individually identified as U, V and W. Each motor control module monitors the current of each phase in order to detect power inverter module over-current conditions.

Because all the motor generator phase circuits are electrically joined together, they should each flow about the same amount of current. The motor control modules perform a mathematical calculation to verify that the phase current sensors are accurate. If the U-V-W phase current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the U-V-W phase currents are not similar, this DTC will set.

Conditions for Running the DTC

- The vehicle is ON.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

The sum of the 3-phase current sensors is greater than 156 A.

Action Taken When the DTC Sets

- DTCs P0BFD and P0BFE are Type A DTCs.
- The power inverter module requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P0BFD and P0BFE are Type A DTCs.

Circuit/System Verification

If the DTC is set, clear DTC; Turn the vehicle OFF for 2 minutes. Turn vehicle ON, Operate vehicle within conditions for running and setting DTC. If the DTC resets, go to Circuit/System Testing.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) procedure for servicing at the power inverter control module cable connections.
2. Remove the 3-phase cable assembly from the T6 power inverter module distribution box. Refer to [Drive Motor Generator Rotor and Stator Removal - Unit A](#) and [Drive Motor Generator Rotor and Stator Removal - Unit B](#).
3. Test for infinite resistance between each of the AC circuit terminals listed below and earth:
 - X5 drive motor 1 phase U terminal
 - X5 drive motor 1 phase V terminal
 - X5 drive motor 1 phase W terminal
 - X6 drive motor 2 phase U terminal
 - X6 drive motor 2 phase V terminal
 - X6 drive motor 2 phase W terminal

If not the specified value and the engine was running then stalled when the DTC set, test the AC circuit for a short-circuit to earth or a short-circuit between the AC circuit terminals and the aluminium cable mounting block. If the circuit tests normal, replace the appropriate M15 drive motor. If the DTC resets replace the T6 power inverter module.

If not the specified value, and the engine would not crank when the DTC set, test the AC circuit for a short-circuit to earth or a short-circuit between the AC circuit terminals and the aluminium cable mounting block. If the circuit tests normal, replace the T6 power inverter module. If the DTC resets replace the M15 drive motor.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) .
2. Vehicle OFF, disconnect the appropriate 3-phase cable assembly from the T6 power inverter module listed below. Refer to [Hybrid Controls Electronic Component Views](#) Figure 2: High Voltage Terminal Locator.

Drive Motor 1

- X5 phase U terminal 3
- X5 phase V terminal 2
- X5 phase W terminal 1

Drive Motor 2

- X6 phase U terminal 3
- X6 phase V terminal 2
- X6 phase W terminal 1

3. Test for infinite resistance to circuit terminals listed below and earth:

Drive Motor 1

- X5 phase U terminal 3
- X5 phase V terminal 2
- X5 phase W terminal 1

Drive Motor 2

- X6 phase U terminal 3
- X6 phase V terminal 2
- X6 phase W terminal 1

If disconnect the 3-phase cable assembly from the T12 automatic transmission assembly. Refer to [Drive Motor Generator Rotor and Stator Removal - Unit A](#) and [Drive Motor Generator Rotor and Stator Removal - Unit B](#) . Ensure the terminals are not contacting chassis earth. Test the circuits for a short-circuit to earth. If the circuits test normal, replace the M15 drive motor.

4. Replace the T6 power inverter module.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Drive Motor Generator Rotor and Stator Removal - Unit A](#) for Drive Motor 1, 3-Phase Cable Assembly replacement
- [Drive Motor Generator Rotor and Stator Removal - Unit B](#) for Drive Motor 2, 3-Phase Cable Assembly replacement

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C05: Drive Motor 1 Phase U-V-W Circuits

DTC P0C08: Drive Motor 2 Phase U-V-W Circuits

Circuit/System Description

Each drive motor is controlled by a motor control module. The drive motor utilises 3-phase AC electricity. The drive motor stator coil is comprised of three phase circuits. The phase circuits are identified as phase U, phase V and phase W. The U-V-W phase circuits are connected in a wye configuration. This means each phase is connected at a single, central point. The motor control modules monitor a current sensor connected to each drive motor generator phase. The current sensor is part of the drive motor assembly and is not serviced separately. The motor control module is part of the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

- The Hybrid Wake-up circuit is active.
- Inverter voltage is greater than 35 V.
- The motor control module has applied greater than or equal to 23A to the drive motor.

Conditions for Setting the DTC

The motor control module detects at least one U-V-W phase current sensor is less than 9 A.

Action Taken When the DTC Sets

- DTCs P0C05 and P0C08 are Type A DTCs.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTCs P0C05 and P0C08 are Type A DTCs.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) procedure for servicing at the T6 power inverter module cable connections.

2. Remove the 3-phase cable assembly from the power inverter module distribution box. Refer to [Hybrid Controls Electronic Component Views](#) Figure 2: High Voltage Terminal Locator.
3. Test for less than 0.5 ohms at each phase by measuring between the following circuits with a DMM:
 - Phase U and phase V
 - Phase U and phase W

If not the specified value, inspect the 3 phase cable terminal fasteners at the Drive Motor Generator Rotor for the proper torque and for arc-flash damage. Refer to [Drive Motor Generator Rotor and Stator Removal - Unit A](#) and [Drive Motor Generator Rotor and Stator Removal - Unit B](#).

If any fasteners were loose and no arc-flash damage is present, torque the fasteners and re-assemble the vehicle. Retest for the DTC.

If any fasteners were loose and arc-flash damage is present, replace the drive motor generator assembly and the 3 phase cable assembly.

Disconnect the 3 phase cable assembly from the transmission. Refer to [Drive Motor Generator Rotor and Stator Removal - Unit A](#) and [Drive Motor Generator Rotor and Stator Removal - Unit B](#).

Test each cable for continuity from the PIM connection terminal to the transmission connection terminal.

If you measure greater than 0.5 ohms, replace the 3 phase cable assembly.

Replace the drive motor generator assembly and retest for the DTC. If the DTC resets, replace the PIM.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Drive Motor Generator Rotor and Stator Removal - Unit A](#) for Drive Motor 1, 3-Phase Cable Assembly replacement
- [Drive Motor Generator Rotor and Stator Removal - Unit B](#) for Drive Motor 2, 3-Phase Cable Assembly replacement

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C0B: Drive Motor 1 Inverter Supply Voltage Circuit

DTC P0C0E: Drive Motor 2 Inverter Supply Voltage Circuit

Circuit/System Description

This is an internal fault detection of the power inverter module. This fault is handled inside the power inverter module and no external circuits are involved.

Conditions for Running the DTC

- Vehicle is ON or Charge Mode is active.
- High voltage is greater than 100 V.

Conditions for Setting the DTC

The control module does not detect voltage at the insulated gate bipolar transistor bias supply.

Action Taken When the DTC Sets

- DTCs P0C0B and P0C0E are Type A DTCs.
- Propulsion will be disabled.

Conditions for Clearing the DTC

DTCs P0C0B and P0C0E are Type A DTCs.

DTC Descriptors

DTC P0C17: Drive Motor 1 Position Not Learned

DTC P0C18: Drive Motor 2 Position Not Learned

Circuit/System Description

The drive motor position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor generator based upon the signals of the resolver-type position sensor. The position sensor or resolver, contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 V alternating current, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular shaped metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coil signals allows the motor control module to determine the exact position, speed and direction of the drive motor generator.

Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor. The motor control module will attempt to learn the position at hybrid wake-up, vehicle ON, only if no valid offset value has ever been learned. The non-learned condition would normally occur only after a motor control module reprogramming event.

Conditions for Running the DTC

Vehicle is cycled from ON to OFF.

Conditions for Setting the DTC

Condition 1

Position sensor offset value not learned because drive motor speed is greater than 50 RPM.

Condition 2

Position sensor offset value not learned because hybrid battery voltage is less than 192 V.

Condition 3

Position sensor offset value not learned because drive motor phase current is less than 15 A.

Action Taken When the DTC Sets

DTCs P0C17 and P0C18 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0C17 and P0C18 are Type A DTCs.

DTC Descriptor

DTC P0C19: Drive Motor 1 Torque Delivered Performance

Circuit/System Description

Each drive motor generator is controlled by a motor control module. The motor control module constantly monitors the requested torque and the delivered torque of its respective drive motor generator. The motor control module is part of the power inverter module, also called the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Vehicle ON.
- Drive motor 1 is commanded to develop torque.

Conditions for Setting the DTC

The motor control module has detected that the drive motor torque is not being delivered as expected.

Action Taken When the DTC Sets

- DTC P0C19 is a Type A DTC.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTC P0C19 is a Type A DTC.

Diagnostic Aids

Because the engine and drive motor 1 are mechanically connected through a planetary gear set, an engine condition that requires drive motor 1 to consume excessive current while trying to rotate the engine may cause this DTC to set such as:

- Extreme braking during regeneration may cause this DTC to be set in history.
- Seized or binding engine
- Seized or binding accessory drive belt

Reference Information

DTC Type Reference

DTC Descriptor

DTC P0C1A: Drive Motor 2 Torque Delivered Performance

Circuit/System Description

Each drive motor generator is controlled by a motor control module. The motor control module constantly monitors the requested torque and the delivered torque of its respective drive motor generator. The motor control module is part of the power inverter module, also called the drive motor generator power inverter module and is not serviced separately.

Conditions for Running the DTC

- Vehicle ON.
- Drive motor 2 is commanded to develop torque.

Conditions for Setting the DTC

The motor control module has detected that drive motor generator torque is not being delivered as expected.

Action Taken When the DTC Sets

- DTC P0C1A is a Type A DTC.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTC P0C1A is a Type A DTC.

Diagnostic Aids

Extremely hard braking during regeneration may cause this DTC to be set in history.

[DTC Descriptor](#)

DTC P0C20: Auxiliary Transmission Fluid Pump Phase U-V-W Circuits

[Circuit/System Description](#)

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon drive motor generator power inverter module commands. The third motor control module controls the Auxiliary Transmission Fluid Pump Motor. The motors utilise 3 phase AC electricity. The motor stator coil is comprised of three-phase circuits. The phase circuits are identified as phase U, phase V and phase W. The U-V-W phase circuits are connected in a wye configuration. This means each phase in the motor stator is connected at a single, central point. The motor control modules monitor a current sensor connected to each motor phase. The current sensors are part of the motor control module assembly and are not serviced separately. The motor control modules are part of the power inverter module and are not serviced separately.

[Conditions for Running the DTC](#)

- The vehicle is ON.
- The motor control module has applied current to the auxiliary transmission fluid pump motor.

[Conditions for Setting the DTC](#)

The motor control module detects at least one U-V-W phase current sensor is less than 1.0 A.

[Action Taken When the DTC Sets](#)

- DTC P0C20 is a Type A DTC.
- Vehicle propulsion will be disabled.

Conditions for Clearing the DTC

DTC P0C20 is a Type A DTC.

Circuit/System Testing

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) procedure for servicing the T6 power inverter module assembly or T12 Transmission.
2. Disconnect the X8 connector from the T6 power inverter module.
3. Test for infinite resistance between the terminals listed below and each for each phase of the G5 auxiliary transmission fluid pump:

- Terminal 1 phase U
- Terminal 2 phase V
- Terminal 3 phase W

If less than the specified value, replace the G5 auxiliary transmission fluid pump.

4. Replace the T6 power inverter module.

DTC Descriptors

DTC P0C4E: Drive Motor 1 Position Exceeded Learning Limit

Circuit/System Description

The drive motor generator position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor generator rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 volt ac, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor generator rotor.

Offset is the relationship between the position sensor and the drive motor generator output shaft. When the vehicle is turned OFF, the motor control module attempts to learn the offset of the drive motor position sensor.

Conditions for Running the DTC

- The vehicle is cycled OFF.
- Drive motor generator speed is less than 20 RPM.
- DC High Voltage is greater than 192 V.

Conditions for Setting the DTC

- The position sensor total offset exceeds 30 degrees during the learning process.
- The current learned value differs from the previous learned value by greater than 10 degrees.

Action Taken When the DTC Sets

DTC P0C4E is a Type A DTC.

Conditions for Clearing the DTC

DTC P0C4E is a Type A DTC.

Diagnostic Aids

- The drive motor generator position sensor circuits operate at very low current. Just a few ohms of additional circuit resistance may cause position sensor signal degradation. Extreme care must be taken when probing terminals and manipulating harnesses.
- The sensor circuit loops are a twisted pair with each pair covered in a foil shield. The shield circuits outside of the transmission are earthed to the drive motor generator power inverter module.
- Ensure the drive motor generator position sensor harness shield circuits are properly earthed prior to testing.

Circuit/System Testing

Note: You must perform the Component Testing before proceeding with Circuit/System Testing.

1. Verify that DTCs P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D or P1B03 are not set.
If any of the DTCs are set, refer to [DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D or P1B03](#) .
2. Vehicle OFF, disconnect the X175 harness connector at the transmission.
3. Install the *DT-44152* jumper harness to the harness side only.
4. Disconnect the X1 harness connector at the T6 power inverter module.
5. Test for less than 1 Ω between the terminals listed below:
 - DT 44152 Terminal L and X1 terminal 1
 - DT 44152 Terminal M and X1 terminal 12
 - DT 44152 Terminal U and X1 terminal 2
 - DT 44152 Terminal T and X1 terminal 13
 - DT 44152 Terminal W and X1 terminal 3
 - DT 44152 Terminal V and X1 terminal 14If greater than the specified range, test the signal circuit for an open/high resistance.
6. If all circuits test normal, replace the drive motor generator position sensor.

Component Testing

1. Vehicle OFF, disconnect the X175 harness connector at the transmission.
2. Install the *DT-44152* jumper harness to the transmission side only.
3. Test for 10-25 Ω between the AC circuit at terminal V and the AC circuit at terminal W.
If less than the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit between the AC circuits. If the circuits test normal, replace the drive motor generator position sensor.
If greater than the specified range, test each transmission control wiring harness extension harness AC circuits for an open-circuit. If the circuits test normal, replace the drive motor generator position sensor.
4. Test for 15-35 Ω between the signal terminal U and the signal terminal T.
If less than the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit between the signal circuits. If the circuits test normal, replace the drive motor generator position sensor.
If greater than the specified range, test each transmission control wiring harness extension harness signal circuits for an open-circuit. If the circuits test normal, replace the drive motor generator position sensor.
5. Test for 15-35 Ω between the signal terminal L and the signal terminal M.

If less than the specified range, test the transmission control wiring harness extension harness circuits for a short-circuit between the signal circuits. If the circuits test normal, replace the drive motor generator position sensor.

If greater than the specified range, test each transmission control wiring harness extension harness signal circuits for an open-circuit. If the circuits test normal, replace the drive motor generator position sensor.

6. Test for greater than 10 Ω between the terminals listed below and earth:

- Terminal V
- Terminal W
- Terminal U
- Terminal T
- Terminal L
- Terminal M

If less than the specified value, test the transmission control wiring harness extension harness circuit for a short-circuit to earth. If the circuit tests normal, replace the drive motor generator position sensor.

7. Test for infinite resistance between the terminals listed below:

- Terminals V and U
- Terminals V and L
- Terminals U and L

If less than the specified value, test the transmission control wiring harness extension harness circuits for a short-circuit between the circuits. If the circuits test normal, replace the drive motor generator position sensor.

DTC Descriptors

DTC P0C4F: Drive Motor 2 Position Exceeded Learning Limit

Circuit/System Description

The drive motor generator position sensor is monitored by the motor control module. The motor control module monitors the angular position, speed and direction of the drive motor generator rotor based upon the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 volt ac, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor generator rotor.

Offset is the relationship between the position sensor and the drive motor generator output shaft. When the vehicle is turned OFF, the motor control module attempts to learn the offset of the drive motor position sensor.

Conditions for Running the DTC

- The vehicle is cycled OFF.
- Drive motor generator speed is less than 20 RPM.
- DC High Voltage is greater than 192 V.

Conditions for Setting the DTC

- The position sensor offset total exceeds 30 degrees during the learning process.
- The current learned value differs from the previous learned value by greater than 10 degrees.

Action Taken When the DTC Sets

DTC P0C4F is a Type A DTC.

Conditions for Clearing the DTC

DTC P0C4F is a Type A DTC.

Diagnostic Aids

- The drive motor generator position sensor circuits operate at very low current. Just a few ohms of additional circuit resistance may cause position sensor signal degradation. Extreme care must be taken when probing terminals and manipulating harnesses.
- The sensor circuit loops are a twisted pair with each pair covered in a foil shield. The shield circuits outside of the transmission are earthed to the drive motor generator power inverter module.
- Ensure the drive motor generator position sensor harness shield circuits are properly earthed prior to testing.

Circuit/System Testing

Note: You must perform the Component Testing before proceeding with Circuit/System Testing.

1. Verify that DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04 are not set.
If any of the DTCs are set, refer to [DTC P0A45, P0A46, P0C57, P0C58, P0C61, P0C62, or P1B04](#).
2. Vehicle OFF, disconnect the X1 and X2 harness connectors at the transmission.
3. Disconnect the X1 harness connector at the T6 power inverter module.
4. Test for less than 1 Ω between the terminals listed below:
 - Terminals 20 and X1 terminal 1
 - Terminals 30 and X1 terminal 2
 - Terminals 21 and X1 terminal 3
 - Terminals 31 and X1 terminal 4
 - Terminals 22 and X2 terminal 1
 - Terminals 32 and X2 terminal 1If greater than the specified range, test the signal circuit for an open/high resistance.
5. If all circuits test normal, replace the drive motor generator 2 position sensor.

Component Testing

1. Vehicle OFF, disconnect the X1 and X2 harness connectors at the transmission.
2. Test for 15-25 Ω between the AC circuit at X2 terminal 1 and the AC circuit at X2 terminal 2.
If not within the specified range, replace the drive motor generator 2 position sensor.
3. Test for 35-55 Ω between the signal circuit at X1 terminal 3 and the signal circuit at X1 terminal 4.
If not within the specified range, replace the drive motor generator 2 position sensor.
4. Test for 35-55 Ω between the signal circuit at X1 terminal 1 and the signal circuit at X1, terminal 2.
If not within the specified range, replace the drive motor generator 2 position sensor.
5. Test for greater than 15 Ω between the terminals listed below and earth:
 - X1 terminal 1
 - X1 terminal 2
 - X1 terminal 3
 - X1 terminal 4
 - X2 terminal 1
 - X2 terminal 2If less than the specified value, replace the drive motor generator 2 position sensor.
6. Test for infinite resistance between the terminals listed below:
 - X1 terminal 1 and X1 terminal 3
 - X1 terminal 1 and X2 terminal 1

- X1 terminal 3 and X2 terminal 1

If less than the specified value, replace the drive motor generator 2 position sensor.

DTC Descriptor

DTC P15F0: Engine Torque Delivered Circuit

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid powertrain control module. The hybrid powertrain control module is internal to the drive motor generator power inverter module, and is not serviced separately. The hybrid powertrain control module monitors its ability to read and write to the memory. The hybrid powertrain control module processor monitors the data to verify that the indicated engine torque delivered calculation is correct.

Conditions for Running the DTC

- The ignition is ON.
- The system voltage is 8-18 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F0 is a Type A DTC.
- The hybrid powertrain control module commands the battery energy control module to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15F0 is a Type A DTC.

DTC P15F1

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P15F1: Axle Torque Request Circuit

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid powertrain control module. The hybrid powertrain control module is internal to the drive motor generator power inverter module, and is not serviced separately. The hybrid powertrain control module monitors its ability to read and write to the memory. The hybrid powertrain control module processor monitors the data to verify that the indicated axle torque requested calculation is correct.

Conditions for Running the DTC

- The ignition is ON.
- The system voltage is 8-18 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F1 is a Type A DTC.
- The hybrid powertrain control module commands the battery energy control module to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15F1 is a Type A DTC.

Circuit/System Verification

If the DTC is set, program the T6 drive motor generator power inverter module. If the DTC resets, replace the T6 drive motor generator power inverter module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for Drive Motor Generator Power Inverter Module replacement, set-up and programming.

DTC P15F2

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P15F2: Engine Torque Command Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). The hybrid powertrain control module is internal to the power inverter module, often referred to as the drive motor generator power inverter module and is not serviced separately. The hybrid powertrain control module sends an engine torque requested message to the ECM over the serial data circuits. The ECM monitors the data to verify the indicated engine torque requested calculation is correct. The ECM processor monitors the data to verify that the engine torque command is correct.

Conditions for Running the DTC

- Vehicle is ON.
- The system voltage is 8-18 V.
- DTC U1817 is not set.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F2 is a Type A DTC.

- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

[Conditions for Clearing the DTC](#)

DTC P15F2 is a Type A DTC.

DTC Type Reference

[Powertrain Diagnostic Trouble Code \(DTC\) Type Definitions](#)

[Circuit/System Verification](#)

Note: Diagnose and repair any communication DTCs prior to performing this testing.

If the DTC is set, program the K20 ECM. If the DTC resets, replace the K20 ECM.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for ECM replacement, programming and set-up.

DTC P16E0

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P16E0: Engine Performance - No Torque Detected

Circuit/System Description

This vehicle does not use a 12 V starter motor to crank the internal combustion engine. A much more powerful 300 V drive motor generator located within the transmission is utilised to crank the engine. The 300 V drive motor generator can rotate the engine to operating speed, 800 RPM, within just a few hundred milliseconds. The hybrid powertrain control module can detect a condition where the engine is cranking but does not start or has stalled.

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is at least 10 V.
- DTC U0100 is not set.
- Engine running.
- Fuel Level is NOT Low.
- No Fuel Level sensor DTCs set.

Conditions for Setting the DTC

The hybrid powertrain control module expected the engine to be supplying torque but no torque is detected.

Action Taken When the DTC Sets

DTC P16E0 is a Type A DTC.

Conditions for Clearing the DTC

DTC P16E0 is a Type A DTC.

Diagnostic Aids

Any condition that causes the engine to stall and/or not start may set this DTC. Possible conditions include:

- Fuel conditions such as low pressure or contamination.
- Engine conditions such as low compression.
- Restricted exhaust or air intake systems.

Always inspect for DTCs that would cause an engine stall and/or no start condition.

Circuit/System Verification

Vehicle ON. Operate the hood release to open the hood. The engine should start and run.

If the engine fails to start, diagnose the engine system. Refer to [Engine Cranks But Does Not Run](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC P16F2

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P16F2: Control Module Transmission Direction Range Switch

Circuit/System Description

The hybrid powertrain control module compares the internal mode switch requested direction to other data to verify that the indicated direction range switch calculation is correct.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is at least 9.5 V and no more than 18 V.

Conditions for Setting the DTC

Condition 1

- No internal mode switch direction switch DTCs are set.
- A valid internal mode switch direction indicated by the internal mode switch does not match the direction indicated by the hybrid powertrain control module software.

Condition 2

- No internal mode switch direction switch DTCs are set.

- Two valid internal mode switch directions are indicated at the same time.

Condition 3

- One internal mode switch direction switch circuit has failed.
- The hybrid powertrain control module calculates a transmission direction based upon the remaining internal mode switch circuits but it does not match the direction indicated by the hybrid powertrain control module software.

Condition 4

- Multiple internal mode switch directions and one internal mode switch direction switch circuit has failed.
- Based upon the remaining internal mode switch circuits the hybrid powertrain control module calculated two directions at the same time.

Condition 5

- More than one internal mode switch direction circuit has failed and the hybrid powertrain control module cannot calculate a transmission direction.
- Ignition voltage is 9.5-18 V.

Action Taken When the DTC Sets

- DTC P16F2 is a Type A DTC.
- The hybrid powertrain control module commands the battery energy control module to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P16F2 is a Type A DTC.

[DTC Descriptor](#)

DTC P16F3: Control Module Redundant Memory Performance

[Circuit/System Description](#)

This diagnostic applies to internal microprocessor integrity conditions within the hybrid powertrain control module. The hybrid powertrain control module is internal to the drive motor generator power inverter module, and is not serviced separately. The hybrid powertrain control module monitors its ability to read and write to the memory. The hybrid powertrain control module processor stores identical data in two locations and compares the data to verify that the stored data is correct.

[Conditions for Running the DTC](#)

The system voltage is 8-18 V.

[Conditions for Setting the DTC](#)

The control module has detected that identical stored data is not the same when retrieved.

[Action Taken When the DTC Sets](#)

- DTC P16F3 is a Type A DTC.
- The hybrid powertrain control module commands the battery energy control module to open the high voltage contactor relays.

[Conditions for Clearing the DTC](#)

DTC P16F3 is a Type A DTC.

[Reference Information](#)

DTC P16F4

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P16F4: Control Module Transmission Range Switch Input Circuitry Performance

[Circuit/System Description](#)

The automatic transmission manual shift shaft position switch assembly, also called the internal mode switch assembly, contains two sliding hall-effect switch assemblies attached to the control valve body within the transmission. The 9 outputs from the switches indicate which position is selected by the transmission manual shaft. Four outputs (A, B, C, P) are range selection inputs to the transmission control module (TCM). Five outputs (R1, R2, D1, D2, S) are direction selection inputs to the hybrid powertrain control module. The Range input signals are represented as TCM scan tool parameters, Internal Mode Switch A, B, C, and P. The Direction input signals are represented as hybrid powertrain control module scan tool parameters, Internal Mode Switch 2 - R1, R2, D1, D2, and S. The input voltage at the modules is high when a switch is open and low when a switch is closed to earth. Each control module independently supplies power and earth to its respective switch assembly.

The hybrid powertrain control module is internal to the power inverter module, often referred to as the drive motor generator power inverter module and is not serviced separately. The hybrid powertrain control module compares the internal mode switch requested direction to other data to verify that the indicated direction and range switch calculation is correct.

[Conditions for Running the DTC](#)

- The vehicle is ON.
- Ignition voltage is greater than 9.5 V.

[Conditions for Setting the DTC](#)

Condition 1

The transmission direction, indicated by both the internal mode range and direction switch circuits, are valid but do not match.

Condition 2

- One internal mode direction switch circuit has failed.
- The hybrid powertrain control module calculates a transmission direction based upon the remaining internal mode direction circuits.
- The calculated hybrid powertrain control module transmission direction does not match the direction indicated by the internal mode range switch circuits.

Condition 3

- One internal mode direction switch circuit has failed.
- The hybrid powertrain control module calculates a transmission direction based upon the remaining internal mode direction circuits.
- The internal mode range switch indicates a transitional position.

Condition 4

- One internal mode direction switch circuit has failed.
- The hybrid powertrain control module calculates a transmission direction based upon the remaining internal mode direction circuits.
- The TCM has indicated the internal mode range switch parameter is invalid.

Condition 5

- More than one internal mode direction circuit has failed and the hybrid powertrain control module cannot calculate a transmission direction.
- The internal mode range switch indicates a transitional position.

Condition 6

- More than one internal mode direction circuit has failed and the hybrid powertrain control module cannot calculate a transmission direction.
- The TCM has indicated the internal mode range switch parameter is invalid.

Action Taken When the DTC Sets

- DTC P16F4 is a Type A DTC.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTC P16F4 is a Type A DTC.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P16F6: Control Module Range State Command

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid powertrain control module. The hybrid powertrain control module is internal to the drive motor generator power inverter module, and is not serviced separately. The hybrid powertrain control module monitors its ability to read and write to the memory. The hybrid powertrain control module processor monitors the data to verify that the commanded range state calculation is correct.

Conditions for Running the DTC

- The ignition is ON.
- The system voltage is 8-18 V.

Conditions for Setting the DTC

The control module has detected the commanded transmission range state is not correct based upon internal calculations or by a comparison to input or output torque conditions.

Action Taken When the DTC Sets

- DTC P16F6 is a Type A DTC.
- The hybrid powertrain control module commands the battery energy control module to open the high voltage contactor relays.

[Conditions for Clearing the DTC](#)

DTC P16F6 is a Type A DTC.

[DTC Descriptor](#)

DTC P179A: Auxiliary Transmission Fluid Pump Over-speed

[Circuit/System Description](#)

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon drive motor generator power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. The hybrid powertrain control module and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis earth.

[Conditions for Running the DTC](#)

The vehicle is ON or the power inverter module is awake.

[Conditions for Setting the DTC](#)

An auxiliary transmission fluid pump motor speed of greater than 6,500 RPM has been detected.

[Action Taken When the DTC Sets](#)

DTC P179A is a Type A DTC.

[Conditions for Clearing the DTC](#)

DTC P179A is a Type A DTC.

Signal D2	P183C	P183D	P183D	-
Signal S	P184A	P184B	P184B	--
Low Reference	--	P183E	--	--

[Circuit/System Description](#)

The automatic transmission manual shift shaft position switch assembly, also called the internal mode switch assembly, contains two sliding hall-effect switch assemblies attached to the control valve body within the transmission. The 9 outputs from the switches indicate which position is selected by the transmission manual shaft. Four outputs (A, B, C, P) are range selection inputs to the transmission control module (TCM). Five outputs (R1, R2, D1, D2, S) are direction selection inputs to the hybrid powertrain control module. The Range input signals are represented as TCM scan tool parameters, Internal Mode Switch A, B, C, and P. The Direction input signals are represented as hybrid powertrain control module scan tool parameters, Internal Mode Switch 2 - R1, R2, D1, D2, and S. The input voltage at the modules is high when a switch is open and low when a switch is closed to earth. Each control module independently supplies power and earth to its respective switch assembly.

The hybrid powertrain control module is internal to the power inverter module, often referred to as the drive motor generator power inverter module and is not serviced separately.

[Conditions for Running the DTC](#)

- The vehicle is ON for at least 5 seconds.
- The ignition voltage is greater than 9.0 V.

[Conditions for Setting the DTC](#)

The direction internal mode switch state does not match a selected gear for 5 seconds.

[Action Taken When the DTC Sets](#)

DTCs P181C, P181D, P181E, P181F, P183A, P183B, P183C, P183D, P183E, P184A and P184B are Type B DTCs.

[Conditions for Clearing the DTC](#)

DTCs P181C, P181D, P181E, P181F, P183A, P183B, P183C, P183D, P183E, P184A and P184B are Type B DTCs.

[Diagnostic Aids](#)

- The internal mode switch assembly can be damaged by electric current exceeding 25 mA. Test the internal mode switch assembly for an open condition whenever a short-circuit to voltage condition is observed.
- The internal mode switch is a non-serviceable part of the manual shift shaft position switch.

Special Tools

DT-44152 Jumper Harness

For equivalent regional tools, refer to [Special Tools](#) .

[Circuit/System Verification](#)

Vehicle ON, observe the scan tool internal mode switch 2 parameters while moving the gear shift lever from Park, through all gear selector positions, and back to Park. The parameters should match each gear range that is selected. Refer to Internal Mode Switch 2 Parameters table below:

Internal Mode Switch 2 Parameters

Parameter	Selector Position				
	Park	Reverse	Neutral	Drive	Manual
Internal Mode Switch 2 - D1	HIGH	HIGH	LOW	LOW	LOW
Internal Mode Switch 2 - D2	LOW	LOW	HIGH	HIGH	HIGH
Internal Mode Switch 2 - R1	HIGH	LOW	LOW	HIGH	HIGH
Internal Mode Switch 2 - R2	LOW	HIGH	HIGH	LOW	LOW
Internal Mode Switch 2 - S	LOW	HIGH	LOW	HIGH	HIGH

Circuit/System Testing

- Vehicle OFF. Disconnect the X175 20-way harness connector at the transmission. Additional DTCs may set.
- Install the *DT-44152* jumper harness to the harness side only.
- Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the low reference circuit terminal G and earth.
 - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the T6 power inverter module.
- Vehicle ON, verify that each scan tool D1/D2/R1/R2/S parameter displays high.
 - If any parameter displays low, test that signal circuit terminal, as listed below, for a short-circuit to earth. If the circuit tests normal, replace the T6 power inverter module.
 - Parameter D1 - terminal E
 - Parameter D2 - terminal F
 - Parameter R1 - terminal C
 - Parameter R2 - terminal D
 - Parameter S - terminal B
- Install a 3 A fused jumper wire between each terminal listed below, one at a time, and earth. Verify that each scan tool D1/D2/R1/R2/S parameter displays low when earthed.
 - If a parameter displays high when earthed, test that signal circuit terminal, as listed below, for a short to voltage or an open/high resistance. If the circuit tests normal, replace the T6 power inverter module.
 - Parameter D1 - terminal E
 - Parameter D2 - terminal F
 - Parameter R1 - terminal C
 - Parameter R2 - terminal D

- Parameter S - terminal B

6. If the circuits test normal, test or replace the transmission internal extension harness or the automatic transmission B15 internal mode switch.

DTC P1A73: 14 Volt Power Module Temperature Sensor 2 Circuit High Voltage

[Circuit/System Description](#)

The 14 V power module, also called the accessory DC power control module, constantly monitors system temperature to protect against overheat conditions. The module also monitors the function of the temperature sensors. These sensors are internal to the accessory DC power control module and are not serviced separately from the control module.

[Conditions for Running the DTC](#)

The Vehicle is ON.

[Conditions for Setting the DTC](#)

DTC P1A71, P1A72 or P1A73: the sensor signal is out of range for more than 5 seconds.

[Action Taken When the DTC Sets](#)

DTCs P1A71, P1A72 and P1A73 are Type C DTCs.

[Conditions for Clearing the DTC](#)

DTCs P1A71, P1A72 and P1A73 are Type C DTCs.

DTC Descriptor

DTC P1ADE: Drive Motor 1 Control Module System Voltage Low Voltage

DTC P1ADF: Drive Motor 1 Control Module System Voltage High Voltage

DTC P1AE0: Drive Motor 2 Control Module System Voltage Low Voltage

DTC P1AE1: Drive Motor 2 Control Module System Voltage High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. The hybrid powertrain control module and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis earth.

Conditions for Running the DTC

The Vehicle is ON.

Conditions for Setting the DTC

DTCs P1ADE and P1AE0

Motor control module ignition voltage is less than or equal to 10 V for 5 seconds.

DTCs P1ADF and P1AE1

Motor control module ignition voltage is greater than 18 volts for 5 seconds.

Action Taken When the DTC Sets

DTCs P1ADE, P1ADF, P1AE0 and P1AE1 are Type C DTCs.

Conditions for Clearing the DTC

DTCs P1ADE, P1ADF, P1AE0 and P1AE1 are Type C DTCs.

Diagnostic Aids

A battery charger or vehicle jump start may have set DTCs P1ADF or P1AE1.

DTC Descriptor

DTC P1AE8: Drive Motor 1 Control Module Hybrid Battery Voltage Sense Circuit Low Voltage

DTC P1AE9: Drive Motor 1 Control Module Hybrid Battery Voltage Sense Circuit High Voltage

DTC P1AEA: Drive Motor 2 Control Module Hybrid Battery Voltage Sense Circuit Low Voltage

DTC P1AEB: Drive Motor 2 Control Module Hybrid Battery Voltage Sense Circuit High Voltage

Circuit/System Description

The drive motor generator power inverter module contains two drive motor control modules. Each drive motor control module monitors its internal high voltage sensor for correct operation, no external circuits are involved. The modules listed below are part of the drive motor generator power inverter module and are not serviced separately.

- Hybrid powertrain control module
- Motor control module 1
- Motor control module 2

Conditions for Running the DTC

- Ignition is ON.
- The system voltage is 8-18 V.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

P1AE8 and P1AEA

The drive motor control module detects high-voltage sensor voltage below 0V.

P1AE9 and P1AEB

The drive motor control module detects high-voltage sensor voltage above 564 V. Cert Doc = 500 V.

Action Taken When the DTC Sets

- DTCs P1AE8, P1AE9, P1AEA and P1AEB are Type B DTCs.
- The hybrid powertrain control module commands the battery energy control module to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1AE8, P1AE9, P1AEA and P1AEB are Type B DTCs.

DTC Descriptors

DTC P1AEC: Drive Motor 1 Control Module Hybrid/EV Battery System Voltage

DTC P1AED: Drive Motor 2 Control Module Hybrid/EV Battery System Voltage

DTC P1AEE: Drive Motor 1 Control Module Hybrid/EV Battery System Voltage High

DTC P1AEF: Drive Motor 2 Control Module Hybrid/EV Battery System Voltage High

Circuit/System Description

The power inverter module, also called the drive motor generator power inverter module, contains two motor control modules. Each motor control modules measures hybrid battery high voltage with several internal sensors. The hybrid powertrain control module 2 also monitors high voltage with several internal sensors. The hybrid powertrain control module 2 high voltage measurement is broadcast over serial data.

P1AEC and P1AED

The motor control modules compare the values in order to verify the hybrid battery high voltage measurement is accurate.

P1AEE and P1AEF

The motor control modules monitors for high voltage that is greater than the system allows during normal operation.

Conditions for Running the DTC

- The hybrid/EV battery system contactor relays are closed.
- Ignition voltage is 8 V and no more than 18 V.

P1AEC

DTCs P1AE8 or P1AE9 are not set.

P1AED

DTCs P1AEA or P1AEB are not set.

Conditions for Setting the DTC

P1AEC and P1AED

A difference of more than 40 V on the high-voltage circuit is detected between the hybrid powertrain control module and the hybrid powertrain control module 2.

AND

A difference of more than 50 V on the high-voltage circuit is detected between the motor control module and the hybrid powertrain control module 2.

P1AEE and P1AEF

More than 425 V on the high-voltage circuit is detected by the motor control module.

Action Taken When the DTC Sets

- DTCs P1AEC and P1AED are Type B DTCs.
- DTCs P1AEE and P1AEF are Type A DTCs.
- The power inverter module requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

- DTCs P1AEC and P1AED are Type B DTCs.
- DTCs P1AEE and P1AEF are Type A DTCs.

Diagnostic Aids

Conditions such as loss of battery energy control module power or earth or removal of the high-voltage manual disconnect while the vehicle was being driven could create a voltage surge that may set DTCs P1AEE and P1AEF. History DTCs P1AEE and P1AEF may indicate that the high-voltage contactor relays opened while large current flow was present.

DTC Descriptor

DTC P1AF0: Drive Motor 1 Control Module Hybrid Battery/EV Voltage System Isolation Lost

DTC P1AF2: Drive Motor 2 Control Module Hybrid Battery/EV Voltage System Isolation Lost

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. Each motor control module measures hybrid battery high voltage with several internal sensors. The motor control modules test for loss of isolation between either the high-voltage positive circuit or high-voltage negative circuit and vehicle chassis. The motor control modules test for isolation when the high-voltage contactor relays are closed. The hybrid powertrain control module 2 only tests the hybrid battery assembly for high-voltage loss of isolation when the high-voltage contactor relays are open.

Motor control modules' loss of isolation is detected through the use of two high-impedance resistors and voltage measuring circuitry. The two resistors are connected in series between the high-voltage positive and high-voltage negative circuits. The centre connection of the two resistors is also connected to vehicle chassis. The motor control module then measures the voltage drop across one of the resistors. Without a loss of isolation, the motor control module should measure about half of the high voltage potential. This is referred to as mid-pack voltage. The Mid-pack voltage value is then doubled by the software and displayed on a scan tool as Motor 1 Isolation Voltage or Motor 2 Isolation Voltage. When a loss of isolation is present, the motor isolation voltage display will indicate voltage that is more or less than actual hybrid battery high voltage.

Conditions for Running the DTC

- The high voltage contactor relays are closed.

- High voltage is greater than 50 V.
- Ignition voltage is 8-18 V.
- DTCs P1AE8, P1AE9, P1AEA, P1AEB, P1AEC or P1AED are not set.

Conditions for Setting the DTC

The ratio between negative Mid-Pack Voltage and positive Mid-Pack Voltage is greater than 4.53 for greater than 5 seconds.

Action Taken When the DTC Sets

DTCs P1AF0 and P1AF2 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1AF0 and P1AF2 are Type B DTCs.

DTC Descriptor

DTC P1B0D: Drive Motor 1 Control Module Drive Motor 1 Overspeed

DTC P1B0E: Drive Motor 2 Control Module Drive Motor 2 Overspeed

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The drive motor control module monitors the angular position, speed and direction of the drive motor based on the signals of the resolver-type position sensor. The position sensor allows the drive motor control module to determine the exact position, speed and direction of the drive motor. The motor control modules are part of the power inverter module, often referred to as the drive motor generator power inverter module and are not serviced separately.

Conditions for Running the DTC

- Vehicle is ON.
- Drive motor control module temperature and voltage out of range DTCs have not set.

Conditions for Setting the DTC

P1B0D

Drive motor 1 speed is greater than 6,300 RPM.

P1B0E

Drive motor 2 speed is greater than 9,500 RPM.

Action Taken When the DTC Sets

- DTCs P1B0D and P1B0E are Type A DTCs.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1B0D and P1B0E are Type A DTCs.

Diagnostic Aids

- The drive axle and drive motor 2 are connected mechanically through a planetary gear set, any condition that allows the front wheel drive shaft to rotate too fast while the transmission is in gear may cause DTC P1B0E to set. Ask the operator if the vehicle was subjected to downhill coasting at an excessive speed.
- A transmission mechanical failure that occurs during high drive motor generator torque may cause these DTCs to set.
- Repeated drive motor generator operation at speeds in excess of the DTC limits may cause deterioration of the drive motor generator magnets.

DTC Descriptors

DTC P1B0F: Drive Motor 1 Position Learn Incorrect

DTC P1B10: Drive Motor 2 Position Learn Incorrect

Circuit/System Description

The drive motor position sensor is monitored by the drive motor control module. The drive motor control module monitors the angular position, speed and direction of the drive motor generator rotor based on the signals of the resolver-type position sensor. The position sensor contains a drive coil, two driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. At vehicle ON, the motor control module outputs a 7 volt ac, 10 kHz excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The motor control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the motor control module to determine the exact position, speed and direction of the drive motor rotor. The position sensor is a non-serviceable part of the drive motor.

A measurement called offset is needed for accurate determination of the motor position. Offset is the relationship between the position sensor and the drive motor generator output shaft. Whenever the vehicle is cycled to OFF, the motor control module attempts to learn the offset of the drive motor position sensor by rapidly oscillating the motor and observing the position sensor signals.

Conditions for Running the DTC

Condition 1, 2, 3 and 4

- Hybrid wake-up signal is not active following a vehicle power mode transition from ON to OFF.

- The motor control module has learned a valid drive motor position sensor offset value at least once.

Condition 2

Motor speed is less than 20 RPM.

[Conditions for Setting the DTC](#)

Condition 1

Position sensor offset value not learned because drive motor speed is greater than 50 RPM.

Condition 2

Position sensor offset value not learned because hybrid battery voltage as observed at the motor control module is less than 192 V.

Condition 3

Position sensor offset value not learned because drive motor phase to phase current difference is less than 15 A.

Condition 4

Position sensor offset value not learned because the offset learn value is greater than the maximum allowed offset of 25 degrees.

[Action Taken When the DTC Sets](#)

- DTCs P1B10 and P1B0F are Type C DTCs.
- The motor control module operates the drive motor generator using the last valid learned offset.

[Conditions for Clearing the DTC](#)

- DTCs P1B10 and P1B0F are Type C DTCs.
- High voltage remains enabled immediately following a vehicle power mode transition from ON to OFF.

[Diagnostic Aids](#)

If the vehicle is powered-off while driving these DTCs may set.

DTC Descriptor

DTC P1B15: Regenerative Braking Torque Request Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the hybrid powertrain control module. The hybrid powertrain control module is internal to the power inverter module, often referred to as the drive motor generator power inverter module and is not serviced separately. The hybrid powertrain control module monitors its ability to read and write to the memory. The hybrid powertrain control module processor monitors the data to verify that the indicated brake torque request calculation is correct.

Conditions for Running the DTC

- The vehicle is ON for 1 second.
- The system voltage is 8-18 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P1B15 is a Type A DTC.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

[Conditions for Clearing the DTC](#)

DTC P1B15 is a Type A DTC.

DTC Descriptor

DTC P1B41: Drive Motor 1 Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance

DTC P1B42: Drive Motor 2 Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two drive motor control modules. Each drive motor control module monitors its internal high voltage sensor for correct operation, no external circuits are involved. The modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid powertrain control module
- Motor control module 1
- Motor control module 2
- Auxiliary transmission fluid pump control module

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is 8-18 V.
- The high voltage contactor relays are closed.

P1B41

DTC P1AE8, P1AE9, P1B0B or P1B0C is not set.

P1B42

DTC P1AEA, P1AEB, P1B43 or P1B44 is not set.

Conditions for Setting the DTC

The difference between the voltage sensed and hybrid battery voltage is greater than 40V.

And

The difference between the voltage sensed and the high voltage measured is greater than 50V.

Action Taken When the DTC Sets

- DTCs P1B41 and P1B42 are Type B DTCs.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1B41 and P1B42 are Type B DTCs.

DTC Descriptor

DTC P1B43: Drive Motor 2 Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit 2 Low Voltage

DTC P1B44: Drive Motor 2 Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit 2 High Voltage

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains two drive motor control modules. Each drive motor control module monitors its internal high voltage sensor for correct operation, no external circuits are involved. The modules listed below are part of the power inverter module and are not serviced separately:

- Hybrid powertrain control module
- Motor control module 1
- Motor control module 2
- Auxiliary transmission fluid pump control module

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is 8-18 V.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

P1B43

The drive motor control module detects isolation sensor voltage less than 20 V.

P1B44

The drive motor control module detects isolation sensor voltage greater than 40 V.

Action Taken When the DTC Sets

- DTCs P1B43 and P1B44 are Type B DTCs.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1B43 and P1B44 are Type B DTCs.

DTC P1E23: Auxiliary Transmission Fluid Pump Control Module Random Access Memory

DTC P1E24: Auxiliary Transmission Fluid Pump Control Module Long Term Memory Performance

DTC P1E25: Auxiliary Transmission Fluid Pump Control Module Read Only Memory

Circuit/System Description

This is an internal fault detection of the auxiliary transmission fluid pump control module. The modules listed below are internal to the power inverter module and are not serviced separately. These faults are handled inside the hybrid powertrain control module and no external circuits are involved.

- Auxiliary transmission fluid pump control module
- Drive motor control module 1
- Drive motor control module 2
- Hybrid powertrain control module

Conditions for Running the DTC

- The vehicle is ON.
- The system voltage is 8-18 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction or a control module was not programmed after replacement.

Action Taken When the DTC Sets

- DTCs P1BFF P1E23, P1E24, and P1E25 are Type A DTCs.
- The hybrid powertrain control module requests the hybrid powertrain control module 2 to open the high-voltage contactor relays.

DTC Descriptor

DTC P1E0E: 14 V Power Module Not Programmed

Conditions for Running the DTC

- The vehicle is ON.
- Ignition voltage is greater than 10 volts.

Conditions for Setting the DTC

A new service replacement 14 V power module, also called the accessory DC power control module, contains a unique manufacturing calibration. This DTC will be current when a new 14 V power module is installed on a vehicle prior to the Service Programming System (SPS) event. The DTC will remain current until the 14 V power module has undergone a successful program. Once the program event is completed, the DTC goes into history and can be cleared.

Action Taken When the DTC Sets

- The auxiliary power module stops supplying power to the 12 V system.
- DTC P1E0E is a Type C DTC.

Conditions for Clearing the DTC

DTC P1E0E is a Type C DTC.

DTC P1E1D: Auxiliary Transmission Fluid Pump Control Module Hybrid Battery Voltage Isolation Sensor Circuit 1 High Voltage

DTC P1E1E: Auxiliary Transmission Fluid Pump Control Module Hybrid Battery Voltage Isolation Sensor Circuit 2 Low Voltage

DTC P1E1F: Auxiliary Transmission Fluid Pump Control Module Hybrid Battery Voltage Isolation Sensor Circuit 2 High Voltage

[Circuit/System Description](#)

The power inverter module, also called the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. The motor control modules and the hybrid powertrain control module are part of the power inverter module and are not serviced separately.

Each motor control module measures hybrid battery high voltage with several internal sensors. The motor control modules test for loss of isolation between either the high-voltage positive circuit or high-voltage negative circuit and vehicle chassis. The motor control modules test for isolation when the high-voltage contactor relays are closed. The hybrid powertrain control module 2 only tests the hybrid battery assembly for high-voltage loss of isolation when the high-voltage contactor relays are open.

Motor control module loss of isolation is detected through the use of two high-impedance resistors and voltage measuring circuitry. The two resistors are connected in series between the high-voltage positive and high-voltage negative circuits. The centre connection of the two resistors is also connected to vehicle chassis. The motor control

module then measures the voltage drop across one of the resistors. Without a loss of isolation, the motor control module should measure about half of the high voltage potential. This is referred to as mid-pack voltage. The mid-pack voltage value is then doubled by the software and displayed on a scan tool as Motor 1 Isolation Voltage, Motor 2 Isolation Voltage or Auxiliary Transmission Fluid Pump Isolation Voltage. When a loss of isolation is present, the motor isolation voltage display will indicate voltage that is more or less than actual hybrid battery high voltage. The motor control module monitors the loss of isolation voltage measuring circuitry for correct operation.

Conditions for Running the DTC

1. The vehicle is ON.
2. The system voltage is at least 9 V.

Conditions for Setting the DTC

P1E1B

The motor control module detects a correlation difference between the mid-pack isolation sensor and overall pack voltage.

P1E1C and P1E1E

The motor control module detects isolation sensor voltage less than 20 V.

P1E1D and P1E1F

The motor control module detects isolation sensor voltage greater than 40 V.

Action Taken When the DTC Sets

DTCs P1E1B, P1E15C, P1E1D, P1E1E, and P1E1F are Type C DTCs.

Conditions for Clearing the DTC

DTCs P1E1B, P1E15C, P1E1D, P1E1E, and P1E1F are Type C DTCs.

DTC P1E30: Auxiliary Transmission Fluid Pump Phase W Current Sensor Circuit Low Voltage

DTC P1E31: Auxiliary Transmission Fluid Pump Phase W Current Sensor Circuit High Voltage

DTC P1E32: Transmission Fluid Pump Phase W Current Sensor Performance

[Circuit/System Description](#)

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. This is an internal fault detection of the power inverter module. This fault is handled inside the power inverter module and

no external circuits are involved.

Each motor control module operates its respective drive motor based upon hybrid powertrain control module commands. Each motor control module controls its respective motor through the sequencing actuation of high-current switching transistors called insulated gate bipolar transistors. Each motor operates utilising 3-phase alternating current AC electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor generator. Each phase is individually identified as U, V and W. Each motor control module monitors the current of each phase in order to detect out of range current conditions.

Because each individual motor's phase circuits are electrically joined together, the phases normally flow about the same amount of current. The motor control module performs a mathematical calculation to verify that the phase current sensors are accurate. If the U-V-W phase current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the U-V-W phase currents are not similar, this DTC will set.

Conditions for Running the DTC

The vehicle is ON or the module is awake.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P1E2A P1E2B, P1E2C, P1E2D, P1E2E, P1E2F, P1E30, P1E31, and P1E32 are Type A DTCs.
- The power inverter module requests the hybrid powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTCs P1E2A P1E2B, P1E2C, P1E2D, P1E2E, P1E2F, P1E30, P1E31, and P1E32 are Type A DTCs.

DTC P1E33: Auxiliary Transmission Fluid Pump Phase U-V-W Current Sensors Not Plausible

Circuit/System Description

The power inverter module, often referred to as the drive motor generator power inverter module, contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor.

Each motor control module operates its respective drive motor based upon hybrid powertrain control module commands. Each motor control module controls its respective motor through the sequencing actuation of high-current switching transistors called insulated gate bipolar transistors. Each motor operates utilizing 3-phase alternating current AC electricity. Each insulated gate bipolar transistor operates a single phase of the drive motor generator. Each phase is individually identified as U, V and W. Each motor control module monitors the current of each phase in order to detect out-of-range current conditions.

Because each individual motor's phase circuits are electrically joined together, the phases normally flow about the same amount of current. The motor control module performs a mathematical calculation to verify that the phase current sensors are accurate. If the U-V-W phase current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the U-V-W phase currents are not similar, this DTC will set.

Conditions for Running the DTC

- The vehicle is ON or the module is awake.
- The high voltage contactor relays are closed.

Conditions for Setting the DTC

The sum of the 3-phase current sensors is greater than 5 A.

[Action Taken When the DTC Sets](#)

DTC P1E33 is a Type A DTC.

[Conditions for Clearing the DTC](#)

DTC P1E33 is a Type A DTC.

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the [High Voltage Disabling](#) procedure for servicing the T6 power inverter module assembly or T12 transmission.
2. Remove the X8 connector from the T6 power inverter module.
3. Test for infinite resistance between the AC circuit terminals listed below and ground:
 - Terminal 1-phase W
 - Terminal 2 phase V
 - Terminal 3-phase U

If not the specified value, replace the G5 auxiliary transmission fluid pump motor.

If the circuit tests normal, replace the T6 drive motor power inverter module. If the DTC resets, replace the G5 auxiliary transmission fluid pump motor.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[DTC Descriptor](#)

DTC P1E34: Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Circuit High Voltage

DTC P1E35: Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Circuit Low Voltage

DTC P1E36: Auxiliary Transmission Fluid Pump Inverter Temperature Sensor Performance

[Circuit/System Description](#)

This is an internal fault detection of the power inverter module, often referred to as the drive motor generator power inverter module. This fault is handled inside the power inverter module and no external circuits are involved.

[Conditions for Running the DTC](#)

- The vehicle is ON or the module is awake.
- Motor temperature is above -40°C (-40°F). If motor temperature is less than -40°C (-40°F) at vehicle ON, the drive motor must operate at greater than 20 N·m (14.75 lb ft) for a cumulative time of 1.5 minutes before the DTC will run.

[Conditions for Setting the DTC](#)

DTC P1E34

The inverter phase temperature sensor is less than -58°C (-72°F) for 3 seconds. If the fault is detected at the start of a drive cycle the DTC will set after 600 seconds.

DTC P1E35

The inverter phase temperature sensor is greater than 130°C (266°F) for 3 seconds.

DTC P1E36

A 20°C (36°F) difference is observed between the individual inverter phase temperature sensor and the average of the Hybrid Electronics Coolant Temperature and the Transmission Fluid Temperature.

Action Taken When the DTC Sets

DTCs P1E34, P1E35 and P1E36 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1E34, P1E35 and P1E36 are Type B DTCs.

DTC P1EA9

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1EA9: 14 V Power Module System Low Voltage

Circuit/System Description

The 14 V power module, also called the accessory DC power control module, monitors its 14 volt circuit when it is enabled. This DTC sets when the 14 volt circuit in the 14 V power module is below this minimum level at the time it is enabled. 14V power module module functions will run only when an APM enable message from the hybrid powertrain control module is active on the serial data circuit.

Conditions for Running the DTC

The hybrid powertrain control module commands the 14 V power module to begin charging.

Conditions for Setting the DTC

The 14 volt circuit at the 14 V power module is below 7.0 volts when attempting to begin charging.

Action Taken When the DTC Sets

- DTC P1EA9 is a Type C DTC.
- The 14 V power module will not allow 14 volt conversion to begin in this condition.

Conditions for Clearing the DTC

- DTC P1EA9 is a Type C DTC.
- The 14 volt circuit at the 14 V power module is above 7 volts.

Diagnostic Aids

The 14 V power module is protected by a 200 amp in-line mega-fuse. The output current of the 14 V power module is lower than the fuse rating.

Circuit/System Testing

1. Remove the B+ harness connector X4 at the K1 14V power module.
2. Connect a test lamp between 12 volt battery positive and the K1 14 V power module connector X4 at the module.
3. Vehicle ON, observe the Low-Voltage Circuit Voltage parameter in the 14 V Power Module data list. The parameter should be within 0.5 volts of the actual 12 volt battery

voltage.

If the voltage is not within the specified range, replace the K1 14V power module.

4. Vehicle OFF, remove the positive connection at the 12 volt battery.
5. Measure the resistance between the X4 connector and the battery positive connection.

If the resistance is greater than 1.0 ohm, repair the high- resistance condition in the 12 volt circuit.

If the resistance is less than 1.0 ohm, replace the battery positive cable - B+ APM Module to Battery Fuse Block.

Repair Instructions

[Circuit/System Verification](#)

1. Verify that DTC P0562 or P0563 are not set.
If DTC P0562 or P0563 is set, refer to [DTC B1325, B1330, B1517, C0800, C0899, C0900, C12E1, C12E2, P0562, P0563, P1A0C, P1A0D, or P1EFC](#).
2. If the DTC is set, program the T6 power inverter module. If the DTC resets, replace the T6 power inverter module.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for Drive Motor Generator Power Inverter Module, also called the power inverter module, replacement, programming and set-up.

DTC P2797

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P2797: Auxiliary Transmission Fluid Pump Performance

[Circuit/System Description](#)

The power inverter module, often referred to as the drive motor generator power inverter module contains three motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generator based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. The hybrid powertrain control module and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis earth.

[Conditions for Running the DTC](#)

- The vehicle is ON.
- The system voltage is between 11.0 and 16.0 V.

[Conditions for Setting the DTC](#)

The actual auxiliary transmission fluid pump speed is 650 RPM less than the commanded speed.

[Action Taken When the DTC Sets](#)

DTC P2797 is a Type A DTC.

Conditions for Clearing the DTC

DTC P2797 is a Type A DTC.

Diagnostic Aids

There should always be other hybrid powertrain or motor control module DTCs set along with DTC P2797. Always diagnose other DTCs before addressing this DTC.

Symptoms - Hybrid Controls

Note: The following steps must be completed before using the symptom tables.

1. Perform the [Diagnostic System Check - Vehicle](#) before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions.

Refer to the following procedures:

- [Drive Motor Generator Power Inverter Module Description and Operation](#)
- [High Voltage Monitoring Systems Description](#)
- [Hybrid Modes of Operation Description](#)
- [Drive Motor Battery System Description](#)
- [Transmission General Description](#)

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Hybrid System. Refer to [Checking Aftermarket Accessories](#) .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to [Testing for Intermittent Conditions and Poor Connections](#) .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

[DC Power Conversion Test](#)

DC Power Conversion Test

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[Circuit/System Description](#)

The 14 volt power module, also referred to as the accessory DC power control module, supplies the energy that flows between the high voltage (300 V) direct current (DC) and low voltage (14 V) DC to charge the 12 V battery and power accessories. The 14 V power module receives a wake-up signal on a discrete line from the hybrid powertrain controller 2 when the vehicle is On. After a successful initialisation, the 14 V power module receives an enable command from the hybrid powertrain control module over the serial data circuits to begin power conversion.

[Diagnostic Aids](#)

- A poor connection at the B+ terminal of the 14 V power module or open 200 Amp Mega-Fuse in the left rear engine compartment, will prevent the 14 V power module from powering up and all values in the 14 V power module data list will read zero on the scan tool.
- A poor connection on the 14 V power module wake-up signal circuit will prevent the 14 V power module from powering up and all data values in the 14 V power module data list will read zero on the scan tool.

[Circuit/System Verification](#)

1. Vehicle OFF, measure and record the battery voltage at the battery terminals. The battery voltage should stabilise between 12.4 and 12.8 V within a few minutes of turning the vehicle OFF.
If not within the specified range, refer to [Battery Inspection/Test](#)
2. Vehicle ON, accessories OFF, measure and record the battery voltage at the battery terminals. The voltage should be at least 1 V greater than the voltage measured in step 1 but less than 15 V.
If not within the specified range, refer to [Circuit/System Testing](#).

[Circuit/System Testing](#)

1. Vehicle ON, verify that no K1 14 V power module or B18 battery current sensor DTCs are set that would cause a charging system concern.
If DTCs are set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Vehicle OFF, measure the voltage across the battery terminals. The voltage should read 12.4 V or greater at room temperature.
If not within the specified range, refer to [Battery Inspection/Test](#)
3. Connect a carbon pile tester to the C1 battery.
4. Vehicle ON, turn all accessories off. Observe the voltage reading on the tester. The voltage should read between 12.6-15.5V.
5. Adjust the carbon pile tester so that the 12 V current on the 14 V power module data list is reading 160 amps. The voltage reading should remain between 12.6-15.5 V.
If not within the specified value, replace the K1 14 V power module.

[Repair Instructions](#)

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

Drive Motor Generator Power Inverter Module Cover Replacement

Callout	Component Name
1	<p>Drive Motor Generator Power Inverter Module Cover Fastener (Qty: 2)</p> <p>Caution: Refer to Fastener Caution in the Preface section.</p> <p>Tighten 9 N·m (80 lb in)</p>

Drive Motor Generator Power Inverter Module Replacement

Removal Procedure

Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the power inverter module cover. Refer to [Drive Motor Generator Power Inverter Module Cover Replacement](#) .

3. Disconnect the electrical connectors (1).
4. Remove the shield circuit harness earth fasteners (2) and reposition the earth cables.
5. Disconnect the coolant pipes from the power inverter module. Refer to [Drive Motor Power Inverter Module Cooling Inlet Hose Replacement](#) and [Drive Motor Generator Control Module Radiator Outlet Hose Replacement](#).

6. Remove the high-voltage interlock loop connector fasteners (1) and reposition the connector.

7. Remove the three-phase cable fasteners (1) and reposition the cables.
8. Discard the cable housing seals and the cable fastener seals.

9. Remove the 300 volt cable fasteners (1) and reposition the cables.

Note: The top cable should already be removed when the high-voltage disabling was performed.

10. Discard the 300 volt cable connector seals.

11. Remove the power inverter fasteners (1) and drive motor power inverter control module (2).

Note: Replacement power inverter module comes pre-assembled with new coolant fittings. Replace coolant fittings only if necessary.

12. Remove the coolant fitting fasteners (1) , the coolant fittings (2), and use NEW seals (3).

[Installation Procedure](#)

Note: It is possible to install the coolant fittings 180° out of position. Ensure the larger alignment tab is facing downwards.

1. Install NEW coolant tube seals (3) and the coolant fittings (2).
2. Tighten the coolant tube fasteners to **3 N·m (27 lb in)**.

Caution: Refer to [Fastener Caution](#) in the Preface section.

3. Install the drive motor power inverter control module (2) and tighten the fasteners (1) to **9 N·m (80 lb in)**.

Note: Start the 300 volt cable fasteners by hand.

4. Install the 300 volt cables with NEW seals and tighten the fasteners (1) to **9 N·m (80 lb in)**.

5. With NEW connector housing and fastener seals, install the three-phase cables and tighten the fasteners (1) to **9 N·m (80 lb in)**.

6. Install the high-voltage interlock loop connector fasteners (1) and tighten to **6 N·m (53 lb in)**.

7. Connect the coolant pipes to the power inverter module. Refer to [Drive Motor Power Inverter Module Cooling Inlet Hose Replacement](#) and [Drive Motor Generator Control Module Radiator Outlet Hose Replacement](#) .
8. Fill the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#) .
9. Install the ground strap fasteners (2) and tighten to **9 N·m(80 lb in)**.
10. Connect the electrical connectors (1).
11. Install the power inverter module cover. Refer to [Drive Motor Generator Power Inverter Module Cover Replacement](#) .
12. Enable the high-voltage system. Refer to [High-Voltage Enabling](#) .
13. For control module programming and set-up procedures, refer to [Control Module References](#) .

Accessory DC Power Control Module Replacement

Callout	Component Name
Danger: Always perform the High-Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.	
The High-Voltage Disabling procedure will perform the following tasks:	Identify how to disable high voltage.

-
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high-voltage system, be sure to wear the following Personal Protection Equipment:

- Safety goggles with appropriate side shields when within 15 metres (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000 V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high-voltage battery assembly, whether the system is energised or not.

Failure to follow the procedures exactly as written may result in serious injury or death.

Preliminary Procedures

1. Disable the high-voltage system. Refer to [High Voltage Disabling](#) .
2. Remove the accessory DC power control module cooling air inlet duct. Refer to [Accessory DC Power Control Module Cooling Air Inlet Duct Replacement](#) .
3. Remove the accessory DC power control module cooling air duct. Refer to [Accessory DC Power Control Module Cooling Air Duct Replacement](#) .
4. Disconnect the negative and positive cables from the accessory DC power control module. Refer to [Battery Positive and Negative Cable Replacement](#) .

1	Battery Positive and Negative Cable Nut (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 9 N·m (80 lb in)
2	Accessory DC Power Control Module Nut (Qty: 2) Caution: Refer to Fastener Caution in the Preface section. Tighten 22 N·m (16 lb ft)
3	Accessory DC Power Control Module Bolt (Qty: 2) Tighten 19 N·m (14 lb ft)
4	Accessory DC Power Control Module Procedure <ol style="list-style-type: none"> 1. Raise the vehicle to access the connector. Refer to Lifting and Jacking the Vehicle . 2. Disconnect the electrical connector underneath the vehicle.

Accessory DC Power Control Module Description and Operation

[Location](#)

The 14 V Power Module, also called the Accessory DC Power Control Module, is located in the rear trunk compartment underneath the floor stowage trim panel. It is attached to the chassis with four fasteners and connected to a plastic cooling duct. The 14 V Power Module has a high-voltage pigtail that passes through the floor of the rear compartment and connects to a high voltage cable that comes from the hybrid battery pack. Also connected to the 14 V Power Module are the 12 V cables + positive and - negative, and a signal connector for serial data.

[Operating Functions](#)

The 14 V Power Module is an electronic device that takes the place of the generator on a traditional vehicle. On a hybrid or electric vehicle the 14 V power module converts high voltage (300 V) direct current (DC) to low voltage (12 V) DC for accessory electrical operation and to charge the 12 volt battery.

Normally, the 14 V power module only supplies 12 volts DC when the vehicle is under a normal drive cycle. However there are certain instances when the vehicle is being charged through a standard wall socket where the 14 V power module operation is required to sustain the 12 volt battery.

The 14 V power module is capable of supplying up to 180 Amps of 12 volt DC.

[Communication and Hosted Diagnostics](#)

The 14 V power module has internal diagnostic tests that run at both power-up and during operation. All DTCs from the 14 V power module are reported to and hosted by the hybrid powertrain control module. The 14 V power module only communicates with the hybrid powertrain control module and only over serial data.

[Circuit Inputs](#)

Inputs to the 14 V power module include the high voltage and 12 volt circuits. The 14 V power module also has two 12 volt discrete inputs, Accessory and Run/Crank, either one has to be at a high level in order for it to wake up. The 14 V power module is connected to the powertrain expansion communication circuit and communicates with the hybrid powertrain control module. The 14 V power module monitors various internal components for current, voltage and temperature. The 14 V power module will not begin supplying 12 volts DC until:

- Either the Accessory input or Run/Crank input are high, and
- The appropriate serial data enable signal is communicated by the hybrid powertrain control module.

The 14 V power module will not begin conversion of voltage however, until the appropriate serial data enable signal is sent by the hybrid powertrain control module.

For more information on the 12 V Battery Charging System, refer to [Charging System Description and Operation](#) .

Circuit Outputs

The only outputs supported by the 14 V power module are serial data communications and 12 volts DC which powers the 12 volt components in the vehicle and charges the 12 volt battery. Low-voltage 12 V cables on the hybrid/EV vehicle do not require unique colouring or servicing procedures.

Drive Motor Generator Power Inverter Module Description and Operation

[Overview](#)

The power inverter module, often referred to as the drive motor generator power inverter module, converts high voltage direct current (DC) electrical energy to 3 phase alternating current (AC) electrical energy. The power inverter module assembly is cooled with pre-mixed Dexcool® circulating through a cooling system that is separate from the engine cooling system. The hybrid cooling system utilises a heat exchanger at the front of the vehicle and electric pumps to circulate the coolant. The engine control module (ECM) monitors a temperature sensor in the hybrid cooling system and operates the radiator fan and the hybrid coolant pumps in response to system temperature.

[High-Voltage Circuits](#)

Direct Current (DC)

The power inverter module assembly is connected to the positive and negative terminals of the high voltage, (DC) drive motor generator battery. Both of the negative and positive high voltage DC battery poles are isolated from the vehicle chassis by a specific amount of resistance. Each high-voltage DC cable is switched ON or OFF by a high-voltage, high-current contactor relay contained within the drive motor generator battery assembly. All high-voltage DC negative and positive DC cables are individually shielded and orange in colour to alert the technician to the potential presence of high voltage. The electric air conditioning compressor high-voltage DC cables are externally connected at the power inverter module assembly.

Three-Phase Alternating Current (AC)

Three individual cables connect each phase of the drive motor to the power inverter module. Each individually shielded cable is orange in colour to alert the technician to the potential presence of high voltage. A single shielded cable connects the auxiliary transmission fluid pump to the power inverter module. This cable contains 3 individual wires that are connected to the 3 phases of the auxiliary transmission fluid pump. The cable is orange in colour to alert the technician to the potential presence of high voltage.

[Low-Voltage Circuits](#)

The 14 V power module, also called the accessory DC power control module is the device which converts high-voltage (300 V) DC to low-voltage (12V) DC for accessory electrical operation and to charge the 12 volt accessory battery.

Low-Voltage (12 V) Direct Current

Low-voltage (12 V) cables on the hybrid-electric vehicle do not require unique colouring or servicing procedures.

Drive Motor Generator Power Inverter Module

Overview

The power inverter module contains 3 motor control modules and the hybrid powertrain control module. Two of the motor control modules operate their respective drive motor generators based upon power inverter module commands. The third motor control module controls the auxiliary transmission fluid pump motor. The hybrid powertrain control module and the motor control modules share the power inverter module ignition voltage circuit, battery voltage circuits and chassis earth. All four modules are flash-programmable micro-processors.

Hybrid Powertrain Control Module

Location

The hybrid powertrain control module is a non-serviceable, flash-programmable micro-processor contained within the power inverter module.

Operating Functions

The hybrid powertrain control module is the main controller of powertrain operation. The hybrid powertrain control module determines when to perform normal operating modes such as electric mode, extended range mode and regenerative braking. The hybrid powertrain control module also operates in conjunction with the hybrid powertrain control module 2 to determine when to enable and disable the DC high-voltage circuits. Each motor control module operates the applicable motor based upon hybrid powertrain control module commands.

Communication and Hosted Diagnostics

The hybrid powertrain control module is the host controller for DTC information for the following control modules:

- 14 V power module
- Motor control module 1
- Motor control module 2
- Auxiliary transmission fluid pump motor control

These modules diagnose their own operation and determine when a fault condition is present. The 14 V power module communicates the diagnostic status to the hybrid powertrain control module over serial data.

All 3 motor control modules and the hybrid powertrain control module exchange information and commands on a serial peripheral interface bus internal communication circuit as well as the hi-speed hybrid GMLAN communication circuit.

In the event a hosted module communicates a fault condition, the hybrid powertrain control module will determine if one or more operating modes are affected and notify the vehicle operator by requesting the MIL illuminate and/or by displaying a message in the Driver Information Centre. In addition, the hybrid powertrain control module will store the associated DTC information for retrieval by a scan tool. Some hosted modules may require an ignition cycle to clear certain DTCs from the hybrid powertrain control

module.

Circuit Inputs

In addition to data parameters, the hybrid powertrain control module directly monitors the following signal circuits:

- Transmission shift selector internal mode switch direction and Park/Neutral switch signals
- Engine crankshaft position sensor signal
- High-voltage interlock circuit

Motor Control Modules

Location

Both the electric motor generators and the auxiliary transmission fluid pump motor are located within the transmission. They are each controlled by their own motor control module, each module is a flash-programmable micro-processor. Each motor control module is contained within the drive motor generator power inverter control module assembly. Also contained within the drive motor generator power inverter control module assembly is the hybrid powertrain control module micro-processor.

Operating Functions

The motor control modules operate their respective motors based upon hybrid powertrain control module commands. Each motor control module controls the speed, direction and output torque of its respective traction motor or the auxiliary transmission fluid pump motor through the sequencing actuation of high-current switching transistors called insulated gate bipolar transistors.

Communication and Hosted Diagnostics

In addition to the internal serial peripheral interface bus communication circuit that the hybrid powertrain control module and each motor control module control use to communicate, the motor control module controls also communicate on the Hi-speed and Hybrid serial data circuits. The motor control module control does not store its own diagnostic trouble code (DTC) information. The hybrid powertrain control module will store motor control module control associated DTC information for retrieval by a scan tool. The scan tool can communicate directly with each motor control module control in order to retrieve data parameters only.

Circuit Inputs

In addition to data parameters, each motor control module control monitors its respective motor for voltage, current, speed, direction and temperature. Additionally, the motor control module control monitors the insulated gate bipolar transistor components for temperature and proper operation. Some of the motor control module control operation data is shared with the hybrid powertrain control module.

Circuit Outputs

Each motor control module controls its respective insulated gate bipolar transistor driver board that, in turn, controls each motor. The motors operate using 3-phase alternating current (AC) electricity. Three cables connect each motor generator to the power inverter module. Each individually shielded cable is orange in colour to alert the technician that the potential for high voltage is present. A single shielded cable connects the auxiliary transmission fluid pump to the power inverter module. This cable contains 3 individual wires that are connected to the 3 phases of the auxiliary transmission fluid pump. The cable is orange in colour to alert the technician to the potential presence of high voltage.

[Accessory DC Power Control Module](#)

Location

The accessory DC power control module, also called the 14 V power module, is located in the rear compartment. Refer to [Accessory DC Power Control Module Description and Operation](#) for description and operation information.

Electromagnetic Compatibility Description

[Overview](#)

Vehicles are typically subject to certain legal requirements that limit the amount of electromagnetic interference (EMI) that can be generated by the vehicle's electronic devices. Additionally, the electronic devices within the vehicle must be able to withstand a certain amount of EMI without affecting their operation. EMI is generated whenever electrical current flows through a circuit. The amount of EMI generated, or amplitude, is usually dependant upon the amount of current flow, amperage, the on-off pattern of current flow through the circuit and frequency. The EMI requirements are generally referred to as electromagnetic compatibility.

There are many ways of ensuring the vehicle meets electromagnetic compatibility requirements. These include:

- Adding capacitors and resistors to certain electrical circuits
- Regulating the frequency at which a component may operate
- Shielding the wires, cables and components

[Circuit Design](#)

The power inverter module, often referred to as the drive motor generator power inverter module, and the 14 V power module, also called the accessory DC power control module assembly, each contain filter capacitors connected to the high-voltage circuits. These capacitors are necessary to reduce the voltage spikes that occur as a result of the switching of current On and Off. Reducing voltage spikes reduces EMI. The frequency of current switching is also closely regulated. Too high a frequency can cause an increase in EMI generation.

[Wiring/Cable Design](#)

Different types of wire/cable shielding methods are utilised in the vehicle. Common types of circuit shielding include twisted-pair and internal braid or foil. Twisted pairs are typically used in circuits such as serial data circuits. The wire pair is twisted together at a particular turns-per-length ratio. Shielded cable is utilised for all other circuits requiring either protection from external EMI or to reduce EMI radiation of the cable itself into other nearby components or circuits.

[High Voltage Cable](#)

- 300 Volt Battery Positive and Negative Cable Assembly
- Power Inverter Module 3 Phase Cable Assembly
- Air Conditioning Compressor Assembly

The high-voltage cables utilise internal braid shielding. Typically, both ends of the internal braid shield are attached to chassis earth. All of the high-voltage, internally shielded cables are earthed at their cable end attachment points. Mounting blocks, where used, perform the shield to chassis earth connection. Connection points not serviced with a mounting block utilise a separate ring terminal.

Low and Intermediate Voltage Wiring

The signal circuits for the transmission sensors utilise shielding protection. The drive motor generator position sensor and temperature sensor circuits utilise internal foil shielding. The wiring harness external of the transmission assembly is connected to chassis earth with ring terminals at the drive motor control module assembly. The internal transmission wiring harness is attached to chassis earth with a ring terminal at the valve body assembly.

The auxiliary transmission fluid pump 3 phase cables utilise internal foil shielding. The wiring harness shield is connected to chassis earth within the motor generator power inverter module.

Component Shielding

Certain components utilise their structure to effectively shield EMI. Metal covers, chassis earthed metal cases and electro-magnetically conductive gaskets may all be part of a component's electromagnetic compatibility design.

Shielding Loss

A loss of proper shielding may result in poor AM band radio reception and/or incorrect sensor circuit readings depending upon the location of the shield loss. Damage that has penetrated to the insulated conductor of high voltage cables is not repairable. Minor damage to the outer sheathing can be repaired, refer to [Drive Motor Generator Power Inverter Module Cable Inspection](#) . Certain Low and Intermediate voltage shielded wiring harnesses may be repairable. Refer to [Wiring Repairs](#) and [Splicing Twisted or Shielded Cable](#) .

High Voltage Monitoring Systems Description

The hybrid system monitors several high-voltage components for attempted access. Additionally, a minimum amount of isolation resistance is maintained at all times between both negative and positive poles of the hybrid battery and the vehicle chassis. The drive motor generator power inverter module microprocessors and the hybrid powertrain control module 2 monitor the hybrid system for access and loss of isolation detection.

[High Voltage Interlock Circuit](#)

The High Voltage Interlock Circuit is a wire loop that passes through certain high-voltage components. The high-voltage interlock circuit is used to determine if access to high-voltage components is being attempted. The opening of these high-voltage components causes the high voltage interlock circuit to open. The hybrid system may react to the loss of high-voltage interlock circuit continuity by opening the high-voltage contactor relays and discharging the high voltage capacitors. The high-voltage interlock circuit signal is generated by the hybrid powertrain control module 2. The high voltage interlock circuit status is monitored by the hybrid powertrain control module 2, the hybrid powertrain control module and each drive motor control module.

[High Voltage DC Chassis Isolation](#)

The hybrid system monitors the electrical potential between high-voltage and the vehicle chassis. High voltage should always be isolated from the vehicle chassis by a certain amount of resistance to avoid the potential for a life threatening current path. In the event that a high voltage leak path is detected to the vehicle chassis, the hybrid system will set a diagnostic trouble code (DTC). High voltage DC chassis isolation is monitored by the motor control modules and the hybrid powertrain control module 2.

Testing for loss of isolation requires special tools and procedures. Because of the high voltages present in the hybrid system, a loss of isolation may occur due to insulation breakdown. Insulation breakdown typically occurs only when high voltages and/or current is present. Conditions such as insulation breakdown cannot be diagnosed with a typical DMM because high voltage is not used by the DMM when measuring resistance.

Hybrid Modes of Operation Description

[Vehicle Operating Modes Description](#)

This vehicle is an Extended Range Electric Vehicle. It uses an electric propulsion system to drive the vehicle at all times. Electricity is the vehicle's primary source of energy, while gasoline is the secondary source.

The vehicle has two modes of operation - Electric and Extended Range. In both modes, the vehicle is propelled by the electric motors that are internal to the transmission. Electrical energy is converted into mechanical energy to drive the wheels and propel the vehicle. The vehicle's performance remains the same in either mode.

This overview is not a comprehensive list of all aspects of the Extended Range Electric Vehicle. Refer to Automatic Transmission 4ET50 [Electronic Component Description](#) for information regarding transmission operation. More detailed and comprehensive information is also available through the dealer training programme.

[Electric Mode](#)

Electric Mode is the primary mode of operation for this vehicle. While in electric mode the vehicle is powered by electrical energy stored in the high-voltage battery. The vehicle can operate in this mode for a range of up to 40-80 km (25-50 miles) until the battery has reached a low state of charge.

[Extended Range Mode](#)

When the vehicle reaches the end of its electric range, it switches to extended range mode. In this mode, electricity is produced by the motor generator which is driven by the internal combustion engine (ICE). This secondary source of electric power extends the vehicle range. Operation will continue in extended range mode until the vehicle can be plugged in to recharge the high-voltage battery and restore electric mode.

The high-voltage battery will continue to provide some power and work together with the ICE to provide peak performance when it is required, such as driving up a steep incline or during high acceleration. The high-voltage battery will not be recharged while in extended range mode.

[Internal Combustion Engine \(ICE\) Starting](#)

This vehicle does not use a 12 V starter motor to crank the ICE. A much more powerful 300 V motor/generator located within the transmission is utilised to crank the ICE. The 300 V drive motor generator can rotate the ICE to operating speed (800 RPM) within just a few hundred milliseconds. The 300 V drive motor generator allows near-instant starting of the ICE.

The vehicle's on-board computers determine when the ICE needs to run. Some of the normal vehicle conditions that force the ICE to run are:

- The high-voltage battery has a low state of charge
- The bonnet is open or not completely latched
- The ICE is needed to maintain the high-voltage battery temperature
- The ICE needs to run for maintenance
- Extremely low ambient temperatures

When the bonnet is open, the ICE will run without turning off. The high-voltage battery is neither charged nor discharged when this occurs.

Some high-voltage battery faults will cause the ICE to run without turning off.

Service Mode

The Service Mode is available for service and diagnostics, and to verify the proper operation of the MIL and may be required for emission inspection purposes. With the vehicle off, and the brake pedal not applied, pressing and holding the POWER button for more than 5 seconds will place the vehicle in Service Mode. The instruments and audio systems will operate as they do in ON/RUN, but the vehicle will not be able to be driven. The propulsion system will not start in Service Only Mode.

Engine Unavailable

If the vehicle runs out of fuel, or the power inverter module has detected the ICE will not start due to a malfunction, the vehicle can continue to be driven in electric mode.

Maintenance Modes

Engine Maintenance Mode

Engine maintenance mode runs the engine to keep it in good working condition when the vehicle has been operated in electric mode only for a prolonged period. Engine maintenance mode will run the ICE, even if the drive motor battery state of charge is sufficient to operate the vehicle in electric mode.

Fuel Maintenance Mode

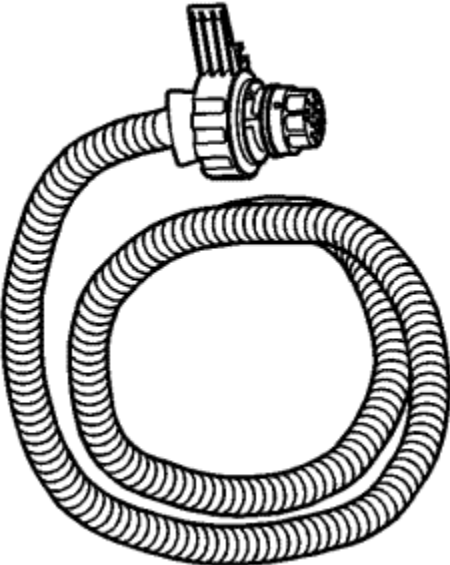

When only electric mode is used for a prolonged period, fuel maintenance mode will run the ICE to use up old fuel. The ICE will run until enough fresh fuel is added or a low fuel level is detected. During fuel maintenance mode the ICE may cycle on and off.

Regenerative Braking

When the vehicle is coasting or braking the power inverter module may operate the drive motor generator in an electrical generation mode. Operating as electrical generator, the drive motor generator exerts a driveline load that helps to slow the vehicle. The electrical energy that the drive motor generator creates is transferred by the drive motor generator power inverter module to the drive motor generator battery assembly. Constant communication between the power inverter module and the electronic brake control module allows the blending of regenerative braking force with hydraulic braking force.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0480: Cooling Fan 1 Control Circuit

DTC P0483: Cooling Fan System Performance

[Circuit/System Description](#)

The hybrid/EV powertrain control module 2 controls the radiator cooling fans. The cooling fans are controlled with a pulse width modulated (PWM) signal. The hybrid/EV powertrain control module 2 diagnoses any faults with the hardwire circuit to the engine control module. The engine control module sends a fan request PWM signal to the hybrid/EV powertrain control module 2 through a hardwire circuit. The hybrid/EV powertrain control module 2 operates in a pass-through mode for the engine control module fan request. The higher the duty cycle the higher the cooling fan speed.

[Conditions for Running the DTC](#)

The 12 V battery voltage is greater than or equal to 9 V.

[Conditions for Setting the DTC](#)

The hybrid/EV powertrain control module 2 has detected an open-circuit, short-circuit to earth or short-circuit to voltage fault on the fan control circuit.

[Action Taken When the DTC Sets](#)

DTC P0480 and P0483 are type B DTCs.

Conditions for Clearing the DTC

DTC P0480 and P0483 are type B DTCs.

Circuit/System Verification

Vehicle in Service Mode, with a scan tool, command the Cooling Fan Motor Command to 90%. Verify that the cooling fan motor speed is greater than 0 RPM and the cooling fans are operating.

Circuit/System Testing

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disconnect the harness connector at the appropriate G10 cooling fan motor.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 1 and earth.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test or replace G10 cooling fan motor.
4. Connect a test lamp between the control circuit terminal 4 and the B+ circuit terminal 1.
5. Command the Cooling Fan Motor Command ON between 10% and 90% with a scan tool. Verify the test lamp changes between dim (10%) and bright (90%).
If the test lamp is always bright, test the control circuit for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
If the test lamp is always dim or OFF, test the control circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
6. If all circuits test normal, replace the appropriate G10 cooling fan motor.

[DTC Descriptors](#)

DTC P0A7E: Hybrid/EV Battery Pack High Temperature

[Circuit/System Description](#)

The hybrid/EV battery pack has 16 hybrid/EV battery temperature sensors. The hybrid/EV battery temperature sensors are located on the top of the hybrid/EV batteries. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery cell groups. The hybrid/EV battery interface control module supplies 5 V to the signal circuit and a ground for the low-reference circuit. The hybrid/EV battery temperature sensor resistance changes with battery temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The hybrid/EV powertrain control module 2 uses the battery temperature sensors to determine the hybrid/EV battery module temperature to control the battery cooling system operation.

[Conditions for Running the DTC](#)

- The hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C7D, P0C7E, P0C7F, P0C82, P0C83, P0C84, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, P0CBA, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, U2401, U2603, U2604, U2605 and U2606.

[Conditions for Setting the DTC](#)

The maximum sensed temperature in the hybrid/EV battery is greater than 73.5°C (164.3°F).

Action Taken When the DTC Sets

- DTC P0A7E is a type A DTC.
- All of the battery contactors will open.

Conditions for Clearing the DTC

DTC P0A7E is a type A DTC.

Circuit/System Description

The hybrid/EV battery pack has 16 hybrid/EV battery temperature sensors. The hybrid/EV battery temperature sensors are located on the top of the hybrid/EV batteries. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery cell groups. The hybrid/EV battery interface control module supplies 5 V to the signal circuit and a ground for the low-reference circuit. The hybrid/EV battery temperature sensor resistance changes with battery temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The hybrid/EV powertrain control module 2 uses the battery temperature sensors to determine the hybrid/EV battery module temperature to control the battery cooling system operation.

Conditions for Running the DTC

P0A9D, P0A9E, P0AC7, P0AC8, P0ACC, P0ACD, P0AEA, P0AEB, P0BC4, P0BC5, P0C35, P0C36, P0C7E, P0C7F, P0C83, P0C84, P0C8A, P0C8B, P0C8F, P0C90, P0C94, P0C95, P0C99, P0C9A, P0CAA, P0CAB, P0CAF, P0CB0, P0CB4, P0CB5, P0CB9 and P0CBA

- The 12 V battery voltage is greater than 9 V.
- Hybrid/EV powertrain control module 2 and battery energy control module are awake and communicating
- None of the following DTCs are set: P1E93, P1E99, P1E9F, P1EA5, P1E8E, P1E94, P1E9A or P1EA0
- 2nd Protection Self test is not running

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3, P0C34, P0C7D, P0C82, P0C89, P0C8E, P0C93, P0C98, P0CA9, P0CAE, P0CB3 and P0CB8

- Propulsion System Off Time is greater than the calibration
- Propulsion System Off Time is not faulted (ECM clock diagnostics)
- Off Board Charging Off Time is greater than the calibration
- Off Board Charging Off Time is not faulted (hybrid/EV powertrain control module 2 clock diagnostics)
- Battery Thermal Conditioning Off Time is greater than the calibration
- Battery Thermal Conditioning Off Time is not faulted (hybrid/EV powertrain control module 2 clock diagnostics)
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C7D, P0C7E, P0C7F, P0C82, P0C83, P0C84, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, P0CBA, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, U2401, U2603, U2604, U2605 and U2606
- The average of the hybrid/EV battery temperature sensors shifts more than a calibrated amount.

Conditions for Setting the DTC

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3, P0C34, P0C7D, P0C82, P0C89, P0C8E, P0C93, P0C98, P0CA9, P0CAE, P0CB3 and P0CB8

- The hybrid/EV battery temperature sensor is in normal operating range, but is 15°C (27°F) different from the other sensors.
- The difference between a hybrid/EV battery temperature sensor and the average of the other hybrid/EV battery temperature sensors is greater than 10°C (18°F).
- The range of the hybrid/EV battery temperature sensor during the period the temperature average was shifting is less than 1°C (2°F)

P0A9D, P0AC7, P0ACC, P0AEA, P0BC4, P0C35, P0C7E, P0C83, P0C8A, P0C8F, P0C94, P0C99, P0CAA, P0CAF, P0CB4 and P0CB9

The hybrid/EV battery temperature sensor is greater than 87.5°C (189.5°F).

P0A9E, P0AC8, P0ACD, P0AEB, P0BC5, P0C36, P0C7F, P0C84, P0C8B, P0C90, P0C95, P0C9A, P0CAB, P0CB0, P0CB5 and P0CBA

The hybrid/EV battery temperature sensor is -40°C (-40°F).

Action Taken When the DTC Sets

- DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C7D, P0C7E, P0C7F, P0C82, P0C83, P0C84, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, and P0CBA are type B DTCs.
- If eight sensors fail, the vehicle will operate in a reduced power mode and electric only engine On (EV) (engine will be running continuously).

Conditions for Clearing the DTC

DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P0C7D, P0C7E, P0C7F, P0C82, P0C83, P0C84, P0C89, P0C8A, P0C8B, P0C8E, P0C8F, P0C90, P0C93, P0C94, P0C95, P0C98, P0C99, P0C9A, P0CA9, P0CAA, P0CAB, P0CAE, P0CAF, P0CB0, P0CB3, P0CB4, P0CB5, P0CB8, P0CB9, and P0CBA are type B DTCs.

Diagnostic Aids

Low or no coolant in the system may set a DTC P0A9D, P0AC7, P0ACC, P0AEA, P0BC4, P0C35, P0C7E, P0C83, P0C8A, P0C8F, P0C94, P0C99, P0CAA, P0CAF, P0CB4 or P0CB9.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C32: Hybrid/EV Battery Pack Cooling System Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 will monitor the battery temperature and set a DTC if the battery temperature can not be properly maintained.

Conditions for Running the DTC

- The 12 V system voltage is greater than 9 V.
- The vehicle is in propulsion system active mode.
OR
- The vehicle is plugged into an AC source.
- DTC P1EC6 heater performance diagnostic, DTC P0C4A pump performance diagnostic and DTC P0534 R134A low-charge detection have completed
- The following DTCs are not set; P0534, P0C47, P0C4A, P0CE0, P0CE2, P0CE3, P1A5A, P1EC6, P1EC7, P1EC8 and P1F18

Conditions for Setting the DTC

- The vehicle is in Active Cooling mode.
- The Battery Average Temperature continuously exceeds 45°C (113°F) for 5 minutes.
OR
- The vehicle is in Active Heating mode.
- The Battery Average Temperature is continuously below -25°C (-13°F) for 50 minutes.

Action Taken When the DTC Sets

DTC P0C32 is a type A DTC.

Conditions for Clearing the DTC

DTC P0C32 is a type A DTC.

Diagnostic Aids

- The hybrid/EV battery pack coolant pump may be faulty.
- The hybrid/EV battery pack coolant control valve may be leaking internally.
- The hybrid/EV battery pack heater may be defective.
- The hybrid/EV battery coolant level may be low or there may be no coolant.
- The AC refrigerant level may be low or the AC chiller may be inoperative.
- The hybrid/EV battery coolant lines may be restricted or blocked.

Circuit/System Verification

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle in Service Mode, verify that DTCs P0C47, P0C4A, P0CE0, P0CE2, P0CE3, P0CE6, P0CE7, P148A, P148B, P148C, P1EBE, P1EBF, P1EC3, P1EC4, P1EC5, P1EC6, P1EC7, P1EC8 or P1F18 is not set.
If any of the DTCs is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
2. Observe the scan tool Battery Average Temperature parameter. The reading should be above -25°C (-13°F) and below 45° C (113° F).
If the reading is below -25°C (-13°F) refer to [Hybrid/EV Battery Cooling Diagnostic](#) .
If the reading is above 45°C (113°F) refer to [Hybrid/EV Battery Cooling Diagnostic](#) .

DTC P0C43-P0C45

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0C43: Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Performance

DTC P0C44: Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit Low Voltage

DTC P0C45: Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit High Voltage

[Circuit/System Description](#)

The hybrid/EV battery has 2 hybrid/EV battery pack coolant temperature sensors. The hybrid/EV battery pack coolant temperature sensors are located in the coolant inlet (sensor 1) and the outlet (sensor 2) of the hybrid/EV battery. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery coolant. The hybrid/EV battery pack coolant temperature sensor resistance changes with battery coolant temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The battery energy control module (BECM) uses the hybrid/EV battery temperature sensors to determine the hybrid/EV battery pack temperature to control the battery cooling and heating operations.

[Conditions for Running the DTC](#)

P0C43

- The ignition is ON.
- The 12 V battery voltage is greater than or equal to 9 V.
- None of the following DTCs are set: P0C44, P0C45, P0C47, P0C4A, P0CD7, P0CD8, P1F18 or U0111.
- The coolant pump speed is greater than 20%.

P0C44

- The 12 V battery voltage is greater than 9 V.
- BECM is awake and communicating
- DTC P1A07 is not set.

P0C45

- The 12 V battery voltage is greater than 9 V.
- BECM is awake and communicating
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0C43

The hybrid/EV battery pack coolant temperature sensor 1 reading is not within 28°C (50.4°F) of the hybrid/EV battery pack coolant temperature sensor 2 and is not within 28° C (50.4° F) of the Average Hybrid Battery Pack Temperature .

P0C44

The hybrid/EV battery pack coolant temperature sensor 1 is greater than 87.5°C (189.5°F).

P0C45

The hybrid/EV battery pack coolant temperature sensor 1 is less than or equal to -40°C (-40°F).

Action Taken When the DTC Sets

- DTC P0C43-P0C45 are type B DTCs.
- The active heating mode is disabled.

Conditions for Clearing the DTC

DTC P0C43-P0C45 are type B DTCs.

Diagnostic Aids

- Low or no coolant in the system may set a DTC P0C43.
- DTC P0C43-P0C45 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25°C (-13°F).

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#) .

Circuit/System Verification

1. Vehicle in Service Mode, observe the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 parameter. The readings should be between -39 and +85°C (-38.2 and +185°F).
2. Compare the Hybrid/EV Battery Pack Coolant Temperature Sensor 1 and Hybrid/EV Battery Pack Coolant Temperature Sensor 2 parameters. The sensor readings should be within 28°C (50.4°F) of each other.

Circuit/System Testing

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle in Service Mode, verify that DTC P0AC1, P0B10, P0C44, P0C47, P0C4A or P1F18 is not set.
If any DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. If DTC P0C43, P0C44, or P0C45 is set, replace the A4 hybrid/EV battery pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Control Module References](#) for battery energy control module replacement and hybrid battery interface control modules 1-4, programming and set-up for the hybrid/EV battery pack replacement.

Hybrid/EV Battery Pack Coolant Pump Malfunction - DTC P0C47, P0C4A or P1F18

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0C47: Hybrid/EV Battery Pack Coolant Pump Control Circuit

DTC P0C4A: Hybrid/EV Battery Pack Coolant Pump Performance

DTC P1F18: Hybrid/EV Battery Pack Coolant Pump Enable Circuit

[Circuit/System Description](#)

The hybrid/EV battery pack coolant pump circulates coolant through the drive motor battery coolant radiator, drive motor battery coolant cooler and the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack. An enable signal from the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump provides overall control of the pump. When this circuit is high, the pump can operate. The pump is controlled with a pulse-width modulated signal from the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump provides a hard-wired pulse-width modulated feedback signal to the hybrid/EV powertrain control module 2. During normal operation, this feedback signal provides pump speed information to the hybrid/EV powertrain control module 2. The hybrid/EV battery pack coolant pump has some self-diagnostic capability. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on this same feedback circuit instead of pump speed information.

[Conditions for Running the DTC](#)

P0C47

- The 12 V battery voltage is greater than or equal to 9 V.
- The coolant pump enable is commanded.

P0C4A

- The 12 V battery voltage is greater than or equal to 9 V.
- The hybrid/EV powertrain control module 2 is awake and communicating with the battery energy control module.
- Runs once per ignition cycle when the propulsion system goes active.
- The heater performance diagnostic has passed.
- None of the following DTCs are set: P0C44, P0C45, P0C47, P1EC6, P1F18, U0111, U18B, or U2602.

P1F18

The 12 V battery voltage is greater than or equal to 9 V.

Conditions for Setting the DTC

P0C47

The hybrid/EV powertrain control module 2 detects the Coolant Pump Control circuit is open, shorted to voltage or shorted to earth.

P0C4A

The hybrid/EV powertrain control module 2 did not see the battery inlet temperature fall fast enough during the 18 second test period. The hybrid/EV powertrain control module 2 did not detect a decrease of 2° C (3.6° F) in 4 seconds within the 18 second test period.

P1F18

The hybrid/EV powertrain control module 2 detects the Coolant Pump Enable circuit is open, shorted to voltage or shorted to earth.

Action Taken When the DTC Sets

DTCs P0C47, P0C4A and P1F18 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0C47, P0C4A and P1F18 are type B DTCs.

Diagnostic Aids

- Low or no coolant in the system may set a DTC P0C4A.
- P1EC5 may cause a DTC P0C4A

- P1F18 may cause a DTC P0C47

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, verify that DTC P0C43, P0C44, P0C45, P0CE0, P0CE2, P0CE3, P0D0A, P0D11, P1EBC, P1EC3, P1EC4, P1EC5, P1EC6, P1EC7 or P1EC8 is not set.
If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
2. Vehicle in Service Mode, with the pump is disabled and not running, verify the scan tool parameters listed below:
 - Hybrid/EV Battery Pack Coolant Pump Command is less than 10%.

- Hybrid/EV Battery Pack Coolant Pump Feedback is 0%.
 - Hybrid/EV Battery Pack Coolant Pump Speed is 25 RPM.
3. Vehicle OFF, connect the charge cord set. With the vehicle in Charge Mode, pump enabled and not running, verify the scan tool parameters listed below:
 - Hybrid/EV Battery Pack Coolant Pump Command is 10%.
 - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
 - Hybrid/EV Battery Pack Coolant Pump Speed is 50 RPM.

Note: The vehicle must be in Charge Mode and the pump is enabled and not running before proceeding to the next step.

4. Vehicle in Service Mode, command the Hybrid/EV Battery Pack Coolant Pump Heater to 90 kW with a scan tool. Observe the Hybrid/EV Battery Pack Coolant Pump Temperature Sensor 1 parameter. The temperature reading should rise after a 15 second delay, +/- 10 seconds, to above 54° C +/-5° C (129.2° F +/-10°).
5. With the pump enabled and running with the Hybrid/EV Battery Pack Coolant Pump Temperature Sensor 1 parameter above 54° C +/-5° C (129.2° F +/-10°), verify the scan tool parameters listed below:
 - Hybrid/EV Battery Pack Coolant Pump Command to be greater than 10%.
 - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
 - Hybrid/EV Battery Pack Coolant Pump Speed is greater than 50 RPM.
6. Verify that the Hybrid/EV Battery Pack Coolant Pump Temperature Sensor 1 parameter dropped to below 40° C (104° F) after a 15 second delay, +/- 10 seconds, with the pump running.

The Hybrid/EV Battery Pack Coolant Pump Temperature Sensor 1 parameter did not drop to below 40° C (104° F). Refer to [Hybrid/EV Battery Cooling Diagnostic](#)

[Circuit/System Testing](#)

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle in Service Mode, verify that DTC P0C43, P0C44, P0C45, P1EC5, P1EC6, U0111, U185B, or U2602 is not set.
 - If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Ignition OFF, disconnect the harness connector at the G37 hybrid/EV battery pack coolant pump.
3. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
4. Connect a test lamp between the B+ circuit terminal 5 and earth circuit terminal 4.
5. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 5 and earth circuit terminal 4.
 - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test or replace the G37 hybrid/EV battery pack coolant pump.
6. Connect a test lamp between the enable circuit terminal 1 and earth circuit terminal 4.

7. Command the Hybrid Battery Pack Coolant Pump Command OFF (10%) and ON (90%) with a scan tool. Verify the test lamp turns OFF and ON when changing between the commanded states.
 - If the test lamp is always illuminated at 10%, test the pump enable circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
 - If the test lamp does not illuminate at 90%, test the pump enable circuit for a short-circuit to earth or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
9. Command the Hybrid Battery Pack Coolant Pump Command ON between 20% and 90% with a scan tool. Verify that a test lamp changes illumination between bright (20%) and dim (90%) between the control circuit terminal 3 and the B+ circuit terminal 5.
 - If the test lamp is always dim or does not illuminate, test the control circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
 - If the test lamp is always bright, test the control circuit for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
10. Verify the scan tool Hybrid/EV Battery Pack Coolant Pump Feedback parameter is less than 10%.
 - If greater than the specified range, test the feedback circuit terminal 2 for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
11. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4. Verify that the scan tool, Hybrid/EV Battery Pack Coolant Pump Feedback parameter is greater than 90%.
 - If less than the specified range, test the feedback circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
12. If all circuits test normal, replace the G37 hybrid/EV battery pack coolant pump.

DTC Descriptors

DTC P0CE0: Hybrid/EV Battery Pack Coolant Control Valve Performance

DTC P0CE2: Hybrid/EV Battery Pack Coolant Control Valve Control Circuit 1 Low Voltage

DTC P0CE3: Hybrid/EV Battery Pack Coolant Control Valve Control Circuit 1 High Voltage

DTC P1EC7: Hybrid/EV Battery Pack Coolant Control Valve Control Circuit 2 Low Voltage

DTC P1EC8: Hybrid/EV Battery Pack Coolant Control Valve Control Circuit 2 High Voltage

Circuit/System Description

The hybrid/EV battery pack coolant control valve drive circuit in the hybrid/EV powertrain control module 2 is two control circuit, terminal 1 (Drive A) and terminal 2 (Drive B), that can drive the valve motor in a forward or reverse direction. One end position of the range is the Radiator connection, the middle position is the bypass position and the other end is the chiller position.

Conditions for Running the DTC

P0CE0

- Vehicle in Service Mode and the Propulsion System transitions to Active.
- The 12 V battery voltage is greater than or equal to 10 V.

- The battery minimum temperature and battery inlet temperature are above -26°C (-14.8°F)
- None of the following DTCs are set: P0CE2, P0CE3, P0CE6, P0CE7, P1EC7, P1EC8

OR

- Hybrid/EV powertrain control module 2 is awake
- The 12 V battery voltage is greater than or equal to 10 V.
- The battery minimum temperature and battery inlet temperature are above -26°C (-14.8°F)
- None of the following DTCs are set: P0CE2, P0CE3, P0CE6, P0CE7, P1EC7, P1EC8

P0CE2, P1EC7, P0CE3, and P1EC8

- The hybrid/EV powertrain control module 2 is awake and communicating.
- The 12 V battery voltage is greater than or equal to 10 V.
- Hybrid/EV Battery Pack Coolant Control Valve is being commanded to move.

Conditions for Setting the DTC

P0CE0

- The control circuit terminal 1 (Drive A) or control circuit terminal 2 (Drive B) is open.
OR
- If during any learn procedure the valve does not reach the end-stops of approximately 42% and 50% in 30 seconds or goes past the end-stops of approximately 30% and 70% or the difference between the two end-stops is less than 15% or greater than 33%.
OR
- Hybrid/EV Battery Pack Coolant Control Valve has not reached its commanded position within 30 seconds.
OR
- Hybrid/EV Battery Pack Coolant Control Valve feedback position is not within 3% of valve commanded position.
OR
- Hybrid/EV Battery Pack Coolant Control Valve feedback position signal is erratic and its noise level sum is greater than 12% over 4 seconds.

P0CE2

The hybrid/EV powertrain control module 2 detects control circuit terminal 1 (Drive A) is grounded during a period when the hybrid/EV powertrain control module 2 is commanding 12 V on the control circuit terminal 1 (Drive A). This occurs when the valve is commanded towards the 100% chiller position.

P0CE3

The hybrid/EV powertrain control module 2 detects control circuit terminal 1 (Drive A) has 12 V during a period when the hybrid/EV powertrain control module 2 is

commanding 0 volts on the control circuit terminal 1 (Drive A). This occurs when the valve is commanded towards the radiator position.

P1EC7

The hybrid/EV powertrain control module 2 detects control circuit terminal 2 (Drive B) is earthed during a period when the hybrid/EV powertrain control module 2 is commanding 12 V on the control circuit terminal 2 (Drive B). This occurs when the valve is commanded towards the radiator position.

P1EC8

The hybrid/EV powertrain control module 2 detects control circuit terminal 2 (Drive B) has 12 V during a period when the hybrid/EV powertrain control module 2 is commanding 0 volts on the control circuit terminal 2 (Drive B). This occurs when the valve is commanded towards the 100% chiller position.

Action Taken When the DTC Sets

DTCs P0CE0, P0CE2, P0CE3, P1EC7, and P1EC8 are type B DTCs

Conditions for Clearing the DTC

- DTCs P0CE0, P0CE2, P0CE3, P1EC7, and P1EC8 are type B DTCs
- The [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) will need to be performed.

Diagnostic Aids

- Verify that the wire harness connector does not have corrosion when diagnosing a DTC P0CE0, P0CE2, P1EC7, P0CE3, or P1EC8.
- After a valve replacement the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) will need to be performed to prevent resetting DTCs.

Circuit/System Verification

Vehicle in Service Mode, with a scan tool, command the Hybrid/EV Battery Pack Coolant Control Solenoid Valve Command between 10%-90%. Verify that the Hybrid/EV Battery Pack Coolant Control Solenoid Valve Feedback matches the command. There may be a delay between the command and valve response.

Circuit/System Testing

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Vehicle in Service Mode, verify that DTC P0CE6 or P0CE7 are not set.
If DTC P0CE6 or P0CE7 is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Verify that DTC P0CE0 is not set.
If DTC P0CE0 is set, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.
3. Ignition OFF, and all vehicle systems OFF, it may take up to 2 minutes for all vehicle systems to power down, operate the vehicle within the conditions for running the DTC.
4. Verify that the DTC does not reset.
5. Ignition OFF, disconnect the harness connector at the Q65 hybrid/EV battery pack coolant control valve.
6. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2.
7. Vehicle in Service Mode, command the Hybrid/EV Battery Pack Coolant Control Solenoid Valve between Normal and Bypass and observe the test lamp. Verify that the test lamp illuminates momentarily between each command.
If the test lamp does not illuminate, test both control circuits for an open-circuit/high resistance on either control circuit. If the circuits test normal, replace the K114B

hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.

If the test lamp illuminates only on one command, test both control circuits for a short-circuit to voltage or short-circuit to earth on either control circuit. If the circuits test normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.

8. If all circuits test normal, test or replace the Q65 hybrid/EV battery pack coolant control valve.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P0CE6 or P0CE7

[Diagnostic Instructions](#)

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptors](#)

DTC P0CE6: Hybrid/EV Battery Pack Coolant Control Valve Position Sensor Circuit Low Voltage

DTC P0CE7: Hybrid/EV Battery Pack Coolant Control Valve Position Sensor Circuit High Voltage

[Circuit/System Description](#)

The valve provides position feedback to the hybrid/EV powertrain control module 2 based on a potentiometer in the valve. The hybrid/EV powertrain control module 2 uses this feedback to monitor the valve position. Different valve positions correspond to different resistance values. The hybrid/EV powertrain control module 2 determines the resistance values corresponding to the end stop positions of the valve by moving the valve to an end-stop and back to its original position when the ignition is first turned on. This is referred to as the hybrid/EV powertrain control module 2 "diagnostic learn" the valve. This provides a valve shaft breakage test and allows the hybrid/EV powertrain control module 2 to "learn" the position feedback value that corresponds to that end-stop. The end-stop that is used at each Vehicle in Service Mode alternates between each end, the radiator end one time, the chiller end the next time, the radiator end the next time, etc.

[Conditions for Running the DTC](#)

The 12 V battery voltage is greater than 9 V.

[Conditions for Setting the DTC](#)

P0CE6

Feedback Voltage is less than 28% of the 5 V reference voltage.

P0CE7

Feedback Voltage is greater than 72% of the 5 V reference voltage.

Action Taken When the DTC Sets

- DTCs P0CE6 and P0CE7 are type B DTCs.
- The hybrid/EV powertrain control module 2 uses only the two extreme positions of the valve, radiator and 100% chiller

Conditions for Clearing the DTC

DTCs P0CE6 and P0CE7 are type B DTCs.

Diagnostic Aids

After a valve replacement the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) will need to be performed to prevent resetting DTCs.

Circuit/System Verification

Vehicle in Service Mode, with a scan tool, command the Hybrid/EV Battery Pack Coolant Control Solenoid Valve Command between 10%-90%. Verify that the Hybrid/EV Battery Pack Coolant Control Solenoid Valve Feedback matches the command. There may be a 2-5 second delay between the command and valve response.

Circuit/System Testing

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disconnect the harness connector at the Q65 hybrid/EV battery pack coolant control valve.
2. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the low-reference circuit terminal 5 and earth.
If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.
3. Vehicle in Service Mode, test for 4.8-5.2 V between the 5 V reference circuit terminal 6 and earth.
If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit is short-circuited to earth, refer to Testing the 5 V Reference Circuits for a Short-circuit to Earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.
If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit is shorted to voltage, refer to Testing the 5 V Reference Circuits for a Short-Circuit to Voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.
4. Vehicle in Service Mode, test for 4.8-5.2 V between the signal circuit terminal 4 and earth.
If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.
If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.
5. If all circuits test normal, test or replace the Q65 hybrid/EV battery pack coolant control valve.

Testing the 5 V Reference Circuits for a Short-circuit to Earth

1. Ignition OFF, disconnect the X1 harness connector at the K114B hybrid/EV powertrain control module 2.
2. Test for less than 100 Ω at the following terminals and earth;
 - Terminal 62
 - Terminal 63
 - Terminal 64

If greater than the specified range, replace the K114B hybrid/EV powertrain control module 2.

3. Repair the short-circuit to earth on the appropriate 5 V reference circuit. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.

Testing the 5 V Reference Circuits for a Short-Circuit to Voltage

1. Ignition OFF, disconnect the X1 harness connector at the K114B hybrid/EV powertrain control module 2.
2. Vehicle in Service Mode, test for greater than 5.2 V at the following terminals and earth;
 - Terminal 62
 - Terminal 63
 - Terminal 64

If less than the specified range, replace the K114B hybrid/EV powertrain control module 2.

3. Repair the short-circuit to voltage on the appropriate 5 V reference circuit. After the repair, with a scan tool, perform the [Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#) procedure.

DTC Descriptors

DTC P0CE9: Hybrid/EV Electronics Coolant Pump Control Circuit

DTC P0CED: Hybrid/EV Electronics Coolant Pump Enable Circuit

Circuit/System Description

The hybrid/EV electronics coolant pump circulates coolant through the drive motor battery coolant radiator, hybrid/EV powertrain control module 1 and the battery charger to control the temperature of the hybrid/EV powertrain control module 1 and the battery charger. An enable signal from the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump provides overall control of the pump. When this circuit is high, the pump can operate. The pump is controlled with a pulse-width modulated signal from the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump provides a hard-wired pulse-width modulated feedback signal to the hybrid/EV powertrain control module 2. During normal operation, this feedback signal provides pump speed information. The hybrid/EV electronics coolant pump has some self-diagnostic capability. If it determines there is an internal fault, it provides this information on this same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P0CE9

- The 12 V battery voltage is greater than or equal to 9 V.
- The coolant pump enabled is commanded.

P0CED

- The 12 V battery voltage is greater than or equal to 9 V.
- The hybrid/EV powertrain control module 2 is awake and communicating.

Conditions for Setting the DTC

P0CE9

The hybrid/EV powertrain control module 2 has detected an open-circuit, short-circuit to voltage or short-circuit to earth on the coolant pump control circuit.

P0CED

The hybrid/EV powertrain control module 2 has detected an open-circuit, short-circuit to voltage or short-circuit to earth on the coolant pump enable circuit.

Action Taken When the DTC Sets

DTCs P0CE9 and P0CED are a type B DTCs.

Conditions for Clearing the DTC

DTCs P0CE9 and P0CED are a type B DTCs.

Circuit/System Verification

Vehicle in Service Mode, propulsion system active, with a scan tool, verify that the Hybrid Electronics Coolant Pump Command is between 20%-90% and Hybrid Electronics Coolant Pump Feedback is 50% +/-5%.

Circuit/System Testing

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Verify that DTC P0C43, P0C44, P0C45, P0C47, or P1EC6 is not set.
If DTC is set, refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
2. Ignition OFF, disconnect the harness connector at the G35 hybrid/EV electronics coolant pump.
3. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
4. Connect a test lamp between the B+ circuit terminal 5 and the earth circuit terminal 4.
5. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 5 and earth circuit terminal 4.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, test or replace the G35 hybrid/EV electronics coolant pump.
6. Connect a test lamp between the enable circuit terminal 1 and the earth circuit terminal 4.
7. Command the Hybrid Battery Pack Coolant Pump Command OFF (10%) and ON (90%) with a scan tool. The test lamp should turn OFF and ON when changing between the commanded states.
If the test lamp is always illuminated at 10%, test the pump enable circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
If the test lamp does not illuminate at 90%, test the pump enable circuit for a short-circuit to earth or an open-circuit/high resistance. If the circuit tests normal, replace

the K114B hybrid/EV powertrain control module 2.

8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.

9. Command the Hybrid Battery Pack Coolant Pump Command ON between 20% and 90% with a scan tool. Verify that a test lamp changes illumination between bright (20%) and dim (90%) between the control circuit terminal 3 and the B+ circuit terminal 5.

If the test lamp is always dim or does not illuminate, test the control circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

If the test lamp is always bright, test the control circuit for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

10. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is less than 10%.

If greater than the specified range, test the feedback circuit terminal 2 for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

11. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the earth circuit terminal 4. Verify that the scan tool, Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.

If less than the specified range, test the feedback circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

12. If all circuits test normal, replace the G35 hybrid/EV electronics coolant pump.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0CEF: Hybrid/EV Electronics Coolant Temperature Sensor Performance

DTC P0CF0: Hybrid/EV Electronics Coolant Temperature Sensor Circuit Low Voltage

DTC P0CF1: Hybrid/EV Electronics Coolant Temperature Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV electronics have a coolant temperature sensor. The hybrid/EV electronics coolant temperature sensor is located in the coolant radiator. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV electronics coolant. The hybrid/EV electronics coolant temperature sensor resistance changes with battery coolant temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The hybrid/EV powertrain control module 2 uses the hybrid/EV electronics coolant temperature sensor to determine the hybrid/EV electronics temperature to control the hybrid/EV electronics cooling operation.

Conditions for Running the DTC

P0CEF

- The 12 V battery voltage is greater than or equal to 9 V.
- Ignition is not in CRANK.
- No fault on power inverter max. temperature sensor.
- Hybrid/EV electronics coolant pump off soak time is greater than 6 hours OR hybrid/EV electronics coolant pump off soak time is greater than 6 hours and has been

enabled for less than 15 seconds.

- None of the following DTCs are set; P0606, P0CF1, P0CF0, P0CE9, P0CED, P0A2D, P0A2C, P0A2B, P0A2F, P0A31, P0A32, P0A33 or P0A35.
OR
- The 12 V battery voltage is greater than or equal to 9 V.
- Ignition is in RUN.
- The propulsion system active.
- The hybrid/EV electronics coolant pump is enabled.
- The hybrid/EV electronics coolant pump speed (duty cycle) is between within 30% and 90%.
- None of the following DTCs are set; P0CF1, P0CF0, P0CE9, P0CED, P1ED6, P1ED7, P1ED8, P0A2D, P0A2C, P0A2B, P0A2F, P0A31, P0A32, P0A33 or P0A35.
OR
- The 12 V battery voltage is greater than or equal to 9 V.
- Ignition is OFF.
- The hybrid/EV electronics coolant pump is enabled.
- The hybrid/EV electronics coolant pump speed (duty cycle) is between within 30% and 90%.
- The vehicle is in charge mode.
- None of the following DTCs are set; P0CF1, P0CF0, P0CE9, P0CED, P1ED7, P1ED6 or P1ED8.

P0CF0 and P0CF1

- The ignition is ON.
- The 12 V battery voltage is greater than or equal to 9 V.

Conditions for Setting the DTC

P0CEF

- The coolant temperature does not fall within 30°C (86°F) of the Drive Motor A Inverter Temperature or Drive Motor B Inverter Temperature (the higher of the two readings).
OR
- The coolant temperature does not fall within 20°C (68°F) and the battery charger temperature is 10°C (50°F).
OR
- The coolant temperature does not fall within 10°C (50°F) of the battery charger temperature.

P0CF0

The hybrid/EV electronics coolant temperature is greater than 87.5°C (189.5°F).

P0CF1

The hybrid/EV electronics temperature is less than -40°C (-40°F).

Action Taken When the DTC Sets

DTC P0CEF-P0CF1 are type B DTCs.

Conditions for Clearing the DTC

DTC P0CEF-P0CF1 are type B DTCs.

Diagnostic Aids

- Low or no coolant in the system may set a DTC P0CF0.
- An inoperative hybrid/EV electronics coolant pump may set a DTC P0CEF.

Cooling Fan Malfunction - DTC P148A-P148C

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P148A: Cooling Fan Signal Circuit Performance

DTC P148B: Cooling Fan Signal Circuit Low Voltage

DTC P148C: Cooling Fan Signal Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 controls the radiator cooling fans. The cooling fans are controlled with a pulse width modulated (PWM) signal. The hybrid/EV powertrain control module 2 diagnoses any faults with the hardwire circuit to the engine control module. The engine control module sends a fan request PWM signal to the hybrid/EV powertrain control module 2 through a hardwire circuit. The hybrid/EV powertrain control module 2 operates in a pass-through mode for the engine control module fan request. The higher the duty cycle the higher the cooling fan speed.

Conditions for Running the DTC

P148A

- The 12 V battery voltage is greater than or equal to 9 V.
- The propulsion system is active.
- The cooling fans are enabled for more than 10 seconds.
- None of the following DTCs are set: P148B or P148C.

OR

- The 12 V battery voltage is greater than or equal to 9 V.
- The propulsion system is inactive.
- The energy storage system thermal condition request is ActiveCool.
- The cooling fans are enabled for more than 10 seconds.
- None of the following DTCs are set: P148B or P148C.

P148B

The 12 V battery voltage is greater than or equal to 9 V.

P148C

- The 12 V battery voltage is greater than or equal to 9 V.
- The propulsion system is active.
- The cooling fans are enabled for more than 10 seconds.
- OR
- The 12 V battery voltage is greater than or equal to 9 V.
- The propulsion system is inactive.
- The energy storage system thermal condition request is ActiveCool.
- The cooling fans are enabled for more than 10 seconds.

Conditions for Setting the DTC

P148A

The PWM fan duty cycle request from engine control module (Hardwire) is not within 30% of the requested engine cooling fan speed sent to the hybrid/EV powertrain control module 2 via serial data.

P148B

The hybrid/EV powertrain control module 2 has detected a duty cycle of greater than 97% from the engine control module.

P148C

The hybrid/EV powertrain control module 2 has detected a duty cycle of less than 3% from the engine control module.

Action Taken When the DTC Sets

DTCs P148A, P148B and P148C are type B DTCs.

14 Volt Power Module Cooling Fan Malfunction - DTC P1EA6 or P1EA7

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1EA6: 14 Volt Power Module Cooling Fan Control Circuit

DTC P1EA7: 14 Volt Power Module Cooling Fan Enable Circuit

Circuit/System Description

The 14 V power module cooling fan blows air through the 14 V power module to control the temperature of the 14 V power module. The fan is controlled with a pulse-width modulated signal sent from the hybrid/EV powertrain control module 2 to the 14 V power module fan. The longer the duty cycle on the signal the higher the fan speed. Maximum fan speed is 3,900 RPM. An enable signal from the hybrid/EV powertrain control module 2 to the 14 V power module fan provides overall control of the fan. When this circuit is high, the fan can operate. The 14 V power module fan provides a hard-wired pulse-width modulated feedback signal to the hybrid/EV powertrain control module 2. During normal operation, this feedback signal provides fan speed information. The 14 V power module fan has some self-diagnostic capability. If it determines there is an internal fault it provides this information on this same feedback circuit instead of speed information.

Conditions for Running the DTC

P1EA6

- The 12 V battery voltage is greater than or equal to 9 V.
- The 14 V power module fan is enabled

P1EA7

The 12 V battery voltage is greater than or equal to 9 V.

[Conditions for Setting the DTC](#)

P1EA6

The hybrid/EV powertrain control module 2 has detected an open, short-circuit to voltage or short-circuit to earth on the 14 V power module cooling fan control circuit

P1EA7

The hybrid/EV powertrain control module 2 has detected an open, short-circuit to voltage or short-circuit to earth on the 14 volt power module cooling fan enable circuit.

[Action Taken When the DTC Sets](#)

DTCs P1EA6 and P1EA7 are type B DTCs.

Circuit/System Verification

Vehicle in Service Mode, with a scan tool, command the 14 V Power Module Fan Command between 10%-90%-10%. Verify that the 14 V Power Module Fan Speed increases and decreases with the command.

Circuit/System Testing

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disconnect the harness connector at the G38 14 V power module cooling fan.
2. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between the B+ circuit terminal 5 and earth circuit terminal 1.
4. Vehicle in Service Mode, verify that a test lamp illuminates between the B+ circuit terminal 5 and earth circuit terminal 1.
If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the B+ circuit fuse is open, replace the G38 14 V power cooling module fan.
5. Connect a test lamp between the enable circuit terminal 4 and earth circuit terminal 1.
6. Command the 14 V Power Module Fan Command OFF (10%) and ON (90%) with a scan tool. Verify the test lamp turns OFF and ON when changing between the commanded states.
If the test lamp is always illuminated at 10%, test the pump enable circuit for a short-circuit to voltage. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
If the test lamp does not illuminate at 90%, test the pump enable circuit for a short-circuit to earth or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.
7. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
8. Command the 14 V Power Module Fan ON between 10% and 90% with a scan tool. Verify that a test lamp changes illumination between bright (10%) and dim (90%) between the control circuit terminal 3 and the B+ circuit terminal 5.

If the test lamp is always dim or does not illuminate, test the control circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

If the test lamp is always bright, test the control circuit for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

9. Verify the scan tool 14 V Power Module Fan Feedback parameter is less than 10%.

If greater than the specified range, test the feedback circuit terminal 2 for a short-circuit to earth. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

10. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the B+ circuit terminal 5. Verify that the scan tool, 14 V Power Module Fan Feedback parameter is greater than 90%.

If less than the specified range, test the feedback circuit for a short-circuit to voltage or an open-circuit/high resistance. If the circuit tests normal, replace the K114B hybrid/EV powertrain control module 2.

11. If all circuits test normal, replace the G38 14 V power module cooling fan.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

[DTC Descriptor](#)

DTC P1EC6: Hybrid/EV Battery Pack Heater Performance

[Circuit/System Description](#)

The hybrid/EV battery contains 5 high-voltage contactors and 2 transistors. The high-voltage contactors allow the high-voltage DC batteries to be connected to the vehicle or safely contain the high-voltage DC within the hybrid/EV battery assembly. The 5 high-voltage contactors are a main positive high-voltage contactor, main negative high-voltage contactor, charge positive high-voltage contactor, charge negative high-voltage contactor and multi-function high-voltage contactor. The 2 transistors are the precharge transistor and heater transistor. These contactors/transistors close and open in sequence and are controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high-voltage contactors/transistors. Earth is provided through the case earth.

The hybrid/EV battery pack coolant heater is mounted to the coolant inlet on the back side of the hybrid/EV battery contactor assembly. The hybrid/EV battery pack coolant heater uses a 360 V power source.

After the ignition is turned ON, the hybrid/EV battery pack coolant heater is commanded ON. The hybrid/EV powertrain control module 2 monitors the temperature change at the hybrid/EV battery pack coolant temperature sensor 1 to determine if the hybrid/EV battery pack coolant heater is functioning properly.

[Conditions for Running the DTC](#)

- The 12 V battery voltage is greater than or equal to 9 V.
- The vehicle is not connected to an active AC source.
- The hybrid/EV battery pack coolant temperature sensor 1 is less than 45°C (113°F).
- The difference between the hybrid/EV battery pack coolant temperature sensor 1 and the hybrid/EV battery average cell temperature is less than 25°C (77°F)
- Runs once per ignition cycle when propulsion system goes active.

- None of the following DTCs are set; P1EC3, P1EC4, P1EC5, P0C44, P0C45, P1F18, P0C47, or U0111.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 did not see the battery pack coolant temperature sensor 1 rise fast enough during the test period of one minute. The required increase in temperature is approximately 1°C (1.8°F) change for every 2 seconds.

Action Taken When the DTC Sets

- DTC P1EC6 is a type B DTC.
- The hybrid/EV battery pack coolant heater will be disabled.

Conditions for Clearing the DTC

DTC P1EC6 is a type B DTC.

Diagnostic Aids

P1EC6 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25°C (-13°F).

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#) .

Circuit/System Verification

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

1. Ignition OFF, disable the high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#) .
2. If the DTC is set, replace the A4 hybrid/EV battery pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Replacement and Shipping Preparation](#)
- [Control Module References](#) for battery energy control module replacement and hybrid battery interface control modules 1-4, programming and set-up for the hybrid/EV battery pack replacement.

Hybrid Cooling System Pressure Cap Testing

Special Tools

- GE-46143 Radiator Cap and Surge Tank Test Adapter
- EN-24460-A Cooling System Pressure Tester

For equivalent regional tools, Refer to [Special Tools](#)

[Pressure Cap Testing](#)

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the pressure cap.
2. Wash the pressure cap sealing surface with water.

Note: Lubricate *GE-46143* Radiator Cap and Surge Tank Test Adapter and pressure cap O-rings with coolant and press cap to seat O-ring on *GE-46143* Radiator Cap and Surge Tank Test Adapter before turning to engage threads.

3. Use the *EN-24460-A* Cooling System Pressure Tester (1) with *GE-46143* Radiator Cap and Surge Tank Test Adapter (2) in order to test the pressure cap.
4. Test the pressure cap for the following conditions:
 - Pressure release when the *EN-24460-A* Cooling System Pressure Tester exceeds the pressure rating of the pressure cap.
 - Maintain the rated pressure for at least 10 seconds.
Note the rate of pressure loss.
5. Replace the pressure cap under the following conditions:
 - The pressure cap does not release pressure which exceeds the rated pressure of the cap.
 - The pressure cap does not hold the rated pressure.

Hybrid Cooling System Leak Test

Special Tools

- *EN-24460-A* Cooling System Pressure Tester
- *GE-46143* Radiator Cap and Surge Tank Test Adapter

For equivalent regional tools, Refer to [Special Tools](#)

Warning: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, wings, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

Warning: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

1. Remove the pressure cap.
2. Test the operation of the pressure cap. Refer to [Hybrid Cooling System Pressure Cap Testing](#) .
3. Wash the pressure cap mating surface with water.

4. Use the *EN-24460-A* Cooling System Pressure Tester with the *GE-46143* Radiator Cap and Surge Tank Test Adapter in order to apply pressure to the cooling system.
Do not exceed the pressure cap rating.
5. The cooling system should hold the rated pressure for at least 2 minutes.
Observe the gauge for any pressure loss.
6. Repair any leaks as required.

Note: Do not use stop leak or any other chemicals. Only use premix Dexcool (50/50 mixture of Dexcool and deionised)

Hybrid Battery Pack Coolant Passage Leak Test

Special Tools

- *EN-24460-A* Cooling System Pressure Tester
- *GE-47716* Vac-N-Fill Coolant Refill Tool
- *GE-50385* Battery Pack Coolant Passage Pressure Test Adapter
- *GE-50389* Coolant Pressure Test Quick Connector

For equivalent regional tools, Refer to [Special Tools](#)

Warning: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, wings, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

Warning: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

1. Install Cooling System Pressure Tester Cap Adapter to *EN-24460-A* Cooling System Pressure Tester .
2. Install *GE-47716-8* Vac-N-Fill Cap to Cooling System Pressure Tester Cap Adapter.
3. Install *GE-50389* Coolant Pressure Test Quick Connector to *GE-47716-8* Vac-N-Fill Cap .
4. Install *GE-50385-1* Coolant Pressure Tester Adapter to *GE-50389* Quick Connector .
5. Install *GE-50385-1* Coolant Pressure Tester Adapter to battery pack inlet connector.
6. Install *GE-50385-2* Coolant Pressure Tester Adapter to battery pack outlet connector.
7. Apply pressure to the battery pack coolant passages.

Do not exceed the pressure cap rating.

8. The cooling passages should hold the rated pressure for at least 2 minutes.

Observe the gauge for any pressure loss.

9. Repair any leaks as required.

Drive Motor Battery Cooling System Draining and Filling

Special Tools

- GE-26568 Coolant and Battery Tester
- GE-47716 Vac-N-Fill Coolant Refill Tool
- GE-46143 Cooling System Adapter

For equivalent regional tools, Refer to [Special Tools](#)

Draining Procedure

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the battery radiator inlet hose from the quick connect at the right frame rail. Refer to [Drive Motor Battery Radiator Inlet Hose Replacement](#)
2. To drain the battery coolant, remove the battery hose quick connect at the battery. Refer to [Drive Motor Battery Coolant Cooler Inlet Hose Assembly Replacement](#)
3. Inspect the coolant.
4. Follow the appropriate procedure based on the condition of the coolant.
 - Normal in appearance--Follow the filling procedure.
 - Discoloured--Follow the flush procedure. Refer to [Flushing](#) .

Vac-N-Fill Procedure

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

Note: To prevent boiling of the coolant/water mixture in the vehicle's cooling system, do not apply vacuum to a cooling system above 49°C (120°F). The tool will not operate properly when the coolant is boiling.

1. Install GE-46143 Cooling System Adapter
2. Attach the Van-N-Fill cap to GE-46143 Cooling System Adapter .

3. Attach the vacuum gauge assembly to the Vac-N-Fill cap.

4. Attach the filling hose to the barb fitting on the vacuum gauge assembly.

Ensure that the valve is closed.

Note: Use a Pre-mixed Dexcool® (50/50 mixture of Dexcool® and deionised water). Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

5. Pour the coolant mixture into the graduated reservoir.

6. Place the fill hose in the graduated reservoir.

Note: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

7. Install the vacuum tank on the graduated reservoir with the fill hose routed through the cut-out area in the vacuum tank.

8. Attach the venture assembly to the vacuum tank.

9. Attach a shop air hose to the venture assembly.

Ensure the valve on the venture assembly is closed.

10. Attach the vacuum hose to the vacuum gauge assembly and the vacuum tank.

11. Open the valve on the venture assembly. The vacuum gauge will begin to rise and a hissing noise will be present.

12. Continue to draw a vacuum until the needle stops rising. This should be 610-660 mm Hg (24-26 in Hg).

Cooling hoses may start to collapse. This is normal due to vacuum draw.

13. To aid in the fill process, position the graduated reservoir above the coolant fill port.

14. Slowly open the valve on the vacuum gauge assembly. When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.
15. Close the valve on the venture assembly.
16. If there is a suspected leak in the cooling system, allow the system to stabilise under vacuum and monitor for vacuum loss.

If vacuum loss is observed, refer to [Loss of Coolant](#) .

17. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

18. Once the vacuum gauge reaches zero, close the valve on the vacuum gauge assembly and repeat steps 12-18.
19. Detach the Vac-N-Fill cap from the *GE-46143* Cooling System Adapter .
20. Remove *GE-46143* Cooling System Adapter from the surge tank filler neck.
21. Add coolant to the system as necessary.
22. Inspect the concentration of the coolant mixture using *GE-26568* Coolant and Battery Tester.

Note: After filling the cooling system, the extraction hose can be used to remove excess coolant and achieve the proper coolant level.

23. Detach the vacuum hose form the vacuum gauge assembly.

24. Attach the extraction hose to the vacuum hose.

25. Open the valve on the venture assembly to start a vacuum draw.

26. Use the extraction hose to draw out coolant to the proper level.

27. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

Drive Motor Generator Power Inverter Module Cooling System Draining and Filling

Special Tools

- GE-26568 Coolant and Battery Tester
- GE-47716 Vac-N-Fill Coolant Refill Tool
- GE-46143 Cooling System Adapter

For equivalent regional tools, Refer to [Special Tools](#)

Draining Procedure

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the drive motor generator control module coolant pump hose from the pump. Refer to [Drive Motor Generator Control Module Coolant Pump Hose Replacement](#)
2. Inspect the coolant.
3. Follow the appropriate procedure based on the condition of the coolant.
 - Normal in appearance--Follow the filling procedure.
 - Discoloured--Follow the flush procedure. Refer to [Flushing](#) .

Vac-N-Fill Procedure

Warning: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

Note: To prevent boiling of the coolant/water mixture in the vehicle's cooling system, do not apply vacuum to a cooling system above 49°C (120°F). The tool will not operate properly when the coolant is boiling.

1. Install GE-46143 Cooling System Adapter
2. Attach the Van-N-Fill cap to GE-46143 Cooling System Adapter .

3. Attach the vacuum gauge assembly to the Vac-N-Fill cap.

4. Attach the filling hose to the barb fitting on the vacuum gauge assembly.

Ensure that the valve is closed.

Note: Use a Pre-mixed Dexcool® (50/50 mixture of Dexcool® and deionised water). Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

5. Pour the coolant mixture into the graduated reservoir.

6. Place the fill hose in the graduated reservoir.

Note: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

7. Install the vacuum tank on the graduated reservoir with the fill hose routed through the cut-out area in the vacuum tank.

8. Attach the venture assembly to the vacuum tank.

9. Attach a shop air hose to the venture assembly.

Ensure the valve on the venture assembly is closed.

10. Attach the vacuum hose to the vacuum gauge assembly and the vacuum tank.

11. Open the valve on the venture assembly. The vacuum gauge will begin to rise and a hissing noise will be present.

12. Continue to draw a vacuum until the needle stops rising. This should be 610-660 mm Hg (24-26 in Hg).

Cooling hoses may start to collapse. This is normal due to vacuum draw.

13. To aid in the fill process, position the graduated reservoir above the coolant fill port.

14. Slowly open the valve on the vacuum gauge assembly. When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.

15. Close the valve on the venture assembly.

16. If there is a suspected leak in the cooling system, allow the system to stabilise under vacuum and monitor for vacuum loss.

If vacuum loss is observed, refer to [Loss of Coolant](#) .

17. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

18. Once the vacuum gauge reaches zero, close the valve on the vacuum gauge assembly and repeat steps 12-18.

19. Detach the Vac-N-Fill cap from the *GE-46143* Cooling System Adapter .

20. Remove *GE-46143* Cooling System Adapter from the surge tank filler neck.

21. Add coolant to the system as necessary.

22. Inspect the concentration of the coolant mixture using *GE-26568* Coolant and Battery Tester.

Note: After filling the cooling system, the extraction hose can be used to remove excess coolant and achieve the proper coolant level.

23. Detach the vacuum hose form the vacuum gauge assembly.

24. Attach the extraction hose to the vacuum hose.

25. Open the valve on the venture assembly to start a vacuum draw.

26. Use the extraction hose to draw out coolant to the proper level.

27. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

Coolant Temperature Sensor Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Partially drain the coolant just below the level of the coolant temperature sensor. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling2. Remove the front fascia. Refer to Front Bumper Fascia Removal and Installation : Volt → Ampera	

3. Disconnect the electrical connector from the coolant temperature sensor.

1	Coolant Temperature Sensor Retaining Clip.
2	Coolant Temperature Sensor

Generator Control Module Coolant Tank Hose Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Drain the coolant. Refer to Drive Motor Generator Power Inverter Module Cooling System Draining and Filling2. Remove the left front headlamp. Refer to Headlamp Replacement : Volt → Ampera	

Generator Control Module Coolant Tank Hose Clamps (Qty: 2)

Procedure

1

Reposition the generator control module coolant tank hose clamps using *BO-38185* hose clamp pliers .

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, Refer to [Special Tools](#)

Generator Control Module Coolant Tank Hose

2

Procedure

Unclip drive motor battery radiator outlet hose from hose.

Tip

Replace corroded hose clamps and brackets.

Drive Motor Generator Control Module Coolant Pump Hose Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, Refer to [Special Tools](#)

Removal Procedure

Note: Replace corroded hose clamps and brackets.

1. Remove the front wheelhouse front liner on the driver's side. Refer to [Front Wheelhouse Front Liner Replacement](#)

2. Place a drain pan under pump.
3. Remove the drive motor generator control module coolant pump hose clamp (1) at generator control module coolant pump using *BO-38185* Hose Clamp Pliers .
4. Remove the drive motor generator control module coolant pump hose (2) from the generator control module coolant pump.

5. Remove the drive motor generator control module coolant pump hose clamp (1) at drive motor battery coolant air separator using *BO-38185* Hose Clamp Pliers .
6. Remove the drive motor generator control module coolant pump hose (2) from drive motor battery coolant air separator.
7. Remove the drive motor generator control module coolant pump hose from the vehicle.

[Installation Procedure](#)

1. Install the drive motor generator control module coolant pump hose to the vehicle.
2. Install the drive motor generator control module coolant pump hose (2) to the drive motor battery coolant air separator.
3. Install the drive motor generator control module coolant pump hose clamp (1) at drive motor battery coolant air separator using *BO-38185* Hose Clamp Pliers .

4. Install the drive motor generator control module coolant pump hose (2) to the generator control module coolant pump.
5. Install the drive motor generator control module coolant pump hose clamp (1) at generator control module coolant pump using *BO-38185* Hose Clamp Pliers .
6. Install the front wheelhouse front liner on the driver's and passenger side. Refer to [Front Wheelhouse Front Liner Replacement](#)
7. Remove the drain pan.
8. Fill the cooling system.

Drive Motor Generator Control Module Cooling Outlet Hose Replacement

Special Tools

BO-38185 Hose Clamp Pliers

For equivalent regional tools, Refer to [Special Tools](#)

Removal Procedure

Note: Replace corroded hose clamps and brackets.

1. Drain the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
2. Remove the front wheelhouse front liner on the driver's and passenger side. Refer to [Front Wheelhouse Front Liner Replacement](#)
3. Remove the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : Volt → Ampera
4. Unfasten and reposition the drive motor battery coolant pump with out draining the battery cooling system. Refer to [Drive Motor Battery Coolant Pump Replacement](#)
5. Unbolt and reposition the drive motor battery coolant cooler outlet hose Refer to [Drive Motor Battery Coolant Cooler Outlet Hose Replacement](#)
6. Unbolt and reposition the drive motor battery coolant inlet hose. Refer to [Drive Motor Battery Coolant Inlet Hose Replacement](#)

7. Remove the drive motor generator control module cooling outlet hose clamp (1) at generator control module coolant pump using *BO-38185* Hose Clamp Pliers .
8. Remove the drive motor generator control module cooling outlet hose (2) from the generator control module coolant pump.

9. Remove the drive motor generator control module cooling outlet hose clamp (1) at drive motor battery charger using *BO-38185* Hose Clamp Pliers .
10. Remove the drive motor generator control module cooling outlet hose (2) from drive motor battery charger.

11. Disconnect the drive motor generator control module cooling outlet hose (1) from the cooling fan and shroud.
12. Remove the drive motor generator control module cooling outlet hose from the vehicle.

[Installation Procedure](#)

1. Install the drive motor generator control module cooling outlet hose to the vehicle.
2. Connect the drive motor generator control module cooling outlet hose (1) to the cooling fan and shroud.

3. Install the drive motor generator control module cooling outlet hose (2) to the drive motor battery charger.
4. Install the drive motor generator control module cooling outlet hose clamp (1) at drive motor battery charger using *BO-38185* Hose Clamp Pliers .

5. Install the drive motor generator control module cooling outlet hose (2) to the generator control module coolant pump.
6. Install the drive motor generator control module cooling outlet hose clamp (1) at generator control module coolant pump using *BO-38185* Hose Clamp Pliers .
7. Reposition and bolt the drive motor battery coolant inlet hose. Refer to [Drive Motor Battery Coolant Inlet Hose Replacement](#)
8. Reposition and bolt the drive motor battery coolant cooler outlet hose Refer to [Drive Motor Battery Coolant Cooler Outlet Hose Replacement](#)
9. Reposition and fasten the drive motor battery coolant pump with out draining the battery cooling system. Refer to [Drive Motor Battery Coolant Pump Replacement](#)
10. Install the front bumper fascia. Refer to [Front Bumper Fascia Removal and Installation](#) : [Volt](#) → [Ampera](#)
11. Install the front wheelhouse front liner on the driver's and passenger side. Refer to [Front Wheelhouse Front Liner Replacement](#)
12. Fill the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)

Removal Procedure

Note: Replace corroded hose clamps and brackets.

1. Drain the cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)
2. Remove the air conditioning compressor and evaporator hose. Refer to [Air Conditioning Compressor and Evaporator Hose Replacement](#)
3. Reposition the air conditioning evaporator thermal expansion valve tubes from the TXV valve. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement](#)

4. Remove the drive motor battery coolant cooler inlet hose assembly clamp (1) at the drive motor battery coolant cooler using *BO-38185* Hose Clamp Pliers .
5. Remove the drive motor battery coolant cooler inlet hose assembly clamps (2) at the drive motor battery coolant flow control valve using *BO-38185* Hose Clamp Pliers .
6. Remove the drive motor battery coolant cooler inlet hose assembly (3) from the drive motor battery coolant cooler and drive motor battery coolant flow control valve.
7. Remove the exhaust pipe heat shield front. Refer to [Exhaust Pipe Heat Shield Replacement](#) : [Rear](#) → [Center](#) → [Front](#)

8. Disconnect the drive motor battery coolant cooler inlet hose assembly quick disconnect fitting (1) at the battery.
9. Remove the drive motor battery coolant cooler inlet hose assembly (2) from the battery.

10. Disconnect the drive motor battery coolant cooler inlet hose assembly quick disconnect fitting (1) from drive motor battery inlet hose and drive motor battery coolant cooler outlet hose and drive motor battery coolant cooler inlet hose.
11. Remove the drive motor battery coolant cooler inlet hose assembly bracket nuts (2) from the body.
12. Remove the drive motor battery coolant cooler inlet hose from the vehicle.

[Installation Procedure](#)

1. Install the drive motor battery coolant cooler inlet hose from the vehicle.

2. Install the drive motor battery coolant cooler inlet hose assembly bracket nuts (2) to the body.
3. Connect the drive motor battery coolant cooler inlet hose assembly quick disconnect fitting (1) to the drive motor battery inlet hose and drive motor battery coolant cooler outlet hose and drive motor battery coolant cooler inlet hose.

Caution: Refer to [Fastener Caution](#) in the Preface section.

4. Install the drive motor battery coolant cooler inlet hose assembly (2) to the battery and tighten to **9 N·m (80 lb in)**.

5. Connect the drive motor battery coolant cooler inlet hose assembly quick disconnect fitting (1) at the battery.
6. Install the exhaust pipe heat shield front. Refer to [Exhaust Pipe Heat Shield Replacement](#) : [Rear](#) → [Center](#) → [Front](#)

7. Install the drive motor battery coolant cooler inlet hose assembly (3) to the drive motor battery coolant cooler and drive motor battery coolant flow control valve.
8. Install the drive motor battery coolant cooler inlet hose assembly clamps (2) at the drive motor battery coolant flow control valve using *BO-38185* Hose Clamp Pliers .
9. Install the drive motor battery coolant cooler inlet hose assembly clamp (1) at the drive motor battery coolant cooler using *BO-38185* Hose Clamp Pliers.
10. Reposition the air conditioning evaporator thermal expansion valve tubes from the TXV valve. Refer to [Air Conditioning Evaporator Thermal Expansion Valve Tube Replacement](#)
11. Install the air conditioning compressor and evaporator hose. Refer to [Air Conditioning Compressor and Evaporator Hose Replacement](#)
12. Fill the cooling system. Refer to [Cooling System Draining and Filling](#)

Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn

[Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn](#)

The Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn procedure must be completed when the following components are replaced:

- Hybrid/EV Powertrain Control Module 2
- Hybrid/EV Battery Pack Coolant Control Solenoid Valve

The Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn procedure can be completed with a scan tool using the following steps:

1. Install the scan tool to the data link connector.
2. Vehicle in Service Mode, engine OFF.
3. Select Hybrid/EV Battery Pack Coolant Control Solenoid Valve Learn in the Hybrid/EV Powertrain Control Module 2 Control Functions list.
4. Follow the scan tool directions to complete the procedure.
5. Clear any DTCs that may be set.

Drive Motor Battery Cooling Description

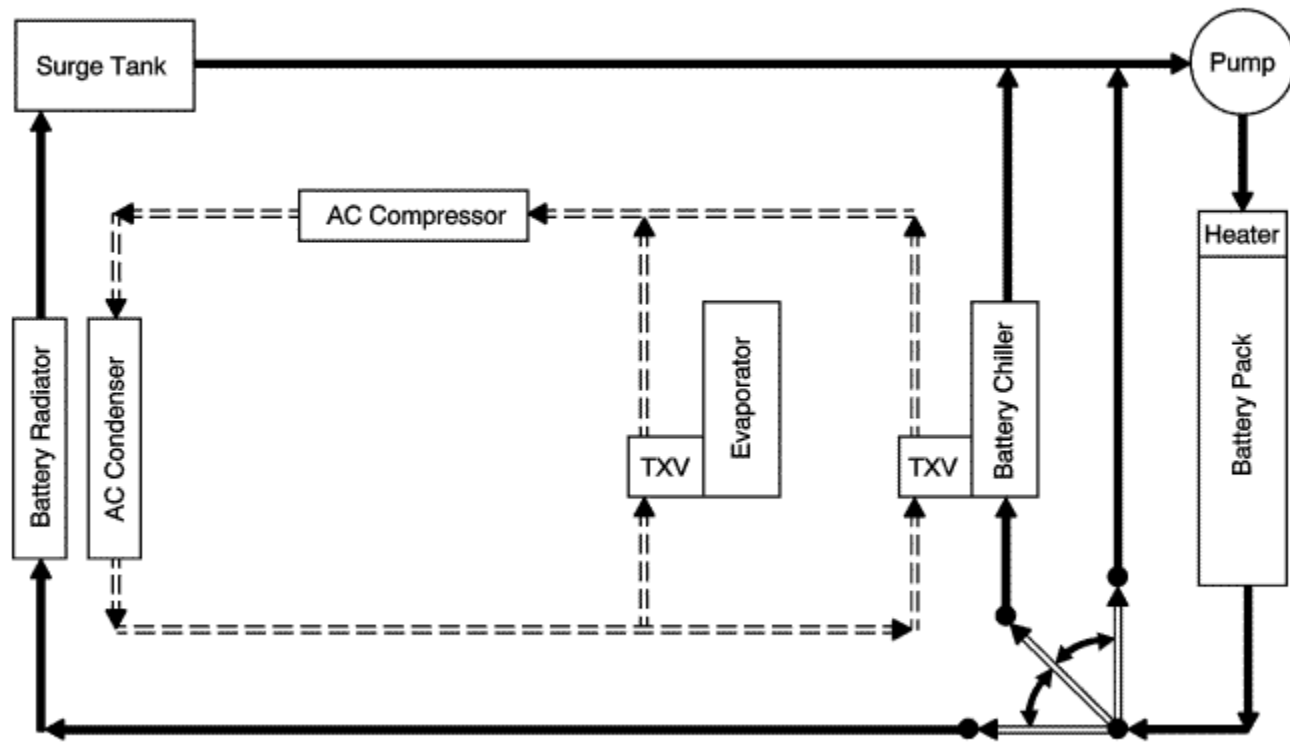

[Cooling System Description and Operation](#)

This vehicle is equipped with three fully independent cooling systems. The power electronics cooling system is dedicated to cooling the battery charger and the power inverter module. The battery cooling system is dedicated to cooling and heating the high-voltage battery. The engine cooling system is dedicated to cooling the engine and providing heat to the passenger compartment.

[Battery Cooling System Description and Operation](#)

The battery cooling system uses a radiator, two 12 volt pulse width modulated (PWM) radiator fans, a 12 volt coolant pump, a refrigerant/coolant heat exchanger (chiller) and a coolant flow control valve to cool down the high-voltage battery. There is also a high-voltage heater inside the battery to heat the coolant entering the battery when needed. The Vehicle Integration Control Module (VICM) monitors the battery coolant temperature, battery cell temperature, refrigerant temperature and refrigerant pressure. The VICM determines how much battery cooling or heating is required and turns on the coolant pump, positions the coolant flow control valve and depending on what is required, will signal the Engine Control Module (ECM) to operate the radiator fans, request the A/C Compressor Module (ACCM) to turn on the high-voltage A/C compressor or turn on the high-voltage heater. The battery cooling system could be activated when the vehicle is on and during charging.

The battery cooling system circulates a pre-mixed Dexcool® which is a 50/50 mixture of Dexcool and deionised water. Deionised water is required for high-voltage isolation and to prevent corrosion from affecting heat sink performance. Always use pre-mixed coolant and never use tap water in the battery coolant system.

Drive Motor Generator Control Module Cooling System Description and Operation

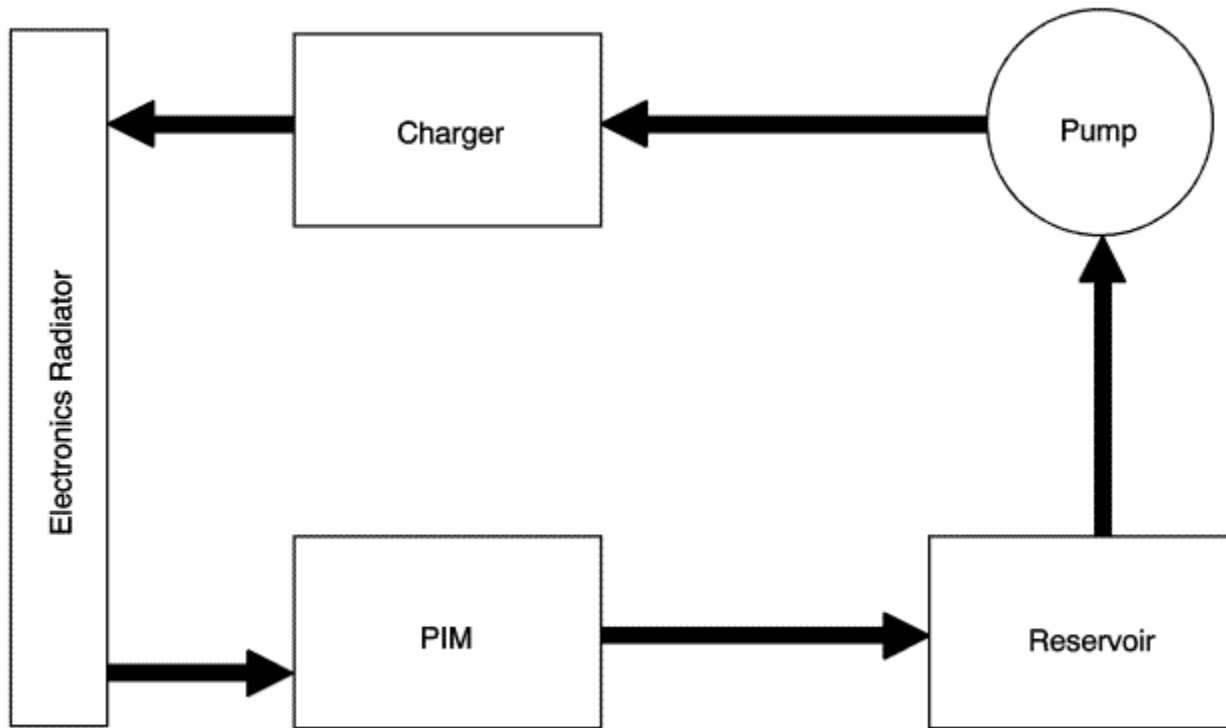

[Cooling System Description and Operation](#)

This vehicle is equipped with three fully independent cooling systems. The power electronics cooling system is dedicated to cooling the battery charger and the power inverter module. The battery cooling system is dedicated to cooling and heating the high-voltage battery. The engine cooling system is dedicated to cooling the engine and providing heat to the passenger compartment.

[Power Electronics Cooling System Description and Operation](#)

The power electronics cooling system uses a radiator, two 12 volt pulse width modulated (PWM) radiator fans, a 12 volt coolant pump and to cool down the Drive Motor Generator Power Inverter Module (PIM) and the Drive Motor Battery Charger. The Vehicle Integration Control Module (VICM) activates the coolant pump and monitors a temperature sensor in the power electronics radiator. The VICM also signals the Engine Control Module (ECM) to operate the radiator fans in response to the power electronics cooling system temperature. The coolant pump will be activated when the vehicle is on and during charging. The power electronics radiator is combined with the battery radiator to form one radiator.

The power electronics cooling system circulates a pre-mixed Dexcool® which is a 50/50 mixture of Dexcool and de-ionised water. Deionised water is required for high-voltage isolation and to prevent corrosion from affecting heat sink performance. Always use pre-mixed coolant and never use tap water in the power electronics coolant system.

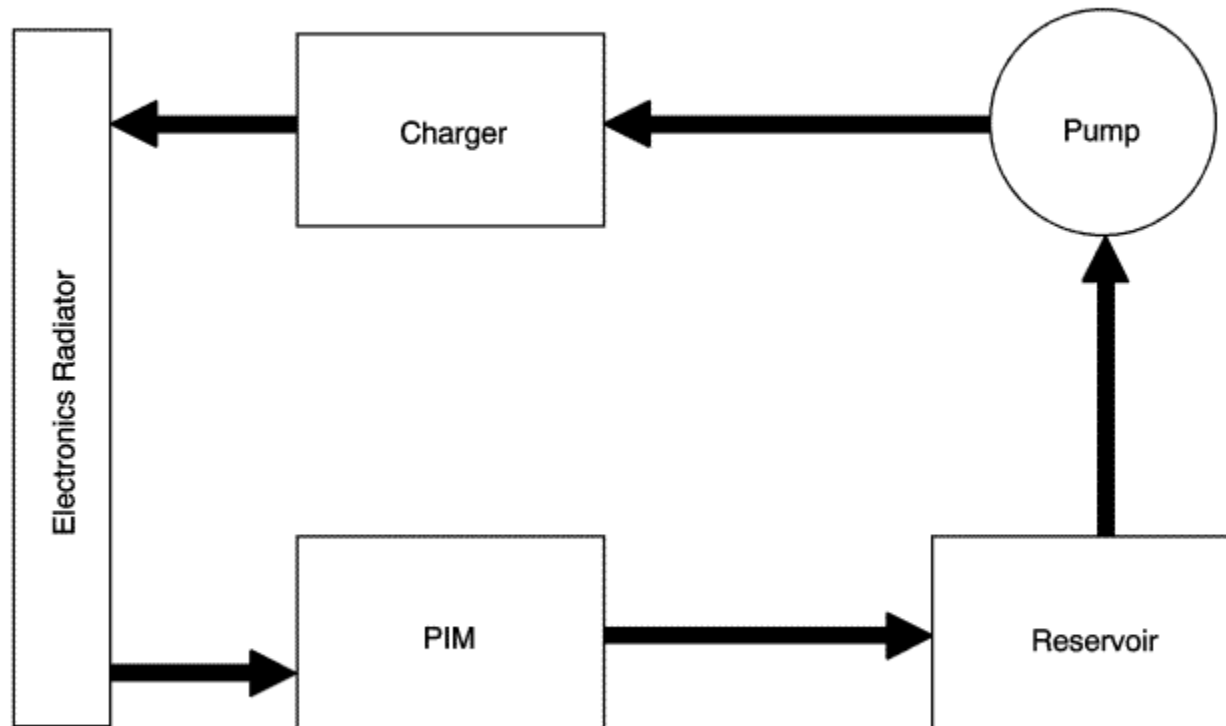

Hybrid Cooling System Description and Operation

This vehicle is equipped with three fully independent cooling systems. The hybrid/EV electronics cooling system is dedicated to cooling the battery charger and the drive motor generator power inverter module. The hybrid/EV battery pack cooling system is dedicated to cooling and heating the high-voltage hybrid/EV battery. The engine cooling system is dedicated to cooling the engine and providing heat to the passenger compartment.

[Hybrid Electronics Cooling System Description and Operation](#)

The primary purpose of the hybrid/EV electronics cooling loop is to cool the drive motor generator power inverter module, while propulsion is enabled, and the on-board charge module, when it is plugged in. The hybrid/EV electronics cooling system uses the hybrid/EV electronics radiator, the two 12 V pulse width modulated (PWM) radiator fans, a 12 V hybrid/EV electronics coolant pump to circulate coolant through the drive motor generator power inverter module and the drive motor battery charger. The hybrid/EV powertrain control module 2 activates the hybrid/EV electronics coolant pump and monitors a temperature sensor in the hybrid/EV electronics radiator. The hybrid/EV powertrain control module 2 monitors the hybrid/EV electronics cooling system temperature to determine when to operate the radiator fans. The hybrid/EV electronics coolant pump will be activated when the vehicle is on and during charging. The hybrid/EV electronics radiator is combined with the battery pack cooling system radiator to form one radiator assembly. The hybrid/EV electronics coolant pump and radiator cooling fans will also be enabled during an after-run event which is determined by coolant loop temperature.

The hybrid/EV electronics cooling system circulates a pre-mixed DEXCOOL® which is a 50/50 mixture of DEXCOOL® and deionised water. Deionised water is required for high-voltage isolation and to prevent corrosion from affecting heat sink performance. Always use pre-mixed coolant and never use tap water in the hybrid/EV electronics coolant system.

[Hybrid/EV Battery Pack Cooling System Description and Operation](#)

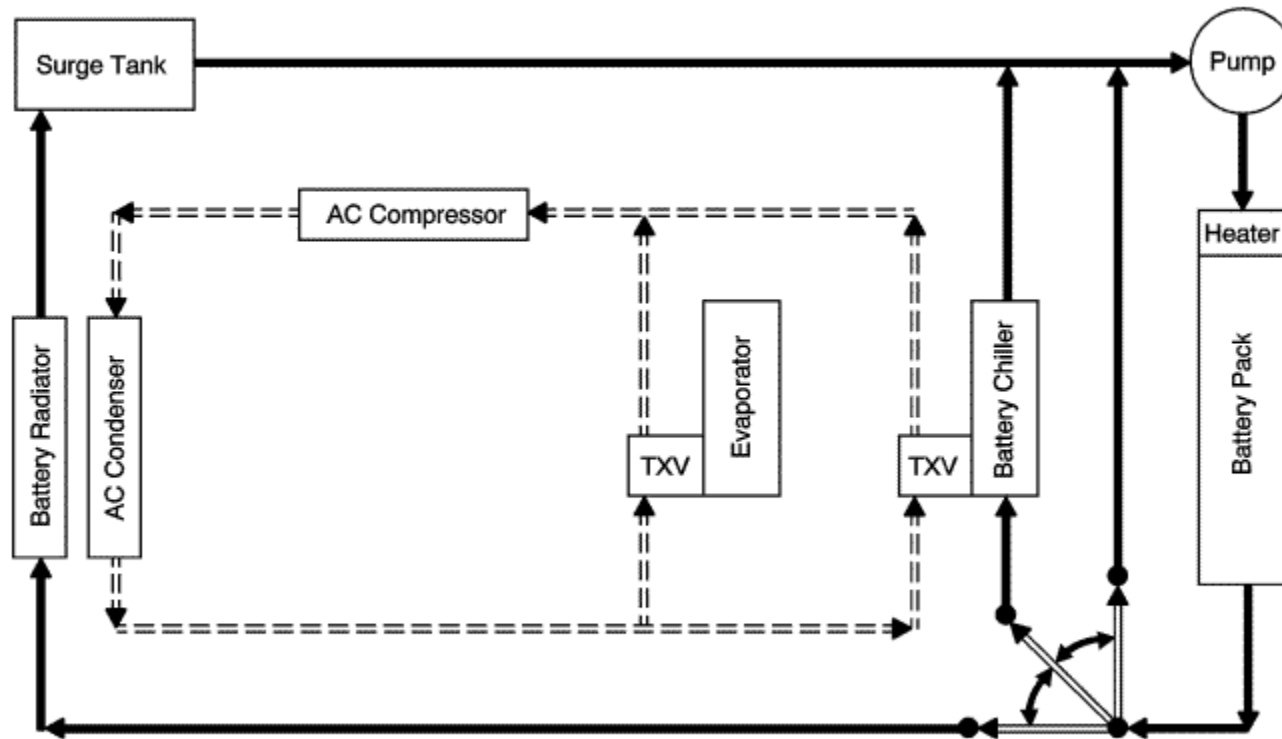

The energy storage system cooling system uses a battery radiator, the two 12 V pulse width modulated (PWM) radiator fans, a 12 V hybrid/EV battery pack coolant pump, a refrigerant/coolant heat exchanger (chiller), the electric A/C compressor motor control module assembly, refrigerant pressure and temperature sensors, ambient air temperature sensor and a hybrid/EV battery pack coolant flow control valve to cool down the high voltage hybrid/EV battery. There is also a high-voltage heater inside the hybrid/EV battery to heat the coolant entering the hybrid/EV battery when needed. The hybrid/EV powertrain control module 2 monitors the hybrid/EV battery coolant temperature, hybrid/EV battery cell temperature, refrigerant temperature and refrigerant pressure. The hybrid/EV powertrain control module 2 determines how much hybrid/EV battery cooling or heating is required and turns on the hybrid/EV battery pack coolant pump, positions the hybrid/EV battery pack coolant flow control valve and depending on what is required will operate the radiator fans, request the A/C Compressor Module to turn on the high-voltage A/C compressor or turn on the high voltage hybrid/EV battery pack heater. The hybrid/EV battery pack cooling system could be activated when the vehicle is operating, during charging, or when the vehicle is OFF and maintaining the hybrid/EV battery pack temperature. Refer to [Automatic HVAC Description and Operation](#) .

The Hybrid/EV Battery Pack Coolant Control Valve is used to manage the flow of coolant circulating through the hybrid/EV battery temperature control system. The valve has one fluid input port and three fluid output ports, identified as Radiator, Bypass and Chiller. The valve has an internal valve body that is rotated by the valve motor to different positions to control which fluid ports are connected. The valve operates through 90 degrees. When the valve is directing coolant to the Radiator port, coolant is routed through

a front-mounted heat exchanger. When the valve is in the Bypass position, coolant is routed through the battery pack without passing through additional heat exchangers. When the valve is in the Chiller position coolant is routed through a heat exchanger that allows the A/C cooling system to reduce coolant temperature. The valve can be moved to several intermediate positions between Bypass and Chiller, for blended cooling of the hybrid/EV battery pack coolant for optimum efficiency.

The valve provides position feedback to the hybrid/EV powertrain control module 2 based on a potentiometer in the valve. The hybrid/EV powertrain control module 2 uses this feedback to monitor the valve position. Different valve positions correspond to different resistance values. When the ignition is first turned on the hybrid/EV powertrain control module 2 determines and records the sensor values corresponding to the end-stop positions of the valve by moving the valve to an end-stop and back to its original position. This is referred to as the hybrid/EV powertrain control module 2 "diagnostic learn" of the valve. This provides a valve shaft breakage test and allows the hybrid/EV powertrain control module 2 to "learn" the position feedback value that corresponds to that end-stop. The end-stop that is used at each ignition key cycle alternates between each end-stop.

The hybrid/EV battery pack cooling system circulates a pre-mixed DEXCOOL® which is a 50/50 mixture of DEXCOOL® and deionised water. Deionised water is required for high-voltage isolation and to prevent corrosion from affecting heat sink performance. Always use pre-mixed coolant and never use tap water in the battery coolant system.

[Passenger Compartment Heater System Description and Operation](#)

Passenger Compartment Heater Coolant Control Valve and Auxiliary Heater Coolant Pump

The passenger compartment heater coolant control valve is also controlled by hybrid/EV powertrain control module 2 to assist in regulating passenger compartment comfort based on presence or absence of engine heat. Refer to [Automatic HVAC Description and Operation](#) .

The passenger compartment heater system uses the engine radiator, the two 12 V pulse width modulated (PWM) radiator fans, a 12 V auxiliary heater coolant pump, a passenger compartment heater coolant control valve, a high- voltage coolant heater control module and a heater core. The hybrid/EV powertrain control module 2 operates the two radiator fans in response to engine temperature.

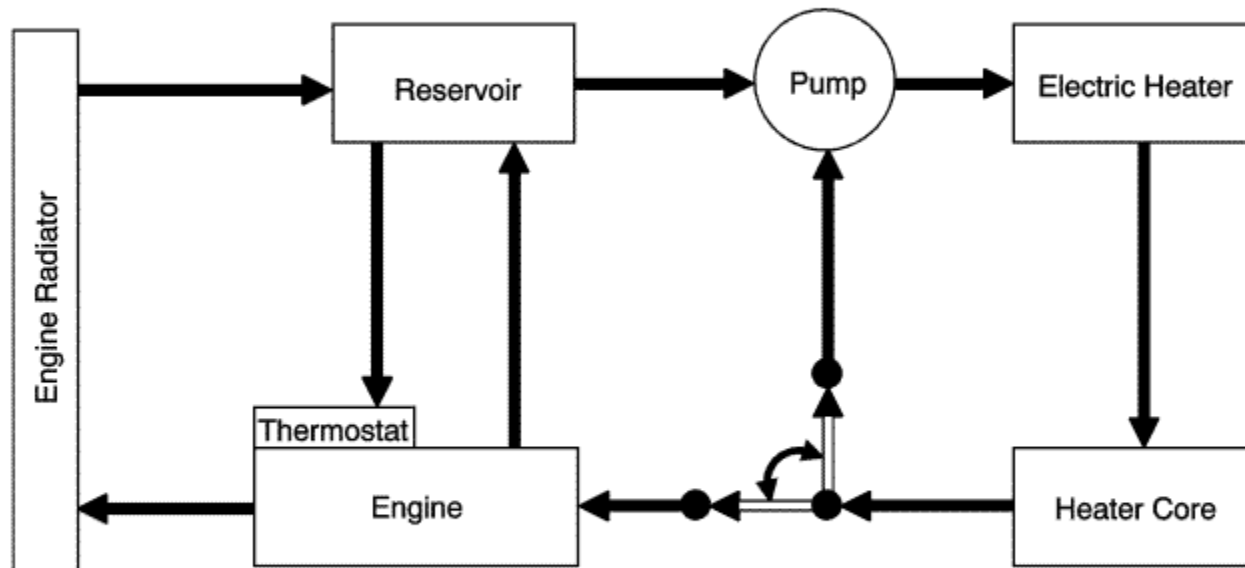

The passenger compartment heater coolant control valve has two positions. When commanded in bypass mode, as when the engine is OFF, the passenger compartment heater coolant control valve separates the engine and the cabin heater control module coolant loops to prevent heat generated by the cabin heater control module for passenger compartment heating from dissipating into the engine coolant loop. After the engine starts up and is warmed up, excess engine heat will allowed to assist the cabin heater control module in heating the passenger compartment; the passenger compartment heater coolant control valve is commanded to link mode and the two coolant loops are connected.

The HVAC control module turns on the auxiliary heater coolant pump and monitors the temperature sensors in the passenger compartment and coolant loop to determine if the high-voltage cabin heater control module is needed. Passenger compartment heat is provided by air flowing through the heater core. The heater core is heated by coolant from the engine, the high- voltage cabin heater control module or both. The hybrid/EV powertrain control module 2 will command the position of the passenger compartment heater coolant control valve to either isolate the passenger compartment heater loop from the engine coolant loop or link the two loops together to maximize efficiency depending on the passenger compartment heat requirements. When operating the vehicle in cold temperatures, the engine may run for short periods to assist in maximising heat efficiency to the passenger compartment depending on the outside temperature and the passenger compartment heat requirements.

The hybrid/EV powertrain control module 2 will command the passenger compartment heater coolant control valve into bypass mode when the module goes to sleep, at controller wake-up, and during other times except:

- During learn (after extended loss of 12 V power to the controller)
- When the scan tool is sending a command.
- If the valve is stuck in an intermediate position (between two end positions) due to failure or debris.

The passenger compartment heater cooling system circulates a 50/50 mixture of DEXCOOL® and distilled water.

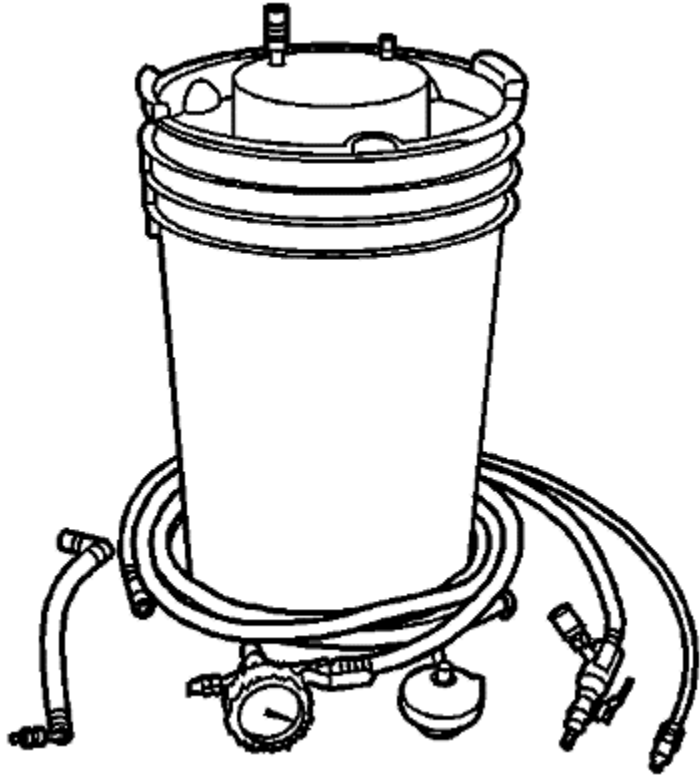

14 V Power Module Cooling

The 14 V power module is air-cooled. Refer to Accessory Power Module Description and Operation. The 14 V power module fan is powered by a brushless DC motor and has operating speeds between 0-3,900 RPM. The 14 V power module fan is serviced separately from 14 V power module assembly. The hybrid/EV powertrain control module 2 will command the 14 V power module fan while in RUN mode.

High Voltage Safety

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Follow the safety regulations for hybrid/electric vehicles. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations. Failure to follow the regulations exactly as written may result in serious injury or death.

Danger: High-voltage circuits should only be tested using the EL-50774 Low/High Resistance Meter and test leads with at least a CAT III rating or isolated test adapters such as EL-50690. Failure to follow the procedures exactly as written may result in serious injury or death.

Danger: This vehicle is equipped with a high-voltage battery that is completely isolated from the chassis earth. Never utilise AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high-voltage system is earthed through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

Special Tools

- *EL-50209* High-Voltage Terminal Cover
- *EL-48900* HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#) .

Precautions when Performing Service or Inspections

- Always verify that the high voltage has been disabled before working on or around high-voltage components, wires, cables or harnesses.
- Remove all metal objects such as rings and watches.
- The *EL-48900* HEV safety kit contains safety cones. Place the safety cones around the vehicle to alert other technicians that you are working on the high-voltage system.
- Remove all keyless entry transmitters and the manual service disconnect from the vehicle and secure in a place outside the vehicle.
- Always wear certified and tested high-voltage insulation gloves when inspecting or testing any high-voltage wires and components.
- Use the "One Hand" rule:
 - Work with only one hand whenever possible.
 - Keep the other hand behind your back.
- DO NOT carry any metal objects such as a mechanical pencil or a measuring tape that could fall and cause a short circuit.
- After removing any high-voltage wires, protect and insulate the terminal ends immediately with the *EL-50209* high-voltage terminal cover and UL® Listed or equivalent insulation tape rated at a minimum of 600 V.
- Always tighten the high-voltage terminal fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.
- After finishing work on the high-voltage systems and before reinstalling the high-voltage manual disconnect, inspect for the following:
 - Verify high-voltage system integrity and that all connectors are installed.
 - Verify that all tools or loose components have been removed.

[Labels for Components, Wire Harness and Connectors](#)

The wire harnesses and cables for high-voltage circuits are encased in an orange coloured covering. In addition, high-voltage components such as the Energy Storage System and high-voltage cables are affixed with "High-Voltage" red danger (1) and orange warning (2) labels.

[High-Voltage insulation Glove Inspection Procedure](#)

The following procedure visually and functionally inspects the insulation gloves to be used while performing service on high-voltage systems. This inspection procedure should be performed prior to any procedure that requires the use of class "0" insulation gloves rated at 1,000 V.

1. Remove glove from leather protector.
2. Inflate glove and seal opening. Pinch the opening closed tightly to prevent any air loss.
3. Press glove to increase pressure.
4. Inspect for the following conditions:
 - pin holes
 - air leaks
 - wear, tears or abrasions
 - damp or wet material
 - certified up-to-date

If any of the above conditions are met, do not use the gloves.

For equivalent regional tools, refer to [Special Tools](#) .

The High-Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify conditions under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Follow the safety regulations for hybrid/electric vehicles. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations. Failure to follow the regulations exactly as written may result in serious injury or death.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the

battery pack.

Note: Print this form. Perform the High-Voltage Disabling procedures listed. Check off individual steps when completed.

Note: A suitable hoist to safely lift the vehicle up is required to perform the disabling procedure.

High-Voltage System Disabling Protocol

Name of certified person performing the high-voltage procedure:		
VIN		Licence Plate
	Procedure Description	Step Completed
1	Review the high-voltage safety information. Refer to High Voltage Safety .	<input type="radio"/>
2	Vehicle OFF. Post red HIGH-VOLTAGE ENABLED sign clearly visible on the vehicle.	<input type="radio"/>
3	Ensure the area around the vehicle is restricted and marked as such via warning cones, cordon tape or chain. Ensure all personnel not tasked with enabling the High-Voltage System have cleared the area.	<input type="radio"/>
4	Disconnect and remove all 12 V battery chargers and the AC Charge Cable from the X98 Hybrid Battery Charger Receptacle.	<input type="radio"/>
5	Remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.	<input type="radio"/>
6	Attempt to start the vehicle with the Ignition Mode Switch. If the vehicle enters Propulsion System Active mode or the engine starts, locate and remove all keyless entry transmitters from within the vehicle and return to step 5.	<input type="radio"/>
7	Secure the vehicle from rolling, set transmission selector to park (P) position.	<input type="radio"/>
8	Note: The 12 V battery must be disconnected to ensure proper test results. Disconnect the 12 V battery. Refer to Battery Negative Cable Disconnection and Connection .	<input type="radio"/>
9	Remove the S15 manual service disconnect (1). Place the manual service disconnect in a secure place outside the vehicle.	<input type="radio"/>
10	Cover the exposed high-voltage opening with insulation tape rated at a minimum of 600 V or equivalent.	<input type="radio"/>
11	Wait 5 minutes before continuing, to allow the high-voltage capacitors to discharge.	<input type="radio"/>
12	Verify the <i>EL-50554</i> voltage disable assurance test harness using the EL-50774, verify that the EL-50554-1 and EL-50554-2 cables measure less than 1 Ω at the following points: <ul style="list-style-type: none">• High-voltage DC (-360 V) negative terminal B to the High-voltage DC (-360 V) negative terminal.• High-voltage DC (+360 V) positive terminal A to the High-voltage DC (+360 V) positive terminal. If the test result was greater than the specified range, repair or replace the EL-50554-1 or EL-50554-2 and repeat all measurements.	<input type="radio"/>
13	Using the EL-50774, verify that the EL-50554-1 and EL-50554-2 have infinite resistance between the High-voltage DC (+360 V) positive terminal A to High-voltage DC (-360 V) negative terminal B.	<input type="radio"/>

	If the test result was less than the specified range, repair or replace the EL-50554-1 or EL-50554-2 and repeat all measurements.	
14	<p>Verify the EL-50554-1 and EL-50554-2 High-voltage DC (-360 V) negative terminal B and the High-voltage DC (+360 V) positive terminal A have the proper terminal tension. Refer to Testing for Proper Terminal Contact. Testing for Intermittent Conditions and Poor Connections</p> <p>If a poor connection is found, repair or replace the EL-50554-1 or EL-50554-2 and repeat all measurements.</p>	O
15	Remove the T6 power inverter module cover. Refer to Drive Motor Generator Power Inverter Module Cover Replacement	O
16	<p>Note: Wear your High-Voltage Insulation gloves and face shield until you have determined that a high-voltage exposure risk is no longer present.</p> <p>Disconnect the X3 harness connector at the T6 power inverter module.</p>	O
17	<p>Note: The following tests must be performed using a EL-50774 set to the DC voltage setting. Performing the following tests with the EL-50774 not set on the DC voltage setting will result in inaccurate test results.</p> <p>Note: A 9 V DC battery can be used to test the EL-50774.</p> <p>Test the EL-50774 by measuring a 12 V battery.</p> <p>If the EL-50774 does not properly measure a 12 V battery, repair or replace the EL-50774 and repeat all voltage measurements.</p>	O
18	<p>Note: 5 minutes must have elapsed since removing the manual service disconnect before continuing to allow the high-voltage capacitors to discharge and ensure proper test results.</p> <p>Verify that the voltage has been disabled at the T6 power inverter module. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, leave the EL-50774 connected to the terminals until the voltage drops below 3 V to allow the high-voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.</p>	O
19	<p>Verify that the voltage has been disabled at the X3 harness connector at the T6 power inverter module. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, there is a stuck closed contactor and a loss of isolation within the A4 battery pack assembly. Refer to Hybrid\EV Battery Voltage Present .</p>	O
20	Remove the 3 catalytic converter nuts . Disconnect catalytic converter from the exhaust manifold. Move and secure the exhaust to one side. Refer to Catalytic Converter Replacement .	O
21	Remove the front exhaust pipe heat shield. Refer to Exhaust Pipe Heat Shield Replacement : Rear → Center → Front .	O

22	Disconnect the X1 and X2 harness connectors at the A28 hybrid battery contactor assembly.	O
23	<p>Disconnect the high-voltage interlock harness connector listed below at the A28 hybrid battery contactor assembly.</p> <ul style="list-style-type: none"> • F118 hybrid battery pack connector jumper connector. • X6 14 V power module jumper connector. • X7 battery charger jumper connector. 	O
24	Disconnect the X4 harness connector at the A28 hybrid battery contactor assembly.	O
25	<p>Connect the EL-50554-1 to the A28 hybrid battery contactor assembly. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, there is a stuck closed contactor and a loss of isolation within the A4 battery pack assembly. Refer to Hybrid\EV Battery Voltage Present .</p>	O
26	<p>Verify that the voltage has been disabled at the X4 harness connector at the A28 hybrid battery contactor assembly. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, leave the EL-50774 connected to the terminals until the voltage drops below 3 V to allow the high-voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.</p>	O
27	Disconnect the X5 harness connector at the A28 hybrid battery contactor assembly.	O
28	<p>Connect the EL-50554-2 to the A28 hybrid battery contactor assembly. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, there is a stuck closed contactor and a loss of isolation within the A4 battery pack assembly. Refer to Hybrid\EV Battery Voltage Present .</p>	O
29	<p>Verify that the voltage has been disabled at the X5 harness connector at the A28 hybrid battery contactor assembly harness. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, leave the EL-50774 connected to the terminals until the voltage drops below 3 V to allow the high-voltage capacitors to discharge. Continue to the next step once the voltage is below 3 V.</p>	O

30	Disconnect the X3 harness connector at the A28 hybrid battery contactor assembly.	O
31	<p>Verify that the voltage has been disabled at the A28 hybrid battery contactor assembly. Using the EL-50774, verify the voltage measures less than 3 V at the following points:</p> <ul style="list-style-type: none"> • High-voltage DC (-360 V) negative terminal B to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A to vehicle chassis earth. • High-voltage DC (+360 V) positive terminal A and high- voltage DC (-360 V) negative terminal B. <p>If the test result was greater than 3 V, there is a stuck closed contactor and a loss of isolation within the A4 battery pack assembly. Refer to Hybrid\EV Battery Voltage Present .</p>	O
32	<p>Note: A 9 V DC battery can be used to test the EL-50774.</p> <p>Test the EL-50774 by measuring a 12 V battery.</p> <p>If the EL-50774 does not properly measure a 12 V battery, repair or replace the EL-50774 and repeat all voltage measurements.</p>	O
33	If all the test results were less than 3 V, the A4 battery pack assembly, 360 V DC power inverter cables or general vehicle can now be serviced.	O
34	Sign, date and time this protocol. Replace red HIGH VOLTAGE ENABLED with GREEN HIGH VOLTAGE DISABLED sign.	O
	Date:

Danger: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high-voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling/Enabling is mandatory. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

Danger: Follow the safety regulations for hybrid/electric vehicles. The High-Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations. Failure to follow the regulations exactly as written may result in serious injury or death.

Danger: Any hybrid/EV battery pack replacement shall be performed by High-Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High-Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior to removal of the battery pack.

Note: Print this form. Perform the High-Voltage Enabling procedures listed. Check off the individual steps as they are completed.

Note: A suitable hoist to safely lift the vehicle up is required to perform the enabling procedure.

Review the high-voltage safety information prior to performing the High-Voltage Enabling procedure. Refer to [High Voltage Safety](#) .

High-Voltage System Enabling Protocol

Name of certified person performing the high-voltage procedure:			
VIN		Licence Plate	

Checklist Ampera/Volt Europe

	Procedure Description	Step Completed	
1	Replace the GREEN HIGH VOLTAGE ENABLED with the RED HIGH VOLTAGE DISABLED sign.	<input type="radio"/>	
2	Ensure the area around the vehicle is restricted and marked as such via warning cones, cordon tape or chain. Ensure all personnel not tasked with enabling the High-Voltage System have cleared the area.	<input type="radio"/>	
3	Ensure that the keys and the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever are securely stored outside the vehicle.	<input type="radio"/>	
4	Disconnect and remove any 12 V battery chargers and cables, if connected.	<input type="radio"/>	
5	Ensure that the 12 V battery is disconnected and the pole is covered to prevent uncontrolled reconnection with the battery cable.	<input type="radio"/>	
6	Secure the vehicle from rolling, set transmission selector to park (P) position.	<input type="radio"/>	
7	Verify if, and which repairs, were performed on the vehicle related to the High-Voltage System and that they are properly documented in the relevant work order file.	<input type="radio"/>	
	Note: Always tighten the high-voltage fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.		
	After finishing work on the high-voltage systems and before reinstalling the high-voltage manual disconnect lever, inspect for the following:		
8	Verify that all tools or loose components have been removed. Verify high-voltage system integrity and that all connectors are installed. Verify that all high-voltage interlock circuit connectors and covers are installed. Install any components or connectors that have been removed or replaced during diagnosis.	<input type="radio"/>	
		Test Performed	
9	If any high-voltage components or wiring had been removed, an electrical test of the earth connections must be performed with the EL-50774 and the 4-wire test leads. Refer to Earth Connection Resistance Test.	Yes <input type="radio"/>	No <input type="radio"/>
10	Install the S15 hybrid/EV battery pack high-voltage manual disconnect lever (1).	<input type="radio"/>	
11	Connect the 12 V battery. Refer to Battery Negative Cable Disconnection and Connection .	<input type="radio"/>	
12	With the bonnet open, start the engine, then Vehicle OFF.	<input type="radio"/>	
	Vehicle in Service Mode, perform the driver's window express learn and clear all DTC Information with a scan tool. Refer to Window Motor Programming -		

13	Express Function .	O
14	Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.	O
15	Vehicle in Service Mode, verify with a scan tool no DTCs are set. If DTCs are set, go to the appropriate DTC information. Refer to Diagnostic Trouble Code (DTC) List - Vehicle .	O
16	Start and idle the engine for 2 minutes.	O
17	Vehicle OFF and wait 5 minutes.	O
18	Vehicle in Service Mode, verify with the scan tool the T6 traction power inverter module and K114B hybrid/EV powertrain control module 2 DTC Information that the following DTCs have Ran Since Code Clear and have not set: <ol style="list-style-type: none"> 1. Motor position sensor learn DTCs P0C17 and P0C18. 2. Contactor DTCs P0AD9, P0ADD, P0D0A, P0D11, P0AE4 and P1EBC. 3. Discharge and Pre-charge DTCs P0C76, P0C77, P0C78 and P0AFB. 4. High-voltage loss of isolation DTCs P0AA6, P1AE6 and P1F0E. If the DTCs have Run and Passed, test drive the vehicle and verify no DTCs are set. If the DTCs are set, go to the appropriate DTC information. Refer to Diagnostic Trouble Code (DTC) List - Vehicle . If the DTCs have Not Run Since Code Clear, review and operate the vehicle according to the applicable DTC Conditions for Running and ensure the DTCs run and pass.	O
19	Note: Ensure this protocol is kept with the vehicle's records after all test steps and repairs have been completed. Sign, date and time this protocol. Replace red HIGH VOLTAGE ENABLED with GREEN HIGH VOLTAGE DISABLED sign.	O

DTC P0601-P0604 or P0606 - Hybrid Powertrain Control Module 2

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0601 00: Control Module Read Only Memory Performance

DTC P0602 00: Control Module Not Programmed

DTC P0603 00: Control Module Long Term Memory Reset

DTC P0604 00: Control Module Random Access Memory Performance

DTC P0606 00: Control Module Processor Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the control module. This diagnostic also addresses if the control module is not programmed. The control module monitors its ability to read and write to the memory. It also monitors a timing function. No external circuits are involved.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 7 V.

Conditions for Setting the DTC

The control module detects an internal malfunction or incomplete programming.

Action Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, and P0606 are Type A DTCs.
- The high-voltage contactor relays may open.

Conditions for Clearing the DTC

DTCs P0601, P0602, P0603, P0604, and P0606 are Type A DTCs.

Diagnostic Aids

DTC P0606 may set in Hybrid Powertrain Control Module 2 due to other faults. Do not replace the Hybrid Powertrain Control Module 2 until other DTCs are diagnosed first.

Circuit/System Verification

Verify that DTC P0601, P0602, P0603, P0604, or P0606 is not set.

If DTC P0601, P0602, P0603, P0604, or P0606 is set with other DTCs set, diagnose all other DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

If the DTC P0601, P0602, P0603, P0604, or P0606 is set without other DTCs set, refer to [DTC P0601-P0604, P0606, or P062F](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

DTC P0641-P0643 or P0651-P0653

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0641: 5 V Reference 1 Circuit - Main

DTC P0642: 5 V Reference 1 Circuit Low Voltage

DTC P0643: 5 V Reference 1 Circuit High Voltage

DTC P0651: 5 V Reference 2 Circuit - Charger

DTC P0652: 5 V Reference 2 Circuit Low Voltage

DTC P0653: 5 V Reference 2 Circuit High Voltage

Circuit/System Description

The high-voltage interlock circuit is utilised to verify high-voltage component integrity. High-voltage interlock circuit is a circuit loop that passes through certain high-voltage components. High-voltage interlock circuit is used to determine if access to high-voltage components is being attempted. The opening of these high-voltage components causes high-voltage interlock circuit to open. The hybrid powertrain control module 2 monitors both the high-voltage interlock 5 V reference circuit voltage and the high-voltage interlock signal circuit voltage in order to detect circuit faults. When the hybrid powertrain control module 2 detects a loss of high-voltage interlock circuit voltage, the high-voltage contactors are commanded open.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 9 V.

- The hybrid powertrain control module 2 is awake and communicating

[Conditions for Setting the DTC](#)

DTC P0641 and P0643

The hybrid powertrain control module 2 detects the main loop 5 V reference voltage is greater than 4.90 V.

DTC P0642

The hybrid powertrain control module 2 detects the main loop 5 V reference voltage is less than 2.63 V and the main loop signal is less than 1.08 V.

DTC P0651 and P0653

The hybrid powertrain control module 2 detects the charger loop 5 V reference voltage is greater than 4.90 V.

DTC P0652

The hybrid powertrain control module 2 detects the charger loop 5 V reference voltage is less than 2.63 V and the charger loop signal is less than 1.08 V.

[Action Taken When the DTC Sets](#)

DTCs P0641-P0643 and P0651-P0653 are type A DTCs.

[Conditions for Clearing the DTC](#)

DTCs P0641-P0643 and P0651-P0653 are type A DTCs.
